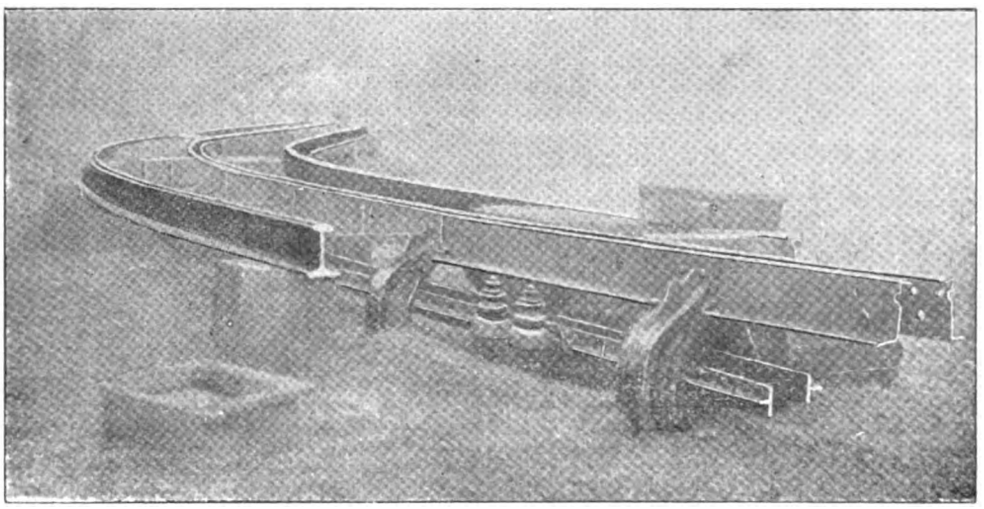
The conductor tees will be divided by section insulators into sections not exceeding half a mile in length. Each section of the conductor tees will consist of a positive and negative length in each conduit. Normally each of the two conduits will be electrically separate from the other, and will be supplied from feeders having a branch for each section. Automatic cut-outs and cross-over switches will be provided for each section, and so arranged that in the event of a fault occurring and persisting on the positive of any section, the polarity of the two conductors in that section can be reversed, so as to throw the fault on to the negative, where it can remain until the stoppage of traffic at night allows it to be located and rectified. The normal difference of potential of the conductors will be 500 volts, and insulated feeders for each conduit will be laid solid in troughs filled in with bitumen under the margins immediately outside the track rails. The Blackfriars and Kennington line and the Waterloo and St. George's-circus line for their entire length, and the Westminster and Tooting line from Westminster as far as the south-east corner of Clapham Common, will be fed direct from the generating station at Camberwell-green at 500 volts. The remainder of the Westminster and Tooting line will be fed at 500 volts from a sub-station, to be placed at the Balham depôt. It is intended to work chiefly with double-decked cars on bogies. The total length of the cars over all will be about 31ft. or 32ft. Each car will hold about 26 or 28 passengers seated inside and about 38 or 42 passengers seated on the roof, or 64 to 70 seats in all, and each car will carry its own motorman and conductor. Each car will carry two independent motors of the geared type, one on each bogie, both motors being started and controlled in the usual way from



Digitized by Google

the front platform of the car. The power of the motors is to be sufficient to give the car a speed of 12 miles an hour, and it is proposed that within a circle of four miles radius or thereabouts, as may be decided, from Charing Cross this speed shall not exceed 10 miles an hour. The cars will be electrically lighted.

It is intended that the whole of the Council's tramways south of the Thames, both those already acquired and those to be hereafter acquired, and also new tramways which may be constructed under powers to be obtained from Parliament, shall be supplied with electrical energy generated at a station at the Camberwell depôt, and distributed, where necessary, from sub-stations to be established at various places along the different routes. This station and plant are now being designed, and the Council hope that the first electric lines will be at work in 18 months' time. This period would have been considerably shortened if the electric current could have been obtained from an outside source.

A very large number of representatives of local authorities were at the public view of the above-mentioned conduit yesterday, and appreciated the short trips which were given them on the electric car. We doubt, however, if they realised that this car was running in a different conduit to that which could be seen in skeleton form; in fact, the working model was that exhibited by the Westinghouse Company at the Tramway Exhibition last year, and the arrangement of the various parts differs considerably from the conduit which the County Council are adopting. Speeches were made to those present at the view by Mr. W. H. Dickinson, the chairman of the London County Council; Mr. J. William Benn, the chairman of the Highways Committee, and several other prominent men, including the mayors of two of the districts through which the first electric lines are to be constructed.

With the short time at our disposal before going to press, we cannot go fully into the details of the new conduit. The points, however, which seem to us to require discussion are the mechanical design of the yoke pieces, which are not made to carry the running rails, and the method of supporting and insulating the conductors. With the exceedingly limited space between the live conductors and the bottom of the conduits, there seems at the first glance to be little room for cleaning *débris* out of the duct without causing it to accumulate round the stems of the insulators, filling up the space between these stems and the gun-metal arms carrying the conductor rails. Any such accumulation would seriously affect the insulation of the system. It leads one to question whether a deeper conduit with insulators supported from above would not give less trouble in maintenance in the London streets.

ELECTRICAL TRADES UNION.

The following are the proposed rules for wiremen, cable jointers, and assistants employed in the London district, to which we referred in our last issue:

1. That 53 hours constitute a week's work, but when members are working on jobs where the hours are less, the money shall be made up to equal the 53-hour week.

2. That 9½ hours constitute a day's work for five days in the week, and 5½ hours on Saturday, finishing work on that day at 1 p.m. Overtime on Saturdays, from 1 p.m. till 4 p.m. to be paid for at the rate of time and a half, after 4 p.m. double time. Overtime worked during the first five days in the week to be paid for at the rate of not less than time and a quarter for the first two hours, time and a half for the next two hours, and after that double time. Each day to stand by itself; night shifts to be paid for at the rate of not less than time and a half.

3. That the rate of pay for wiremen and cable jointers shall be not less than 9½d. per hour, chargemen not less than 10½d. per hour. Apprentices, assistants, and jointers' mates shall be not less than 17 years of age when entering the society, and shall serve three years at the trade as apprentice, assistant, or jointers' mate, and one year as probationary member. The rate of pay during the probationary period to be not less than 7½d. per hour. No one shall be allowed to join as assistant, apprentice, or jointers' mate who is above the age of 21 years.

4. Members working over one and less than 12 miles from shop to be allowed travelling time and expenses. Country expenses to be not less than 10s. 6d. per week. Travelling time and expenses to be paid for the journey from London to job, and from job to London.

5. All members working on boats, under floors, in roofs, on accumulators, oil vessels, waterside premises, and other dirty jobs, must receive not less than 6d. per day dirty money.

6. District holidays to be Easter Monday, Whit Monday, August Bank Holiday, Christmas Day, and Boxing Day. That no holiday shall entail more than two days' loss of time. The rate of pay for bank holidays shall be not less than time and a half, Christmas Day and Sundays not less than double time.

7. That no member in the London district be allowed to work more than one night in succession—namely, that after working all night our members must cease work at the usual time of leaving work the next day.

8. One hour's notice to be given on either side. Weekly wage employés to give and receive one week's notice. Members running casing to receive one hour's grinding money.

9. That on all jobs requiring four or more men, not more than one assistant or apprentice to four men shall be employed.

10. That no member be allowed to work overtime, unless absolutely necessary, when members in the district are unemployed.

11. That on all jobs a lock-up for tools and materials be provided, and on building jobs, and, where circumstances require, a messroom shall be provided.

QUESTIONS AND ANSWERS.

If thou hast knowledge, let others light their candle at it.

Under this heading we insert questions and answers of a practical character relating to central-station work, tramway work, or construction work; and for each suitable question offer *one shilling*, and for the best solution of any question we offer *ten shillings*. We also give *five shillings* for every other answer we print. The answers to any question should be sent within 10 days after the question has appeared. We would call the attention of those sending in answers to the fact that the neatness of any sketches (which must be in *ink*) sent in is considered when marking the relative values of these answers. All formulæ should be carefully written to prevent mistakes as to symbols, and all loose sketches should be signed by the author. The matter must be written on one side only of the paper. Questions may be sent at any time.

QUESTIONS.

351. In running alternators in parallel it is possible to obtain two kinds of motor current between them, one caused by any irregularity in the turning moment of the engines, and which is shown by a violent swinging of the ammeter needles, and the other due to the strengths of the alternator fields being in the wrong proportion. This results in a current passing between the machines which is quite steady, and has the appearance of an increased load. The writer has run two machines in parallel, one of which would not maintain full voltage on full load when running alone, but in parallel would give its full amperage, the other machine maintaining the voltage on the 'bus bar at full pressure. Can any reader explain this apparent boosting up of the volts, and if it is an armature reaction, how it is the field is not weakened instead of strengthened? F. T. C.

352. What advantages are obtained by the adoption of electrical coal-cutting machinery? Describe shortly, with the aid of sketches, what you consider to be the best types of electrical coal-cutters.—G. S.

ANSWERS.

Question No. 345.—Explain, with diagrams, the method usually adopted in combined lighting and traction stations for connecting the generators to either switchboard.

Best Answer to No. 345 *(awarded* 10s.*)*—It is not always the case in combined lighting and traction stations that two distinct switchboards are erected when the same generators are used for both purposes—in fact, it is seldom that such a practice is carried out, especially if the station was originally designed to supply current for lighting and traction. In stations of this sort the lighting current is delivered to the consumers by the three-wire system at a pressure of 400, 440, or 460 volts between the outer conductors, preferably 460 volts, as it is nearest to the voltage required for traction, and will not require the speed of the

Digitized by Google

generator altered or its field weakened too much to obtain this lower voltage. Fig. 1 shows a very usual method of connecting the generators to lighting or traction feeders at will, all shunt connections being left out, as they are not important and possess no special feature. As will be seen in Fig. 1, the two leads from each generator are connected to a double-pole main switch, the other side of the positive pole of which is connected through a maximum-current circuit breaker (marked C B) and an ammeter to a separate horizontal plug bar, which is situated on the upper half of the plug panel, as the section of the switchboard is called that carries these bars. The other side of the negative pole of the main switch is connected direct to a plug bar (horizontal) on the lower or negative half of the panel There is, as a rule, some auxiliary machinery which will also be connected to horizontal plug bars, such as a battery of accumulators or a motor-generator, which can be run off the traction machine to take light lighting loads or to charge the accumulators if they are used. This motor-generator is very useful, as it obviates the necessity of installing a large set of accumulators, for with it the accumulators need only be used during the time the

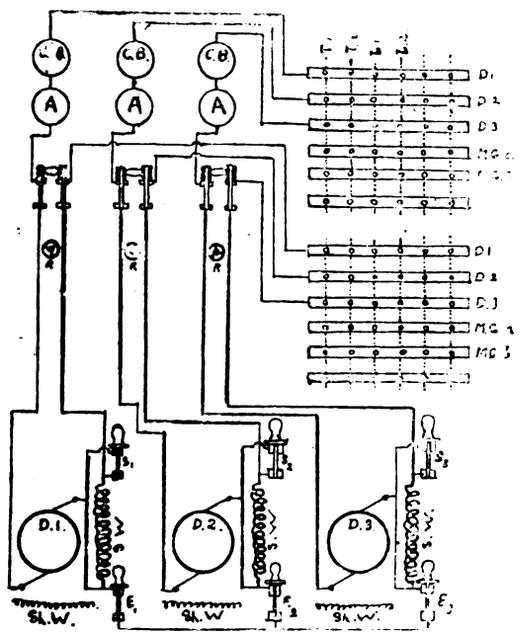


FIG. 1.—C B, automatic circuit breaker; A, ammeter: Sh W, shunt field winding (connections not shown); S W, series field winding; R, hand regulator of shunt resistance; S_1 S_2 S_3, switches to short-circuit series winding; E_1 E_2 E_3, switches for equaliser.

traction set is shut down, which means from three to six hours a day. The two leads from the two machines comprising the motor-generator are connected through suitable meters, switches, and starting arrangements to the bars marked M G *a* and M G *b*, the two positive leads going to the upper two bars and the two negative to the lower. The remaining bar is fitted in case of extensions. Behind these horizontal plug bars, but insulated from them by being placed at the back of the slate or marble panel, are fitted vertical bars, represented by the dotted lines in Fig. 1, which have holes drilled and screwed in each that come opposite to slightly larger holes in the panel and horizontal bars. The (in this case) two traction feeders are connected to the upper two of this vertical bars, marked T_1 and T_2, of course first going to a switch, meter, and automatic circuit breaker; the lower two, T_1 and T_2, are connected together and to the rails of the traction system. The positive lighting feeders are connected through suitable apparatus to the upper or positive vertical bars, marked L_1 and L_2, and the negative lighting feeders are connected to the lower or negative bars, marked L_1 and L_2 (Fig. 1). Brass plugs are made with a thread on one end, that screws into the vertical bars, and with a large head at the other, which makes contact with the horizontal bars, so that by screwing in a plug in a line horizontally with, say, D_1, and vertically with, say, T_1 on both halves of the plug panel, generator No. 1 is connected up to No. 1 traction feeder, or it can be connected to any other feeder by putting the plug in opposite to it and the desired feeder. Care must be taken, however, never to break circuit with a plug; the switches should always be opened before the plug is unscrewed. The generators are generally compound-wound, sometimes over-compounded 5 or 10 per cent., so as, when used for traction, to keep the voltage fairly constant on the line, but to increase at the station slightly with the load; but when put on lighting, the series winding is cut out or short-circuited, and the shunt winding only is used by means of a switch (marked S_1, S_2, and S_3), which is bolted on to the machine, or to a pillar beside it that also carries the equaliser switch (marked E_1, E_2, and E_3) for running two or more machines in parallel on traction.

Fig. 2 shows another method of switchboard arrangements which is more simple and less liable to accident. In this case the two generator leads, together with the equalising lead of each generator, is brought to a triple-pole throw-over switch and connected to the hinge or centre contacts of it, shown on the dotted line, *h*. When a machine is required to be put on traction this switch is closed *upwards*, which makes connection direct to the traction 'bus bars,

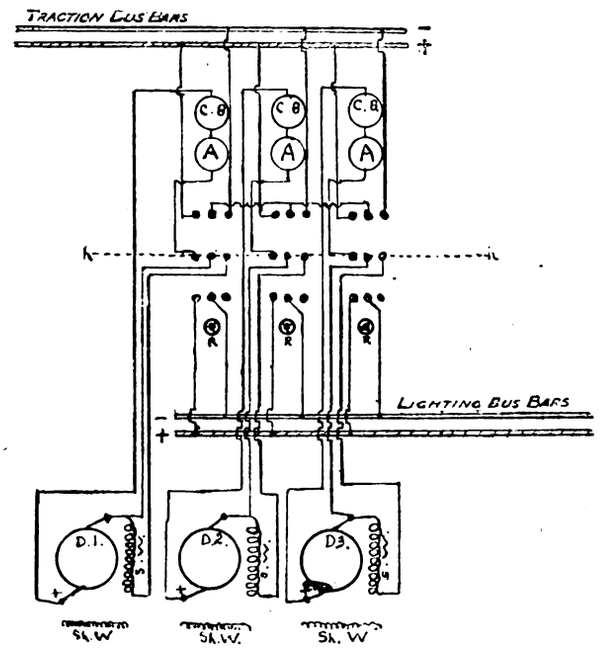

FIG. 2.—C B, automatic circuit breaker; A, ammeter; Sh W, shunt winding (connections not shown); S W, series field winding; R, hand regulator of shunt resistance (connections not shown).

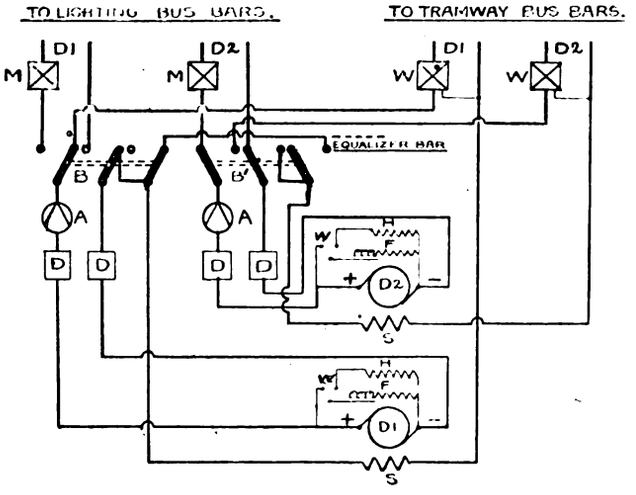
leaving it working compound-wound and connected to the equalising bar. If the machine is wanted on lighting, the triple-pole switch is closed *downwards*; it will then be running as a shunt machine and connected to the lighting 'bus bars, as will be seen by looking at Fig. 2, the bottom right-hand contact of the switch being blank. If a motor-generator is used, or a set of accumulators, they are connected to the 'bus bars by switches. With a switchboard of this kind a generator can be changed from lighting to traction or *vice versâ* in a very short time, and there is no danger of putting in wrong plugs, or forgetting the equaliser, or to short-circuit the series winding.—A. J., SWANSEA.

Answer to No. 345 (*awarded* 5*s.*).—The accompanying diagram shows the connections which have been adopted for connecting generators to either the lighting and tramway switchboards. This is the arrangement for two generators, but the same holds good for any number. D_1 D_2 are the two generators with shunt coils, F, and series coil, S. H is a non-inductive resistance, used when breaking the shunt circuit by means of switch W. The current from the machine passes through double-pole automatic magnetic switch cut-outs, D D, through ammeters on one pole, A A, to three-way throw-over switches, B B^1 (one for each machine), constructed so that when switch is on positions as in diagrams, dynamo No. 1 is feeding the traction switchboard, and dynamo No. 2 is feeding the lighting switchboard. M M are ampere-hour meters on the lighting

Digitized by Google

circuits, and W W are watt-hour meters on the tramway circuits. The generators are generally wound to give from 460 volts to 500 volts when running as shunt machines (D_2), and over-compounded to give 500 volts to 550 volts as compound machines (D_1). If the connections from D_1 are traced, it will be seen that the series coil is in action, and the generator is working as a compound machine; in the connections for D_2, the series coil is idle, and the generator is working as a simple shunt machine. If it is required to run D_2 in parallel with D_1 on the traction load, the switch B^1 is thrown over to the other set of contacts, when the – sides of the two armatures are connected together by means of the equalising bar, the two series coils are put in



parallel, and the machines, if identical, take equal shares of the load. To run both machines for lighting, switch B is thrown over. Care should be taken to see that the shunt coils are sufficiently excited before using switch B or B^1. It would be a better arrangement if these switches were interlocked with their respective shunt switches.—W. A. J.

Question No. 346.—The dynamos used in an electrolytic bleach works are sparkless under normal conditions, but when fumes of chlorine gas are present the commutators exhibit continuous rings of sparks. Why is this?

Best Answer to No. 346 (*awarded* 10*s.*).—The fact that under normal circumstances the dynamos run sparklessly shows that they are properly built, and it is also well known that the presence of rings of sparks around a commutator is due to the burning of metallic dust, which may arise from a loosely-made brush, or from solder or copper dust which has collected between the various commutator segments. These rings often occur in an intermittent manner when a new dynamo is first tested, but upon running soon cease owing to the dust being burnt out, as it is technically called, in the testing-room. Now, the fact that in this case these rings are continuous shows that the chlorine has some action upon the copper of either the brushes or the commutator—probably the former—as the copper is here more finely divided, and there are frequently loose ends to get hot.

Every chemist knows that chlorine has a great affinity for copper, and this knowledge is made use of in Hunt and Douglas's process for the extraction of copper from its ore, which is treated, after roasting, with a solution of 112 parts of calcium chloride, 280 parts of sulphate of iron, dissolved in 1,000 parts of water, and then adding 200 parts of common salt. If cuprous oxide is present, metallic copper is at once precipitated. The formula is $3Cu_2O + 2FeCl_2 = Cu_2 + 2Cu_2Cl_2 + Fe_2O_3$, but it will be seen that double the amount of copper remains combined with chlorine. In the case under consideration most probably cupric chloride ($CuCl_2$) is formed. This compound occurs when metallic copper is burnt in an excess of chlorine. It is a dark liver-coloured powder, which would fly over the commutator and bridge across the mica from section to section, and burning out would give rise to continuous rings of sparks. In burning out it might lose some chlorine and so form cuprous chloride (Cu_2Cl), a substance which turns green upon exposure to air,

If there are any loose ends to the brushes these will get hot, and chlorine gas being present we have all the conditions fulfilled for the formation of cupric chloride, and the writer thinks this will be found to be the correct explanation; and if carbon brushes be substituted for gauze ones, provided there is ample brush area, the sparks will considerably diminish in number, even if they do not entirely cease—at any rate, the alteration is worth trying. Cuprous chloride readily absorbs ammonia and forms a blue product, and as the chlorine gas is not pure, the writer would like some of the dust which is gathered from under the commutator for analysis to see what product is formed. This investigation would be very interesting, even if it did not yield any tangible result in the way of giving a definite solution to the question of how best to overcome the difficulty.—M.

Answer to No. 346 (*awarded* 5*s.*).—The ring of light which is often visible round the commutator of a dynamo working in an atmosphere containing a great deal of chlorine is in no way to be confounded with the sparking, properly so called, due to electrical actions. It results from the mechanical wearing off of particles from the commutator and brushes by their mutual friction. These particles of copper dust, being heated by the mechanical work expended in their abrasion, combine chemically with the chlorine in their neighbourhood, forming copper chloride ($CuCl_2$). As the affinity between copper, or, indeed, most metals, and chlorine is very great, sufficient energy is liberated during the combination to raise the gases in proximity to incandescence. This copper dust near the commutator surface is swept round with it, so that the region in which combination occurs is a more or less complete ring. The combination may be easily demonstrated by dropping warm filings into a jar of chlorine gas, or, in "T. A.'s" case, more simply by filing a piece of brass in the chlorine-laden air of the works. This apparent sparking has no particularly prejudicial effect on the machine or commutator beyond a possible lowering of the insulation between adjoining segments, due to a film of the chloride being deposited on the surface of the insulation between them. With even tolerable care, however, in wiping the surface occasionally, this should not occur. In one way, indeed, the action is an advantage, as it prevents copper dust getting in the armature. It is sad, nevertheless, to think of a machine condemned to stifle in chlorine, for with the moisture also present, hydrochloric acid is formed, and this must sooner or later tell on the dynamo.—ZERO.

Answer to No. 346 (*awarded* 5*s.*).—The question states that the dynamos run sparklessly in the absence of chlorine. I should imagine, however, that there is a little sparking, and that the brushes are scoring the commutator considerably. When a dynamo has been running some time under these conditions, the brush gear and the bedplate under the commutator are found to be covered with a fine copper dust worn off the commutator and the brushes. Now, copper in a finely-divided state will fire spontaneously in chlorine gas, and although the atmosphere is very very far from being of pure chlorine, it is yet sufficiently rich in it to cause the copper dust to ignite, coming, as it does, hot from the brush tips. The questioner will no doubt have noticed that very soon after the chlorine becomes perceptible the commutators lose their bright coppery look, and become a dull yellowish colour: this is caused by a film of copper chloride, and illustrates the great affinity of copper for chlorine. This sparking in rings does not injure the commutator at all, as it is simply the combustion of the dust, and not actually on the surface of the commutator. If the voltage is high, however, there is a possibility of it causing flashing from brush to brush all round the commutator. It can be prevented by the use of a brush made up of thin sheet white metal, such as the Boudreaux brush, which does not wear the commutator, and does not itself wear into dust.—J. W.

ADVANTAGES OF ELECTRIC LIGHTING.—These, as well as the intricacies of the maximum-demand system of charging, formed the two chief items of an essay read at the Croydon Debating Society, on Feb. 13, by Mr. W. Perren-Maycock, M.I.E.E.

Digitized by Google

COMPANIES' MEETINGS AND REPORTS.

ST. JAMESS AND PALL MALL ELECTRIC LIGHT.

The annual meeting of the Company was held on Tuesday at the offices Golden square, W., Mr. Eustace J. A. Balfour (chairman) presiding.

The **Chairman**, in moving the adoption of the report, congratulated the shareholders on the position of the Company and on the results which had been arrived at during this year's work. It was proposed that a distribution amounting to 14½ per cent. should be made on the ordinary shares, so that the dividend would have been maintained steadily at this rate for the past four years. During the period under review they had added to their service the equivalent of 21,597 8-c.p. lamps, making the total lamps at the end of 1900 183,347. As had been explained on previous occasions, the policy of the directors had been to make periodical reductions in the charges to consumers, and the large reduction made two years ago had already borne good fruit, for the value of the return per 8 c.p. lamp, which fell from 9s. 6d. in 1898 to 9s. 2d. in 1899, had in the past year risen again to 9s. 8d., which proved that the extra amount of electricity consumed at a lower price would more than make up for the actual loss incurred in making such reductions. Similarly, the larger output, together with economies which were from time to time effected in the Company's methods, enabled the directors, in spite of the large increase in the cost of coal, not only to prevent an increase in the cost to them of their supply, but even to effect a small reduction. This, thought they would agree, was an altogether healthy sign. Unfortunately, the advance in the price of coal would be felt in equal measure in the current year, for although hand to mouth supplies might now, perhaps, be obtained at a lower figure, it was necessary for this Company, having important public responsibilities, to safeguard the continuity of their fuel supply by regular contract. They had, too, on the current year to face a very serious addition to their rates—in fact the increase in the amount to be paid was from £2,829 to £5 700. In view of the extra expenditure on these two items it had been decided to make no further alteration in the charges for the present, but to devote the current year to strengthening and consolidating their resources, and in pushing on with the important extensions which they had in hand, so that everything might be ready for undertaking the large increase in their business which they confidently expected to have. The extensions at Carnaby-street would be finished in ample time for the next winter's supply. They consisted of a second chimney shaft, a large boiler-house and engine-room with a yard for coaling, workshops, and other conveniences which had been very much needed. The whole of the floor space above the boiler-house and engine-room was prepared for the plant to be used in connection with the supply from the Central Electric Supply Company. The St. James's Company, in combination with the Westminster Electric Supply Corporation, took a half share in the construction and equipment of the new works of the Central Company at Grove road, which would be employed for the service of the two companies after their present resources within their respective districts had been exhausted. The site for these works, which had now been secured, gave direct access to the sidings of the railway company and to the canal. The first section of the works was in process of erection, and orders had been placed for the engines and boilers and the necessary electric plant.

Mr. Walter Leaf seconded the motion.

In reply to a shareholder, who complained of the small amount of extra net profit in comparison with the large increase in the gross profit during the past two years, the **Chairman** said he was convinced that the policy the directors were pursuing was the right one.

The report having been unanimously adopted, the retiring directors, Mr. Walter Leaf and Mr. Bennett Fitch, were re-elected.

An extraordinary meeting was then held to alter the articles of association, in accordance with the requirements of the new Companies' Act.

The proceedings then closed.

CENTRAL LONDON RAILWAY.

The ordinary general meeting of the Company was held at the Holborn Restaurant on Wednesday, Sir Henry Oakley (chairman) presiding.

The **Chairman**, in moving the adoption of the report, said they would see by the accounts that their expenditure during the half-year had been £158,000. Considerable payment was made to the contractors towards the finishing of their work—£127,000—and the balance had been paid for sundry additions that they had had to make, and which they should have to continue to make in order to enable them adequately to conduct the service. There was only one point in the capital account to which he would call attention, and that was the issue of debenture stock. A portion of that stock was reserved for the contractors, subject to the condition that it was not to be liable to interest until the line was opened for public use. That being accomplished they were bound to issue the debenture stock to them, and the Board proposed shortly to raise the money, and with a view to affording all the proprietors any advantage there might be in it, they should send a circular to every proprietor at the time of issue stating the position of the bonds and the price at which they would be issued. They would bear 4 per cent. interest, and as the security was undoubted, those who had money to invest would do well to add to their holdings. During the five months that they had been in actual work the number of passengers daily carried had progressed regularly and satisfactorily. They began with 80,000; they carried up to the end of December 101,000 per day, including Sundays, and for the month of January the number reached 108,000 per day. He was glad to say that nearly all their passengers were satisfied; he had heard of no complaint that had indicated any want of management of the line. They had very little doubt, therefore, that they should make their undertaking a model for all future underground railways. Their aim was to make the road through the tunnel as bright, as clean, and as comfortable as possible, to interpose as few restrictions on the ingress and egress of their passengers as possible, and to give them as little trouble and anxiety in dealing with their tickets as they could. The simple system they had adopted appeared to have met with general approval. On the question of numbers, they carried, roughly, 15 000,000 passengers in the five months. Of those, rather less than 1½ millions were workmen who booked before half-past seven in the morning, and were carried at the reduced fare of 2d. for the return journey. Their daily experience was that the public willingly paid their 2d. for a short distance when they could travel overhead for 1d. The *inter se* traffic between stations and for comparatively short distances was steadily augmenting. In the early morning and in the evening they had more than they could do, and many of the trains were crowded far beyond what was comfortable and what they desired to see. The Board had been turning their attention to that subject for some time, and their manager had exercised his ingenuity to run an exceptional number of trains during the crowded hours. The best they could do was to change engines and get the trains round to the other line in about 2 minutes 50 seconds. They had called the engineers into consultation and also the manager, and the latter went to Paris, as did several members of the Board, to see the working of the Paris underground railway, because it was said that on that line they had no such difficulties; nor had they, because at each end of their line there was a loop to enable the trains to run continuously round. Of course, at Shepherd's Bush the cost of such a loop would be comparatively light—it was estimated at about between £50,000 and £60,000—but the cost of a loop in the City was far more serious, for it would cost £400,000. They were satisfied, however, that if they constructed such a loop in the City and provided an additional station at Liverpool-street, they would, by the augmentation of the traffic owing to the centre they would create in Liverpool-street, and by the general increase of traffic owing to the additional facility of the line, be repaid even that large outlay. Therefore, the Board, advised by their engineers, had deposited a Bill in Parliament this session asking for power to make the loop. Their earnings per train mile for every mile they ran was 4s. 10½d. Comparing that with the average earnings of other railways, they found themselves in a very satisfactory condition indeed. Referring to the question of expenditure, the chairman explained that they spent at least £200 per week more in coal than they should spend under normal conditions. Notwithstanding this drawback they had achieved what was really a dividend of 3 per cent. for the five months in which it was earned. They would be obliged to declare it at 2½ per cent., because they had no power to pay this half year any further interest out of capital. I should mention that they had not put aside any sum this half year for depreciation. They would probably recommend the proprietors at some future time to assent to a fund being formed for depreciation, instead of charging each half-year with the amount expended in renewals.

Mr. Henry Tennant seconded the motion.

Several shareholders pointed out that they carried passengers over six miles for 2d., and questioned whether this was in their interest to do so.

The **Chairman**, in reply, said the directors were, of course, above prejudice in the matter of the fares; all they wanted to do was to ascertain what was the right thing. If the directors found that the fares they were charging were not remunerative, they would have no hesitation in making an alteration with a view to an improvement. It was rather remarkable that the fares suggested by a shareholder of 1d., 2d., and 3d. were the identical fares originally contemplated by the Board. On working the matter out, however, having regard to the experience which had been gained in America and Paris, and having also ascertained as nearly as they could before the line was opened what proportion of passengers they would be likely to carry, the directors came to the conclusion that it would be more advisable to charge a uniform fare. They carefully watched, not only their own working, but the working of the Paris railway and of the London electric railways. The City and South London earned, in round figures, 2s. 4d. per train mile, and their average fare was 2 06d.; the Liverpool Overhead Company earned 1s. 8d. per train mile, and their average fare was 1 82d.; and the North London Company—which they included because it had a very large traffic, and was an old-established and well-managed line—earned 3s. 1d. per train mile, while their average fare was 1 61d. Their own experience, so far, was that they earned 4s. 10½d. per train mile, and that their average fare was 1 90d. This result was better than on any of the other lines he had quoted, all of which, except the Paris railway—and they were doing so in a modified degree—charged sectional fares. As to the question of damage to other property, alleged to have been caused during construction, any payment to be made in respect of that would fall on the contractors, and not on the Company. Regarding vibration, they were advised that, having parliamentary rights, there was no question of liability as far as the Company was concerned, but the Company would of course, do all they possibly could to relieve adjoining owners from any

Digitized by Google

inconvenience or annoyance, and they were rendering the Board of Trade all possible assistance in investigating the matter.

The resolution was carried unanimously, the dividends recommended were declared, and the retiring directors and auditor were re-elected.

At a special meeting the Bill referred to by the chairman was approved, and at a further meeting it was resolved: "That, pursuant to the powers conferred upon the Company by the Companies Clauses Consolidation Act, 1845, Sections 61 and 64, 196 980 ordinary shares of £10 each, 88,020 preferred half shares of £5 each, and 88,020 deferred half-shares of £5 each, all fully paid up in the capital of the Company, be converted or consolidated into capital stock to be divided amongst the shareholders according to the respective interest therein."

KENSINGTON AND KNIGHTSBRIDGE ELECTRIC LIGHTING.

The fourteenth ordinary general meeting of this Company was held on Wednesday at the offices, Great George street, Westminster, Mr. Granville R Ryder presiding.

The **Chairman**, in moving the adoption of the report, stated that the directors were able to propose a dividend making 12 per cent. for the year, and to carry forward £4,700. Coal had cost the Company about £2 000 more than in the previous year, and in the last three months of 1900 the weather in London was unusually light and free from fogs, to which circumstance he attributed the fact that they sold electricity to the amount of £2,000 less than in the corresponding period of the previous year. During the year the number of houses and shops lighted by the Company had increased by 214, and in the number of lamps there had been an advance of 15,636. They sold in the year 2 630 482 units, or an increase over the quantity sold in 1899 of about 166,000 units; but there was a disproportionate increase in the cost of production—namely, £37,326—as against £33,823 in the previous year, but this difference was shown at once in the higher price of coal. The new generating station which had been constructed in conjunction with the Notting Hill Electric Lighting Company, Limited, was approaching completion. A certain amount of electricity had been received from it, and it was expected to be in full working order in two months. Great results were anticipated from the new generating station when it was in full working order. During the year they had created a new transformer station, situate at the back of the Albert Hall, and it was in every respect convenient and well equipped. This would render unnecessary the accumulator station in Queen's-terrace-mews, which it was intended to discontinue.

Sir. F. J. Bramwell seconded the motion, which was carried unanimously.

APPOINTMENTS VACANT.

Electrical Engineers, Isle of Thanet Electric Tramways and Lighting Company, Limited, to take charge of power station, Feb. 22. Full particulars in our advertisement columns.

Electrician, to work up installation contracting business, also wiring, etc. Details in our advertisement columns.

Draughtsman and Assistant Engineer, with considerable experience in drawing office, experience in German and French advantageous. Details in our advertisement columns.

Fitters, several experienced in building and fitting up of commutators. Details in our advertisement columns.

CONTRACTS FOR ELECTRICAL SUPPLIES

CONTRACTS OPEN.

Sheffield.—Tenders are to be obtained for 25 extra double deck cars, trucks, and equipments.

Bournemouth.—The Town Council invite tenders for 42 electric cars. Tenders by March 2. Details in our advertisement columns.

Brighton.—The Council invite tenders for continuous current arc lamps and accessories for street lighting. Tenders by Feb. 25. Details in our advertisement columns.

Clyde Navigation.—The Trustees invite tenders for a three-ton electric wharf crane for Prince's Dock. Tenders by March 11. Details in our advertisement columns.

Leeds.—The Tramways Committee invite tenders for supplying and fixing trolley wires and attachments. Tenders by March 8. Details in our advertisement columns.

Middleton.—The Corporation invite tenders for the supply, delivery, and erection of a traction switchboard. Tenders by Feb. 28. Details in our advertisement columns.

Aberdeen.—The Electric Lighting Committee invite tenders for fuel economiser and additional Babcock and Wilcox boilers. Tenders by March 15. Details in our advertisement columns.

Darwen—The Corporation invite tenders for the supply and delivery of steel rails, fish and sole plates, tierods, bolts, etc., and copper bonds. Tenders by Feb. 25. Details in our advertisement columns.

Taunton.—The Corporation invite tenders for two 100-kw. tramway generators, one engine, and tramway switchboard and connections. Tenders by Feb. 25. Details in our advertisement columns.

Dundee.—The Gas Commissioners invite tenders for the supply of underground electrical conduits, together with the necessary jointing apparatus. Tenders by Feb. 20. Details in our advertisement columns.

Beckenham.—The Council invite tenders for boilers, steam alternator and combined engine dynamo and motor, pipework, batteries, and switchboard. Tenders by Feb. 25. Details in our advertisement columns.

Leeds.—The Tramways Committee invite tenders for supplying and fixing trolley wires and attachments. Specifications etc., may be obtained at the City Engineer's Office, Municipal Buildings, Leeds. Tenders by March 8.

Long Eaton.—The Urban District Council invite tenders for producers, gas-engines, dynamos, switchboard, feeder and distribution cables, and conversion of street lamps. Tenders by Feb. 18. Details in our advertisement columns.

Canterbury.—The Lighting Committee invite tenders for the extension of the electricity works. Specification, etc., may be obtained at the City Surveyor's Office, Tudor-chambers, High-street, Canterbury. Tenders by Feb. 18.

Bormondsey.—The Council invite tenders for the construction, supply, and erection of (Section A) main switchboard and instruments; (Section B) battery of accumulators and accessories. Tenders by Feb. 25. Details in our advertisement columns.

Wallasey.—The Urban District Council invite tenders for the overhead equipment of about 10 miles of tramways and for the supply and erection of section boxes and the bonding of rails. Tenders by March 4. Details in our advertisement columns.

Bristol—The Electrical Committee invite tenders for coal conveyor and elevators and coal-discharging plant, including hoist, automatic weighing machine, tower, and bridge over roadway. Tenders by Feb. 21. Details in our advertisement columns.

Wallasey.—The Urban District Council invite tenders for the erection and completion of car sheds, stores, workshops, and dwellings at their tramway depôt, Seaview-road, Liscard, Wallasey. Tenders by March 4. Details in our advertisement columns.

Cardiff—The Corporation invite tenders for steam-pipes, exhaust pipes, injection and overflow pipes, feed pipes, drain pipes, engine-house flooring, and switchboard gallery and central service gangway. Tenders by March 18. Details in our advertisement columns.

Stockport.—The Gas and Electricity Committee invite tenders for supply and erection at their electricity works, Millgate Stockport, of a condensing plant capable of dealing with 20,000lb. of steam per hour. Specifications can be obtained from Mr. S. Meunier, engineer. Tenders by March 6.

Wallasey.—The Urban District Council invite tenders for extension of engine-house, Lancashire boiler, condensing apparatus, water-cooling tower, overhead travelling crane, engines and dynamos, cables, economisers, and transformers. Tenders by March 4. Details in our advertisement columns.

Bournemouth—The Corporation invite tenders for the supply of three steam dynamos and two steam-driven surface condensers, and other works in connection therewith. Specifications, etc., may be obtained of Mr. F. W. Lacey, M.I.C.E., borough engineer, Municipal Offices, Bournemouth. Tenders by March 2.

Egremont (Cheshire).—The Wallasey Urban District Council invite tenders for the supply of 1,600 tons of steel rails, 70 tons of fishplates, 50 tons of tiebars, and 45 tons of soleplates. Specifications, etc., can be obtained from the engineer, Mr. W. H. Travers, Church-street, Egremont. Tenders by Feb. 19.

Luton.—The Town Council invite tenders for wiring for electric lighting purposes the Council-chamber, town hall, free library, corn exchange, and baths. Sketches of designs and full details of the proposed works to be given. Further information can be obtained of the Borough Engineer. Tenders by March 4.

Grantown-on-Spey.—The Town Council invite tenders from electric light companies to supply electric light for public and private consumption within the burgh, stating highest price charged consumer, and terms for future purchase by the burgh. Tenders by March 6. Details in our advertisement columns.

Wimbledon.—The Urban District Council invite tenders for the supply and erection of steam and exhaust pipes, etc., and the moving of two boilers, feed pumps, feed-water heater, and storage tank, an independent surface-condensing plant, and two water-tube boilers. Tenders by Feb. 18. Details in our advertisement columns.

London, S.W.—The London County Council invite tenders for the supply of two blocks of water-tube boilers required for the electrical power generating station to be erected at the Camberwell depôt of their tramways. Full particulars may be obtained at the Engineer's Department, County Hall, Spring-gardens, S.W. Tenders by Feb. 19

Bristol.—The Electrical Committee invite tenders for the erection of the superstructure of the Avonbank electricity works, Feeder-road, Bristol. The work comprises a large amount of steelwork, as well as brickwork and concrete work. Specification, etc., can be obtained at the office of Henry Williams, Esq., architect, 24, Clare-street, Bristol. Tenders by March 12.

Southwark.—The Electric Light Committee invite tenders for the supply and erection of the following plant for their electric light station at Penrose-street, Walworth-road, S.E.: (Section A) One 400 kw. high-speed engine and dynamo and accessories;

Digitized by Google

(B) two water-tube boilers, fitted with mechanical stokers, and extension to the steam and water mains. Tenders by Feb. 18. Details in our advertisement columns.

Huelva (Spain).—The Secretary of State for Foreign Affairs has received a dispatch from her Majesty's ambassador at Madrid, stating that tenders are invited by the Spanish Government not later than Feb. 21 for the establishment of a telephone system in the city of Huelva. Such particulars as have been received may be examined on personal application at the Commercial Department of the Foreign Office any day between 11 a.m. and 5 p.m.

Glasgow.—The Corporation invite tenders for the supply of the following material: (1) 1,000, 2,000, or 3,000 tons steel straight track rails, 100, 200, or 300 tons steel curved rails, 50, 100, or 150 tons steel fishplates; (2) 50 tons steel tiebars. The rails and fishplates will be a separate contract from the tiebars. Specification, etc., can be obtained on application to Mr. John Young, general manager, 88, Renfield street, Glasgow. Tenders by Feb. 22.

Wolverhampton.—The Tramways Committee invite tenders for the supply of the necessary materials and labour for the construction of tramway track and contingent works in Tettenhall-road, Newhampton-road, Waterloo-road, Darlington-street, Queen-square, Lichfield-street, Fiveways, Piper's-row, Bilston-street, Cleveland-road, and Bilston-road, to the borough boundary, amounting to a route length of about 4½ miles, mainly double track. Specification, etc., may be obtained on application at the Borough Engineer's Office, Town Hall, Wolverhampton. Tenders by Feb. 26.

RESULTS OF TENDERS.

Partick.—Messrs. D. Bruce Peebles and Co. have secured the contract for steam dynamos, balancers, and boosters.

Brighton.—Messrs. D. Bruce Peebles and Co. have secured the contract for the supply of one 330-kw. and two 200 kw. tramway sets.

Plymouth.—The Electricity Committee have accepted the tender of Mr. W. F. Blake, at £8,384, for the extension of the electricity works.

Eccles.—The Corporation have accepted the tender of Browett, Lindley, and Co., Limited, Sandon Works, Patricroft, at £732, for a 40 kw. steam alternator.

Ballinasloe.—The tender of the Ampère Electrical Company, of Dublin, has been accepted for the electric lighting of the new hospital block at the Ballinasloe District Asylum. The amount was £1 205.

Croydon.—The following tenders have been accepted: British Thomson-Houston Company, Limited, transformers, £68; Carrick and Ritchie, overhead travelling crane for the electric light station, £470.

Morecambe.—The tender of F. Moore, Morecambe, at £2 040, has been accepted for the extension of the present generating station, providing the Council agree to supply the necessary shingle free of cost; but if the Council cannot see their way to supply the shingle, the total amount of tender will be £2,110.

Bristol.—The Electrical Committee have entered into the following contracts: Low-tension power board, S. Z. de Ferranti, Limited, £193; storage battery, Electrical Power Storage Company, Limited, £766; electric crane, Higginbottom and Mannock, £772; steam circulating pump, Bumsted and Chandler, £460.

Sheffield.—The following tenders have been accepted: British Thomson-Houston Company, Limited, 1,000-kw. generator for the new Cole, Marchent, and Morley engine at the Kelham power station, £3,812. 12s.; J. G. Brill Company, six motor trucks required for the cars now being built at the Nether Edge Depôt, £58. 16s. for each complete truck.

Colchester.—The Council have accepted the tender of Messrs. Davey, Paxman, and Co., Limited, at £295, to supply, deliver, and fix the piping, valves, etc., required in connection with the surface condensing plant; also the tender (being the lowest) of the Electric Power Storage Company, at £822. 15s., to supply an additional storage battery, subject to the Local Government Board's sanction being obtained for the further loan.

Keighley.—The following tenders are recommended for acceptance: T. E. Sugden, Keighley, tiling the floor of the engine-house at the electricity works, £63. 15s.; Gabriel and Augenault, London, 500 230-volt incandescent electric lamps, £21. 17s. 6d.; Brush Electrical Engineering Company, Limited, London, 500 230-volt incandescent electric lamps, £21. 17s. 6d.; J. H. Heathman and Co., London, telescopic ladder for trimming arc lamps, £20. 6s. 9d.

Worthing.—The Corporation have received the following tenders for the supply and erection of a main switchboard:

W. J. Fryer and Co.	£806
John Fowler and Co. (Leeds) Limited (accepted)	1 015
Blackwell and Co., Limited	1,032
Lea and Warren	1,035
Spagnoletti and Crookes	1,030
Williamson and Joseph, Limited	1,040
Cowans, Limited	1 050
Brush Electric Company	1,075
Mechan and Sons	1 200
Cox-Walkers	1 205
General Electric Company	1,285
Siemens Bros.	1,293
Heaton and Smith, Limited	1,434
Nalder Bros. and Thompson, Limited	1,450
Crompton and Co., Limited	1,730

Swindon.—The Town Council have accepted the tender of Messrs. Siemens Bros. and Co., of Woolwich, for the supply of three dynamos, at £7,355, under Contract No. 1 of the scheme for the provision of a system of electric lighting and traction for the borough. There were in all 53 tenders, the highest being £9,400 and the lowest £6,046. The contract price includes, in addition to the three dynamos, the provision of three of Messrs. Browett and Lindley's (Manchester) triple-expansion engines of 350 h.p. each.

Colne.—The following tenders have been received by the Town Council:

Section No. 1.—Switchboard.

Mechan and Sons	£580 0 0

Wolverhampton.—The Tramway Committee have recommended the Council to purchase nine new tramcars in accordance with the following tenders: (1) British Thomson-Houston Com-

Digitized by Google

pany, Limited, for the supply of two single-deck tramcars (design B), at a cost of £544. 10s. each, and one single-deck tramcar (design C), at a cost of £539. 5s. (2) British Westinghouse Company, Limited, for the supply of two single-deck tramcars (design B), at a cost of £537. 8s. 6d. each, and one single deck tramcar (design C), at a cost of £536. (3) Messrs. Dick, Kerr, and Co., Limited, for the supply of two single-deck tramcars (design B), at a cost of £560 each, and one single-deck tramcar (design C), at a cost of £595. The total amount proposed to be expended on the nine cars is £4 954. 2s.

BUSINESS NOTES.

TRACTION.

Colchester.—The Town Council have agreed upon the site for the proposed tramways shed for £2,250.

Finchley.—The Urban District Council have decided to oppose the Finchley and Hendon Tramways Bill.

Middleton.—The Town Council intend to apply for a loan of £37,500 for the construction of electric tramways.

Yarmouth.—The construction of the proposed tramways, it is thought, will be commenced in three months' time.

Blackpool.—The tramways, the estimated cost of which is put at £94,060, are expected to be completed by Whitsuntide.

Stalybridge.—The tramways to be constructed in the district are estimated to cost £226 884 independent of rolling-stock.

Southport.—Sanction has been obtained to the borrowing of £75 000 for electrical equipment and reconstruction of tramways.

East Molesey.—The District Council have confirmed their resolution to oppose the London United Tramways Company's Bill.

Salford.—In consequence of his appointment as tramways manager, the tramways engineer's salary has been increased by £160.

Brighton.—The Town Council have decided to purchase two pieces of land on the Lewes-road for tramway sheds, etc., for £3,850.

Camberwell.—The Borough Council have approved the London County Council's scheme for constructing electric tramways in the district.

North Shields.—The new electric tramways to Whitley are now completed. The Board of Trade inspection took place on Wednesday.

Cardiff.—The borough engineer's salary has been increased by £100 per annum, rising to £250, on account of his additional tramway duties.

Broughty Ferry.—Negotiations are still proceeding with regard to the establishment of a tramway between Dundee and Broughty Ferry.

Dublin.—Messrs. Arthur Guinness, Son, and Co. are about to promote a parliamentary Bill to construct electric tramways at their premises in Dublin.

Whitehaven.—The Harbour Commissioners regard the West Cumberland electric tramway scheme as beneficial to the harbour, and have agreed to support it.

Battersea.—The Parliamentary Committee recommend the Borough Council to give their formal consent to the London County Council (Tramway) Bill.

Hampton Wick.—The District Council have refused to agree to the County Council becoming the purchasing authority in the matter of the tramways in their district.

Alvaston.—The Urban District Council have intimated their approval of the Derby Corporation Bill so far as it relates to the construction of tramways in the Alvaston district.

Scarborough.—The Corporation have granted a license for the running of electrical omnibuses in the borough. It is expected that the vehicles will be inaugurated at an early date.

Leamington.—The Town Council have sealed the amended agreement between the Corporation and the tramway company, and sanctioned the Tramway Committee's provisional order.

Brentford.—Mr. W. G. Cooke has been appointed by the Guardians as valuer to assess the property belonging to the London United Tramways Company in the several parishes within the union.

Rochdale.—As the result of a conference between representatives of the Rochdale, Heywood, and Bury Corporations, terms have now been provisionally arranged for the working of the Rochdale trams.

Sunderland.—A new electric car was run over the three unopened routes of the Sunderland tramways last week with most satisfactory results. The Board of Trade have been invited to inspect the new sections.

Tunbridge Wells.—A meeting of ratepayers will be held on the 27th inst. to consider the advisability of establishing a municipal tramway service in the borough, communicating, if possible, with the destructor on either side.

Darlington.—Negotiations are proceeding for the purchase by the Corporation of the horse tramways, with the object of establishing electric traction. The total cost is estimated at about £60,000. The opinion is expressed that electric tramways ought to be left alone by the municipality.

Brighouse.—The work of fixing guard boards over the electric cables belonging to the Corporation at various points in the centre of the borough where these overhead cables are crossed by telegraph and telephone wires was carried out this week.

Bradford.—The City Council have instructed the city surveyor and tramways manager to prepare specifications for the overhead equipment and all other work required for converting to electric traction the tramways at present leased to companies in the city.

Wolverhampton.—A long discussion took place at the Town Council meeting on Monday upon the merits of single and double decked tramcars, and as to the safety of the last named on a narrow gauge. It was eventually decided to purchase six single-decked cars and three double decked cars.

Stirling.—The Board of Trade have given powers to the Town Council to purchase that part of the tramway line within the burgh. It is expected, however, that an arrangement will be made whereby the British Electric Traction Company will acquire the whole line, and work the traffic by electricity.

Birkenhead.—The Town Council have resolved to issue workmen's tickets to any persons before 8 a.m. on weekdays, enabling the holder to travel the whole journey for a penny. A return twopenny ticket will also be issued. The resolution fixing certain fares for the New Ferry route has been confirmed.

Waterloo and City Railway.—In accordance with a new arrangement as to the working of this line, trains now run at intervals of five minutes, and directly the coaches have left the platform at Waterloo another train comes alongside so that passengers have an opportunity of selecting their seats for the short and fast journey.

Oldham.—At the monthly meeting of the Town Council last week it was stated that the total cost of the tramways scheme had been reduced from £27,102 to £26,091. That part of the Tramways Committee's report recommending that the laying of the Lee-street tramway should be commenced forthwith was rejected.

Tramway Receipts.—The receipts of the Brisbane Electric Tramways Company to Dec. 26 last show an increase of £300, and of the Buenos Ayres and Belgrano Electric Tramways Company to Jan. 13 an increase of £427. The receipts for January of the Cape Electric Tramways amount to £15,106, and of the Mexico Electric Tramways £16,800.

Dundee.—The Convener of the Tramways Committee stated at last week's meeting of the Town Council that the telephone wires in the extreme west of the city which crossed the tramway wires had been insulated. It was resolved to insist on the insulation of all telephone wires, or that they should be put underground. It has been decided not to grant free tramway passes to councillors.

The "Underground."—The District and Metropolitan Railways Joint Committee having considered the tenders which have been submitted for the conversion of the Underground Railway from steam to electric traction, the decision as to the letting of the contract will rest with the boards of directors of the respective companies, who will probably make a definite selection in the course of the next week.

Leeds.—The Town Council, on the recommendation of the Parliamentary Committee, have decided to oppose the Bill promoted by the Yorkshire Electric Power Syndicate, Limited, with a view to the exclusion of the city from the area of the syndicate's operations, and if found desirable, to act in conjunction with the other county boroughs affected. The salary of Mr. Harold G. Jekin, assistant tramway electrical engineer, has been increased by £50 per annum.

Protection of Hampstead Heath.—At the monthly meeting of the Metropolitan Public Gardens Association a favourable communication was read from the London County Council with regard to certain amendments it is proposed to secure in the Charing Cross, Euston, and Hampstead Railway Bill for the preservation of the Heath. The president and 21 members of the Royal Academy have petitioned the London County Council to oppose the proposed extension of the railway to the Heath.

East Middlesex Electricity Bill.—The ratepayers and owners of Edmonton and Enfield have declared against their District Councils joining in the promotion of this Bill. A poll was taken last Tuesday, when the figures were—Enfield; for the Bill, 1,691; against, 2,734—majority against, 1,043. Edmonton: for the Bill, 1,027; against, 1,597—majority against, 570. On Thursday night last week a meeting of ratepayers in the district of Southgate passed a resolution in favour of the Councils' joint action.

Private Bills.—The examiners have reported that the Paisley district tramways order has not complied with the Standing Orders of Parliament, as the promoters had failed to obtain the consent of the Paisley Corporation. The consent of the Johnstone Town Council, however, has been obtained, and the promoters are negotiating, with every hope of success, to obtain the consent of the Renfrew Town Council and the Renfrewshire County Council. The promoters have been allowed till the 21st inst. to see whether they can obtain the consent of these two bodies.

London County Council.—Next week the Council will be asked to pass estimates for £623,500 for the reconstruction for electric traction of the Council's tramways between (*a*) Westminster Bridge road and Upper Tooting road; (*b*) Kennington Park-road (at its junction with Kennington-road) and the terminus at Blackfriars road; and (*c*) St. George's-circus and the terminus in Waterloo-road, of sums not exceeding these amounts respectively in respect of (1) buildings and railway sidings, and (2) lines, machinery, generating plant, rolling stock, and electrical equipment.

Halifax.—The Town Council have approved the decision of the Tramways Electricity Committee to apply for sanction to borrow

Digitized by Google

£130,000 in connection with the electricity department. At a cost of £12 000 the Corporation have resolved to construct a lift at Salterhebble, by means of which tramcars and other vehicles will be transferred from the hill on which the town is perched to the bed of the Calder Valley, 300ft., from which point tramway and other traffic to the towns of Sowerby Bridge and Elland will avoid encountering gradients. This will be the first lift of the kind in Great Britain.

Ayr.—The work of laying the first section of the electric tramways from Burns's Monument to Ayr, authorised in 1899, was commenced about a fortnight ago, and good progress has already been made. The Lighting Committee have arranged to supply electrical energy for the working of the tramways at the rate of 1½d. per unit up to 200,000 units, and 1d. per unit above that quantity. To meet the demand the committee are placing two additional generators and boilers at the works, and making extensions of the buildings. The cost of the entire scheme is £50,000. It is hoped that a considerable portion of the system will be ready for operations in the beginning of June next.

Sheffield.—The chairman of the Tramways Committee has prepared a statement with reference to the possible danger in connection with the electric tramway system. From this it appears that on the centre poles three guard wires are erected, and also on the side poles. In either of these cases, if telephone or other bare wires drop they are caught on the guard wires, which are connected to the rails, and there is no danger from the loose ends hanging down in the street. A memorial has been presented to the Tramways Committee urging the construction at the earliest possible moment of the extension of the Heeley tramway to Norton Woodseats. The through service of cars commenced yesterday.

The Proposed Electric Railway under the Solent.—Estimates have now been deposited by the promoters of this scheme, showing in detail the cost of the undertaking. The proposed railway, from its junction with the Lymington branch of the London and South-Western Railway at Sway to its junction with the Freshwater, Yarmouth and Newport Railway will be nearly eight miles in length, of which about 2 miles and 500 yards will be in tunnel under the Solent. The total cost of this scheme is estimated at £535 250, of which the tunnel section will cost £343 000. Throughout its whole length the railway will be constructed as a single line. The scheme is proposed to be carried out by an independent company with a capital of £600,000, of which £50 000 may be expended as interest out of capital during the construction of the railway. It is hoped that one-half of this capital will be subscribed for by the London and South-Western Railway Company.

Central London Railway.—As required by Parliament, the engineers have prepared estimates showing the capital which will have to be expended on new works in the event of the Bill promoted by the company receiving the sanction of both Houses. The total estimated expenditure is put down at £465 227, of which the proposed loop line extension from the Bank to Liverpool-street is estimated to cost £398,671. Of this sum £41 000 will be expended on the actual station accommodation, and £248 330 is the estimated cost of clearing an area of 20 poles for the Liverpool-street station. The balance of the total estimated expenditure will be spent on the construction of a loop line at the Shepherd's Bush terminus, which is estimated to require £59 922, and on a siding under Throgmorton street, which will cost £6,634. To meet this expenditure Parliament will be asked to sanction the creation of £600 000 additional ordinary capital, which includes a sum of £50,000, which may be expended as interest out of capital during the construction of the above works.

Manchester.—The tramways become the property of the Corporation on April 1 next. Prof. Kennedy in his last report says that the Bloom-street station ought not to be depended upon for a supply of electrical energy next winter on any tramway route other than the three already determined upon—namely, Bury New-road, Cheetham-hill, and Rochdale-road. This means that no electric tramcars can be run on any other route for about 18 months, and probably not until the Stuart-street station is completed. The cable laying has commenced, but none of the overhead equipment has been started, and the buildings are in such a backward state that the plant, which is partly ready for delivery, is being stored in various places in England and America. It will probably be three years before the system will be entirely converted to electric traction. It is roughly calculated that the increase in the wages bill over that paid by the carriage company will be about £16 000 per annum. The Corporation have promised to entertain the proposal to institute halfpenny fares on the Cheetham-hill route.

Barrow.—At last week's meeting of the Town Council the General Purposes Committee recommended that the date at which the Corporation reserve the right of purchasing the tramway undertaking be extended from 1919 to 1926. If, however, the British Electric Traction Company cared to submit fresh proposals, the committee would consider them. The license granted by the Board of Trade expired last Monday, but it is expected that a temporary license will be granted for three months. The committee's suggestion was adopted. The County Council have agreed upon the following prices to be charged the tramways company by the Corporation for the supply of current in place of those previously stated—viz, for the first 200,000 units per annum 2d. per unit; for the next 200,000 units per annum 1¾d. per unit; for the next 100,000 units per annum 1½d. per unit; for all above 500,000 units per annum 1¼d. per unit. On the recommendation of the Highways and Lighting Committee, the County Council have passed a resolution not to accept the terms offered by the company for the purchase of the tramways.

Unfounded Tramway Opposition.—In a circular letter to the Press, the Earl of Kinnoull, the chairman of the West-end Tramways Opposition Association, states that "the majority of these schemes are entirely uncalled for and unnecessary," and that "the introduction of tramways into well-inhabited districts almost inevitably brings about great depreciation in the value of residential and other property." With these statements, of course, it is impossible to agree, and if proof to the contrary were necessary, plenty of evidence is forthcoming from different parts of the country. In reply to enquiries from the London United Tramways Company, the town clerks of Sheffield, Dublin, Dover, Blackpool, Liverpool, Leeds, Cork, Kingstown, Coventry, Hull, Douglas, Hartlepool, Wednesbury, Walsall, Middlesbrough, and many other cities and towns have all sent messages to the same effect—viz that the tendency is for property to increase in value with the introduction of tramways. The reply from the town clerk of Dover is, perhaps, the best. He says: "No justification from our experience for impression named. Send critics here; all local opponents converted."

LIGHTING AND GENERAL.

Wallasey.—The time for receiving tenders has been prolonged to March 4.

Burnley.—Extensions of mains are to be carried out at a cost of about £2,350.

Sudbury.—It is proposed to borrow £20,000 for an electric supply scheme.

Halifax.—Application has been made to borrow £130,000 for electric supply extensions.

Darwen.—Application is to be made for a further loan of £2,000 for electric supply extensions.

York.—The City Council have decided to charge 5d. per unit up to 600, and above 600 and up to 2 000 4½d.

Exeter.—A scheme is under consideration for placing the local wires of the National Telephone Company underground.

Sleaford.—The Urban District Council have sealed tenders amounting to £5,000 in connection with the installation of electric light.

Penistone.—The Rural District Council are not taking any action with regard to the South Yorkshire Electric Power Company's Bill.

Hucknall Torkard.—The Urban District Council have decided to oppose the proposed Electrical Power Bill for the district so far as Hucknall parish is concerned.

Gillingham.—The District Council are instituting enquiries prior to taking decisive steps for the purchase of the New Brompton electricity supply works.

Lanchester.—The consideration of the Cleveland and Durham County Electrical Power Bill has been referred to a special committee of the Rural District Council.

Keswick.—The electric lighting company's charges for public lighting by electricity are being considered by the Lighting Committee of the Urban District Council.

Heanor, Codnor, and Loscoe.—The Urban District Council intends to join the Alfreton District Council in opposing the Derbyshire and Notts Electric Power Bill.

Accrington.—The proposed electrical extensions are to provide for next winter, and the Town Council expect to have full employment for the power proposed to be provided.

Salford.—On the recommendation of the Electric Light Committee, Mr. C. D. Taite, of Southport, has been appointed borough electrical engineer at a salary of £700 a year.

Warrington.—The Electric Lighting Committee are about to visit the works of Messrs. Willans and Robinson, of Rugby, to inspect and see tested the set of new engines.

Bristol.—The salary of Messrs. Phillips and Bird have been increased by £25 per annum, as from Jan. 1. 1901, with a further increase of £25 per annum as from Jan. 1, 1902.

Trowbridge.—The Urban District Council's agents have attended before the Board of Trade, and proved compliance with the Electric Lighting Acts and the Board of Trade rules.

Spalding.—At the last meeting of the Urban District Council the question of telephonic communication with Spalding was mentioned, and a committee was appointed to secure 10 annual subscribers.

Darlington.—The promoters of the Cleveland and Durham County Electric Power Bill have asked the Rural District Council to petition in its favour. The clerk has been requested to report on the subject.

New Works.—With regard to the note in our last issue *re* Messrs. Congdon and Powell's new works, we are informed that they have removed to Bravington Works, Bravington-road, Harrow-road, W.

Hampton Wick.—The District Council have decided to consult Mr. Lacey (Lacey, Clirehugh, and Sillar, Westminster) before approving the draft agreement with the Richmond Electricity and Power Supply Company.

Telephone Wires Underground.—It is reported that the National Telephone Company have decided, in order to allay the alarm already existing in Liverpool, to commence at once laying their wires underground.

Digitized by Google

Alnwick.—Letters from Messrs. Leadbitter and Harvey and from the Board of Trade with reference to the proposal to provide Alnwick with electricity, are before the Lighting Committee.

Glasgow Telephones.—The Telephone Committee hope to be able to supply a few of their subscribers in March, and the completion of the work will be proceeded with as speedily as possible

Stafford.—The Town Council have decided to extend the electric cable from North-street along Rowley-street and George street at a cost of £190, applications having been received for a supply of current for motive power.

Fulham.—It is proposed to purchase two additional transformers at a cost of £265. Mr. Alexander Murdoch has been appointed assistant engineer at the electric light station in place of Mr. E. Garside, resigned.

Manchester.—At a meeting of the Electricity Committee of the Corporation on the 13th it was decided to recommend the appointment of Mr. Metzger, of Bath, as electrical engineer for the city. The salary is £800 a year.

Batley.—Sanction has been obtained to the borrowing of £25,402 by the Corporation for works of electrical energy. Tenders for the engines and dynamos required for the proposed electrical works are to be advertised for.

Aylesbury.—The Urban District Council have asked for an estimate for construction and maintenance of a Post Office telephone wire from the Council offices to the post office, and also to the sewage works and isolation hospital.

Blackburn.—The engineer is preparing, in conjunction with the consulting engineers, detail specifications for new buildings, new chimney, and engine and boiler plant at the generating station which will be required for the winter of 1902.

German East Africa.—The Budget Committee of the German Reichstag on Wednesday sanctioned the expenditure of 200 000 marks for the construction of a telegraph line between Dar-es-Salaam and Mpwapwa, in German East Africa.

Nantwich.—The draft of the agreement between the Rural District Council and Messrs. W. H. Trentham and Geo. R. Peers, the engineers on the proposed electric light works and refuse destructor, has been approved by the Council.

Bootle.—The electrical engineer's report will be issued at the end of March. It is stated that the cost of producing the electric light is decreasing. The lighting of Akenside and Gray streets is in hand, and the Derby-road lighting will be completed shortly.

Stroud.—The Stroud Traders' Association have passed a resolution with regard to the proposed scheme of electric light for Stroud, supporting the Urban District Council, who are about to oppose the Bill now being promoted in Parliament by the gas company.

Dublin.—The Local Government Board have given their absolute sanction to the £254.000 which has been applied for electric lighting, and with a view of facilitating the Corporation, they will grant that amount in sums of £50,000 as required during the contracts.

St. Annes.—The seven street lamps on South Promenade (between Eastbanke-road and Fairhaven-road) and the jubilee lamp at the parish church, are to be fitted with 50-c.p. lamps instead of 32. Accounts for machinery amounting to £1,108 have been passed for payment.

Hammersmith.—Provision was made in the last loan for electricity purposes obtained by the late Vestry for the expenditure of £1,000 in the purchase of several instruments required for testing purposes. Some of the instruments referred to are now to be obtained at a cost of £272. 8s. 8d.

Indiarubber.—The indiarubber production of the world for 1900 is estimated at 50,000 tons, 30,000 tons of which came from Brazil. Amongst the consumers, Great Britain heads the list with 20,000 tons, and nearly the same amount went to the United States. France and Belgium took about 3,000 tons each.

Dundee.—Notice of motion has been given that the Town Council consider the municipalisation of the telephone system, and appoint a small committee to make full enquiry into the matter, and in the meantime communicate with Glasgow regarding the steps taken in this direction by that Corporation.

Unfenced Machinery.—The Blackheath and District Electric Light Company was summoned last week by the inspector of factories for failing to fence dangerous machinery—a switchboard—whereby Arthur Robinson, a young man, was killed. Fines to the amount, with costs, of £41. 14s. were inflicted.

Cannock.—The Cannock Gas Company have filed notice of objection to the Council's application to the Board of Trade for a provisional order to supply electricity, chiefly on the ground that it would adversely affect their interests. On behalf of the Council an answer has been filed rebutting the gas company's arguments.

Nelson.—The Town Council have appointed Messrs. Gibbings and Baker consulting engineers for the proposed new scheme of electricity supply, with instructions to forthwith prepare plans of new electricity station near the refuse destructor, with a view to utilising the chimney thereat and the waste heat from the refuse destructor.

Malton.—The directors of the gas light company say in their report: "We purpose, having regard to the threatened competition of the electric light and the temporary depression which may possibly arise therefrom in the company's business, to take £250 from the divisible profits of the year and add it to the reserve fund."

Ashbourne.—The Finance Committee have recommended the Urban District Council with regard to the Derby and Nottingham Electric Supply Bill that the following clause be inserted: "Provided that the company should not exercise any of the powers in the district of this Council other than the laying of mains to another district."

London Gazette.—An adjudication order has been made out re T. A. Flather, 496, Meanwood-road, Leeds. The last day for receiving proofs in the estate of E. J. Paterson and C. F. Cooper, carrying on business as Paterson and Cooper, at European Works, Pownall-road, Dalston, London, is Feb. 2. Mr. E. C. Moore, 3, Crosby square, London, E.C., is trustee.

Salford.—At the recent conference of local authorities for the purpose of considering the municipalisation of telephones, three boroughs and 18 district councils were represented. A resolution in favour of municipalisation in the Manchester area was passed, and as at that time Manchester had not been consulted, a committee of five was appointed to formulate a scheme.

West Bromwich.—The Estates Committee of the Corporation have resolved to light the town hall and offices by electricity. The wiring and fittings will be put in at once, so as to be ready by the time the works are ready to generate and supply the current. It has also been decided to put in an electric motor for blowing the organ in place of the present gas-engine.

Crompton and Co.—With regard to the resolution mentioned in our last issue to the effect that the capital of the Company be increased to £300 000 by the issue of 46 000 new shares of £3 each, we learn that the directors have taken this step in order to provide for the growth of the electrical engineering industry by further working capital and by enlarging the works at Chelmsford.

Church Stretton.—On Monday a letter was read from the Church Stretton Land Company asking for the co-operation of the Urban District Council in an application they proposed to make for a provisional order to lay down electric cables for the lighting of Church Stretton. The Council decided not to consider the application until they had been supplied with a draft of the order.

Middlesbrough.—Mr. Hammond has submitted his estimates for an extension of the electric light works. These include the following items: boiler-house plant, £1 000; engine-house plant, £5 250; building work, £350; railway siding coal conveyor, etc., £1 665; mains, £3,937; meters, £900; arc lighting, £1,350; and general charges, contingencies, etc., £1,493—making a total of £21,000.

Croydon.—The Local Government Board have decided that they cannot entertain any future applications for borrowing capital for free wiring, consequently the Electricity Committee are unable to give effect to the free wiring scheme recommended in their report of Nov. 19 last, and adopted by the Council on Nov. 26. The committee have authorised an alteration in the method of supply of light to certain arc lamps at a cost of £84.

Dudley.—The Local Government Board have informed the Town Council, in reference to the refusal to grant the application of the Town Council for sanction to borrow £10 000 to wire the premises of consumers of electrical energy, that the Board did not see any advantage of the attendance of a deputation to discuss the matter, as having regard to the views expressed by the Board of Trade, they were debarred from reconsidering their decision.

London County Council.—At Tuesday's meeting of the Council it was agreed to lend the Poplar Borough Council £27,360 for electric light installation, and the Fulham Borough Council £24,145 for dust destructor and street-lighting purposes. Mr. John Hall Rider, chief consulting and resident engineer for electric tramways and electric lighting under the Plymouth Corporation, was appointed as electrical engineer at a salary of £1,000 a year.

Thornhill.—The District Council have decided to lodge objections with the Board of Trade and parliamentary agents for the order to the application of the Northern Counties Electricity Supply Company for authority to produce and supply electricity for motive power and all other purposes in the Council's district. With regard to the South Yorkshire electric power scheme no action has been taken, the Council not desiring to oppose the Bill at present.

Morley.—The following report has been adopted by the Town Council: "Resolved that the Electric Lighting Committee undertake to supply the Edison and Swan lamps; that the cables be extended from the sub-station, near the Fountain Inn, for the purpose of lighting the Ebenezer Chapel; that the committee adopt the easy wiring system, and approve the terms of the agreement to be entered into by consumers who adopt the hire-purchase wiring system."

Share Market.—Electric shares were fairly active, but no changes of importance were recorded. Smithfields were good on the report, and Kensington and Notting Hill remained in demand. Westminsters were steady at 12½. British Electric Tractions were harder at 14-14½, a rise of ¼. All tractions are being bought by insiders, and higher prices are anticipated. Charing Cross Electric shares were unaltered on the dividend. There was also some demand for electric debentures.

Sheffield.—The Board of Trade have consented to the accounts of the electric lighting undertaking being made up to March 25 in each year, instead of Dec. 31, as at present. The town clerk has been instructed to defend any action which the Brush Electrical Engineering Company may commence against the Corporation for the payment of the balance of the contract price for the 600 kw. inductor plant at the electric light station, and to take all such proceedings as may be necessary.

Sunderland.—Great improvements are being made by the National Telephone Company at Sunderland, according to the *Northern Echo*. The whole of the wires have recently been placed

Digitized by Google

underground, and return wires have also been added. Within a few months subscribers in the Wearside town will have no need to "ring up." A new device is about to be installed which will so act that the lifting of the receiver by the caller will automatically inform the exchange that a connection is required.

Maidstone.—The Electric Light Committee last week submitted the following report, which, however, was ultimately withdrawn: "That, in reply to their advertisement, they have received several tenders offering to negotiate the loan for £38,000. The lowest tender received is that of Mr. Horace G. Rayner, who states that he is prepared to introduce the same at 3½ per cent., his commission being 10s. per cent., inclusive of law charges, stamp duty, and all expenses. Your committee recommend the acceptance of this offer."

Charing Cross and Strand Co.—The directors of the Charing Cross and Strand Electricity Supply Corporation, Limited, have decided to recommend a dividend for the half-year ended Dec. 31, 1900, at the rate of 9½ per cent. per annum, making (with the interim dividend distributed for the half-year ended June 30, 1900, at the rate of 8½ per cent. per annum) a dividend payable for the year 1900 of 9 per cent. on the ordinary share capital. The lamps connected during the past year have amounted to the equivalent of 39 431 8 c.p. lamps.

Sell's Telegraphic Addresses.—The usefulness of the sixteenth issue of "Sell's Directory of Registered Telegraphic Addresses," just published, has been considerably increased by a number (50 000 it is stated) of alterations made to bring the work up to date Telephone numbers of subscribers on the trunk lines and the addresses of consuls in foreign countries are added. A map of Africa south of the Zambesi, which is full of useful mercantile statistical information, is appended. This will be found of great value by all connected with African trade.

Evesham.—At a quarterly meeting of the Town Council on Wednesday the Chairman of the Gas Committee reported the results of the enquiries as to the installation of electric lighting in various towns, and explained the reasons which induced the committee not to recommend electric lighting at present. It would require an expenditure of at least £10,000 and it would be necessary to make an income of not less than £1,000 a year before they saw any chance of profit. The subject was referred to the General Purposes Committee for further consideration.

Worcester.—The Council have appointed Mr. E. E. Hoadley, who for the past year has acted as electrical engineer to the committee's satisfaction, to be chief assistant in the electricity department, and to devote his attention especially to the work connected with the proposed generating station, at the salary of £250 per annum, subject to the appointment being terminable by one month's notice on either side. Mr. Hoadley is to be permitted to receive in addition 3 per cent. on the Council's outlay for supervising the wiring of houses, etc., under the Council's scheme.

Grimsby.—A portion of the town was for the first time lighted with the Corporation's electric light on Monday. There are now 20 arc lamps ready for street illumination, and the current was switched on to these experimentally with satisfactory results. The whole of the installation is now nearly completed, and it was stated on Tuesday that the current will be available for private consumers at once. The total sum authorised to be spent for the Grimsby light works is £55,000 Five arc lamps are to be erected in George street. Osborne-street, and Bethlehem-street at an estimated cost of £120.

Worksop.—The Derbyshire and Notts Electric Power Company's Bill is considered detrimental to the interests of the Urban District Council, who have an electric power and lighting scheme in hand, inasmuch as they would have power to go through the Council's district and in some cases to supply electric power. The Council's suggested price is 5d. to 6d. per unit, whereas that of the company is stated at 2d. The Council last week decided to approach the promoters with the object of inducing them to expunge Worksop urban district from their proposals; if not, the Council would consider as to opposing the Bill.

Pongo.—At Monday's meeting of the District Council a letter was received from the Lewisham and District Electric Supply Company, Limited, stating that in pursuance of an agreement made with the late Lewisham Board of Works they were applying for an electric light provisional order for the whole of the district of that Board, which included the present area of the District Council. They had already obtained the assent of Lewisham to the provisional order, a copy of which was enclosed, and they now required to have the consent of the District Council. It was eventually decided to discuss the matter in committee.

Shannon Water and Electric Power Co.—This Company propose to generate and supply electricity and "to acquire and work any patents relating to the supply of water for motive power, and to the generation and distribution of electrical energy." The area within which the Company propose to carry on business is to be so much of the counties of Clare and Limerick as are within a radius of 30 miles of the townland of Springfield. The capital of the Company is to be £365,000. The first directors are to be Mr. William Brownlow, Mr. John Chambré, Mr. Alfred Lane Joynt, Mr. Henry Herbert Montague Smith, and Baron Lurgan Brown.

Stock Exchange.—Applications have been made to the Stock Exchange Committee to appoint a special settling day in and to grant a quotation to Edmundsons' Electricity Corporation, Limited, 13,363 6 per cent. cumulative preference shares of £5 each; and to allow the following securities to be quoted in the official list: British Columbia Electric Railway Company, Limited. 20.000 ordinary shares of £10 each, fully paid, Nos. 1 to 20,000, and £250,000 4½ per cent. first mortgage debentures of £40 each, Nos. 1 to 6,250 (renewed application); Edmundsons' Electricity Corporation, Limited, further issue of £45,000 4 per cent. first mortgage debenture stock.

Dewsbury.—At the last meeting of the Council, the services of Mr. Jonas were very highly spoken of. It was said that he came at a time when, owing to the action of the Board of Trade, the committee were faced with the expense of doubling the capacity of their mains, as the mains were not suitable to the current they were called on to carry. On the advice of Mr. Jonas it was decided not to double the mains, but to double the voltage, which would allow them to send the amount they required through the same copper—a result of a saving of from £4,000 to £5,000. When Mr. Jonas came there was a loss on the plant of about £479; last year they had cleared a profit of £201.

Ramsgate.—The engineer of the gas and water undertakings has been instructed to prepare plans and specifications and invite tenders for laying cables to supply electricity along the front of the borough between the east end of the Victoria-parade and the west end of the West Cliff Promenade, and through the following streets: High-street to Chatham-street, Harbour-street to the Sands, King street to Boundary-road, Queen street to Addington-street. He has also been instructed to communicate with the Isle of Thanet Electric Tramways and Lighting Company, Limited, and ascertain the terms upon which they would be willing to supply the Corporation with electric current.

Cape-to-Cairo Telegraph.—Mr. Robert Williams, who returned a few days ago from a trip up the Nile, visited Aberdeen on Saturday last. On Saturday next he sails for the Cape to meet Mr. Rhodes with regard to important matters relating to the Cape to Cairo telegraph scheme, in which Mr. Williams is largely concerned, and in connection with which he is getting a barge constructed by Messrs. Hall, Russell, and Co. This vessel is to be used on the great African lakes in conveying telegraph poles and other material for the construction of the line. Mr. Williams spent a good deal of time in Messrs. Hall, Russell, and Co.'s shipbuilding yard on Saturday inspecting the progress of the work on the barge.—*Aberdeen Journal.*

Greenwich.—Consent has been given by the Lewisham Borough Council to the application by the Lewisham and District Electric Supply Company, Limited, for a provisional order to supply electricity in the parish of Lewisham. It was stated at the meeting of the Council on Wednesday, as an argument against suggested installation of municipal plant, that in the borough Sydenham, Blackheath, and Lee were already covered by private companies, and that the rates which had been agreed upon by the late Lewisham District Board of Works and the Electric Extension Company. Limited (of which company the Lewisham and District Electric Supply Company were the nominees) approved by the late District Board, were very low, and compared very favourably with the rates of municipal undertakings generally.

Bradford.—On Friday evening last the employés at the Corporation electricity works, Bolton-road, met at the works to show their appreciation of Mr. R. C. Hickling, one of their colleagues who has volunteered for active service in South Africa with the Electrical Engineers Corps, by presenting him with a pair of field glasses and pipe. Mr. Eastwood presided. Mr. Saunders, in making the presentation, regretted the unavoidable absence of Mr. Chattock, the chief engineer, and spoke of the esteem and good feeling that existed between Mr. Hickling and his colleagues. He added that should Mr. Hickling desire to return back to Bradford at the end of his active service, his present post would be at his disposal. Several other members of the staff endorsed Mr. Saunders's remarks, to which Mr. Hickling suitably responded.

Birkenhead.—The Council have considerably reduced the price of electrical energy. During the winter quarters (October to March) for the first hour and a half of maximum demand 6d. per unit will be charged to ordinary consumers; for the second hour and a half of maximum demand, 3d. per unit; afterwards, 1½d. per unit. Summer quarters (April to September): first half hour of maximum demand, 6d. per unit; second half hour maximum demand, 3d. per unit; afterwards, 1½d. per unit. For power purposes during the winter quarter the charges will be: for the first hour and a half of maximum demand, 4d. per unit; second hour and a half of maximum demand, 3d. per unit; afterwards, 1½d. per unit. Summer quarters: first half hour of maximum demand 4d. per unit; second half hour of maximum demand, 3d. per unit; afterwards, 1½d. per unit.

Boilers.—The boiler-house of the Pan-American Exhibition, which is to be held at Buffalo, N.Y., U.S.A., from May 1 to Nov. 1 this year, will contain four Climax boilers, built by the Clonbrock Steam Boiler Company, Brooklyn, N.Y. These boilers will be about 13ft. external diameter, will stand over 31ft. high to the base of a 48in. chimney stack, and will have a minimum evaporative capacity of 15,000lb. of water per hour each. They will be fired with natural gases, but will have the regular coal grates covered with firebrick, so that in case of failure of the gas supply the covering can be removed, and the boiler run with coal without serious interruption of the service. These Climax boilers are now being built in this country by Messrs. B. R. Rowland and Co., Limited, Climax Works, Reddish, near Manchester, who are the sole manufacturers outside the United States.

Tunbridge Wells.—A sub-committee of the Lighting Committee are about to inspect and report upon the lighting of Benhall Mill-road from Forest-road to the sanatorium. The electrical engineer has been instructed to purchase one enclosed arc lamp and seven other arc lamps in order to complete the lighting of Church-road, Crescent-road, London-road, and St. John's-road. The town clerk is to report as to the power of the committee to

Digitized by Google

undertake the work of wiring houses for electric light installations. The National Electric Wiring Company having asked whether the Corporation were prepared to purchase the free-wired installations belonging to the company in Tunbridge Wells, they have been informed that the Corporation have no power to purchase the installations. Mr. Blackburn, of the firm of Blackburn, Starling, and Co., Limited, is now preparing a report upon the suggested heightening of the chimney shaft at the central station.

Festival.—The annual festival of the employés of the National Telephone Company was held last week in the National Halls at Glasgow. Mr. W. A Valentine, district manager, occupied the chair. After tea the Chairman delivered a brief address, in course of which of which he referred to the wonderful developments in electrical science during the last 60 years. He also said that last year the National Telephone Company had 121,000 subscribers, and at the present time 180 000 people were connected with telephone exchanges throughout the country. The number of messages passing between different subscribers last year was 617,000 000. In Glasgow they were at the present time engaged in substituting metallic circuits for the single wires, and only those engaged in the business could realise the magnitude of such an undertaking. Their business in Glasgow was now going up by leaps and bounds, last year having been by far the most successful in the company's history.

Christchurch.—The Guardians have received a letter from the Local Government Board with reference to the proposed provision of a system of electric lighting at the workhouse and cottage homes, asking that the matter be deferred for the present. The Board are of opinion that the scheme was too costly, and they would like to know whether the Guardians could not obtain a supply of electricity from Bournemouth, which they considered would be better than generating their own. It appears that Mr. Peers, consulting electrical engineer, had pointed out to the Local Government Board that Bournemouth was five or six miles from the workhouse, and that the electric supply could not be very well obtained from there, but the Board wished to be informed upon what terms the electric supply company would supply the house and for how many years. The matter is now in the hands of the Buildings Committee, who will enquire on what terms the supply would be made.

Maidenhead.—The Electric Lighting Committee have decided not to make any amendment in the number of lamps for private lighting, which is placed at 3 000, nor to reduce the number of units per lamp; they have also decided that the figures with regard to sewage pumping and launch charging shall remain unaltered, but they have reduced the estimated amount to be derived from meter rents to £100, in view of the fact that there is now a cheaper meter on the market. This recommendation has been approved by the Town Council. It is stated that the number of 8-c.p. lamps which could safely be connected without increase in the plant provided for in the estimate will be 5 000. Notice has been given to move the following resolution: "If it be the intention of this Council to carry out the lighting of the town by electricity, notice should be given of the same by advertisement offering a premium for the best and second best plans, specification, and estimates for carrying out the necessary work."

Dalkeith.—At Monday's meeting of the Town Council the chief business on the agenda was the question of the electric lighting of the burgh in connection with Messrs. Crompton and Co., who had intimated that the price of 3d. was for the supply of electric current only, and did not include the erection of the lamps. The Town Clerk said he had had no reply from Messrs. Crompton and Co., but Bailie Chisholm stated that while in London a week ago he had had a meeting with the general manager of Messrs. Crompton and Co. The agreement forwarded lately to Dalkeith was made out in similar terms to those of other towns, and Messrs. Crompton and Co. were themselves unaware that the lamps were to be provided. Having, however, been shown the proposals made to Dalkeith Council by their (Messrs. Crompton's) Edinburgh agent, they said they must carry out that agreement, although at a loss. The Bailie, in reply, said that the company seemed to be quite willing to give way on the point as to the upkeep of the lamps.

Skipton.—The Urban District Council, who are seeking a provisional order of the Board of Trade authorising them to supply electricity in their district, last week had before them a letter from Messrs. Baker, Lees, and Co., parliamentary agents, who stated that they had been informed by the Board of Trade that, having regard to the advance made in electrical science, and to the development of methods of distribution since 1899, when the maximum price of 8d. per unit was adopted, and as they understand that the price actually charged is as a rule much less than 8d., the Board are of opinion that the time has come when the maximum of 8d. should no longer be allowed. They propose, therefore, in the provisional orders now before them and in all orders applied for in the future, to fix a maximum of 6d. per unit. The Council directed the clerk to appeal to the Board of Trade to allow the price to remain at 8d. in the Skipton order on the ground that the Council had applied for the order on the faith of the price inserted in the Board's model orders.

Manchester Telephones.—The proceedings of the special committee *re* telephones, which were adopted at the last meeting of the Council, stated that the city surveyor submitted plans and gave explanations with reference to applications which were before the Council in 1899 as to underground wires. The first line in question was 1,186 yards long—in Ashton Old-road. There was also in the same road a short length of 27 yards across the road to the company's offices, also a line in Oldham-road, Collyhurst, 1 mile 1,624 yards in length. The committee resolved that permission be granted to the National Telephone Company to lay the short length of underground wires (27 yards or thereabouts) in Ashton Old-road, and that the necessary agreements be prepared. It was also resolved that the committee were not prepared to consent to the placing of any telephone wires underground, except the short length referred to, but that they offered no objection to overhead wires being provided, in order that the telephonic communication desired might be obtained.

Otley.—The report of the engineer (Mr. George Wilkinson, M I M E., Harrogate) appointed by the District Council to report upon the question of the establishment of a public electricity supply for the town has just been presented to the Council, and has been submitted to the Electric Lighting Committee of the Council. Mr. Wilkinson's proposals include the establishment of a steam driven generating plant in a field near the river capable of providing 6,750 8 c.p. lamps. He estimates the capital outlay at £18,000, and the annual expenditure at £1 122. 15s. The revenue is to be derived from the sale of current to 6,750 lamps at 6d. per unit, averaging 7s. per lamp per annum—a total of £2,362. 10s. Thus the annual gross profit is £1 239 15s., and the net profit is estimated at £231. 15s. In comparing this scheme with that for obtaining a supply in bulk from the Yorkshire Electric Supply Syndicate, he estimates the total annual expenditure for the latter at £2,110. 10s., and the receipts at £2,250, thus giving a net annual profit in favour of local works of £92. 5s.

Sales of Plant.—The Postmaster-General is selling about 30 tons of guttapercha 70 tons of old copper wire, plates, etc., and a quantity of other metals (brass, zinc, and iron), indiarubber-covered copper wire, tools, raw and limed side pieces, electric incandescent lamp tops, accumulators, etc. Particulars of the sale appear in another column. We also refer readers to our last week's issue for details of the following: The Blackburn Corporation invite offers for two Willans-Siemens 45 kw. continuous current direct coupled steam dynamos. Voltage, 110 to 150; steam pressure, 180lb.—The Electric Lighting Committee of Aberdeen have for disposal two direct-coupled continuous-current Willans Elwell Parker sets. Engines 38 h.p; dynamos, 23 kw. (170 amperes at 135 volts), together with a spare armature to fit either machine, and some engine spare parts.—The Great Eastern Railway Company invite tenders for the purchase of the whole or any part of the existing steam and hand power cranes, etc, and also for the present electric light installation at Parkeston Quay.

Private Bills.—The report by the Chairman of Committees of the House of Lords and the Chairman of Ways and Means in the House of Commons under Section 2 of the Private Legislation Procedure (Scotland) Act, 1899, issued this week by the Scottish Office in the following terms, states that the committee are of opinion (1) that the provisions of the Caledonian Electric Power Order, the Clyde Valley Electrical Power Order, the Glasgow and Renfrew District Railway Transfer Order, are of such a character that they ought to be dealt with by private Bills and not by provisional orders; (2) that the Paisley Police Public Health and Tramways Order may proceed so far as it relates to tramways. Mr. Campion, one of the examiners appointed under Standing Orders, has reported to the Secretary for Scotland that in the case of the following draft provisional orders the general orders have been complied with: Clydebank Tramways, Dundee Corporation, Falkirk and District Tramways, Kilmarnock Corporation, Stirling Corporation. A Bill has been deposited at the Scottish Office in substitution for the draft provisional order in each case in which the chairmen of the two Houses of Parliament previously decided that the order could only proceed as a Bill. In the case of the Charing Cross, Hammersmith, and District Electric Railway Bill the necessary proofs have been given, but the examiner will report a non compliance in the Tyneside Tramways and Tramroads Bill. The examiners have decided to sit again at Westminster on the 18th, 21st, and 28th inst. to receive proofs of compliance with Standing Orders.

Telephone Arbitration.—An arbitration case was heard at Pontypridd Police Court on Tuesday morning between the Postmaster General and the Glamorgan County Council, the arbitrator being Mr. J. Ignatius William, stipendiary magistrate. The subject at issue related to the proposal to establish a telephone call office at the Llantrisant post office, and the laying of wires between Pontypridd and that place on the road leading through Pencoedcae and over the hill overlooking Pontypridd. The County Council objected to the erection of poles on the ground that the road is too narrow. Sir Robert Hunter (London) solicitor to the Postmaster General, appeared on behalf of the Post Office, and Mr. B. F. Williams, K C, and Mr. Rhys Williams (instructed by Mr. W. E. R. Allen, solicitor) for the County Council. Mr. Blandy Jenkins, J.P. (chairman of the Council) was present. The following terms, to be embodied in the stipendiary's award, were agreed to—viz: that consent be given to the Postmaster-General to place telegraph poles over roads from Pontypridd to Llantrisant maintained by the Glamorgan County Council, the line entering the road at the stone depôt near the Penrhiw Colliery upon the following terms: (1) no pole to be placed on metalled roads; (2) subject as aforesaid, the position of the poles to be settled between the engineer to the Post Office and the county surveyor, with reference to magistrates, necessary; (3) the Postmaster-General to make good any damage done in the execution or maintenance of work; (4) the County Council to be at liberty to withdraw consent at three months' notice. The Postmaster-General, if he objects to remove the poles from the highway, to take immediate steps to bring the difficulty for decision to arbitrator's tribunal,

Digitized by Google

Battersea.—At the meeting of the Borough Council on Wednesday the Works Committee reported that on Jan. 9 the Council, on the recommendation of the committee, decided to accept the tender of the Edison and Swan United Electric Light Company Limited, for the supply of electrical fittings for wiring the new baths, subject to their entering into the usual contract. The company have raised objections to signing the contract, and, as a matter of urgency, the committee have instructed the surveyor to obtain the fittings from the General Electric Company The Lighting Committee reported that for the appointment of electrical engineer to the Council at a salary of £350 with residence at the works, 50 applications had been received, three of the applicants being selected for interview that night. They are: Mr. Hugh Rose Forbes Mackay, chief assistant to the Edinburgh Corporation; Mr. Albert Frederick Nixon, engineer on the staff of Messrs. Kennedy and Jenkin; and Mr. Leonard Leslie Robinson, chief engineer and representative of Mr. Robert Hammond.

Bolton.—The growing demand for current for both tramway traction and lighting will render requisite some important extensions in connection with the Bolton Corporation electricity department at its generating station in Spa-road. In the tramway service it is expected that a dozen additional heavy bogie cars will shortly be running, whilst electricity as an illuminant is an ever-increasing quantity in the town. Over a score of places of worship and schools have had the light installed, and others have it in contemplation, whilst by reason of its purity and convenience it is recommending itself to private consumers in increasing number. With the view to providing for future developments, the electrical engineer (Mr. A. A. Day) has been formulating a plan as to the capacity of the existing buildings and site for additional power, which it is proposed to lay down by instalments as the need may arise. The existing plant is of 4 500 h.p., supplied with steam by nine boilers, and it is now proposed to add two 1,500-h.p. engines, with equivalent boiler power. The latter will entail a considerable extension of the boiler-house.

Telegraphs and Telephones.—The Cables Communication Commission recently appointed by the Government will receive strong support from the Associated Chambers of Commerce at their annual meeting. The Newcastle and Gateshead and the South of Scotland Chambers urge that all our Colonies and dependencies should have telegraphic communication apart from the jurisdiction of foreign nations and entirely under the control of the Imperial Government, and the Liverpool Chamber advocates an enquiry into telegraphic communication between the different parts of the Empire and the charges for the same with a view to increased efficiency and economy in the telegraph service for commercial purposes. The Liverpool Chamber wants additional and improved cables between the United Kingdom and the Continent; and Edinburgh desires the Post Office to continue northward the main underground cables now open between London and Birmingham "in order to prevent the breakdowns which happen every season." As to the telephonic communication Liverpool and Southampton urge that, owing to the uncertainty attending the use of the trunk-line telephones, the service should be expedited.

Burry Port.—The trial of the electric light installation at Burry Port took place on Thursday last week with great success, when the docks and property about them were lighted up for the first time. The Burry Port and Gwendraeth Valley Railway Company have recently erected a commodious engine and boiler house, under whose roof has just been placed electric light machinery by Messrs. Crompton, of Chelmsford, to be followed later by hydraulic machinery for use on the docks and sidings Powerful lamps, each of 3 600 c.p., have been placed at frequent intervals about the docks and adjoining railways, which will much facilitate the loading and discharging of vessels at night as well as dealing with railway traffic in the sidings The locomotive shed has been lighted by incandescent lights, and arrangements made for hand electric lamps on flexible cables for the use of cleaners when working under and about the engines. The whole of the workshops, offices, and company's houses have also been lighted by numerous incandescent lights. The installation has been entirely carried out by the Burry Port and Gwendraeth Valley Railway Company, under the superintendence of their engineer, Mr. Robert A. Carr, A.M.I.C.E.

Barrow.—The County Council have adopted a report of their Electricity Committee on the supply of electricity to Vickerstown, including a letter from the Isle of Walney Estates Company, Limited, making the following offer with regard to the electric lighting of Vickerstown for the consideration of this committee—that is to say: (*a*) streets and houses to be lighted by the Corporation with electricity; (*b*) the price to be paid by the company for electric current in the houses, etc., shall not exceed the rate prevailing for the time being in the borough generally; (*c*) the company shall guarantee that the total aggregate consumption of electricity in Vickerstown, irrespective of the streets, shall not be less than £1,000 per annum for five years, and that should the actual consumption amount to less, at current rates, than an average of £1 000 per annum, then the company shall pay to the Corporation the difference between that sum and the value of current actually supplied, less the sum saved through not having to generate the deficiency. The committee recommended that the offer of the estates company, so far as it relates to the electric lighting of the houses, be accepted, and that the necessary mains be laid at an estimated cost of about £6 207, subject to the company executing an agreement in terms to be approved by this committee.

Yorkshire Electric Power Syndicate.—A meeting of the council of the Bradford Chamber of Commerce was held last week, at which a deputation was received from the Yorkshire Electric Power Syndicate, Limited. It was stated that the company did not interfere with any existing provisional orders granting powers of supply, and to meet any possible objection it had been agreed to insert a clause in the Bill as follows: "Nothing in this Act shall prejudice any application by any local authority for a provisional order under the principal Acts for power to supply energy within their district." It was thought that that would safeguard everybody. The Chairman said that the Leeds Chamber of Commerce had passed a resolution in favour of the principle of the Bill, and the Darfield local authority had decided to support the Bill. Several of the directors of the Yorkshire Electric Power Syndicate Limited, had an interview with the Mayor of Bradford (Mr. William C. Lupton) and the town clerk (Mr. F. Stevens) with a view to securing the support of the Corporation to their parliamentary Bill. After the scheme had been fully explained, it was intimated to the deputation that the matter would be reported to the Parliamentary Committee of the Corporation, but that it would probably be deemed necessary in any case to lodge a formal petition against the Bill, in order that certain clauses for the protection of the interests of the Corporation may be inserted.

Cooling Towers.—The Electric Light Committee of Edinburgh Town Council recently visited a number of towns in connection with the proposal to fit up M'Donald-road station with cooling tower and condensing plant. From a report of these visits we gather that when the deputation arrived at Bolton the cooling-tower and condensing arrangements were in operation. There were large clouds of watery vapour hanging about the neighbourhood of the station and as the horse-power production was only 2 500, while at M'Donald-road this would be multiplied 12 times, the deputation decided that such a system would not suit Edinburgh. At Oldham, where 1 300 h.p. was at work, they saw another cooling tower where there were no fans at work, natural ventilation alone being depended upon. Here also there were large clouds of steam hanging about the neighbourhood. In London, where they saw the station of the Central London Railway at Shepherd's Bush, there was 5,000 h.p. in operation, and the cooling tower was vomiting forth such immense clouds of steam and watery vapour that the members of the deputation had to put up their umbrellas. Next the works on the South London Railway at Stockwell, on the Surrey side, were visited with similar results. At Brighton the station is in the middle of the town, among low class houses and factories, and the cooling tower is erected on the top of the station roof, as would have to be done at M'Donald-road. Here also the deputation were conclusively of opinion that such an arrangement would not do for Edinburgh, and, consequently, there will be at M'Donald-road neither cooling towers nor condensing plant, and the waste steam will be sent up an iron pipe to the top of the chimney.

Hereford.—The Town Council have adopted a report of the Electric Lighting Committee recording the sanction of the Local Government Board to a loan of £5 000 and that the 250 kw. triple-expansion engine and dynamo (the tender of the Silvertown Company for which they had provisionally accepted) was in course of construction. The committee reported that the existing machinery continued to give every satisfaction. The financial results for the year ended Dec. 31 last were as follows: total units sold 66,031; producing (including meter rents), £1,608. 7s. 9d.; working expenses (including salaries, wages, oil, coal, waste, and sundries), £695. 15s. 3d.; interest, £577. 10s. 11d.—total, £1,273. 6s. 2d.; leaving a profit of repayment of capital of £335. 1s. 7d. The committee stated that almost the only complaints that had reached them from consumers had had reference to the cost of the current, and they advised the Council to reduce as from the end of that quarter the period of the maximum demand from two hours to one hour per day to such customers only as paid their accounts within one month after delivery. This would make the cost of the current 6d. for the first hour and 4d. for every subsequent hour, and would be recognised as a very material concession. As a consumer might on some particular day use an abnormal quantity of electricity, and if the demand was not of frequent occurrence, it was doubtless a hardship that the maximum demand for the whole half-year should be increased owing to such an occasional consumption, the committee recommended that consumers be permitted to have their maximum demand indicators reset on six separate days in each half-year on giving notice to the engineer that they anticipated an abnormal consumption on the day in question.

Ayr.—A report by the burgh electrical engineer, Mr. A. J. Fuller, has been submitted to the Council, in which he states that during the last month the whole of the works have been maintained and run in perfect order. The output during the month was 2,000 units in excess of the quantity generated during the same period last year. The engineer says he had experienced some difficulty during the month in getting the arc lamps to burn through the regulation period, owing to the bad quality of the carbons delivered in the last batch, and pending further steps he has arranged for the lamps to be trimmed double in order to avoid their going out in the early hours of the morning. He made a number of suggestions, and in consequence it was resolved at Tuesday's meeting that the rate of interest to be paid by tenants on the cost of installations provided by the Corporation under the municipal wiring system be reduced from 7½ to 5 per cent. It was also agreed to extend the cable to supply the hospital, and to charge the local authority with interest at 5 per cent. on the cost of the extension from the junction of Heathfield-road with Prestwick-road, such charge to cease as soon as the general infectious diseases hospital takes a supply. The engineer's plan showing the

Digitized by Google

proposed extensions on the ground adjoining the works was approved of, and it was agreed to instruct Mr. John Eaglesham to carry out the work, provided he was able to take it in hand at once. Mr. Fuller was instructed to prepare a specification and ask for tenders from six of the best makers of switchboards, without advertising, and submit them to a future meeting. He was also authorised, in view of the fact that Messrs. Callender had the contract for laying the cables for the tramways, and will shortly be laying the cable in the streets, to procure from them a tender for the alterations required in connection with the change of system in the central area, and report to next meeting.

Keighley.—The Electricity Committee have prepared a report recommending that the charges for electricity consumed by meter be as follows: "For lighting purposes: (1) for any quantity up to 500 units consumed in any half-year ending June 30 or Dec. 31, at the rate of 5d. per unit; (2) for all units consumed above 500 in any half-year ending June 30 or Dec. 31, at the rate of 4½d. per unit. A rental of 10s. per annum, payable half-yearly, will be charged for every meter installed. That, as an alternative, consumers be charged on the 'maximum demand' or 'Brighton' system, on the following basis: the charge for electricity consumed by meter in the half-years ending June 30 or Dec. 31 respectively will be at the rate of 7d. per unit until the amount equals that required by the consumer's maximum demand for 182½ hours, or for one hour per day during the half-year. All electricity consumed in excess of this quantity in the respective half-years will be charged at the rate of 3d. per unit. The consumer's demand will be taken to be the maximum rate at which electricity has been consumed in the respective half-years, and will be determined by the consumer's demand indicator. A rental of 5s. per annum, payable half-yearly, in addition to the ordinary meter rent of 10s., will be charged for each demand indicator installed. Consumers may, with the consent of the committee, adopt which method of payment they choose. For motive power and heating purposes: (1) for the first 10,000 units consumed in any half-year ending June 30 or Dec. 31, at the rate of 3d. per unit; (2) for all units consumed between 10,000 and 25,000 in any half-year as above, at the rate of 2½d. per unit; (3) for all units consumed between 25,000 and 50,000 in any half-year as above, at a rate of 2¼d. per unit; (4) for all units consumed above 50,000, at a rate to be agreed upon between the Corporation and the consumer." Mr. W. Mackintosh, from the Southport Corporation electricity works, is to be appointed to the post of assistant electrical engineer.

Colchester.—The Town Council have sealed mortgages of the general district rate to the amount of £6,000 for electric lighting. The report of the borough electrical engineer, adopted at the last meeting, gives the following figures: Output of electricity in units during December, 1900, 19,443; 1899, 9,935. Maximum Christmas load in kilowatts during December, 1900, 162; 1899, 78. Number of equivalent 8-c.p. lamps connected during month of December, 1900, 450; 1899, 99. Total number of lamps now connected during 1900 9 793; 1899, 4 503. Number of consumers during December, 1900, 160; 1899, 88. Mr. Siller also states: "Although we have not yet connected a single public light, we hold the position of being the second station in the United Kingdom for progress during the last 12 months. The only town showing a better average than Colchester is Wimbledon, and it must be taken into consideration that Wimbledon has almost entirely lighted the streets during the last year." The engineer mentioned that several consumers had complained to him of the amount of the charge for lighting purposes, and suggested the advisability of the Electric Light Committee considering the question of reducing the price. Subsequently the committee resolved that the borough accountant prepare a financial statement for the purpose of enabling them to take into consideration the question of reducing the price, if practicable, as from April 1. The borough surveyor's plans and detailed estimates for the addition to the battery-house (estimated cost £250) and proposed underground storage tank (estimated cost £160) respectively have been forwarded to the Local Government Board. A plan is to be prepared showing the manner in which it is proposed to erect the cooler over the roadway between the works and the bakery to the east thereof. Mr. W. H. Massey has reported, stating that the whole of the machinery and plant appeared to be in good condition on the occasion of his inspection on Dec. 14, and adding that the "committee may therefore rest assured that they were fully justified in taking over the works at the end of the period for which Messrs. Siemens contracted to run them; and as soon as the cooling arrangements which I advised you to go in for about a year and a half ago are completed, you ought to have no further trouble with the condensing plant."

Underground Telegraphs.—At a meeting of the directors of the Glasgow Chamber of Commerce on Tuesday a copy was submitted of the memorial by the Chamber to the Postmaster-General urging the adoption of an underground system of telegraphs. It was pointed out that the memorialists, representing the commercial and manufacturing interests of Glasgow and the West of Scotland, had in recent years much reason to complain of frequent interruptions, and, in some cases, of the total collapse of the telegraphic service occasioned by storms. These interruptions and disturbances had caused loss, and put the merchants, manufacturers, and traders of this country at material disadvantage to their rivals in trade and commerce on the Continent, and especially in Germany, where such interruptions are now, through the adoption of the underground system of telegraphy, unknown. The memorialists were satisfied that the only means whereby such derangements of the telegraph service could be avoided, and the service placed on a footing creditable to the department and satisfactory to the nation, was by the establishment and maintenance of underground wires between the principal cities and towns of the United Kingdom. The memorialists were aware that the initial cost of such an undertaking was great, and that an underground telegraph system could not be worked with the same rapidity as the aerial system, but, on the other hand, they believed it could not be disputed that the upkeep and maintenance of overhead wires were much greater than the underground system, and that by the improvements in the science of telegraphy in recent years the difficulties which caused retardation with underground wires had been largely removed, the cost of working diminished, and the expeditious transmission of messages by this system greatly accelerated. To ensure at all times a trustworthy means of communication the main telegraphic service of this country should not be aerial, but, if not entirely certainly principally an underground system, supplemented where necessary by overhead wires. The President (Mr. G. Handasyde Dick) stated that copies of the memorial had been sent to other chambers. Replies had been received from Kirkcaldy, Dunfermline, Sunderland, Birmingham, and Aberdeen, all expressing sympathy with the action of the Glasgow Chamber. There was every indication that the matter was going to be taken up by the chambers of commerce throughout the country.

Taunton.—At Tuesday's meeting of the Town Council a report of the Electric Lighting Committee was discussed, stating that arrangements are being made for the work of laying of the trams to be commenced on an early date, and the committee have advertised for tenders for the electrical plant. The company hope to start running the trams by the middle of May. The statement of accounts of the electricity department for the year ending Dec. 31, 1900, showed a net profit of £706. 5s. 11d., which, with a balance of £94. 0s. 5d. brought forward from last year, leaves a balance of £800. 6s. 4d. to be disposed of. The committee have carried £750 of the balance to a reserve fund to meet renewals and other contingencies, and the balance of £50. 6s. 4d. will be carried forward to the next account. In anticipation of the continued prosperity of the electricity department the committee have resolved to reduce the charge for each public arc lamp by £1. 10s. per annum, to charge all places of worship owning their own installation 5d. (instead of 6d.) per unit, and to charge consumers under the demand system 3d. per unit (instead of 4d.) after the first hour, the foregoing alterations to take effect as from Jan. 1, 1901. With regard to the accounts, it was stated that the working expenses amounted to £3,678 and receipts to £6,603, leaving a profit of £2,965, which was more than sufficient to pay 6½ per cent. on the £45,000 capital sanctioned. Of that £2,965, £1,349 has been paid for interest on mortgage debt due to date, and also of interest on overdraft on temporary loan; and £955 was transferred to the stock redemption fund. The loan (£4,408) has been paid off. Thus after having paid every penny they had to up to Dec. 31, 1900, the committee show a net profit of £706, to which they added £94 carried forward from the previous year's account, which gave them a balance in hand of £800. Their working expenses increased to the extent of £834, and their receipts as much as £1,629, or nearly double that amount. The condensing plant had been a great benefit. In 1897 one ton of coal produced 162 units; last year a like quantity of coal produced 311 units. He thought that proved the wisdom of the Council in having acted upon the advice of their consulting engineer to lay down the plant. Of the increased receipts, £737 was due to the increased use of private lighting, and £334 public lighting. The report was adopted as far as given above, and the salary of Mr. E. B. Thornhill, the electrical engineer, was increased by £100 per annum, and the rest, which deals with a special report by Messrs. Kincaid, Waller, and Manville, and an application by the Council to borrow a further £17,780, was adjourned to Feb. 19.

Bury St. Edmund's.—The Electric Lighting Committee reported on Tuesday that they had considered a report by the electrical engineer on public street-lighting and expenditure on capital account. The report dealt with the three following schemes: (1) A system of mains and cables distinct from those laid down for private lighting, the capital cost of which is estimated at £8,050. The cost for lighting and maintenance is £988 per year, and estimated revenue £879. (2) The portion of the mains called the feeders to be dispensed with, the present mains for private lighting taking their places; the estimated capital expenditure being £6 299, the annual cost £820, and the annual income £879. No. 3 scheme provided for the lighting of only that portion of the town in which mains were at present laid—about 100 lamps—no special mains being required, except for the Brown Estate. The capital cost was estimated at £1,040, the annual cost at £309, and the annual income £274. The report also referred to probable expenditure in the near future. The present plant being only just capable of supplying the public and private lighting during the next winter, it was thought that it would be quite unable to cope with the winter of 1902-3. Some extensions to the private lighting mains, it was suggested, should also be undertaken. It was, therefore, urged that provision ought to be made for extensions at the works and to the mains, the additional cost of which was estimated at £4,890, making a total capital, if the No. 2 scheme was adopted, of £11,189. It was also stated that money should be borrowed for the cottages built on the site. The committee unanimously recommended the adoption of No. 2 scheme, and that provision be also made for the extension of the works referred to. The committee also recommended that a capital sum of £12,000 be raised and application is to be made

Digitized by Google

to the Local Government Board for their sanction to the raising by the Council of the sum of £12,000 for the purpose of laying cables and other work for public lighting by electricity, including the cost of the two new cottages, and also for the purpose of extending the present works and mains to meet future requirements, the sum to be repaid in 25 years by means of a sinking fund in the usual way. The £820 referred to as annual cost for public lighting do not include the eight arc lights about to be erected in some of the principal streets of the borough, the estimated cost of each of which is £13 per annum, or a total of £104 for the eight arc lights. Since the last monthly meeting applications have been received from seven persons for 201 8-c.p. lamps. During the five weeks of the new year 4,750 units were sold, representing a gross revenue of £112. 10s., the expenses of working, including management, wages, etc., for the same time amounting to £72. 8s. Instruments for testing the amount of energy given out by the batteries are to be obtained at the cost of £25, and the engineer's suggestion as to the new cottages is to be carried out. A charge of 4d. per unit will be made for special street lamps. The Electric Lighting Committee have appointed the Mayor, Alderman Lake, and Councillor Jaggard as a sub-committee to meet a similar committee from Bury St. Edmund's Gas Company to discuss the question as to the purchase of street lamps and lamp-posts by the Town Council.

PROVISIONAL PATENTS, 1901

FEBRUARY 4.

2317. An improvement in electric stop motions for warping machines. Thomas Holt, Limited, and Frank Ashworth Holt, 17, St. Ann's square, Manchester.

2320. Improvements in the method of covering cables, wires, and conductors for electrical purposes with india rubber or other insulating material and in machinery therefor. William Hanchett, 4, St. Ann's-square, Manchester.

2322. A double-wheel contact on a rocker for overhead electric tram contact. Harry Garstang, 69, Darwen-street, Blackburn.

2330. Improvements in and connected with controlling arrangement in telephone exchanges for branch or trunk lines. Hermann Oppenheimer, 55, Redcross-street, Barbican, London. (Actien Gesellschaft Mix und Genest, Germany.)

2345. Electric meters. Edward S. Halsey, 601, Omaha building, Chicago, U.S.A. (Date applied for under Patents, etc., Act, 1883, Sec. 103, July 5, 1900, being date of application in United States.) (Complete specification.)

2353. Improvements in gear for collecting the current on electric locomotives, electric trams, electric cranes, and such like machines. Edward Colin Wilson, 66, Victoria Park-road, South Hackney, London.

2363. Electrode for galvanic cells. Frederic Landolt, 52, Chancery-lane, London.

2394. Improvements in distributing electricity and in apparatus for use therein. Robert Bolton Ransford, 24, Southampton-buildings, Chancery-lane, London. (La Société Anonyme des Brevets Dolter, France.) (Complete specification.)

2411. Improvements in and relating to electric motors. Martin Kallmann, 18, Southampton-buildings, Chancery-lane, London.

FEBRUARY 5.

2420. Silent automatic switch arrangement for electric motors for church organs. Harry Garstang, 69, Darwen-street, Blackburn.

2421. Improvements in electric incandescent lamps. John Johnston Green and Edward Obley Green, Commercial-street, Halifax.

2438. Improvements in electric motor-starting switches. Edward Woodrowe Cowan and Alfred Still, Springfield-lane, Salford, Manchester.

2461. Improvements in conduits for electric wires. Emmett D. Page, 52, Chancery-lane, London.

2471. Improvements relating to electric switches. Henry Harris Lake, 45, Southampton-buildings, Chancery-lane, London. (William Maxwell Scott, United States.)

2474. Improvements relating to transmitters for telephones. Lemuel Mellett and Albert Franklyn Henderson, 45, Southampton-buildings, Chancery lane, London. (Complete specification.)

2488. Apparatus for disinfecting the transmitters and receivers of telephones. Cyrus Fletcher Axtell, 53, Chancery-lane, London. (Complete specification.)

2490. Improvements in storage batteries. Thomas Alva Edison, 23, Southampton-buildings, Chancery-lane, London. (Complete specification.)

2497. Improvements relating to electric igniters. Jean Marie Ricard and François Clement Cory, 45, Southampton-buildings, Chancery-lane, London. (Complete specification.)

2505. Improvements in and in apparatus for obtaining metals by electrolysis. Arthur Percy Strohmenger and Antoine Bonaventure Pescatore, 322, High Holborn, London.

2523. Improvements in means for the distribution of electricity on the three-wire system for electric traction on rails. Alexander Bewicke Blackburn and Ernest Sherwood Woollard Moore, 47, Lincoln's-inn-fields, London.

FEBRUARY 6.

2536. Improvements relating to the commutators of dynamo-electric machines. Walter Langdon-Davies, 101, Southwark-street, London.

2553. Improvements in electric arc lamps. August Eckstein and Arthur Ernest Angold, Peel Works, Adelphi, Salford, Manchester.

2570 Improvements in or connected with electrical signalling apparatus. William John Mildon, 22, Glasshouse-street, Regent-street, London. (Complete specification.)

2579. Fabrics for electric heating purposes. Joseph Michel Camille Herrgott, 23, Southampton-buildings, Chancery-lane, London.

2587. Improvements in electric batteries. George Rosset, 55 Chancery-lane, London.

2607. Improvements in electrical transformers. Arthur Francis Berry and the British Electric Transformer Manufacturing Company, Limited, 46, Lincoln's-inn-fields, London.

FEBRUARY 7.

2618. Improvements in electrical heating apparatus. Albert Loacker and Franz Riedl, 4, Corporation-street, Manchester.

2619. Improvements in electrically-heated smoothing irons. Albert Loacker and Franz Riedl, 4, Corporation-street, Manchester.

2636 Improvements relating to overhead electrical conductors, such as trolley wires, for electric trams and the like. Arthur Pass, 34, Castle-street, Liverpool.

2643. Improvements in and connected with the diaphragms of phonographs and such like instruments. Ernest George Craven, 33, Chancery-lane, London.

2659 Improvements in electric arc lamps. Helios Upton Company and Thomas Spencer, 24, Southampton-buildings, Chancery-lane, London. (Complete specification.)

2689 Improvements in or relating to electrolytic electricity meters. Francis Malger Staunton, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London.

2692. Improvements in incandescent electric lamps. Levi Lobenthal, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Complete specification.)

2696 Improvements in means for protecting electrical conductors. Walter Langdon-Davies, 24, Southampton-buildings, Chancery-lane, London.

FEBRUARY 8.

2729. Improvements in apparatus for regulating electric generators. Count Albert de Dion and Georges Bouton, 47, Lincoln's-inn fields, London.

2741. Electrode plate for forming Plante cells. Rudolf Hager, 321, High Holborn, London.

2776. Improvements in electric fuses. Callender's Cable and Construction Company, Limited, and James Ormiston Callender, 24, Southampton-buildings, Chancery-lane, London.

2779. Improvements relating to electric conductors. William Gordon Potter, 27, Chancery-lane, London.

FEBRUARY 9.

2793. Improvements in and in connection with the storage of electricity. Sherard Cowper-Coles, 82, Victoria-street, Westminster, London.

2806. Improvements relating to electric light fittings, such as electroliers, brackets, or the like. Richard Bertram Leach, 64 Barton-arcade, Manchester.

2830. Improvements in means for electrically igniting miners' safety lamps. Robert Octavius Best and Ackroyd and Best, Limited, 33, Chancery-lane, London.

2834. Improvements in or relating to telegraph apparatus. Frederick George Creed and William Arthur Coulson, 46, Lincoln's-inn-fields, London.

2835 Improvements in the manufacture of thermo-electric couples. Eugène Hermite and Charles Friend Cooper, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Date applied for under Patents, etc., Act, 1883, Sec. 103, Aug. 1, 1900, being date of application in France.) (Complete specification.)

2836. Improvements in the manufacture of thermo-electric couples. Eugène Hermite and Charles Friend Cooper, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London.

2838. Apparatus for governing the output of dynamos when driven at different speeds. Horace James Jordan Hummel, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London.

2853. Improvements in electric batteries. George William Johnson, 47, Lincoln's-inn-fields, London. (Société Paul Chapuy et Cie., France.)

Digitized by Google

2645. Improvements relating to apparatus for starting and regulating or controlling electromotors. Jasper Wetter, 37, Essex-street, Strand, London. (The Elektricitäts Aktien-Gesellschaft, vormals Schuckert und Co., Germany.) (Complete specification.)

COMPLETE SPECIFICATIONS ACCEPTED.

To be published on March 8.

1900.

2176. Regulating mechanism for arc lamps. Eckstein and Angold.

2212. Electric arc lamps. Peritz.

2260. Electric arc lamps. Bremer.

2513. Apparatus for recording, without friction, the indications of electrical and other measuring and indicating devices. Eckstein and Coates.

2783. Electrical arc furnaces. Johnson. (Deutsche Gold und Silber-Scheide Anstalt vorm. Roessler und Birger Carlson.)

3683. Electricity meters. Marion Emily Reason, William Paddison, and Herbert Charles Hughes (executors of the late Henry Reason), and Reason Manufacturing Company, Limited.

4387. Systems of alternating-current electrical distribution. Young. (Date applied for under International Convention, Aug. 8, 1899.)

4709. Electric cable joint-boxes. Nisbett.

5016. Porous diaphragms for electrolytic apparatus. Holland and Laurie.

5767. Construction of carrier for globes or glasses of electric, gas, or oil lamps. Stanley.

6496. Means for dropping, or cutting out broken overhead conductors on electric railways. Skopec and Orel.

6615. Terminals and binding screws for electric batteries and connections. Edwards.

8208. High-potential electric switches or circuit breakers. British Thomson-Houston Company, Limited. (Hewlett.)

10612. Arc lamps. Martin, Stewart, Brown, and Boggs.

13616. Apparatus for indicating phase and frequency relations in electric alternating-current systems. Clarke.

18921. Electric furnaces. Benedicks.

19138. Electric arc lamps. Schuster.

19512. Electric circuit breakers or switches. Lake. (McElroy-Grunow Electric Railway System.)

19554. Combined telephone and sound telegraph apparatus. Ljungman.

21149. Electrolytic process for the precipitation of metals and alloys from their solutions, as also for the deposition of metals or alloys on other metals or alloys or on other substances. Meurant.

22142. Telephone relay. Hagemann and Poulsen.

1901.

434. Secondary electric batteries. Lake. (Globe Electric Company.)

NOTES.

New Form of Magazine.—The proprietors of *Cassier's Magazine* inform us that they are now issuing a library edition, bound in cloth with gilt lettering, in place of the old paper cover. In this form, it is conceived, the magazine will be better kept in a good state of preservation.

Personal.—We are pleased to hear that Mr. George W. Smith, who for 30 years has been the manager in France of the Persan works of the India Rubber, Gutta Percha, and Telegraph Works Company, has received from the French Government the Cross of the Legion of Honour. On the 9th inst. about 700 of the firm's workpeople, as a demonstration of their esteem and affection for their chief, presented him with a cross of that order in brilliants.

Telegraph and Telephone Charges on the Congo.—It is interesting to note the tariff fixed for the telegraph and telephone on the Congo. For instance, a telegram of 15 words from Boma to Matadi costs 1s. 8d., to Tumba 2s., to Leopoldville 2s. 6d., and to Lukolela 4s. The charge for every additional five words is 5d. For the use of the telephone on the various sections for every five minutes the price is exactly the same as that for a telegram of 15 words, an additional 10d. being charged if the conversation lasts for 10 minutes.

Birmingham Local Section.—The inaugural meeting of the Birmingham Local Section of the Institution of Electrical Engineers, which was to have been held on Jan. 23, has now been fixed for Wednesday, Feb. 27, in the university buildings, Edmund-street, at 8 p.m., when, as already announced, Dr. Oliver Lodge, chairman of the section, will deliver an inaugural address, and the President of the Institution, Prof. John Perry, will be present. The hon. secretary of the section is Mr. D. K. Morris, to whom all letters should be addressed at the University, Birmingham.

Committee Proceedings.—The members of the Metropolitan Borough Council of Fulham on Wednesday last were assembled in special meeting to consider the question as to the privacy of committee meetings. An attempt to exclude the Press from certain committees was frustrated recently, and it is now proposed that each committee shall decide the matter separately. Personally we believe that all committees should meet in private, as much trouble and often scandal would be prevented were the details discussed in committee kept absolutely secret. Another advantage is that the long-winded speaker is apt to lose his main incentive when reporters are banished.

Glasgow Electrical Congress.—The Institution of Electrical Engineers, it was announced at the last meeting, have been asked to take charge of the organisation of the electrical section of the engineering congress to be held in Glasgow this year in connection with the Glasgow Exhibition. The days named for the congress are Sept. 4, 5, and 6, and the secretary will be pleased to receive the names of any members who wish to read papers at the same. We understand that a number of visits to interesting works in the neighbourhood of Glasgow are to be arranged for the afternoons, and that the electrical section of the congress will meet on each morning of the three days in question.

Electro-Harmonic Society.—We would remind our readers of the concert (ladies' night) which the above society are holding to-night (Friday) at the St. James's Hall Restaurant (Banqueting Hall), Regent-street, W. It will commence at 8 o'clock precisely, and Mr. Henry Edmunds will be in the chair. The vocal music will be provided by Miss Gertrude Maxted, Miss Mary Hay, and Mr. Braxton Smith, while Miss Trixie Defries will give three violin solos. Humorous sketches and recitations are to be contributed by Mr. James G. Dunn, Mr. Herbert Harvey, and Mr. Edward Minshall. Messrs. T. E. Gatehouse and A. E Izard, Prof.R.A.M., are the musical directors, and the last-named will officiate at the piano.

The Southport Tramways.—At a recent meeting of the Town Council it was mentioned that the Tramways Committee had, on the advice of their engineer, already placed a number of Post Office wires underground at points at which they crossed the track. We gather from the report that in such instances the work of laying the underground wires is done by the Post Office at the expense of the Corporation tramways. Again, the telegraph wires of the Lancashire and Yorkshire Railway Company had also been placed underneath a bridge where the line was crossed by the tramways instead of over the road. These pre cautions show that the engineer responsible for the work at Southport has been energetic in his endeavours to avoid all chance of accident.

Electric Waves.—Last week Dr. Molloy, the rector of the Catholic University of Ireland, delivered the Friday evening discourse at the Royal Institution. The lecture was a most interesting *résumé* of the whole subject of electric waves, commencing with the work of Henry, Kelvin, and Clerk Maxwell before dealing with the more recent work done by Hertz, Röntgen, and others. As is usual in these lectures, a number of experiments were given. Dr. Molloy showed the refraction, reflection, and polarisation of electric waves. He explained that the electric waves used by him were from 6in. to 7in. in length, and their place in the spectrum was below the infra-red rays. The X-rays were above the ultra-violet rays. As to the future, Dr. Molloy said that much work remained to be done, and that the scientific men of the twentieth century must endeavour to reveal the nature of that mysterious substance pervading all space which transmitted heat, light, and electricity from point to point without loss, and which was termed the ether.

The Manchester Section.—A meeting of this section of the Institution of Electrical Engineers was held at the Owen's College, Manchester, on the 12th inst., Dr. E. Hopkinson in the chair. The Chairman announced that in consequence of an application on the part of the Manchester Society of Junior Electrical Engineers, a students' section for the Manchester disrrict was in course of formation, and there was a promise of a large number of applications for membership from the Junior Society and from students outside the society. The students would have a right to attend the meetings and to enjoy the other privileges of the Manchester Section. The chairman then introduced Dr. John T. Nicolson, M.I.C.E., who read a paper "On the Training of Electrical Engineers." This paper we referred to in our notes last week. In the discussion which followed, Prof. C. Wilson, Dr. Lees, Dr. Hopkinson, Messrs. W. G. Rhodes, C. H. Wordingham, A. F. Guy, and W. H. Gee took part. A vote of thanks to Dr. Nicolson concluded the proceedings.

Insulated Overhead Conductors.—In confined situations round ironworks and blast furnaces where a great quantity of metal is employed trolley wires often become short-circuited to earth. Mr. E. B. Cheatham, in the *American Electrician*, describes an insulated trolley conductor which is in use round the Boston and Montana Copper Smelting Works at Great Falls. The locomotives used in this instance are of the small type, requiring low overhead conductors, and it was found necessary to so insulate these conductors that the men would not hit them with their iron rods which they have to use round the furnaces. After a number of trials, the present method of

Digitized by Google

using a trolley conductor in an inverted wooden trough has been adopted with great success. The conductor consists of a flat copper strip secured to the bottom of the inverted trough. The collector is simply a flat copper end on the trolley pole. The author states that the wooden sides of the trough keep the collector always in place, in spite of sharp curves.

The Liberty and Property Defence League.—This league has just issued its eighteenth annual report, in which lists of the parliamentary Bills opposed by the league during the chief session of 1900 are grouped, with short summaries of the proposals and effects involved, according as they affected land and houses, commerce, trade and industry. The report of the Select Committee enquiring into boiler registration is quoted with satisfaction. The committee, it will be remembered, reported strongly against the advisability of legislation, holding it of the greatest importance to maintain the responsibility of the boiler user for the condition and safety of the boiler which he works, and believing that legislation giving any Government department control over the inspection of boilers would be a grave mistake, and that State certification of registration, unless accompanied by State control, would not be of any practical value. The report also refers to the success of the various Electricity Supply Bills, the passage of which the league claims to have materially assisted.

Tramway Congress.—The Tramways and Light Railways Association are looking well ahead in their endeavours to promote the welfare of their members. Thus the association has approached the Union Internationale Permanente de Tramways with an invitation to hold their 1902 congress in London. This invitation has been accepted, and the dates chosen for the congress are July 1, 2, 3, and 4 of next year. The secretary of the Tramways and Light Railways Association, Mr. Norman A. Thompson, now invites members of the association to enrol themselves as members of the Union Internationale. The subscription is £2 per annum for tramway companies, and 10s. for private members. The union is doing good work on the Continent, and we hope that the meeting in London will enable our tramway and light railway engineers to extend their interests. The publications of the society alone are well worth the annual subscription. We also learn that a light railway exhibition is being organised by the *Tramway World*, to be held during the week the congress meets in London.

Submarine Aqueducts.—An interesting experiment in submarine aqueduct building is just now being carried out by the New York Gas and Electric Light, Heat, and Power Company at their power plant in that city. Here it is proposed, according to the *Railway and Engineering Review*, to build a duct under the East River, through which all the water required for condensing purposes at the plant will be obtained. This duct will be a steel pipe 12½ft. in diameter and 225ft. long, and is now being built at the yard of Lewis Nixon, the shipbuilding firm, 38 miles away from the power plant. When the length is completed, the whole structure will be towed up the bay and sunk in the place required. The final details will consist merely of riveting the tunnel with the shore approaches. The Manhattan Elevated Railway Company has also given contracts for a similar structure. The gas company's tunnel, however, will be considerably longer than that of the Manhattan Company. The latter is to be 40ft. in length, and square, with walls 17ft. by 19ft. Both tunnels will be under 23ft. of water, so that they will not interfere with the shipping in any way.

Sleet on Trolley Wires.—We notice in the *American Electrician* for this month a short article by Mr. A. B. Weeks on the use of sleet-cutters for removing ice and sleet from trolley wires. It seems that the experience in the States has shown that when half-melted snow is lodging on the trolley wire and freezing, the ordinary wheel is quite incapable of removing the same without causing serious interruption to the supply of current to the car. In such conditions the author advocates the use of a scraper, which can be easily fixed on the end of the trolley pole after the trolley wheel has been removed. This scraper, which is made to embrace the wire, is constructed in the form of a rounded V. The scraper is made of steel, the cutting edge being drawn to a dark blue. It would be thought that the steel edge would cut the trolley wire, but careful tests and close observation prove that it does not harm the wire in the least. The frozen sleet which has to be removed seems to afford the pretection required. The author adds that as the pressure on the wire is only from 15lb. to 40lb., the scraper would not do much damage even if it were run on the wire after the ice had been taken off. It is usual, however, to remove the scraper and revert to the trolley wheel after the one run along the line, which is quite sufficient to clear away the ice.

Projected American Automobile Service.—Chicago is to have a new service of electrically-propelled vehicles, including a cab service running in conjunction with the electric 'buses. In view of the failure of the London electric cab service, it will be most interesting to watch the result of the enterprise of our friends on the other side of the Atlantic. The *Western Electrician* gives an outline of the scheme, which is being promoted by a new corporation, to be known as the Chicago Automobile Transportation Company. It is proposed in the first instance to put as many as 348 'buses and 160 cabs on the various routes. Four stations will be provided. One is to be near the Union depôt, and another as near as possible to the terminus of each regular route. Besides being used as stables these stations will be utilised for charging purposes. Each 'bus will be equipped with a specially-designed 9-h.p. motor having an overload rating of 130 per cent. The battery will consist of 40 cells, with a 222 ampere-hour capacity, working on a five-hour discharge rate. With a maximum speed of 10 miles an hour it is proposed to use a controller with four speeds. One electrical brake and two of a mechanical nature will be provided. Together with the battery, which will have a weight of 1,800lb., the conveyance will weigh 5,400lb. If this proposed passenger service should prove a success, the company intend to take up the question of parcel delivery by automobiles, and to put on several hundred vehicles of this class to make delivery of merchandise, for carrying mails, distributing newspapers, and general express business.

Central London Railway Construction.—Further expert evidence was given before Mr. J. W. Penfold, architect, at the resumed hearing of the claim by Lord Herschell and Mr. Wm. Baillie, as the executors of the late Mrs. Mary Cunliffe, against the Central London Railway Company for damage to the house, 2, Lancaster-gate, due, as alleged, to the construction of the line. Mr. Arthur Manton, C.E., chief agent for the contractor who had charge of the construction of the section of the railway in question, attributed the damage solely to the bursting of the main of the East London Waterworks Company in 1897. Respecting the method of cutting through the clay by means of Greathead shields, the witness denied that the system could have had any effect whatever on the upper strata. During the cross-examination of Mr. Manton it was admitted that Mr. Price, the contractor referred to above, would be responsible to the railway company for any liability cast upon them on account of defects in workmanship. Sir

Digitized by Google

Douglas Fox agreed that the damage complained of could not possibly have been caused by the construction of the railway. The primary reason why he thought the railway could not have caused the damage was that, if it had, he felt sure it would have been manifested some time in the autumn of 1897, before the tunnel reached the spot. His experience of the railway was that whenever there had been any movement it was always before the railway tunnel reached the place. The hearing now stands adjourned till the 1st of next month, but from the expert evidence already adduced it seems sufficiently clear that the construction of the tunnels by means of the Greathead shields is in no way responsible for the damage to house property situate in the vicinity of the railway.

Huddersfield Tramways.—We understand that there has been some slight delay over the inauguration of a complete service of electric cars over those sections of the Huddersfield tramways already equipped. This delay is due to the Board of Trade inspectors requiring certain small modifications to be made before issuing a certificate. While the delay is, of course, vexatious to those connected with the line, we are sure that in the long run it will be to the advantage of all concerned that the Board of Trade requirements should be promptly attended to. Respecting the guard wires, Mr. Trotter reports that only one or two additional ones were required, but he emphasises the fact that whereas in some streets rosettes are employed instead of poles to support some of the span wires, these rosettes are of no service as a means of earthing the guard wires. He also requires that the iron poles which are used for this purpose should be bonded to the tramway track. After a number of experimental runs last week, the regular service was commenced on Monday last on the Crosland Moor and Linthwaite routes, whereas the other section to Longwood will be opened next Monday. Up to the present a 20-minute service is proposed on each of the routes, which will, of course, give a much more frequent service where these routes coincide in the middle of the town. We believe that the Corporation would be well advised in the near future to run a more frequent service, even if they required smaller cars in order to keep down working expenses. Just as we are going to press we hear of an accident at Huddersfield, for which the driver seems to be solely to blame. At the top of a down grade the driver locked the wheels of the car with the hand-brakes, and then tried to get the electric brakes to check the car, which, of course, they could not do with the wheels locked. Luckily no serious damage was done.

Tesla Telegraphs.—The *Daily Chronicle* is the last medium to take up the exploitation of Mr. Tesla's invention in connection with wireless telegraphy, and the editor has tried to get additional light on the supposed inventions which Mr. Tesla states enables him to communicate between England and America, using the earth as a conductor. In consequence of these statements, the editor has interviewed Mr. Marconi and asked him to explain Tesla's inventions. The result is what one would expect—*i.e.*, that a good deal of information was given to the interviewer on the question of Mr. Marconi's own success in sending long-distance messages in England; to be more correct, we should say Mr. Marconi's success in sending messages over the sea from one point along the coast to another. For such work Mr. Marconi holds the record with a distance of 196 miles, as he succeeded in sending readable signals between St. Catherine's Point, in the Isle of Wight, and Mullion, at the Lizard. When, however, Mr. Marconi came to analyse Mr. Tesla's statements, we find a good deal we can object to. For instance, a statement by Mr. Marconi that the highest voltage at which any quantity of current has yet been obtained in practice is only 10,000 volts alternating, which is the working pressure at Niagara. The disparity between this voltage and the voltage employed in wireless telegraphy is, of course, enormous; but surely Mr. Marconi knows that voltages of three times this value are in regular work in certain transmission schemes in America—in fact, the whole interview throws no light on the supposed inventions, which we are inclined to regard as existing mostly in the mind of the original interviewer of Mr. Tesla. We cannot, however, hold that scientist free from blame in allowing his name to be associated with such schemes without giving practical experimental facts to support his conclusions.

Temperature Regulator.—We notice in the January number of the *Physical Review* a description of an automatic temperature regulator which was designed in the physical laboratory of the Cornell University by Mr. C. T. Knipp. It seems that in this laboratory they had need for absolutely uniform temperatures which could be varied up to 380deg. C., and which could be maintained constant for a day or more at a time. The heating was done by means of electricity, the source of which was a 110-volt Edison dynamo. It was found, however, that the fluctuation of the load on this dynamo was enough to upset the constancy of the temperature in the oven in which the experiments were carried out. To avoid this, an automatic regulator was devised which has certainly novel features. It consists of two copper-iron thermostats which are suspended in the oven. The ends of the thermostats are delicately pivoted. The free end is connected by linkwork to the relay contact which makes or breaks the heating circuit. The end of the relay lever contains a number of holes, and the connecting link between the levers driven by the thermostats and this relay lever can be moved so that the temperature at which the contact is made can be varied. The article in question illustrates the apparatus, and also gives curves of the results obtained. When working at 25deg. C., the variation in temperature after the apparatus had had a steady run was not more than half a degree between the extremes. When working at about 376deg. C., the variation between maximum and minimum was more like 1deg. The arrangements for heating the oven consisted of two coils, one of which provided the bulk of the heat lost in radiation, and tended to keep the oven at 5deg. or 6deg. below the temperature required. The smaller coil to add the remaining 5deg. or 6deg. was controlled by the thermostats by which the circuit was alternately made and broken.

A Cabling Record.—The last West Indian mail brings home particulars of an extraordinary record in the matter of submarine cabling, which has to be placed to the credit of the West India and Panama Company. When her Majesty the late Queen passed away at Osborne the Greenwich time was 6.45 p.m., which represents in Demerara the hour of 2.53 in the afternoon. The cable company's depôt was surrounded at that time by a crowd of her Majesty's subjects in British Guiana—Europeans, imported East Indian labourers, African blacks descended from the old slaves, and others—who were all alike watching with painful interest the bulletins about the Great White Queen. At 3.15 local time, or 7.7 Greenwich time, the notice was published that the Queen was dead, and the impulsive coloured people burst into tears. Mr. R. T. Brown, the West India Company's secretary in London, thus announced the news in our far-away colony, the other side of the world, long before the majority of Londoners knew that the Queen was dead. More than

Digitized by Google

that, his record feat in 22 minutes outstripped the Government communication through the Secretary of State for the Colonies, and the local governor, whilst putting a flag at half-mast, had to await confirmation from the Government before adopting the procedure usual on the death of a sovereign. The more the feat is looked into, the more astonishing do the achievements of modern science appear. The news was conveyed from Osborne to the telegraph office, thence under sea to the mainland, thence to one of the Atlantic cable companies, and so across the ocean to America. On the other side it was sent southwards overland, and put once more on a submarine system, this time the West India Company's own cable. Their system alone is several thousand miles in length, and touches all the chief islands of the West Indies, the extreme end of the system being Demerara on the mainland. The company had never had such momentous news to transmit before in the 30 years of their existence, and they proved worthy of the occasion.

A Large Transformer Contract.—The Westinghouse Electric and Manufacturing Company, of America, have just received what is said to be the largest single order for transformers ever given. This order was received from the Chambly Manufacturing Company, and is for 20 transformers each of 2,750 kw. capacity. These transformers will be of the Westinghouse air-blast type, and will weigh approximately 11 tons and stand 9ft. high. Ten of the transformers are to be employed to raise from 2,200 up to 25,000 volts. The frequency is given as 8,000 alternations, which works out at 133 alternations per second. This seems to be very high. The input into the transformers is to be two-phase and the output three-phase currents. The remaining 10 transformers are for lowering the voltage, and will receive three-phase currents from the line at 22,000 volts and deliver two-phase currents of either 2,400 or 4,800 volts as required. The blowers for furnishing the air blast for cooling both the raising and lowering transformers are operated by Westinghouse type C induction motors. The well-known Westinghouse methods of construction are employed in these transformers, both primary and secondary being divided into several flat coils wound with many layers, and few turns per layer, each coil being insulated separately. The advantages of this construction are that it divides the total E.M.F. between the several coils, reducing proportionately the strain of each individual coil; also it divides the E.M.F. in a single coil between many layers, thus reducing the potential between the adjacent layers. The regulation of the transformers is also improved, and the windings may be connected easily in series or multiple, thus giving a wide range of E.M.F. Also in case of damage to a coil a substitute may be provided with but little trouble, and without sending the transformer to the works. The iron and copper used have been so carefully prepared that high efficiency, considerably over 98 per cent., is to be obtained. It is also claimed by the Westinghouse engineers that they have found an iron which will not change in hysteresis losses with time. The design of the windings of the transformers in order to change the current from two-phase to three-phase is that due to the inventive skill of Mr. C. F. Scott, of the Westinghouse Company.

Electrically-Driven Refrigerating Plant.—Before the Liverpool Engineering Society last week Mr. J. Wemyss Anderson read a valuable paper, the latter part of which refers to the use of electricity for refrigerating machinery. The author points out that large quantities of electrical power could be used with advantage for driving the whole of a refrigerating plant, particularly in small or moderately-sized districts, as a means of bringing up the day load in the electrical generating stations. The output from such stations is, of course, greatest during the winter months, and the hours of large demand extend over a fair portion of the day. It so happens that the requirements of refrigeration during the same period would be small, and consequently, if the plant were electrically driven, it could easily be arranged that it should be stopped during the period of maximum demand. On the other hand, the total electrical output for ordinary purposes is smallest during the summer months, but now we find that the refrigerating requirements are large, so that if a generating plant and a refrigerating store were running in conjunction, a more balanced arrangement it would be hard to imagine. Thus, it is not hard to imagine a combination of refuse destructor, electrical generating station, and refrigerating plant working in conjunction. The quantity of chilled and frozen goods coming into this country has been and is advancing by leaps and bounds, and the question of transport over the sea has been answered by fitting up complete refrigerating machines and cold chambers on shipboard—as complete in every feature and detail as the cold stores on land. With respect to transport on land the railway companies provide special refrigerator cars. The car is insulated by felt and air spaces, and is refrigerated by crushed ice being placed in special cans provided. In Liverpool, however, it cannot be said that ideal arrangements exist for either icing these cars or for loading same with refrigerated produce. However, it is not hard to imagine the railway companies and Dock Board arranging for the refrigerator cars to run either on the top of or in the quay sheds, where the once handling would place the goods on the railway—the cars, on the way to the dock, being iced in succession from a special depôt. The paper closed with a reference to the great value which might result from the utilisation of liquid air, which, in the author's opinion, is an ideal power.

Electric Train-Lighting.—We have several times referred to the advantages of using electricity as the illuminant on railway carriages. In a great number of instances the passenger merely remembers the advantages which the electric light gives him as an illuminant, but there is another point in connection with the use of electric light on trains which must not be neglected by railway engineers when designing new stock. We refer to the danger which arises from the use of other means of illuminant in the event of a railway accident. The experience of the United States in this respect is worthy of quoting. In the old days they used stoves for heating, with the result that a number of serious accidents were made much more costly as regards loss of life by the fact that these stoves immediately set light to the *débris* after an accident had occurred. The same result has been noticed with cars lighted by gas. When a train is smashed up, the gas cylinders, as a rule, burst, and in consequence an explosive mixture of gas and air surrounds the wreckage. Cases are on record where explosions have resulted, greatly increasing the damage and loss of life. With electric lighting, however, the dynamo being driven off the car axle, there is no possibility of a fire occurring in consequence of a breakdown. Another most valuable advantage derived from the use of this method of car-lighting is that there is no need to put the trains into sidings in order to recharge them with gas or to trim oil lamps, as the very fact of running the trains generates the electricity for lighting. This in times of heavy traffic is a most valuable advantage, as it renders a train always available night and day. Various new means of coupling these dynamos to the car axle have been brought forward of recent

Digitized by Google

years, but we have yet to see a new system which is at once so effective and so simple as that adopted by the English company who specialise in this matter—Messrs. J. Stone and Co. It will be remembered that this firm so suspend their dynamo that its weight gives the necessary tension to the belt. The suspension is also arranged so that the belt will slip when the normal output from the machine is exceeded. In this way the dynamo give a constant voltage independent of speed, which is an essential feature in this work. The cost of upkeep must be reasonable in view of the large amount of new stock which is equipped by companies having experience with this system.

The Liverpool Accident.—The fatal accident at Liverpool caused by telephone wires falling on to the trolley wire of the electric tramways has stirred up a good deal of discussion amongst all the municipal authorities owning electric tramways in England. We gather from the reports of these discussions in the town councils that in a number of towns indiarubber gloves had before the accident been provided on every tramcar. These, of which two pairs are supplied, will enable the conductor and driver of the car to handle any fallen wires with impunity, even if the same are in direct connection with the trolley wire. As a precaution, therefore, the provision of these indiarubber gloves, and of pliers by which the fallen wires can be cut, is good. On the other hand, it is desirable that means should be taken to prevent any telegraph or telephone wires becoming connected to the 500-volt circuit even if they do fall. The best solution of this problem is the placing of the wires in question underground, so that there is no possibility of the Liverpool conditions being repeated. It will also be remembered that at Liverpool earthed guard wires were not provided. Instead of these, strips of wood were fixed over the trolley wire, in order to support and insulate from it any wires which might fall. Until the Board of Trade enquiry has been held we cannot say how far these strips of wood were defective, but a heavy fall of wet snow would do much to lower their insulating properties. The other alternative, that of using earthed guard wires over the trolley wires, is the one more generally adopted, and it should give much more protection against accidental contacts between a fallen wire and the trolley. In such a case, if the fallen wire becomes connected from the trolley wire, it is almost sure to be connected at the same time to the earthed wire, which will make the circuit breaker in the sectional pillar disconnect the half-mile of trolley wire affected. We notice that Mr. J. H. Rider, the electrical engineer to the London County Council, and late engineer to the Plymouth Corporation, has written to the chairman of the Tramways Committee of the latter town. In this letter he expresses his opinion that the proper thing for the Council to do is to prohibit the crossing of public streets by telephone wires unless (1) all wires crossing any street be made to do so at one place and at one place only; (2) the number of wires fastened to any one support (post or chimney) be limited; (3) a strong wire netting, or laced-wire support, be fixed immediately under the telephone wire crossing so as to catch any wire before it can come near the trolley wire, or the telephone wires be insulated and made up into the form of a cable, and carried by strong steel wire supports, also insulated. The guard wires over the trolley wires could then be taken down, and another source of danger removed. The Councils should insist on the Telephone Company putting their wires underground.

Insulated Returns.—At the meeting of the South Metropolitan Gas Company held last week, Mr. George Livesey referred to the damage which he considered was likely to be caused to gas and water mains by the multiplication of electric tramways and railways in the Metropolis. He said he had been shown a circular issued by the London Chamber of Commerce in reference to this question. In this circular attention was drawn to a clause which the Wrexham Water Company were trying to get inserted in the Wrexham Tramways Bill. This clause would read as follows: "Notwithstanding anything contained in the Wrexham District Tramways Act, 1873, or the Wrexham District Tramways Order, 1899, the promoters shall be liable for any loss or damage to the water mains or pipes of the Wrexham Waterworks Company resulting from fusion or electrolytic action caused by any currents generated or used for the purposes of electric traction on any of the tramways authorised by the said Act or order." In the circular it was stated that the prejudicial effect of this and its far-reaching consequences on the electric traction industry would be seen at once, and it went on to say that it was most desirable that no promoter should give way on the point, or agree to any modification of the Joint Committee clauses, and that arrangements were being made to fight a test case during the ensuing session in the general interests of the electric industry. Mr. Livesey objected to the Chamber of Commerce taking up the cudgels on behalf of one industry. That electric traction people should be at liberty to let their waste current escape, to the damage of other people's property and to the danger of the public, was a doctrine to which he could not subscribe. He added that the gas and water companies of London intended to oppose the Bills of all such electric undertakings until they got the only protection which was really worth having—namely, insulated return conductors. The secretary of the London Chamber of Commerce has sent us a copy of the circular complained of, which when read as a whole shows that Mr. Livesey's limited quotations are hardly fair to that body. The clauses which are usually inserted in Electric Tramway Bills to protect gas and water companies were settled in 1893 after a committee of both Houses of Parliament had heard evidence on the subject of electrolysis to underground pipes due to tramway currents. One section of these clauses reads thus: "The tramway company shall take all reasonable precautions in constructing, placing, and maintaining their electric lines and circuits and other works of all descriptions, and also in working the undertaking so as not injuriously to affect by fusion or electrolytic action any gas or water pipes or other metallic pipes, structures, or substances, or to interfere with the working of any wire, line, or apparatus used for the purpose of transmitting electric power, or of telegraphic, telephonic, or electric signalling communication, or the currents in such wire, line, or apparatus." Another clause makes the tramway company responsible for the due observance of regulations made by the Board of Trade. We think the Electrical Trades' Section of the Chamber of Commerce is quite right in trying to prevent individual promoters giving away the advantage of Board of Trade control and placing themselves in the hands of rivals. If the Wrexham clause were generally accepted, there is little doubt but that the tramway companies would be called upon to make good damage which they may not have been responsible for. The secretary of the Chamber of Commerce adds, in a letter to us, that so far from the chamber being only willing to "take up the cudgels on behalf of one particular industry," it may be pointed out that if the gas and water companies wished to utilise the machinery of the chamber in the same way as its electrical section has done similar facilities would be afforded to them, as the organisation of the chamber expressly provides for the furtherance of sectional interests when desired.

Digitized by Google

FULHAM COMBINED ELECTRICITY AND REFUSE DESTRUCTOR WORKS.

Mr. Russell Forrester Ferguson, borough electrical engineer, was born in the city of Glasgow, and was educated at the academy there. He served his apprenticeship with Mr. William Young, of Ardrossan, Ayrshire, after which he sailed as an engineer, and was latterly a chief engineer of the River Steam Navigation Company, India. On returning home, Mr. Ferguson took up electrical work, and studied under Prof. Jamieson, of the West of Scotland Training College, Glasgow, holding at the same time the position of chief draughtsman to Messrs. Muir, Mavor, and Coulson, Glasgow.

In 1891 Mr. Ferguson was appointed first engineer to the Brighton Corporation electricity works; then in 1892 as construction engineer to the City of London Electric Lighting Company's large station at Bankside, which position he held till 1896, when he was appointed temporary resident engineer during the construction of the Shoreditch combined electricity and refuse destructor scheme, and was afterwards engaged as guarantee engineer for Messrs. Manlove, Alliott, and Co., Limited, Nottingham, who were contractors for the refuse destructor. In 1898 Mr. Ferguson was appointed clerk of works for the borough of Fulham combined electricity and refuse destructor works, and takes the position of chief engineer and manager when the works are handed over by the contractors.

The borough of Fulham has marked the dawn of the new century by the inauguration of a combined refuse destructor, electricity supply, and disinfector scheme, the whole presenting several novel and interesting features which will be more particularly described in the account which, through the courtesy of the consulting engineer and the contractors, we are privileged to give.

Considerable discussion has taken place from time to time at Fulham on electrical matters, but no very definite step was taken to provide an installation until May, 1895, when a committee was appointed on the motion of Mr. W. R. Sayer, a veteran member of the Vestry, to consider the desirability of obtaining electric lighting powers with the idea of erecting electricity works in conjunction with a refuse destructor. Mr. Tom Green, the leader of the Moderate party, was elected chairman of the committee, and devoted much time and attention to the duties of his position, which he held with conspicuous success till the vicissitudes of party warfare and the birth of the new Fulham Borough Council necessitated the appointment of a new chairman in the autumn of 1900. Mr. Timothy Davies was then elected to this important position, which he still holds.

In the autumn of 1895 the committee resolved to obtain expert advice on the whole subject, and Mr. F. H. Medhurst was appointed to report on the subject generally. The recommendations contained in his report were, briefly, that a combined scheme consisting of a refuse destructor, electric lighting works, and a disinfector would be a commercial success, and that an initial installation should be put down on the high-pressure alternating system to supply some 15,000 8-c.p. lamps. The Vestry therefore decided to apply for an electric lighting order, which was obtained in the summer of 1897, and soon afterwards a deputation visited various towns with the object of satisfying the Vestry as to the desirability of the proposed combined scheme. The result of these investigations was that in April, 1898, Mr. Medhurst was instructed to prepare the necessary plans and specifications for a combined scheme, to be erected on an excellent riverside site which the Vestry had with commendable foresight acquired a year or so previously.

In view of the growing demand throughout the country for electric light and power, it was considered desirable to increase the capacity of the station beyond that originally proposed, and a plant capable of supplying a total of 30,000 8-c.p. lamps connected to the mains, exclusive of spare plant, has therefore been installed. The capital outlay amounts to over £100,000, and the contracts entered into are as follows:

Buildings, comprising destructor-house, engine-room, offices, and transformer chamber; also a small building for public disinfecting purposes, F. G. Minter, Westminster	£22,970
Refuse destructor, steam-raising plant, inclined roadway, and chimney shaft, Horsfall Destructor Company	16,760
Generating plant, including steam-pipes, condensing plant, mains, etc., and apparatus for the above-mentioned disinfector building, General Electric Company, Limited, of London and Manchester	46,000

Additional contracts for the supply of coal-handling plant and meters, wellsinking, extra foundations, and engineering expenses increase the total to £108,000.

Site.

The generating station is situated on a well-adapted site in the Townmead-road, having an area of about four acres and a frontage to the Thames of 370ft., protected by a massive quay wall. The present works cover but a small portion of the site, and there is, therefore, ample space for the extensions which will no doubt be necessary at no distant date.

Buildings.

The general arrangement of the buildings will be seen in Fig. 1. Substantial construction and due provision for light and ventilation have been aimed at with considerable success. Externally they are of red brick with relieving bands of white Suffolk brick. The boiler and engine rooms stand parallel to each other and at right angles to the river, the offices standing between the end of the engine-room and the river-wall. The offices, therefore, face the river. They are of a particularly commodious nature, and comprise the following apartments on the first floor: resident engineer's office, assistant engineer's office, chief clerk's office, general office, attendants' room, a lavatory and bathroom. There is also a testing-room on the first floor of this block, and on the ground floor there are stores, a meter-testing room, workshops for light work and repairs, the water-softening and filtering room with the well-pump driving gear. Beneath this block of offices is also the pump-room; both these latter rooms being reached from the engine-room. Access may be had to the offices both from the general entrance outside and from the engine-room, destructor-house, etc. In addition, a corridor leads direct from the offices to the switchboard gallery, and a window in the assistant engineer's office affords a complete view of the engine-room. An exterior view of the main buildings taken from the office corner is shown in Fig. 2.

Destructor-House and Steam-Raising Plant.

The destructor and boiler house is a lofty building, 35ft. high to the springing of the roof, 137ft. in length, and 87ft. wide. It contains 12 destructor cells with room for an additional four cells. The present cells are arranged in two groups of six each on either side of six Babcock and Wilcox boilers, as shown in Fig. 1, and are capable of efficiently destroying 120 tons of refuse in 24 hours. Over the boiler firing floor, and extending from end to end of the building, is the tipping floor to which the carts are brought for the purpose of discharging their loads on to the tops of the groups of cells where the refuse is fed into the furnaces. The tipping floor is arranged to allow of the storage of a

Digitized by Google

considerable quantity of refuse, so that the working of the plant may be continued without interruption. Access to the tipping floor is obtained by means of an inclined roadway having a gradient of about 1 in 14, at the foot of which there is a weighbridge and house where an account will be kept of the weight of refuse brought in.

mentioned above, the refuse itself closing the openings when the operation of charging is complete, and thus obviating the necessity for doors on the tops of the furnaces. Each furnace is provided with a sloping fire-brick hearth, on which the refuse rests before being drawn forward from below on to the grate bars. The grate bars

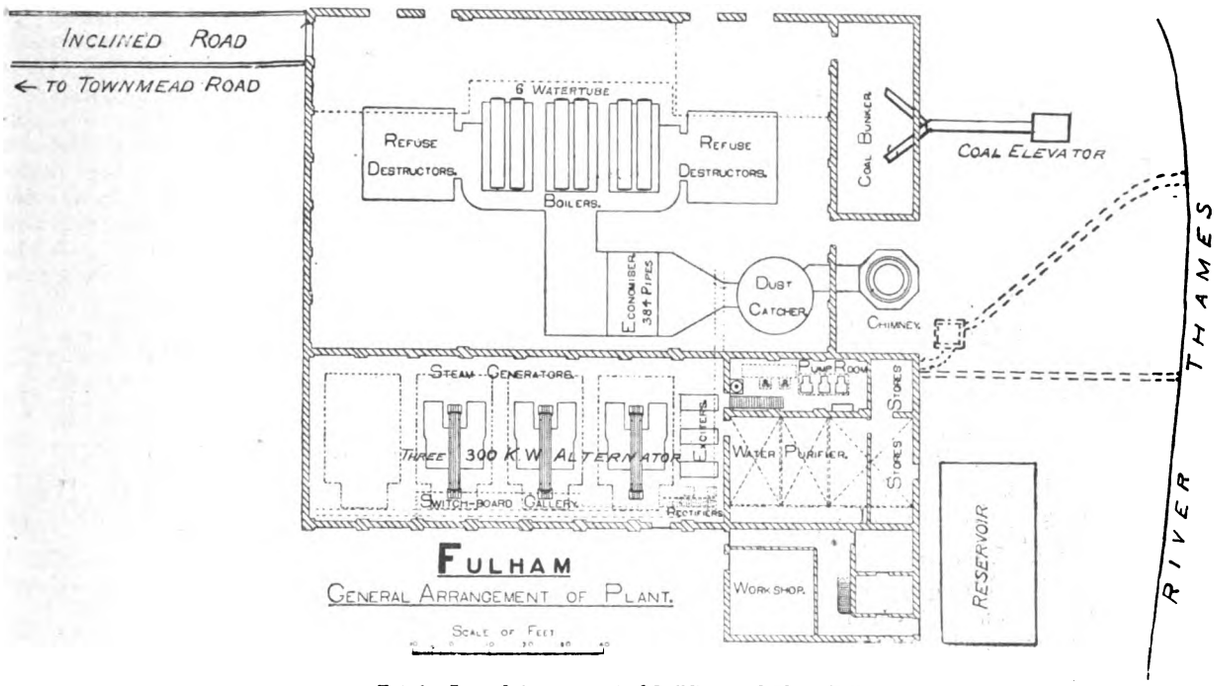

FIG. 1.—General Arrangement of Buildings and Plant, Fulham.

The destructor furnaces are of the standard Horsfall type, each having a grate area of 30 square feet. The boilers are of the Babcock and Wilcox water-tube pattern, each having a heating surface of 1,284 square feet, and each provided with Vicars mechanical stokers electrically driven by a motor, the destructor gases being led into each of the boilers by means of an opening behind the bridge, the flue to this opening being provided with a suitable damper so that the boiler may be heated at will from the destructor or be fed with coal. Provision has also been made for firing the boilers by hand in the event of interruption in the working of the mechanical stokers, and forced draught has been applied to each boiler. The refuse is fed into the destructor furnaces through charging openings on the tops of the blocks of the cells, as have fine spaces between them, and are made all in one length, so that there is no obstruction to the clinkering tools in traversing the length of the bars. The furnace crown is composed of special fire-resisting blocks, specially mixed and burned, capable of standing not only high temperatures, but rapid changes of temperature. At the sides of the furnaces, and extending about 8in. above

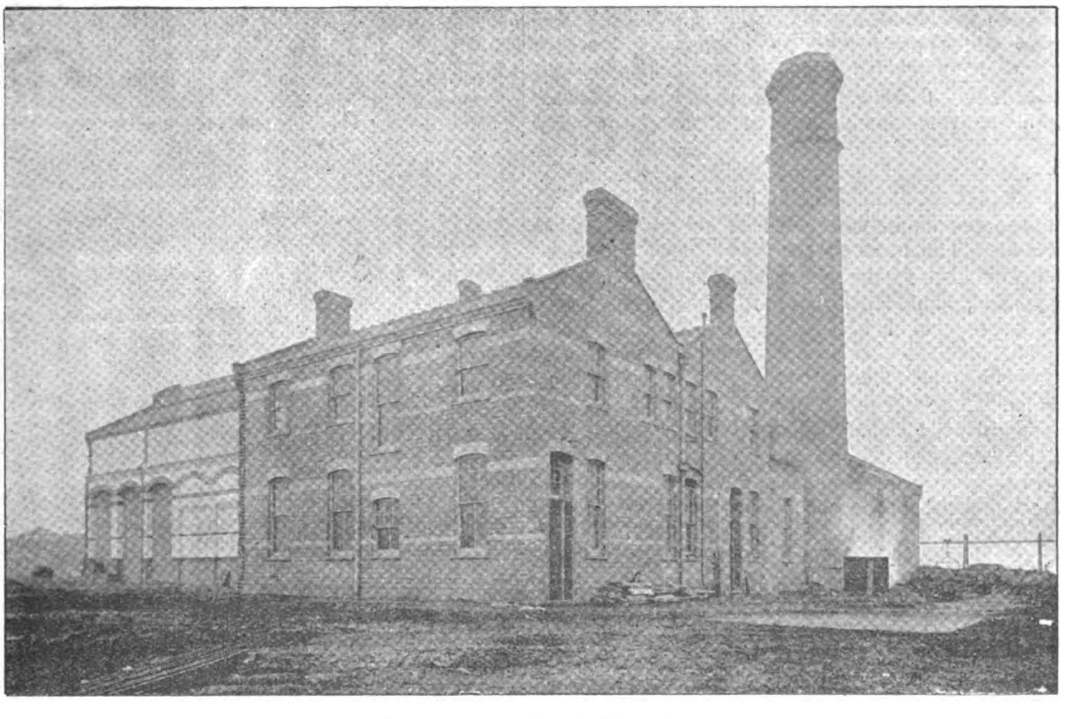

FIG. 2.—Exterior View of Main Buildings, Fulham.

the grate bars, are cast-iron side boxes, through which the whole of the air for combustion is passed. These boxes serve the double purpose of heating the air for combustion, and at the same time protecting the sides of the furnaces from the undermining action which takes place with brick sides owing to the clinker adhering thereto and causing rapid deterioration. Each of these side boxes is provided with a valve controlled from

Digitized by Google

the front of the furnaces, and openings for the delivery of the mixed air and steam forming the blast into the ashpit underneath the grate bars. The air for the blast is drawn from above the charging decks of the furnaces, through large hoods, by means of powerful steam-blasts, and thus ventilation of the upper part of the destructor-house is assisted, and any smells arising from the refuse on the decks are partially drawn off and passed into the furnaces. The steam trumpets by which the blast is promoted are of special construction, the principal feature being the adoption of the Horsfall flat steam jet apparatus, which gives the maximum of blast with the minimum of steam used. The blasts force the air into longitudinal air passages (Fig. 3) extending under the furnaces, and communicating by means of the valves above described with the side air-boxes of the furnaces. There is a single outlet for the products of combustion from each furnace placed in the crown of the arch at the front of the furnaces in such a manner as to draw off the escaping gases over the hottest part of the fire, thus cremating them before they leave the furnaces. The unburnt gases which have been given off by the refuse drying at the back of the furnace are thus subjected to a temperature of from 1,800deg. to 2,000deg. F. before passing away to the flues. The exhaust openings from the furnaces lead into flues, which in turn open into a main flue which runs the whole length of both blocks of cells and the battery of boilers between them, the flue being on ground level under the blocks of cells, but below ground level under the boilers. The furnaces are provided with massive steel buckstays and tiebolts and with cast-iron cleaning and clinker doors, the latter being lined with firebrick. The clinker doors are of the balanced type, and are so arranged as to open the whole width of the furnaces at once. Branch flues with dampers are provided from the main flue to lead the gases into the furnaces of the boilers, and also by-pass flues, by means of which the hot gases can be led past the boilers to the chimney. The dampers in the hottest parts of these latter are swivel dampers of a special design, being kept cool by means of water circulation.

The boilers are constructed for a pressure of 160lb. per square inch, and no difficulty is found in maintaining this pressure by means of the hot gases brought from the furnaces until the demand for steam becomes too heavy. The clinker is drawn from the furnaces into iron skips carried on an overhead railway, by which it is conveyed to the wharf alongside the river. Two Green's economisers, each having a heating surface of 1,920 square feet, are erected between the boilers and a dust-catcher near the chimney, a by-pass being provided to carry the gases to the dust-catcher direct when desired.

The dust-catcher is a large circular brick chamber lined with firebrick, with a domed roof of the same materials. The structure is strengthened by massive iron rings and buckstays, and is so constructed as to cause the gases to swirl round rapidly within it in such a way as to throw off the dust, which they carry along with them by centrifugal force. Cleaning doors are provided for the removal of the dust at any time without stopping the furnaces.

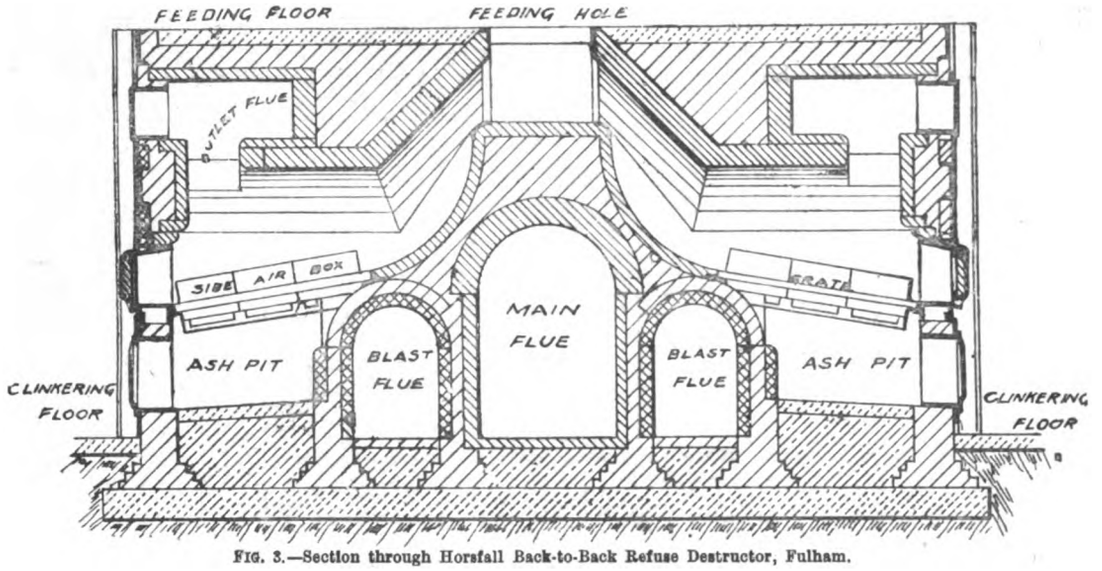

FIG. 3.—Section through Horsfall Back-to-Back Refuse Destructor, Fulham.

The chimney, which was also built by the Horsfall Destructor Company, Limited, has a height of 100ft. and an internal diameter of 8ft. It is octagonal in form, and is lined throughout with firebrick. The engineer estimates the amount of refuse that will be passed through the

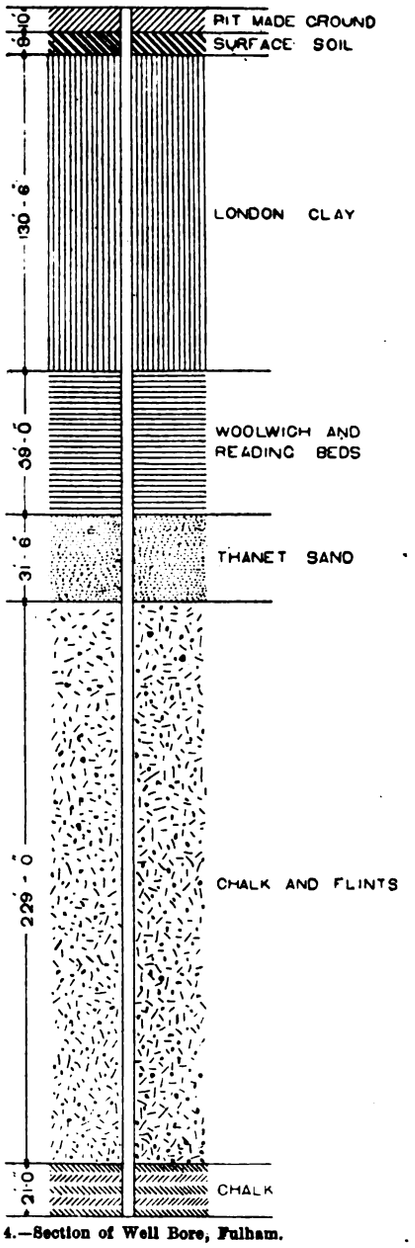

FIG. 4.—Section of Well Bore, Fulham.

Digitized by Google

destructor per annum at 40,000 tons approximately, and places its calorific value at one-twentieth that of good steam coal. The Borough Council, therefore, expects to save the cost of 2,000 tons of coal per annum.

Pipework.

The system of steam-pipes consists of a 9in. diameter ring main, with a branch to each steam alternator, and an auxiliary ring main of 3½in. diameter, which supplies the three exciter engines and feed pumps. The steam-pipes are of lap-welded steel, with mild-steel flanges, and are supported on roller bearers. Ample provision has been made for expansion by the adoption of copper bends, and the range is drained by means of six separators of Holden and Brooke's manufacture, which are connected to steam-traps discharging to the feed-water tank, the traps being fitted with three-way cocks and by-passes to allow of inspection. The main exhaust pipe is of cast iron 24in. in diameter. The exhaust steam from the exciter engines is taken by cast-iron pipes, 6in. in diameter, to a Royle's feed-water heater situated in the pump-room, to which the exhaust from the feed pumps is also led, the heater being arranged with a by-pass to allow the engines to exhaust direct to the atmosphere when required.

Careful attention has been given to the supply of water for boiler feed and condensing purposes. River water is used for the latter, but it was not considered suitable for boiler feed purposes. An artesian well, sunk to a depth of 500ft. with successful results, will supply all water required for the boilers, there being a supply from the town mains in addition as a stand-by. The well bore (a section of which is shown in Fig. 4) is uniform throughout, with a diameter of 9½in., and is lined with steel tubes to a depth of some 300ft. It was sunk by Messrs. A. C. Potter and Co., of 1, Leadenhall-street, E.C., who carried out the work under a separate contract placed with them. The pump barrel is 7½in. diameter, and is placed at a depth of 165ft. from the surface with 30ft. of suction pipe, the still-water level being 104ft. from the surface.

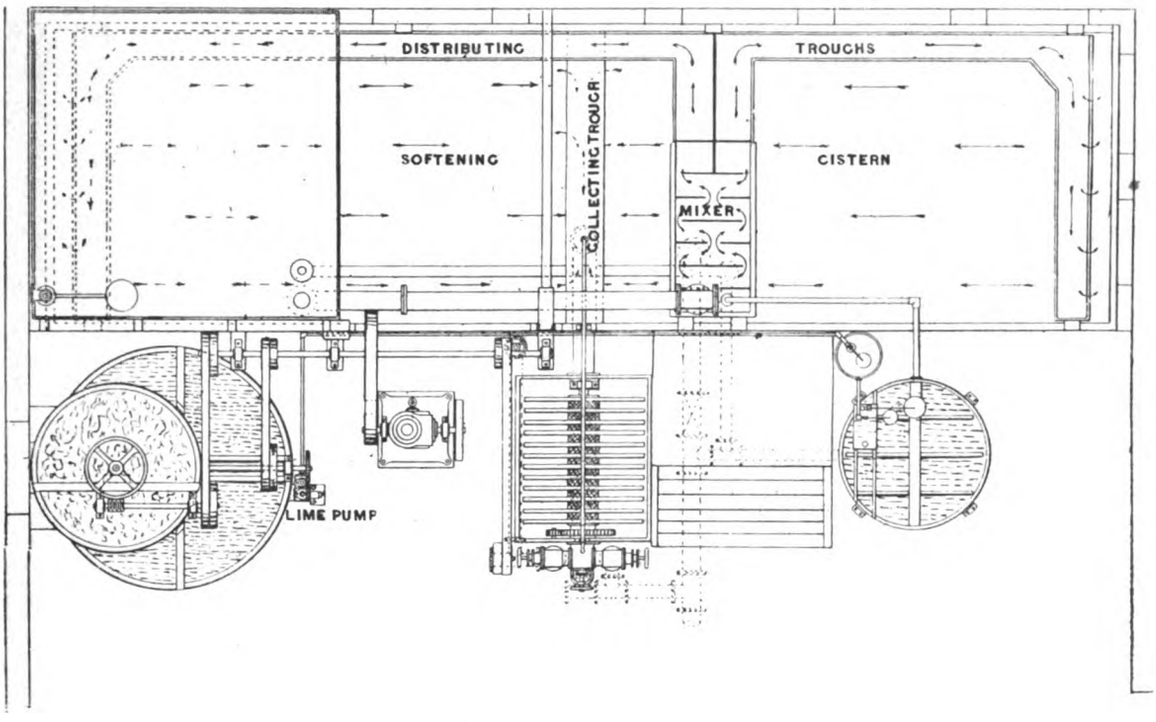

Fig. 5.—Plan of Water-Softening Plant, Fulham.

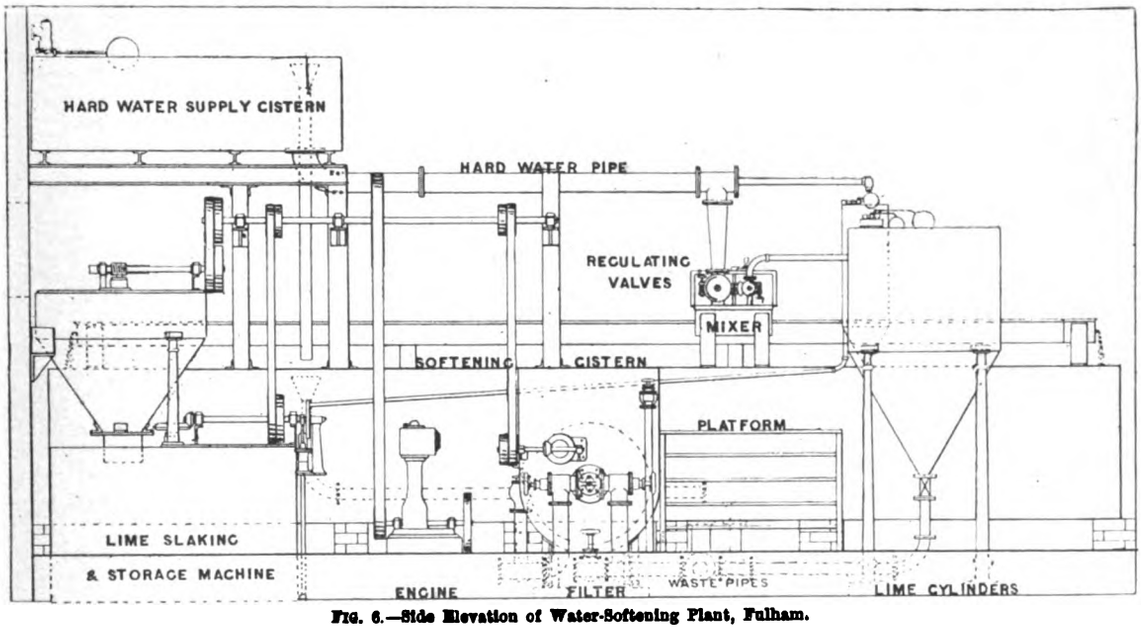

Fig. 6.—Side Elevation of Water-Softening Plant, Fulham.

The pump is driven through spur gearing by a 14-b.h.p. motor. The water, whether taken from the well or town mains, will be softened by apparatus described later, and led to an underground reservoir in connection therewith, having a capacity of 35,000 gallons, whence it flows by gravity to the feed tank in the pump-room. There is also a direct connection between the town mains and feed tank to meet emergencies. Two vertical Weir pumps are installed for boiler feed purposes, each pump being

Digitized by Google

capable of delivering 4,000 gallons an hour. A duplicate system of feed pipes has been arranged, the water passing in one case through the feed-water heater mentioned above and the two economisers in parallel, or through the economisers alone, and in the other case direct to the boilers. The feed pipes are of wrought iron, 3½in. diameter, with heavy cast flanges and copper bends to the boilers. The drain-pipe system appears to have been well thought out, but calls for no special mention. Hopkinson's valves are used throughout the steam and feed pipe systems, and the pipes and flanges are lagged with coverings of sectional magnesia.

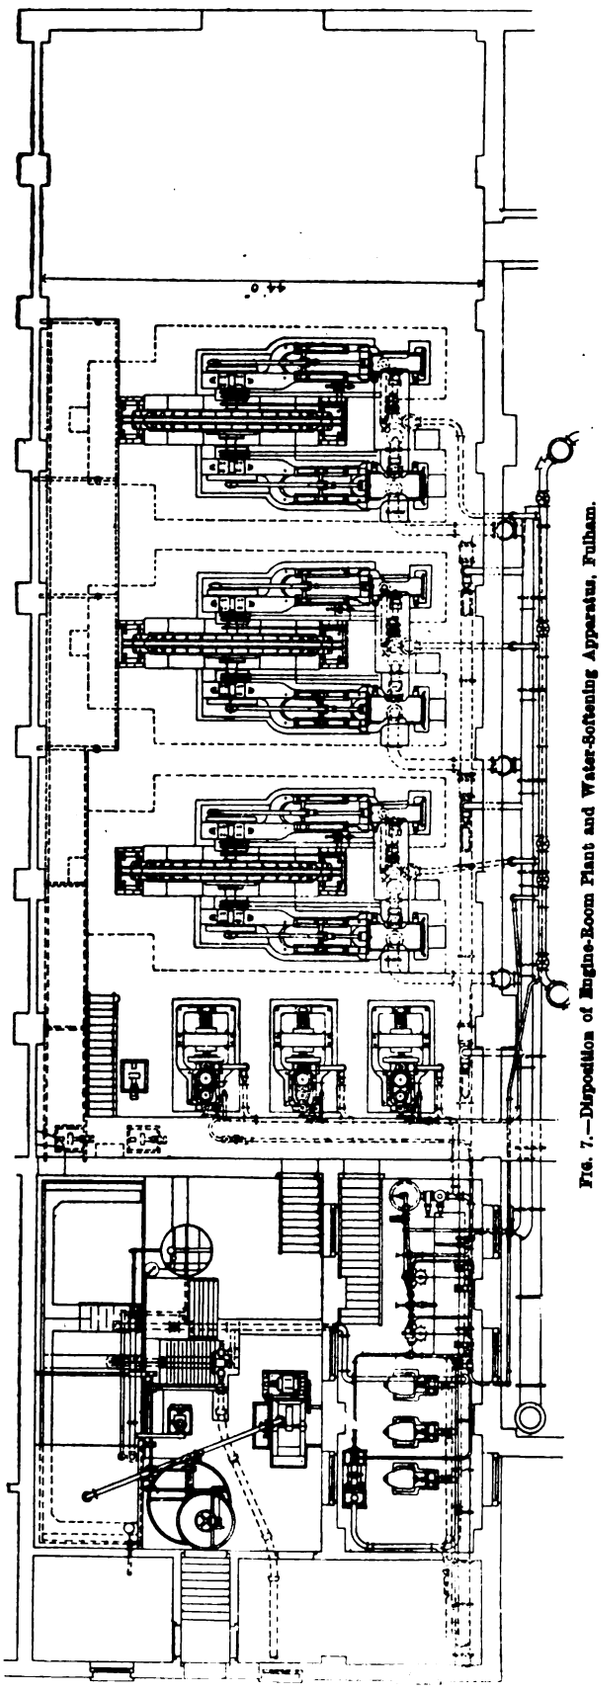

FIG. 7.—Disposition of Engine-Room Plant and Water-Softening Apparatus, Fulham.

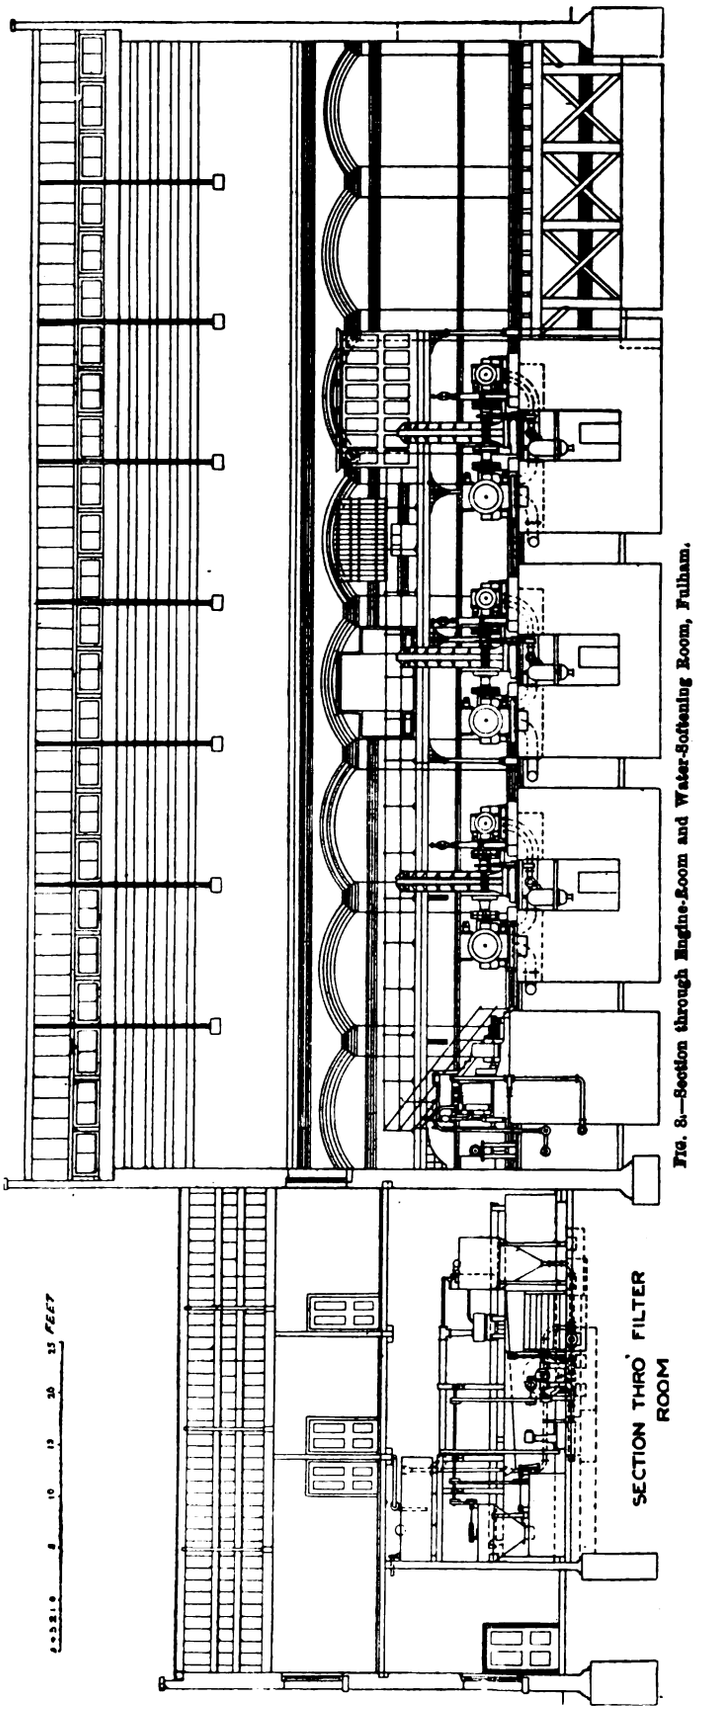

FIG. 8.—Section through Engine-Room and Water-Softening Room, Fulham.

WATER-SOFTENING PROCESS.

The water-softening plant above referred to treats the water by Clark's process carried out on the "Atkins" system, named after the inventor, Mr. W. G. Atkins, whereby a certain quantity of caustic lime is added to the water, mixed with it, run into large tanks, where the chalk is precipitated, and finally filtered. The plant is capable of dealing with 8,000 to 10,000 gallons of water per hour. A plan and elevation of its arrangement are shown respectively in Figs. 5 and 6. The guarantee requires that any intelligent workman can operate the plant, and that water with 15 or less degrees of hardness must be softened so

Digitized by Google

that the hardness is reduced to less than one-half grain of carbonate of lime per gallon if required. The plant consists of the following parts: (1) a lime slaking, straining, and storing machine; (2) a cylinder in which lime-water is formed, and therefore termed the lime-water cylinder; (3) a "mixer," being a shallow trough fitted with baffle plates; (4) a cistern in which the actual softening takes place; (5) a filter. The method of working is as follows: The lime is delivered direct into a hopper, which forms part of the lime-slaking machine. The machine is set in motion, and in a few hours sufficient lime to last three weeks is automatically reduced to the form of "cream of lime," and stored in a mill under the hopper. This mill is fitted with stirring arms and a self-cleaning strainer. About once a day the "cream of lime" is stirred, and a certain quantity pumped into the lime-water cylinder. A jet of water is admitted at the bottom of this cylinder, and passes out at the top as a saturated solution of lime-water. It is then conducted to the "mixer," where it is joined by the hard water. There are two specially constructed regulating valves by which any desired quantity of hard water and the correct proportion of lime-water can be adjusted, and both supplies can be turned on or off without interfering with the other. Whilst flowing through the mixer, the lime-water and hard water mix automatically in a few seconds, and the water is delivered into the softening cistern, which is always full, and where water is always flowing through. It is during this period that the actual softening takes place, which may be described thus: Chalk is dissolved in water by carbonic acid gas; this is termed bicarbonate of lime. When caustic or quicklime is added to such water, the gas

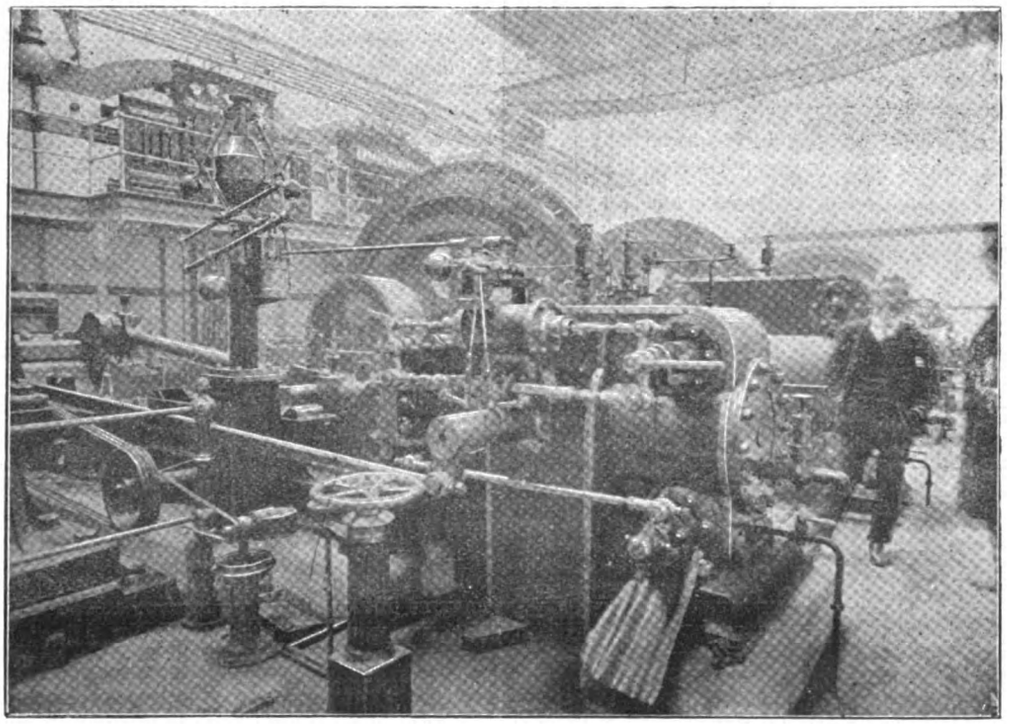

FIG. 9.—General View of Engine-Room, showing High-Pressure Cylinder and Valve Gear of Musgrave Engine in Foreground, Fulham.

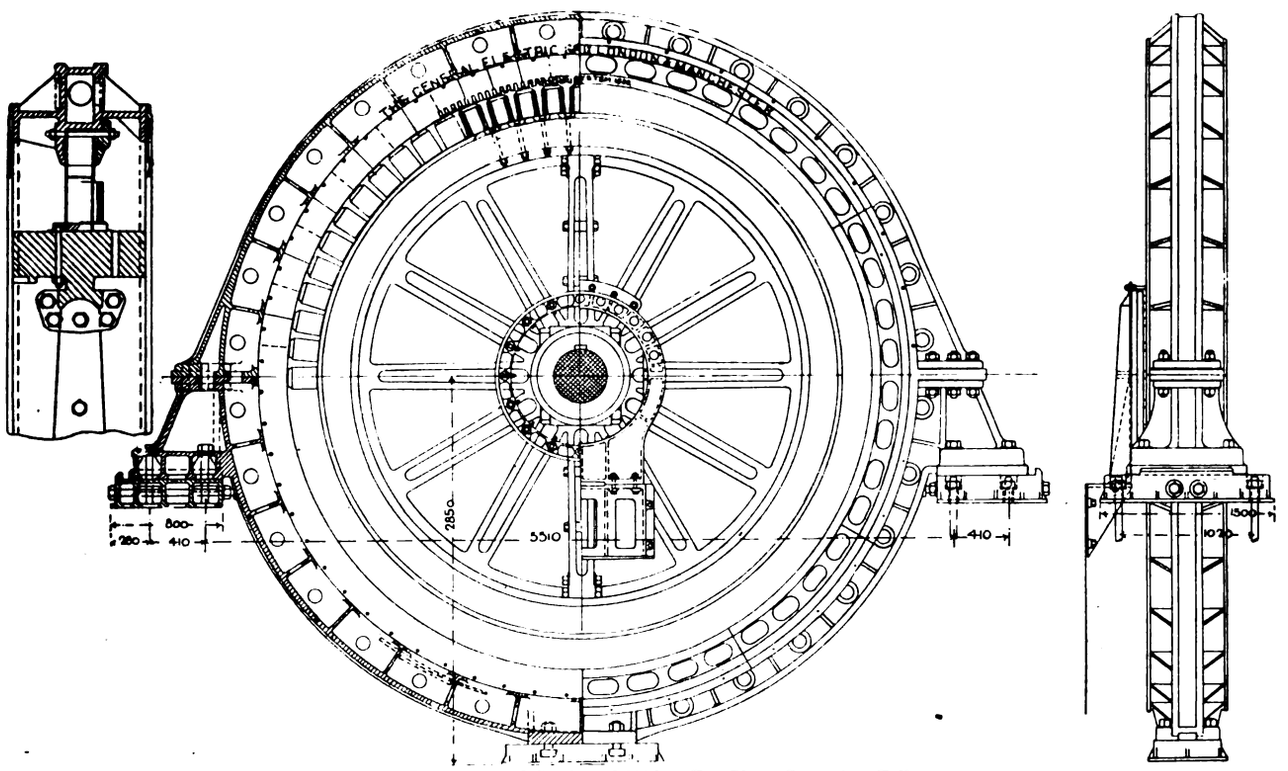

FIG. 10.—Elevations and Section of 800-kw. Two-Phase Generator, Fulham.

Digitized by Google

releases the chalk, which, together with the lime, is precipitated. It should be carefully noted—for it is a point on which misapprehension exists—that so long as the chalk is in solution it hardens the water, but as soon as it is precipitated, or in suspension, it has no hardening effect. The water is now soft, but excessively turbid owing to the deposit. This may be allowed to subside, or be removed by filtration much more quickly. The important point is that the softening or precipitation of the chalk is a strictly chemical action, whereas the removal of the precipitate, whether by subsidence or filtration, is entirely mechanical, and has no power whatever to soften the water. The filter consists of a series of hollow discs covered with cotton filter cloth. The discs are secured to a hollow centre tube, and the tube and discs mounted in a cistern. The water is admitted to the cistern, filters through the cloth, leaving the deposit on the outside, passes inside the hollow discs to the centre tube, and is delivered outside the cistern. When cleaning is necessary—usually once a day—the discs and tube are revolved by means of gearing provided for this purpose, jets of water play on the discs, and the deposit which has been arrested is washed off in a few minutes, passes down a waste-pipe, and filtering can be resumed. The advantages claimed by this system of filtering are that the filtering medium is cheap, it is arranged vertically, and takes up little room, and is readily cleaned by mechanical means.

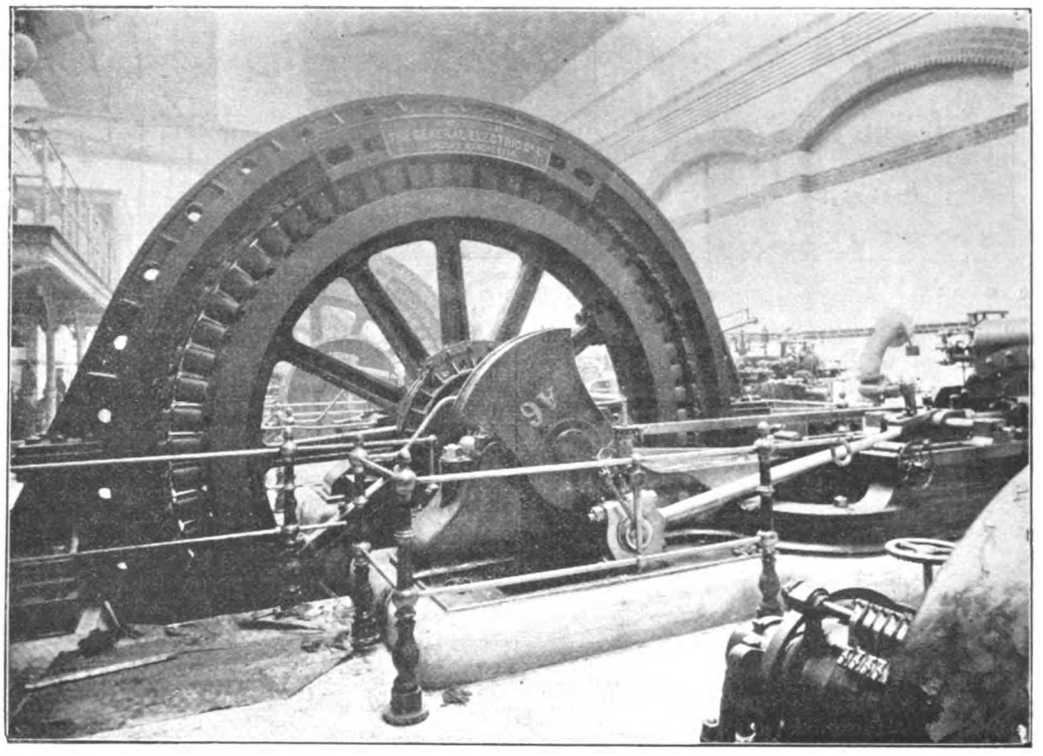

FIG. 11.—View of 300-kw. Two-Phase Generator, Fulham.

ENGINE-ROOM PLANT.

The engine-room, which is 110ft. long, 42ft. wide, and 30ft. in height to the springing of the roof, is well adapted for the machinery it contains. The walls are entirely faced with white glazed bricks, relieved by bands and string-courses of salt glazed bricks. The floor is paved with mosaic work, with hand-laid borders. A special feature of the room is the absence of all pipework, which is arranged under the floor level. The general arrangement of the engine-room plant is shown in Figs. 7 and 8. A gallery runs round two sides of the room, and carries the main switchboards and a switchboard attendant's office. Space is left at one end of the room for an extension engine and dynamo. Two entrances to the destructor-house are provided from the engine-room, one from the gallery and one from the floor, and these are carefully protected by double doors and glazed screens with the object of keeping out dust. The steam alternators are three in number, each set containing a two-phase generator of the flywheel type, coupled direct to a horizontal compound condensing engine. The engines are of the slow-speed Corliss type, made by Messrs. J. Musgrave and Sons, Limited, of Bolton, and each is capable of giving 450 b.h.p. when supplied with steam at a pressure of 130lb. per square inch at the engine stop valve and a vacuum of 24in. of mercury in the exhaust pipe. The governor is capable of controlling the speed of the engine within 3 per cent. from no load to full load, and is provided with means of adjustment to vary the speed 5 per cent. about the mean speed whilst running. There is a continuous and automatic system of lubrication, with the requisite draining arrangements for waste oil fitted to all working parts. The pistons are fitted with Buckley's patent packings. The cylinders are non-jacketed. The high-pressure cylinders are 17in. diameter and the low-pressure cylinders are 33in., and have a stroke of 3ft. 6in. The high-pressure cylinders are fitted with Corliss valves and Musgrave's patent automatic cut-off motion, connected direct to the governor (see Fig. 9), thereby dispensing with an equilibrium throttle valve, and giving greater regularity in the speed of the engine. The low-pressure cylinders also have Corliss valves. The cylinders are lagged with planished steel and fitted with Crompton's patent metallic packings.

The three two-phase generators were constructed by the General Electric Company, Limited, at their Manchester works. Each generator is capable of giving a normal output of 300 kw., each of the two sets of coils being capable of giving 150 kw. at all E.M.F.'s from 2,800 to 3,000 volts at the terminals of the machines. The machines will also give an overload of 330 kw. continuously for two hours. The speed is 93·7 revolutions per minute, and the frequency 50 cycles per second. Two elevations and a section of one of these 300-kw. generators are given in Fig. 10. The energy stored in the flywheel when running at its normal speed is 1,800,000 foot-pounds. The field-magnet poles with their windings are fixed on the periphery of the flywheel. The poles are laminated, riveted together, and fixed to the flywheel rim by means of steel wedges, the latter being securely fastened to the flywheel by strong bolts passing through its rim. There are 64 laminated poles on each flywheel, wound with round copper wire, the exciting current being brought to them through two slip rings. The diameter over the poles is about 14ft. The necessary current for exciting the field coils is obtained from the continuous-current dynamos driven by high-speed engines mentioned below. On the inner circumference of the stationary armature are spaced 256 slots which carry the copper windings. These

Digitized by Google

windings are arranged to form two circuits, one for each phase. The windings of the one circuit have straight ends, whilst those for the other circuit have bent ends, as is the usual practice. The insulation between the coils and the iron frame is efficiently effected by mica tubes, the coils being fastened securely in the slots by means of strong fibre wedges. The general appearance of one of the 300-kw. generators is seen in Fig. 11. The four ends of the two series of windings are brought out to terminals, from which the current is carried to the switchboard for distribution to the various circuits.

There are three continuous-current dynamos (Fig. 12), which were also made by the General Electric Company, Limited, for exciting and other purposes. Each is capable of giving an output of 600 amperes at 100 to 110 volts at a speed of 460 revolutions per minute, and each is direct coupled on one bedplate to a high-speed enclosed type compound engine of Messrs. Musgrave's make. They supply not only the necessary current for exciting the field-magnet circuits of the three large generators, but also the various electric motors which are used for driving the condensing plant, economisers, and stokers. They also supply the necessary power for lighting the buildings

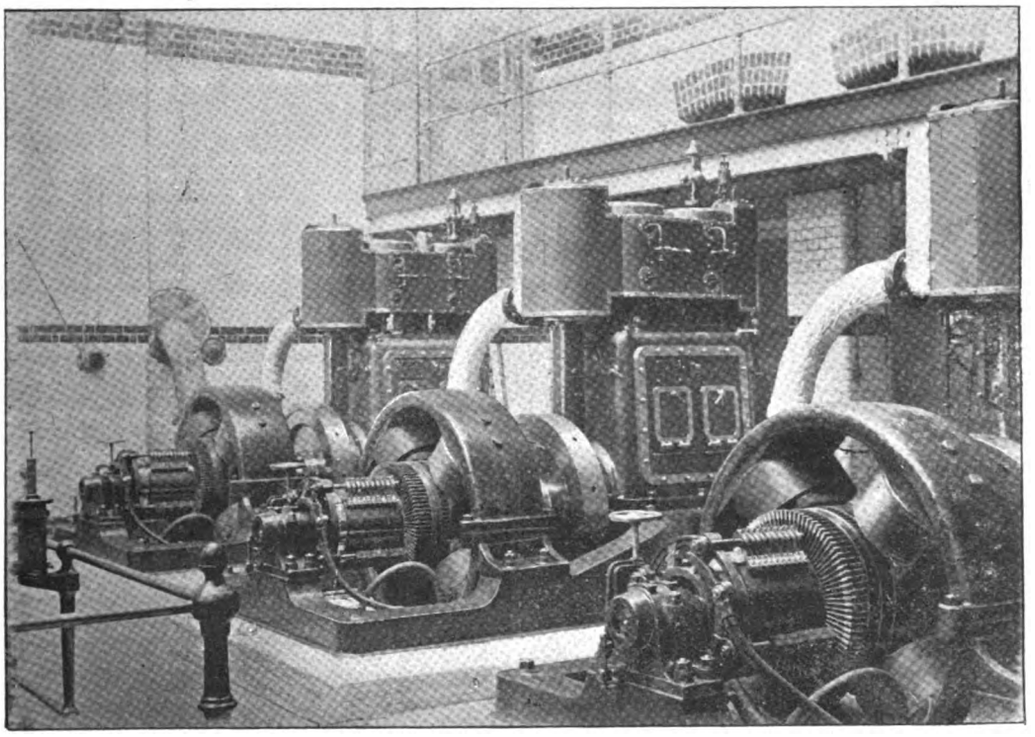

Fig. 12.—Continuous-Current Plant, Fulham.

and inclined roadway by arc and incandescent lamps. Either of the three dynamos are, of course, far more than capable of supplying the current required for the three generators. The dynamos are shunt-wound, having four poles with cast-steel yokes, whilst the armatures are of the slotted type with former-wound coils placed in the slots. The commutator is built up of hard-drawn copper, fitted with carbon brushes, and conforms to the usual specification as to temperature and fixed position of brushes. Three of Ferranti's latest-type rectifiers are placed in one corner of the room, with provision for a fourth, for supplying the public lighting circuits. The switchboard in connection with these is fixed on the wall beside the rectifiers; it is arranged for three circuits, any one of which can be fed from any one of the rectifiers. A 15-ton overhead crane traverses the room from end to end.

Condensing Plant.

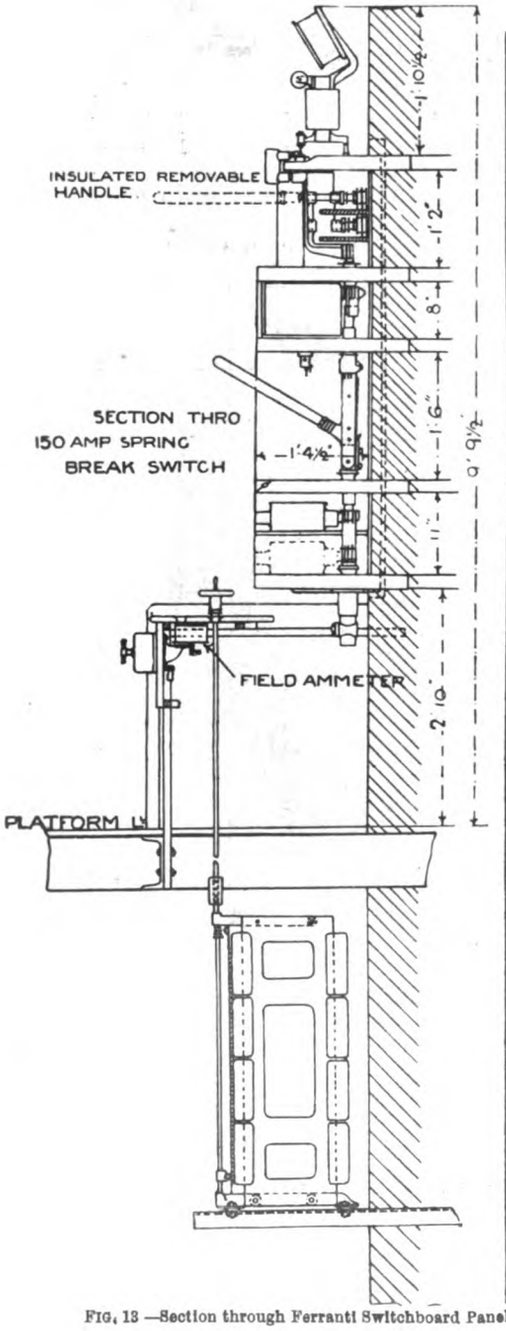
The three steam alternators are fitted with Korting ejector condensers, placed partly above the engine-room floor-level and partly in the pipe trench. A branch is run from each condenser to the main exhaust pipe, in which is fixed a Blake and Knowles automatic exhaust valve to enable the steam to reach the atmosphere in case of any failure of the condensing plant. Each condenser is required to give a vacuum of 24in. of mercury when dealing with 10,000lb. of steam per hour. The condensers are supplied with water from a large tank placed on the roof of the pump-room, kept filled by three motor-driven centrifugal pumps of 18 b.h.p. each, running at 1,200 revolutions per minute, the motors being the General Electric Company, Limited, standard make. These pumps are placed in the pump-room, and are each capable of delivering 33,000 gallons of water per hour through a total lift of 48ft. at low tide. The supply pipe to the condensers is 14in. in diameter, and is carried on brackets fixed to the wall of the destructor house, with 9in. diameter branches to each condenser. The water returns to the river through cast-iron pipes discharging over a concrete apron on the foreshore. The condensing water is drawn from a closed sump made of piles on the foreshore, but as water could not be obtained from this sump at all states of the tide a line of 24in. cast-iron pipes was run out into the river for a distance of 170ft. These pipes have spherical joints to allow of some slight play, and terminate in a cast-iron sump, which is always submerged. In order to clean the second sump and line of pipes of the river mud which is expected to collect in it, arrangements have been made for discharging the contents of the overhead tank already referred to into the pipes when required. It is anticipated that the powerful flush that will thus be obtained will have the desired effect.

Main Switchboards.

The switchboard for controlling the distributing circuits and alternators is fixed on a gallery 10ft. above the floor level, so as to enable the engineer-in-charge to have a full view of the machinery in operation below. The board, which is of the Ferranti type, is divided into 15 panels, six of which are allotted to the generators, six to the feeders, two for the rectifiers, and one for a testing circuit. Each generator panel contains one ampere-meter, one main switch for connecting and disconnecting the machine to the 'bus bars and the necessary safety fuses. The circuit panels are fitted in a similar manner, and the whole are of enamelled slate. The usual synchronising voltmeters, transformer, etc., are provided, and also a plug board, so that any section of the 'bus bars and corresponding panel or cable connections can be connected up to a testing circuit leading to the testing-room. Plugs are used for isolating the various sections. In the office on the switchboard gallery are a recording voltmeter for continuously recording the pressure across the 'bus bars, and six recording wattmeters placed in the earthed connecting cables to the

Digitized by Google

alternators, so that the outputs of both phases of the alternators may be continuously recorded. A pilot voltmeter on the main board also indicates the pressure on the network at all times. A section through one of the Ferranti switchboard panels is shown in Fig. 13. The low-pressure board, also on the gallery, is provided with the usual instruments, switches, and shunt regulators for the three 60-kw. dynamos above mentioned, and also switches and fuses for controlling the various motors in the building and the lighting of the station. All the principal connections between the switchboards and machines are run beneath the floor level and made with rubber-insulated pressure is reduced from 2,800 volts to 200 volts by static transformers, two-wire distributors radiating from the sub-stations, the two phases being run—the one down one side of the streets, the second down the other side. The two phases will, therefore, be available everywhere where energy is required for motors. In addition to the above, two circuits of single cable run through the principal streets for public arc lighting, which is described later on. Spare ducts have been provided liberally for future extensions. Fig. 14 will give a good idea of the extent of the distributing network of mains, besides showing the relative position of the generating station thereto.



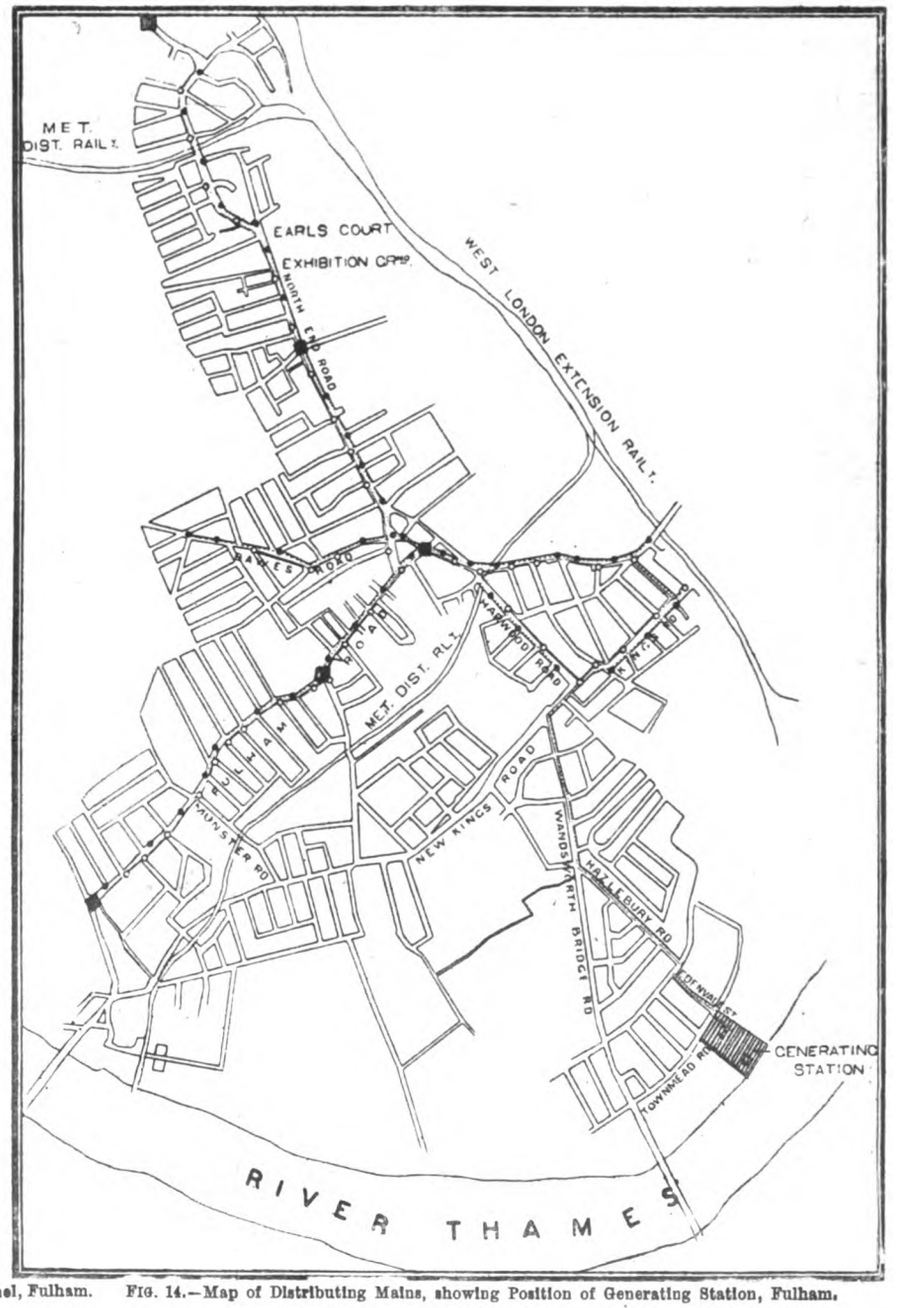


FIG. 13.—Section through Ferranti Switchboard Panel, Fulham. FIG. 14.—Map of Distributing Mains, showing Position of Generating Station, Fulham.

and, in the case of the high-pressure cables, lead-covered cables.

MAINS.

The cables for public and private lighting purposes were supplied by the British Insulated Wire Company, Limited, and are concentric, lead covered, yarned outside, and compounded. They are drawn into Doulton conduits under the footpaths, and into cast-iron pipes where under roadways. At road crossings, however, wrought-iron pipes embedded in concrete have been used, special reducing pieces of Doulton ware being employed for gradually changing the shape of the ducts from the square form of the Doulton conduit to the round form of the iron pipes. High-pressure feeders for both phases run from the generating station to the sub-stations where the

SUB-STATIONS.

There are at present five sub-stations, each of which contains two 50-kw. transformers, one for each phase. The high-pressure windings of these transformers are connected up to the feeders through quick-break fly-off switches and fuses, while the low-pressure sides are connected up to the distributors through removable spring contact fuses. The switching arrangements, as well as the transformers, are placed in watertight cases, all ironwork is earthed, and a Cardew earthing device fitted to each transformer. Due provision has been made for ventilating the sub-stations, which are lighted with incandescent lamps supplied off the low-pressure bars in the switchboxes. The chambers are all lined throughout with white glazed bricks. With the exception of the refuse destructors and Babcock-Wilcox

Digitized by Google

boilers (which were supplied under the Horsfall Company's contract), the General Electric Company, Limited, as contractors, have been responsible for the whole of the machinery and plant so far described.

Public Lighting.

The public lighting consists of 86 arc lamps carried on posts of ornamental design, bearing the borough arms, and run in two circuits of about half the number on each. The lamps are 12-ampere, 32-hour, double-carbon lamps of the General Electric Company, Limited, standard type, fixed about 25ft. from the ground. Brackets are also provided on each post for two 32-c.p. incandescent lamps, which are automatically switched on when the arc lamps are switched off or fail. The well-known Edmunds's switch is employed for this purpose, and is fixed in the base of each lamp-post. This switch, it may be mentioned, has recently been redesigned and improved. The lamps are supplied with current through the rectifiers at the generating station, and the two circuits have been so arranged that in the event of one circuit failing the street-lighting would only be reduced by one-half, and no district would be placed in darkness. On the map of the distributing mains (Fig. 14) the positions of the arc lamps on the two circuits are distinguished by white and black circles, while black squares mark the positions of the sub-stations.

Private Lighting.

Private consumers will be supplied at a pressure of 200 volts, while for motors both a single-phase and a two-phase supply will be at hand. The charge for lighting purposes is 5d. a unit, and for motive power 2½d. a unit during the hours of daylight. No meter rent will be charged. No free-wiring contract has been entered into, but it is satisfactory to note that the number of applications for energy already amount to an equivalent of some 10,000 8-c.p. lamps.

Station Lighting.

With the exception of the offices, the cables are carried in watertight "Simplex" steel conduits. There are six distribution boards, to which the current is transmitted from the works' lighting board, which is placed under the switchboard gallery in the engine-room. The inclined roadway and destructor house are lighted by eight 12-ampere arc lamps, four similar lamps being suspended from swivelling brackets of handsome design, two on either side of the engine-room. There is also a large number of incandescent lamps, and wall plugs have been provided at all points where hand-lamps will be required for inspecting and cleaning purposes.

Coal-Handling Plant.

Coal will be brought to the station by water, and will be raised from the lighters alongside the quay by a steam crane fitted with a Hone's patent grab. It will then be dropped into an Ingrey weighing machine, which automatically weighs, records, and discharges the loads, and adds up the successive quantities passing through the machine. After being discharged from the shoot of the weighing machine, the coal is conveyed to the top of the bunker by an electrically-driven elevator (a section of which is shown in Fig. 15), whence it is deposited in different parts of the bunker through shoots.

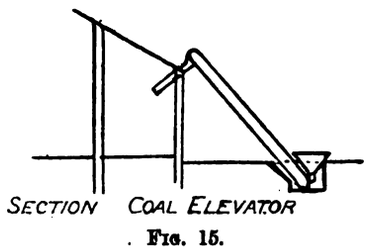

Fig. 15.

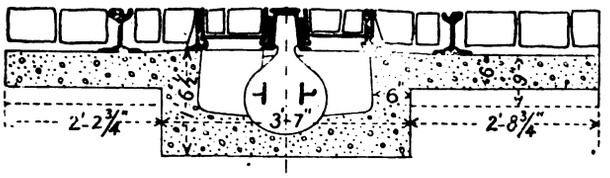
Opening Ceremony.

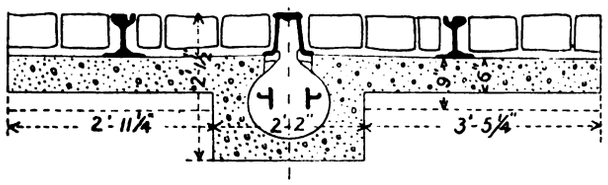
The formal ceremony of switching on the electric light in Fulham was performed by the Mayoress (Mrs. Cornwall) yesterday afternoon, when a large number of guests were present by invitation. Throughout the proceedings were eminently successful, and, we trust, will mark the inauguration of a successful undertaking.

LONDON COUNTY COUNCIL CONDUIT TRAMWAYS.

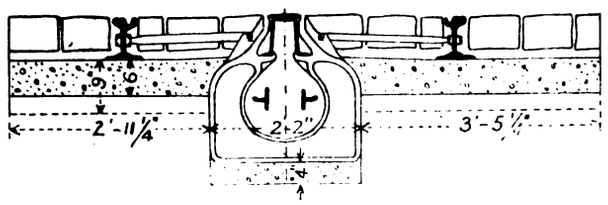
In further reference to the inspection last week of the short length of conduit line such as the London County Council propose to adopt for their tramways, we are now able to give sections of this conduit, and have thought it well at the same time to reproduce some typical sections of other conduits which have been constructed elsewhere. This will enable our readers to compare the details between the various systems, and to see in what respect the conduit of the London County Council will differ from these other conduits which have been worked with more or less success up to the present time. In Figs. 1, 2, and 3 we give typical



SECTION THROUGH INSULATOR PIT



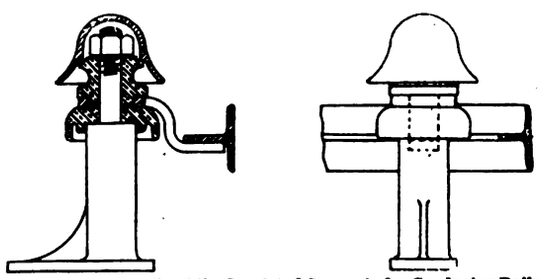
SECTION THROUGH TUBE



SECTION THROUGH YOKE

Figs. 1, 2, and 3.—Sections of the L.C.C. Conduit.

sections through the track and conduit as proposed to be laid by the London County Council under the advice of Dr. A. B. W. Kennedy. In Fig. 1 it will be noticed that the insulators are not shown in the insulator pit. These insulators could be seen in the photograph reproduced in our last issue. Figs. 4 and 5 give the details of their construction. The foot of the cast-iron pillar which supports

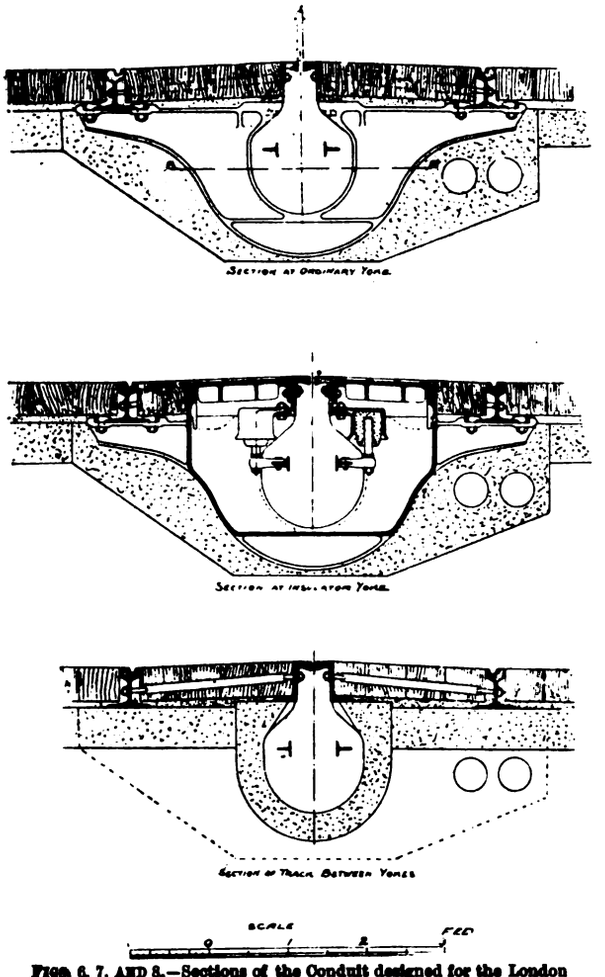


Figs. 4 and 5.—Details of the Insulated Supports for Conductor Rails.

the insulators carrying the gunmetal strap for the conducting rails is embedded in the concrete midway between two yokes. The position is such that if one looks down a conduit there will be no part of the insulators projecting into the fairway. Coming now to other types of conduits, we give in Figs. 6, 7, and 8 the sections of the conduits got out by Mr. Clifton Robinson for the London United Tramways Company. It will be seen that in these the insulators are supported from above much in the same way as is done in the American systems illustrated below. The yoke pieces, however, are made to carry the running rails, which can be securely fixed to the same in the method shown. Fig. 9 is a type of conduit used on the Third Avenue Railway in New York. This

Digitized by Google

conduit was constructed in 1898, and in it the insulators supporting the conducting rails are attached to insulators which are bolted on to the sides of the conduit rails. Fig. 10 shows a conduit as first constructed for the Lennox-avenue Tramway in New York, in which the insulators were supported from below. The vertical



FIGS. 6, 7, AND 8.—Sections of the Conduit designed for the London United Tramway Company.

supports 8in. in diameter, which are seen in the illustration, were made of soapstone, but these were found not to give satisfaction. They were placed in chambers at the side of the conduit much in the same way as are the insulators in the London County Council system, and the dirt collecting in the bottom of the conduit was found to be forced up round these insulators when cleaning out the conduit, with the result that the insulation gave way. As a result this method of insulation was abandoned, and the method shown in Fig. 11 adopted. Here again, it will be seen, the insulators which support the running rails from above are secured to the conduit rails. In order to remove an insulator, a special key was required to loose the connection between the live conductors and the metal support carried by the insulator. This was not such an easy operation as is the removal or renewal of the insulating supports on the London County Council's system. It will be noticed that here again the running rails are supported on the yoke pieces, which are so formed as to give a strong backing to prevent the rails being forced inwards due to any expansion of the pavement. Fig. 12 illustrates the shape of the yoke pieces on the Paris tramways, while Fig. 13 is the latest type of yoke as employed by the Westinghouse Company. A critical comparison between these various types and the design which the London County Council propose to adopt, will show that the latter is the only example in which the running rails

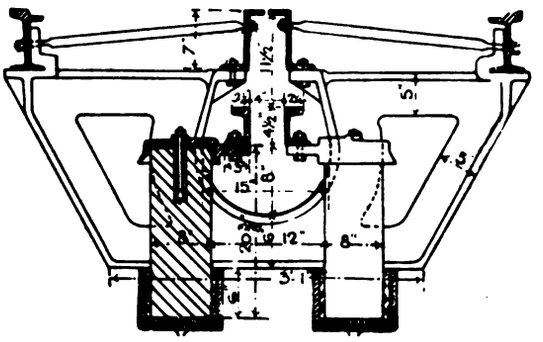


FIG. 10.—The First Lennox Avenue Conduit with Insulators Supported from the Bottom.

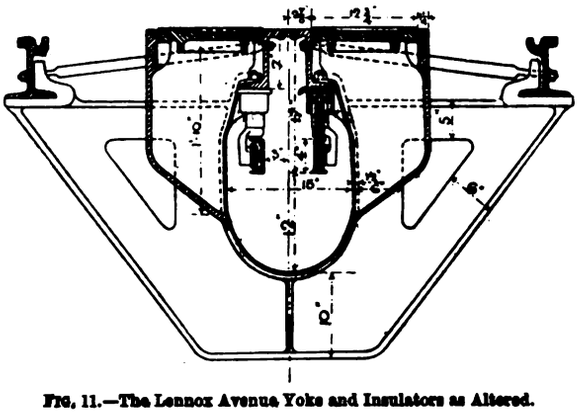

FIG. 11.—The Lennox Avenue Yoke and Insulators as Altered.

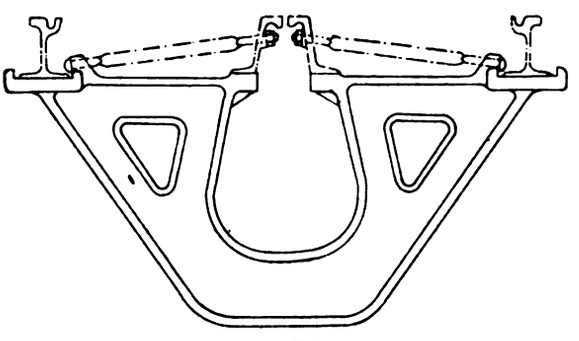

FIG. 12.—View of Yoke used in Paris.

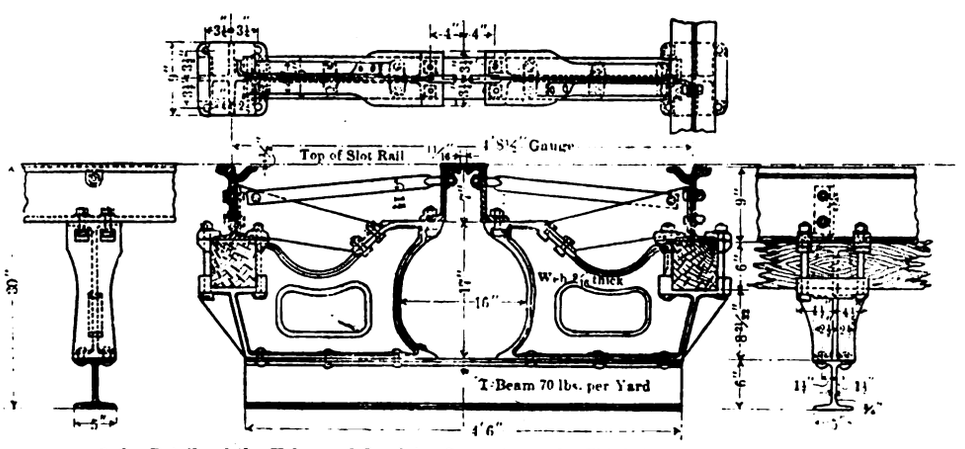

G. 9.—Details of the Yokes and Insulator Supports on the Third Avenue Railway, New York.

Digitized by Google

are not carried on the yokes forming the conduit. These rails are tied to the yokes by tiebars, which will prevent the rails from spreading, but which will be of little or no service against compressive forces tending to close the gauge and the conduit slot. The running rails will have a certain hold on the concrete bed, which will enable them to relieve the yokes of a certain amount of such forces, which are caused by the expansion of the pavements. When wood blocks are used for the pavement the forces exerted are very great, and it seems to us that it would be advisable to so form the concrete bed under the track that it can take part of the strains so caused. This could be done by filling in the angle between the 8in. bed of concrete under the rails and the concrete of the conduit.

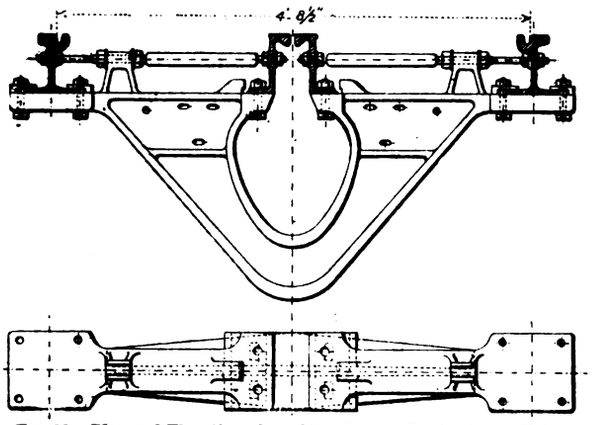

FIG. 12.—Plan and Elevation of the New Type of Westinghouse Yoke.

Another point on which the London County Council design seems to be open to question is that of the clear space between the bottom of the conduit and the two conductor rails. This scales from the sections supplied to us at 4in., whereas the clearance in the other types of conduit is over 6in. in every case. It is clear that these conductor rails could be raised slightly in the first-mentioned duct, and this would give more safeguard against failure of insulation when dirt accumulates in the duct, or when it is being cleaned out. It would, however, be better to take a greater depth from the roadway rather than to prejudice the success of the undertaking.

LIVERPOOL ELECTRICITY ACCOUNTS.

The accounts of the Liverpool Corporation electric supply department, just to hand, show a total expenditure to date on capital account of £1,048,558. Abstracts of the revenue account and balance sheet are given herewith.

REVENUE ACCOUNT.

Expenditure.

Dr.				£ s. d.
Generation of Electricity.				
Coal (including cost of unloading, etc.)	£28	943	19 7	
Oil, waste, water, and stores		3,172	11 0	
Wages at generating stations		7,930	17 8	
Repairs and maintenance: buildings, £311. 5s. 6d.; machinery, etc., £2,405. 18s. 8d.		2,717	4 2	
				42,764 12 5
Distribution of Electricity.				
Wages		1,242	0 8	
Repairs and maintenance of mains		829	9 8	
Repairs and maintenance of meters		538	2 0	
Repairs of machinery at distributing stations		619	0 6	
				3,228 12 10
Rents, Rates, and Taxes.				
Rents		1,817	12 11	
Rates and taxes on buildings, etc.		4,865	6 5	
Rates and taxes on property		23	14 10	
				6,706 14 2
Special Charges.				
Insurances		381	9 9	
Expenses for certification of meters		221	10 0	
Proportion of cost of management of Liverpool Corporation stock		188	1 4	
Stamp duty on ditto		149	6 7	
Repairs and maintenance of property		88	14 9	
Auditor's fees		26	5 0	
				1,055 7 5
Management Expenses.				
Salaries—engineer's department		5,621	9 2	
Contribution to the City fund		2,000	0 0	
Stationery, printing, and advertising		423	2 2	
General establishment charges		491	13 11	
				8,536 5 3
Amount written off for bad debts				43 19 11
Balance carried to net revenue account				47,478 9 8
				£109,814 1 8

Cr.	Income.	£ s. d.
Sales of energy for lighting and power		72,055 13 3
Ditto public street lighting		1,764 3 8
Ditto electric tramways		30,596 17 6
Rental of meters		2,029 6 4
Rents of property		822 11 5
Manufacturing account — sales and repairs, £23,219. 17s. 1d.; less wages and material, £20,674. 7s. 7d.		2,545 9 6
		£109,814 1 8

BALANCE SHEET.

Dr.	Liabilities.	£ s. d.
Loans as per capital account		817,818 15 10
Sundry creditors		51,106 19 3
Surplus and sinking fund		82,499 2 2
Cancelled debt account		18,500 0 0
Bank balance due to the Bank of Liverpool		159,521 13 4
		£1,129,446 10 7

Cr.	Assets.	£ s. d.
Land, building, plant, etc.—amount expended		1,048,558 14 1
Stocks on hand		3,133 6 9
Sundry debtors		41,868 6 0
Investment of sinking fund		35,886 3 9
		£1,129,446 10 7

FORTHCOMING EVENTS.

FRIDAY, FEB. 22.

Institution of Mechanical Engineers.—At 8 p.m., extra meeting. Adjourned discussion on "Light Lathes and Screw Machines," by Mr. John Ashford.

SATURDAY, FEB. 23.

Institution of Electrical Engineers.—Students' visit to the Bankside works of the City of London Electric Lighting Company, Limited.

Royal Institution.—At 3 p.m., Lord Rayleigh on "Sound and Vibrations" (Lecture I.).

Institution of Junior Engineers.—At 2.30 p.m., students' visit to the Willesden station of the Metropolitan Electric Supply Company.

Glasgow and West of Scotland Scientific Society.—At 7.30 p.m., ordinary meeting. Paper on "Mond Gas, its Production and Use," by Mr. A. Rollason.

London County Council.—At 5.30 p.m., formal opening of the electric light installation for Victoria Embankment and Westminster Bridge.

MONDAY, FEB. 25.

Royal Institution.—At 3 p.m., Prof. J. A. Ewing on "Practical Mechanics" (Lecture VI.).

Society of Arts.—At 8 p.m., "The Bearings of Geometry on the Chemistry of Fermentation," by Mr. W. J. Pope (Lecture III.).

TUESDAY, FEB. 26.

Institution of Electrical Engineers (Manchester Section).—At 7.30 p.m., ordinary meeting. Paper on "The Use of Storage Batteries in connection with Electric Tramways," by Mr. G. A. Grindle.

Institution of Civil Engineers.—At 8 p.m., ordinary meeting. Paper on "The Rotatory Process of Cement Manufacture," by Mr. W. H. Stanger.

WEDNESDAY, FEB. 27.

Institution of Civil Engineers.—At 2.30 p.m., students' visit to the electrical works of the London United Tramways, Company, Chiswick.

THURSDAY, FEB. 28.

Institution of Electrical Engineers.—At 8 p.m., ordinary meeting. Paper on "Cables," by Mr. O'Gorman, if the discussion of Mr. Madgen's paper be concluded.

FRIDAY, MARCH 1.

Royal Institution.—At 9 p.m., discourse by Mr. Henry H. Cunynghame on "Enamels."

SATURDAY, MARCH 2.

Royal Institution.—The Right Hon. Lord Rayleigh on "Sound and Vibrations" (Lecture II.).

North-East Coast Institution of Engineers and Shipbuilders. General meeting at West Hartlepool.

Institution of Electrical Engineers.—Students' visit to the generating station of the London United Tramways Company, Chiswick.

General Electric Company.—Annual dinner.

TO CORRESPONDENTS.

All Rights Reserved. *Secretaries and Managers of Companies are invited to furnish Notice of Meetings, Issue of New Shares, Installations, Contracts, and any information connected with Electrical Engineering which may be interesting to our readers. Inventors are informed that any account of their inventions submitted to us will receive our best consideration.*

All communications intended for the Editor should be addressed C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street London, E C. Anonymous communications will not be noticed.*

TO ADVERTISERS.

Advertisements should be addressed to the Publisher, 139-140 Salisbury Court, Fleet Street, E.C., and should reach him not later than noon of Thursday. **Special Terms** *for a series can be arranged on application.*

SITUATIONS WANTED will be charged at three words for One Penny (prepaid and net), with a minimum charge of Sixpence.

TO SUBSCRIBERS.

"THE ELECTRICAL ENGINEER" *can be had by Order, from any Newsagent in Town or Country, and at the various Railway Stations; or it can, if preferred, be supplied direct from the Office on the following terms:*

	3 months.	6 months.	12 month
United Kingdom	3s. 3d.	6s. 6d.	13s. 0d.
Other Places	5s. 6d.	10s. 6d.	21s. 0d.

(Post Free, Payable in Advance.)

Cheques, Post Office and Postal Orders for Subscription and Advertisements should be made payable to C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, and be crossed "Union Bank."*

Now Ready, Vol. XXV., bound in blue cloth, gold lettered price 8s. 6d.

THE PROPOSED VISIT TO BERLIN.

It may seem somewhat premature to discuss a visit proposed to be held next June, but all business men know the necessity of very early knowledge in order to make the requisite arrangements to be absent for a few days from business. For many years past the Iron and Steel Institute has arranged a biennial visit of members to centres of the industry outside the United Kingdom. Hence, whatever may be said to the contrary, the members of that institute have a very accurate personal knowledge of the methods pursued and the organisation followed by foreign ironmasters. It may be taken for granted that the broad principles followed in any great industry are more or less well known to every member of the industry throughout the world—the value of personal examination and conversation is in making men more fully acquainted with details. We have long held that the man is most successful who in his design pays greatest attention to details, and more particularly is this the case in all that relates to electrical engineering. Another point of considerable value in the examination of other folks' practice is that the conditions under which that practice is successful will be seen, and probably instead of indiscriminately praising what has not been seen, it will be realised that the conditions are somewhat different to those that hold in any given case. Thus we have often been asked why British engineers do not avail themselves more of water power, like the Swedes and Swiss, though when the questioners are asked to say where water power is available their geography is at fault. Then the battle of the phases has to be fought, and it is often forgotten that a system of supreme importance under one set of conditions is not so important under another set of conditions. No amount of descriptive or illustrated printed information will replace personal inspection. These views will serve to show why we advocate such visits as that proposed to Berlin. There are other reasons which might be urged. Applied science is cosmopolitan. Civilisation desires to see the progress of the whole world onward and upward, and whatever means are taken to bring the best educated men of different nations together to get them to exchange views and socially to rub shoulders is of value, and tends towards a millennium. But to our immediate object. Our readers know that during the visit to Switzerland a hearty invitation was given to visit Berlin, and Prof. Perry, the president-elect, expressed his wish that the invitation should be accepted. Subsequently a formal invitation was given by our *confrères* at Berlin, and accepted. The provisional programme is of a double character, providing for a visit to Berlin and then to take part in the annual meeting of the Verband Deutscher Elektrotechniker at Dresden. The time required to go through the whole programme will be from June 22 to July 5 or 6. So much has been said of foreign competition that it might be worth while to recall a fact perfectly familiar to all of us. In some way or other a large number of our American friends do find time and money to visit and inspect the works and the factories in Europe. Unless such visits had

Digitized by Google

a money value, we may be sure they would not be made; hence why not take a leaf out of the book of those who are supposed to have made such vast strides that we are to be left out in the cold. It might be worth while also for the younger members of the profession to note that the majority of successful men are those who have made it a practice to go about most and to see most, thus gaining experience; and in the long run it is experience that pays.

THE METROPOLITAN DISTRICT RAILWAY.

The electrification of the Metropolitan District Railway progresses about as quickly as is to be expected, seeing that the would-be purchasers of electric plant have not at their present command sufficient means to pay for the new equipment. In the meanwhile a fight as to the best system is going on between the Ganz Company, who sent in the lowest tender, and their next competitor, the British Westinghouse Company. It is a contest between locomotives with alternate-current motors working at about three thousand volts on the one hand, and direct-current motors distributed throughout the train on the other hand. The directors will in the meanwhile have the question of acceleration brought prominently before them, and we trust that they will not sacrifice the economy of running and speed of service when coming to their decision.

CORRESPONDENCE.

"One man's word is no man's word,
Justice needs that both be heard."

ENGINEERS AND PROFESSORS.

SIR,—The difficulty that occurs to everyone who heard the late discussion at the meetings of the Institution of Electrical Engineers, and the applause which greeted the reference not only to "professors" but to "rows of them," was the apparent inability of the meeting to understand the simple question before them

Mr. Mordey had described one solitary test made on one solitary cable. He gave no details of how it was carried out, or what steps he had taken to avoid obvious risk of error. From this single result he drew generalised conclusions, which he apparently intended us to apply to any cable with any dielectric. Even if he had taken all the possible precautions to ensure accuracy, it would have been unwise to apply his result to another indiarubber cable, working at any electric pressure, and it would have been impossible, without further test, to have applied it to, for instance, a paper cable.

Is it unfair to describe his action in laying so crude a compilation, with conclusions for the guidance of engineers, based on so superficial an investigation before a scientific engineering society as (to say the least) very uncomplimentary to the intelligence of his audience? May we not also regard with some indignation his apparent attempt to secure applause by his remarks about "engineers and professors"?

Again, do those who may think that Mr. Mordey has done a service to science by extracting from Prof. Ayrton the result of the valuable investigations which were laid before the meeting on Thursday, consider that the *rôle* of the engineers is to put forward wholly erroneous conclusions for the professors to expose?—Yours, etc., M.I.E.E.

ELECTRICAL ACCESSORIES.

SIR,—In commenting upon the list of approved fittings issued under the system of registration adopted by the Manchester Corporation, you state that "in a number of instances the catalogue prices are given opposite the makers' names." I can only suppose that you have inadvertently written prices for numbers, as in no instance is a price given, though wherever catalogue numbers exist these are inserted for purposes of identification. I should be much obliged if you would make this point quite clear in your next issue, as it would be altogether foreign to the purpose in view, and in my judgment most improper, for prices to be attached to such a list.—Yours, etc.,

Feb. 18, 1901. C. H. WORDINGHAM.

[Mr. Wordingham is correct in his surmise that "catalogue number" was intended, and not "catalogue prices." We think this is clear from the context.—ED. *E. E.*]

INSULATION TESTS.

SIR,—*Re* answer to question No. 342, which is printed in your issue of Feb. 8, and signed "A. H." The primary and first portion of the answer to this question is based upon the formula,

$$F = \frac{d^1 - d^2}{2\,d^2 - d^1} \cdot r^1,$$

F being the resistance of the fault.

I beg, Sir, to call your attention to the fact that this formula is erroneous, and give below the reasoning for the correct deduction of a formula to suit the conditions of the question.

We start with the same hypothesis as "A H." Two readings are taken on instrument A, first with resistance, r, in series, and, secondly, with shunt r_1, which is equal in resistance to r plus the resistance of the instrument, which we will call G.

From this we have—

First reading: $$d^1 \propto \frac{1}{F + (r + G)} \quad \ldots \quad (1)$$

Second reading: $$d^2 \propto \frac{1}{F + \frac{(r+G)\,r^1}{(G+r)+r^1}} \quad \ldots \quad (2)$$

Now, $r + G$ is made equal to r^1. $\therefore$ substituting and dividing (2) by (1):

$$\frac{d^2}{d^1} = \frac{1}{F + \frac{r^1}{2}} \times \frac{F + r^1}{1};$$

$$\therefore \frac{d^2 - d^1}{d^1} = \frac{\frac{r^1}{2}}{F + \frac{r^1}{2}};$$

$$\therefore F = \frac{\frac{r^1}{2} \cdot d^1}{d^2 - d^1} - \frac{r^1}{2};$$

$$\therefore F = \frac{r^1 d^1 - r^1 d^2 + r^1 d^1}{2\,(d^2 - d^1)}.$$

Hence $$F = \frac{2\,d^1 - d^2}{2\,(d^2 - d^1)} \cdot r^1.$$

This is a correct solution to the problem as stated in the answer to question No. 342, and is obviously very different to the formula published, which gave

$$F = \frac{d^1 - d^2}{2\,d^2 - d^1} \cdot r^1.$$

Yours etc., H. PIERSON.

DIELECTRIC HYSTERESIS.

SIR,—In the tests made at Silvertown and Prescot on dielectric losses, instead of arranging all the drums of cable merely in series, we tapped the inner and outer conductors at several points along the length so as to reduce the copper losses in the cable to a negligible amount, and thus get a more exact value of the hysteresis loss.

In testing the laid cable of the County of London Company on Thursday, the 14th inst., it was, of course,

Digitized by Google

impossible to reduce the copper loss in this way, and the number given by me at the Institution of Electrical Engineers for the power factor of that cable—viz., 0·033—included the copper loss. Making, however, the proper correction for the copper losses in cable, leads, and instruments, the power factor for dielectric hysteresis alone is reduced, I find, to as low a value as 0·029, a number in close approximation to the 0·028 which we obtained at Silvertown on Feb. 1 on another long indiarubber cable.—Yours, etc., T. MATHER.

THE LONDON COUNTY COUNCIL TRAMWAYS.

SIR,—There is nothing more enthralling than criticism of the truly great. And thus the few faults of England bring a joy to the nations. But the game carries little credit in England, because sins are not concealed. They are easy to find, not being subtle, and it is seen that the faults of a great people are as those of a child. While some nations are committing unheard-of crimes—real mistakes, I may say—England is convulsing the gods by her methods in learning certain new steps. I am thinking of electric traction.

England invented the dynamo, and she told us how to design the motor. She went into the question of electric telpherage at an early date, and in her learned societies she has for long shown her grasp of the theory of motor working. In fact, Sir, what small part could I write down in the space at my disposal of what England has done?

But is there sarcasm lurking in these words? I assure you, Sir, it is but the attribute of a greater chagrin. For, although I am one of the critics on the frontier, my heart is with the inventor of the motor rather than with them who are cock-sure about electric traction. But it is annoying to see her so embarrassed in the practical application of her invention. I suppose embarrassed is the word.

On Thursday last I had the honour of seeing the London County Council's demonstration of the conduit system of electric traction. There you had your car started and stopped as if by magic. The wonderful and invisible force had been harnessed with signal success. Seats inside and out, every luxury, and all the appointments carried out charmingly. The new electric light (which could be turned on and off at will), and all this with no clatter of horses' hoofs nor the harsh tones of an over-persuasive driver. I know that electricity is in its infancy, but that demonstration, Sir——

Seriously, the incident was like a dream of 1886; the same success, the same plans laid to ignite an enthusiasm. It made one feel old; it made one feel that, in view of the perfect commercial success, the suburban success, the urban success, and æsthetic success of the electric tram; in view of the years of happy trial of that same car, say, it made one feel that there were a great viscosity of intellect—an hysteresis of wit somewhere—to be explained away.

On perusing the pamphlet supplied the same spirit was found: ". . . (5) *Going backwards and forwards at will;* and ascending *steep gradients*, if desired, *without diminution of speed*" The same *motif*. I felt that there was some mystery in the attitude of half-doubt conserved since 1886.

But when the speeches began all was explained. It was clear that the gentlemen of the London County Council and of the City were in no way unacquainted with the real state of affairs. They were obliged to teach the sloth mind of a controlling *Demos;* they had to repeat old saws for his enlightenment; and the electric car had to be shown as a sudden triumph in order that the crowd would look up, as it were, and smile.

Mr. Dickinson, the chairman of the wise London County Council, spoke kindly to those who might still be uncertain as to the success of electric traction, and he gained his point. He was followed by Mr. Williams Benn (chairman of the Tramways Committee), who showed reasons and figures, and if anything could move the crowd it was the vision of earnings which he gave. As a representative of the interest which the City takes in matters of municipal progress, Mr. Sheriff Lawrence also spoke of the benefits of electric traction, and gave some interesting and sound advice. In other words, some of the most representative men in municipal affairs and in industrial development in this country had to appeal to the people, not only by the weight of their own approbation, but with tangible proof of long standing, before one could see a glimmer of chance that the electric tram would be acclaimed by the multitude.

Now, in doing what was necessary (a sad necessity) the Tramways Committee did well, except in one particular. Surely, if it is necessary in the twentieth century to go to such ends that backward people may be convinced, it is paramount that everything used in the demonstration should be of a high order of long-tried excellence. How, then, is it that a questionable section of conduit track was shown to the innocents as the best to be had in the twentieth century? I remember the troubles of 1887 and 1888 in—was it Budapest?—when good castings were made according to good drawing-office practice and laid in the streets to stand the stress of time and weather. Nothing was right and nothing was heavy enough. And it took several years to find the proper way to make conduits, simple as they seem.

In the section of conduit shown, few of the results of experience seemed to have been followed. The structure is far too flimsy, and is not, I venture to say, a good design from any standpoint. Obviously, if there is any question about the sort of installation the Council is to have, it should be settled now. With the heavy traffic and the frequent rain in London, and with the predominance of wood paving (which expands and leads to trouble), it is important to instal a lasting sort of railway. In America, bad systems can be put up to-day, can blow up to-morrow, and be superseded the day after by the best thing in the world. *Demos* likes the sense of progress thus attained, and, in spite of all explosions, gets the good thing in the end which is always near.

How impossible were such methods here! After seeing the efforts of the London County Council last week in Camberwell, one feels that a tragedy is afield unless the people have a tried and known thing. A complete proposition should be got from people who have built electric railways and have run them with success.—Yours, etc., M. B.

Feb. 20, 1901.

THERMOSTATIC FIRE-ALARMS.

We have this week been privileged to inspect in the showrooms of the General Electric Company, Queen Victoria-street, E.C., an invention of Mr. Musgrave Heaphy, C.E., in connection with thermostats for giving an alarm of fire. The thermostat, consisting of an ordinary thermometer with a wire fused into the bulb and another wire fused into the stem of the thermometer at the point corresponding to the temperature at which an alarm is required, is an old device, and one which has been largely used with the object of protecting buildings and private houses. The efficacy or otherwise of these fire-alarms is determined very much by the way in which they are fixed, and it is obviously requisite that they should be placed in such positions that a fire in any part of the room in which they are situated should quickly raise their temperature up to the alarm point. The details as to position, however, are usually left in the hands of the electrical engineer who fixes the thermostats. Mr. Musgrave Heaphy's invention was designed with the object of ascertaining if the thermostats when once fixed are maintained in good order. The old method of applying a burning match to the bulb of the thermometer does not commend itself to the person who is particularly anxious to guard against fire, but this has been up to now the usual method of ascertaining whether the thermostat's connections between the mercury and the wires are in good order. It is apparent, also, that this test can frequently not be applied quickly owing to the inaccessible positions of the thermostats and other obvious reasons. Mr. Heaphy's invention provides a source of heat at the thermostat. For this purpose he runs a third wire from the indicator board to each thermostat in the building. This wire ends in a coil of high-resistance material placed near the bulb of the thermostat, but

Digitized by Google

the exact details of the arrangement we are debarred from giving at the present, owing to the fact that certain foreign patents have not yet been completed. At the indicator board a multiple-way switch enables a six-volt battery to send a current to the resistance coil of any thermostat. The resistance of the circuit is such that the resistance wire is heated only slightly above the temperature at which an alarm is given. With the apparatus we saw recently at the General Electric Company's showrooms, it took about half a minute for the current to bring the mercury in any thermostat up to the alarm temperature and to complete the circuit. We also found that the temperature of the resistance wire was not sufficiently high to prevent one holding one's thumb on it while the heating-up process was going on. If, then, Mr. Musgrave Heaphy's invention be adopted, the person responsible for the inspection of the fire-alarms has only each day to move the multiple-way switch from one contact on to the next to prove that the various thermostats one by one are in order. We think the idea is an exceedingly good one, and there should be absolutely no difficulty in making the details exceedingly durable. The great advantage of the apparatus is that it not only proves that the mercury contacts within the thermostats are working satisfactorily, but that the wires from the thermostat to the indicator board and alarm bell are also in good condition. The invention prevents false trust being placed on electrical fire apparatus which might be out of order when required to give an alarm. It is only right to say that Mr. Heaphy does not consider his invention, or any other electrical alarm, to be any valid reason for demanding a reduction in the fire insurance premiums for any premises. In our opinion electric fire-alarms are an additional precaution against excessive damage from fire, as they can be made to give a prompt alarm in case of an outbreak. For buildings containing valuable original papers and works of art which cannot be replaced, such precautions become necessities.

THE LANCASTER CORPORATION AND THEIR ELECTRICAL ENGINEER.

[From a Correspondent.]

The attitude of the Lancaster Corporation to their electrical engineer, Mr. Alan Fraser, is being much canvassed in the town, and both among the public and the members of the Council there is a growing body of opinion that Mr. Fraser has not only been shabbily treated, but that the Corporation have distinctly broken faith with him.

The genesis of the affair dates back to the time when the war fever was at its height. Mr. Fraser had been the electrician only about a year when the war broke out. He was, it appears, a member of a southern yeomanry regiment, and when the Government began appealing for mounted volunteers he was one of those who gave in their names for service. He was accepted, and intimated the fact to his committee. Not a single obstacle was placed in his way. The Corporation had already granted a constable unlimited leave of absence, they had taken charge of the colours of two Lancaster regiments at the front, and were full of martial enthusiasm. Mr. Fraser was granted unlimited leave of absence, was given a grant of £1 a week whilst away, and his assistant had 10s. a week extra put on his salary for doing Mr. Fraser's work while he was away. Moreover, Mr. Fraser was given a hearty send-off, the Mayor, we believe, being present, and with the hurrahs of the townspeople in his ears and a few substantial gifts in his pockets from the Corporation staff he set out for the seat of war.

The trouble began six months after Mr. Fraser had been away. The Corporation carried a Bill through Parliament giving them power, among other things, to construct a system of electrical tramways within the borough. Nearly all the specifications for this had been got out by Mr. Fraser before he left Lancaster. When the Bill was passed, and the Council began to think about making a start with the work, a difficulty presented itself. Who was to do the work? Who was to be the engineer-in-charge? At first it was thought that the present staff, with the borough surveyor as engineer, could make a beginning, leaving it to Mr. Fraser to take charge when he returned. But that was altogether unsatisfactory. It would never do to have divided authority. Even if the borough surveyor's staff knew sufficient about tramways to erect stations, lay down extra plant, purchase tramways, etc., it was hardly fair to them or Mr. Fraser that the responsibility should be cut into halves, and that Mr. Fraser should be made responsible for the completion of a scheme with whose initial steps he had had no concern. So this idea was dropped. Another alternative was to appoint a new engineer altogether, leaving it until Mr. Fraser returned to reconcile the two positions, and see how the two engineers could adjust their positions. Strangely enough, it seems to have occurred to nobody that Mr. Fraser had gone away as chief electrical engineer, that he had been promised his place intact on his return, and that any interference with it would be in distinctly bad taste.

However, matters progressed. First, it was decided to appoint a tramways engineer, leaving Mr. Fraser in charge of the lighting station. One difficulty was that the proposed appointment was to be under the borough surveyor, and as he was not an electrical expert it was found that friction would arise. Nobody would be tramway engineer and be placed under the control of a man with no special aptitude for electrical work, however able in his own department as surveyor and water engineer. This was seen when the answers to the advertisement were considered, for the applicants to a man declined to serve under the borough surveyor. Then the committee decided to appoint a separate tramways engineer, supreme in his own department, with Mr. Fraser as lighting engineer. Meanwhile, not a word had been said to Mr. Fraser. The committee had made no attempt to communicate with him. They carried their resolution in committee, and at that stage Mr. Fraser returned and unexpectedly arrived on the scene. The point to be remembered is that he had assisted in the preparation of a tramways scheme, that he had left Lancaster on unlimited leave of absence as chief electrical engineer, and that he returned to find that a new chief engineer had been appointed by the committee; that the tramway work was altogether taken out of his hands, and that the only department left to him was the lighting station. Some of the Council argue that he is where he was when he went away. The answer to that is found in a sentence. He went away first engineer; he returned to find himself second man, the appointment having been made the week before he arrived back in town. The resolution was only carried in full Council after a very acrimonious debate. It excited more bad blood than any other local question of previous years. The fact is that there began to arise in the minds of some members of the Council an uneasy feeling that Mr. Fraser was being shabbily treated, and it was their attempt to revoke the appointment, or at any rate to secure a different status for Mr. Fraser, that led to the anger which disturbed the usual placidity of the Council-chamber.

The situation now, therefore, is this. Mr. Fraser, the old engineer, who did so much to make the work of the Corporation easy in pushing their Bill through Parliament, has been "relieved" of any responsibility in carrying out the details of the scheme. That is the euphemism of the Corporation. A plain man would say he had been supplanted. Of course, in stating these facts, no hostility is shown to the gentleman who has been appointed to the work of laying down the tramways. The idea is to give full publicity to the facts. And on these facts the present writer thinks the reader will ask two questions: First, why could not the whole matter be left over until Mr. Fraser returned? Second, before he was supplanted would it not have been fairer to have first given him an opportunity of saying whether he would care to undertake the work? To some who may still believe in the old-fashioned virtue of keeping to a bargain, there may even arise a third question: Have the Corporation been quite honourable in thus turning their back upon a solemn promise?

[The above, which we have received from a local correspondent, seems to confirm the old adage, "Out of sight, out of mind," and it will not tend to increase the respect with which municipal bodies should be held. Having granted Mr. Fraser leave of absence, the Corporation should certainly have written to him before taking away any of his responsibility. Ed., *E. E.*]

INSTITUTION OF ELECTRICAL ENGINEERS.

Capacity in Alternate-Current Working.

BY W. M. MORDEY.

Discussion.

(Concluded from page 123.)

The discussion on this paper was concluded at the meeting of the Institution of Electrical Engineers on Thursday week last:

The **President** (Prof. J. Perry) first called upon the author to make some observations on what was said at the last meeting.

Mr. Mordey said Prof. Ayrton's criticism on the last occasion amounted to this—that what was new was wrong, and what was old was his. He hoped that the subject might be thoroughly

Digitized by Google

thrashed out, so that they might feel at the end of the discussion that they all knew more about it. He wished to make an alteration to the first part of the paper, in which he draw attention to the well-known fact that if you knew your volts, periods of capacity, etc., you could calculate your current, and that instead of measuring capacity by the ordinary methods, you should simply use an ammeter, take the current, and determine the capacity in that way. Prof. Ayrton thought that he (Mr. Mordey) had omitted to give him credit for having known that fact a good many years ago. Of course, he was aware that everybody knew it, but since the last meeting he had been led to look into the matter, as he thought possibly, as all the professors agreed on the subject, it might not be right. He found that in ordinary commercial conditions of distribution the advice he gave to central-station engineers was not wise. He found that the variation might be from 200 to 300 per cent. on a given capacity, the cause being that the ordinary assumption was that the current depended upon the E.M.F. being a sine function. There was not one word said in the warning given them by Prof Ayrton as to the enormous correction that might have to be applied in the use of the formulæ given in the paper, which, he assured them, had been used for many years. He (Mr. Mordey) was somewhat surprised to find that under the ordinary conditions of distribution that rule was not applicable with any degree of accuracy, unless the E.M.F. curve was a sine function. He wished to point out that this introduced a new definition of power factor. If the current varied for a given curve, the power factor might vary in the same proportion.

Dr. Perry here asked Mr. Mordey to leave the rest of his remarks until he was replying.

Mr. C. P. Sparks referred to the statement of Mr. Mordey that capacity in cables was a serious drawback to alternating current work. It was true that capacity was a disadvantage at times of very light load, but this could be largely neutralised by energising a minimum number of cables. In most extra high pressure stations there were two or more feeders leading to every distributing station, and extra mains could be connected as the load rose, thus reducing any inconvenience due to the leading capacity current to one-half or one-third maximum amount as the case might be. As most of the apparatus connected to the system, with the exception of the incandescent lamps, was of an inductive nature, the capacity of the cables became a positive advantage, and improved the load factor. The capacity current and its power factor varied with the character of the dielectric of the cable and the form of wave curve given by the alternator. The instance given by Mr. Mordey was for a rubber dielectric, in which the capacity and power factor were abnormally high. Had a paper dielectric been used in place of rubber the capacity current would not have been more than 30 to 40 per cent., thus decreasing any inconveniences from capacity to about one-third for every mile of cable in circuit. Since the date when the cable tested was ordered and set to work paper had almost entirely replaced rubber as a dielectric for such purposes. This was not only due to its lower capacity, but also to its very much lower price and greater durability. Mr. Mordey also alluded in his paper to the low efficiency of a large alternator running to supply the capacity current. Up to now, with the limited number of extra high pressure stations in England the length of cables had in no case been such as to make the capacity current too much to be supplied by the smallest unit, and although the greater economy might have been reached by using still smaller units at times of light load, it was necessary in case of a sudden demand to have some reserve of power in the working plant. Under these circumstances little advantage would be felt in any existing station if the capacity current was balanced by means of chokers at times of light load, so as to cut down the size of the unit. The figures on which Mr. Mordey had based part of his paper—viz., those relating to the loss of energy in dielectric hysteresis in this concentric rubber cable—were founded upon tests carried out in March last, when the current was reduced from 6 to 1·6 amperes by means of choking coils. Further tests relating to loss of energy followed, the watts being taken with both choker and cable in circuit and on the choker alone. The energy shown was 2,015 watts, or within 24 watts of the test made separately with leading and lagging currents on the choker and cable independently. With regard to the instrument used for measuring the energy, similar instruments had been subjected to tests, the standard of comparison being a Kelvin electrometer wattmeter, specially arranged for alternating-current energy measurements at low power factors, erected under the supervision of the late Dr. John Hopkinson. In testing against this standard it was found that the particular wattmeter used could be adjusted to read true watts on a periodicity of 100 working on an inductive circuit, the pressure being supplied by an alternator giving a sine curve The same instrument read energy within 1 per cent. when connected with an inductive circuit of 50 periods Thus under these conditions there was no periodicity error. He understood that on the last occasion when the paper was discus ed, Prof. Ayrton severely criticised the figures given by Mr. Mordey, taking exception to the loss of energy given, and predicted that if tests were carefully made the loss of energy would be found to be about one-tenth of Mr. Mordey's figure. Since then he (Mr. Sparks) had supplemented the figures previously taken by some other system of measurement. The method chosen was measuring the difference of power required to drive a motor-generator driven by a direct-current motor. The result was that the power factor observed on the cable was ·069, which was considerably lower than the figure obtained by Mr. Mordey—viz., ·124. Two tests were taken on two separate occasions, this result being the mean. Since making these measurements he had received a letter from Prof. Ayrton offering Dr. Mather's services in making an independent test on the particular length of cable referred to by Mr. Mordey. These experiments were made that morning, and he had just received a copy of the results obtained from Prof. Ayrton. The tests were made by energising the 5½-mile length of main from a transformer situated at the Peckham sub-station at a pressure of 2,250 volts. The inflow of current to the main was 6·8, showing that the transformer was giving approximately a sinusoidal wave. The current into the choker, which he understood consisted of 80lb. of copper wire with no iron core, was 6·6. The actual current required to supply the main and choker was 2·7. The energy was measured by means of a Ganz wattmeter. The ammeters were hot-wire instruments, the pressure being measured on the electrostatic voltmeter, and the periodicity being taken with a periodicity recorder. The wave-form was examined with Mr. Duddell's oscillograph. The energy taken by the cable alone, measured with the wattmeter, was 522 watts, and the energy in both cable and choker was 798 watts. Deducting from this the C^2R losses in both they got 503 watts. The test was then made with the choker in series with the cable, when the energy was found to be 703 watts; deducting a C^2R loss in the choker of 281, the energy taken by the cable was 482 watts. The current flowing into the cable was approximately that given by the formulæ for sine curves, and the curve was checked by being examined on the oscillograph. The power factor in each of these cases was ·034, the power lost per mile with the cable at 100 periods, 2,225 volts, being 96 watts. In conclusion, Mr. Sparks considered that the thanks of the society were due to Mr. Mordey for having pointed out the importance of dielectric hysteresis, which, although undoubtedly known to some, had not had the attention of the many. He was aware that by using other dielectrics a lower power factor might be obtained; but from tests on other dielectrics it was clear that on the best cables the power factor was about 1½ times the amount suggested at the last meeting by Prof. Ayrton, while it was possible, as was shown by the figures he had given, in exceptional cases to find a power factor of 3½ times the amount. Under special conditions a power factor as high as ·07 on the observed current of the cable could be obtained, or ·16 on the calculated. It was interesting to see how far these dielectric losses influenced the efficiency of the transmission system. Assuming that the cable was capable of transmitting 600 kw., and was 12 miles long, assuming also that there was a 10 per cent. load factor, and that the cable worked at 6,000 volts, he calculated that of the whole energy transmitted some 2·1 per cent. would be lost in dielectric hysteresis with paper-insulated cables, and about 8·3 per cent. if rubber insulation was employed of the same character as on the cable tested by Mr. Mordey.

Dr. J. A. Fleming referred to the question of dielectric losses in the cable. Mr. Mordey had given them no details in his paper of the experiments to prove the correctness of the wattmeter by which his figures were obtained. At the time the Ferranti cables were laid the question which concerned most people interested was, how much of the 600 h.p. which apparently went to the line was real horse power. In order to ascertain this, the engineer of the station, Mr. P. W. D'Alton, proceeded to take indicator diagrams from one of the engines when running light. He then switched in one cable, and again took indicator diagrams, repeating the operation as he increased the number of cables connected to the alternator driven by the engine. Speaking from memory, Dr. Fleming thought that each cable between Deptford and London took from 10 to 12 actual horse-power, which was equivalent to a power factor of about ·02. Mr. Mordey had been misled by his wattmeter. He would suggest to Mr. Mordey that he should re examine this question, employing another wattmeter or some other method of measuring.

Dr. W. E Sumpner confined himself to two points, one being the power factor and the other relating to a matter which Mr. Mordey had left out of account altogether. The author had given a number of figures as to the watts lost in the cables, but in no case had he referred to the load current, or to the proportion which the capacity current bore to the load current. That proportion depended upon one thing which Mr. Mordey had not mentioned—viz., the percentage drop in volts which was allowable in the line. Taking the case of a 5½ mile cable of $^{37}/_{18}$ under like conditions to those mentioned in the paper, and assuming a drop in the line of 4 per cent., then the capacity current came out at nine amperes The load current would be 77 amperes, as compared with a capacity current of nine amperes. In other words, the load current was more than eight times the capacity current, and, taking Mr. Mordey's figures, the loss in the dielectric was only 1½ per cent. of the full load. Taking the power factor as ·02, which he (Dr. Sumpner) believed to be correct, the loss in the cable was only ¼ per cent. of the full load. How was it that the author had arrived at his result? His point was that it was quite possible for a wattmeter to read absolutely wrongly. In ordinary condensers the power factor was ·02, which corresponded to a current leading 88·4deg. in front of voltage. In fact, this was only about 1½deg. less than the right angle. If, then, the lag in the voltage coil of the wattmeter exceeded 1½deg., the reading of the wattmeter became negative. He should like to know if it was not the fact that Mr. Mordey used a transformer in connection with the voltage circuit of his wattmeter. A transformer would make more than the difference referred to in the lag—*i.e.*, 1½deg. He had experimented with a condenser, measuring the power required for it by means of a wattmeter in connection with a transformer, and by altering the load on the transformer, and the connections of the same, had succeeded in getting readings which varied the power factor as follows: + ·40, + ·02 − ·07, − ·43, − 1·6. He noticed that the author had said that his wattmeter as described in the paper was not independent of the frequency, which really meant that he had a lag in the voltage coil, otherwise it would have been

Digitized by Google

independent of the frequency. In fact, he thought that Mr. Mordey's wattmeter might be useful to measure what one knew, but useless to measure anything which was not known.

Mr. J. Swinburne thought the author had brought prominently before the society certain things which were known to many people, but if they were to cut out every paper which would not stand the tests of the Law Courts they would have very little to read. As to measurement in capacity in terms of current, it was an old thing in engineering. Prof. Ayrton had said it was his suggestion, but it was in practice long before. With regard to the dielectric losses, he did not think they had been fully appreciated lately. The whole credit of drawing their attention to this matter was due to Mr. Mordey, whether his figures were accurate or not. About 10 years ago he himself pointed out, in a paper before the Physical Society, the great loss in dielectric hysteresis. It was said then that his experiments were impossible, but the results turned out to be right. As regards condensers, Prof. Ayrton had mentioned some early condensers, but the power factor struck him as being very much higher than he (Mr. Swinburne) found them to be. The condenser could be made now with a very much smaller waste of power than Prof. Ayrton made out. Concerning dielectric hysteresis, Maxwell had pictured a dielectric which lost power as consisting of condensers and resistance in series. It must be remembered that the dielectric loss was intimately connected with the refractive index as regarded light. As to actual loss in cables, he thought that must vary from cable to cable, and he did not believe that even in one make of cable it would be constant. It depended greatly upon the moisture in the cable. There was one way of getting out of the difficulty of dielectric hysteresis, and that was by using a low frequency. There was no difficulty in making wattmeters accurate. They could be easily checked on two-phase circuits.

Dr. T. Mather considered that the power factor of ·124 was far above the average. Even if that were the result on the cable used by Mr. Mordey, he should have tested other cables before he brought general conclusions forward. They must conclude that the author was inaccurate, and his figures ought not to be applied to any general case. In his opinion the use of iron in a choker was a mistake. Through the kindness of Mr. Sparks, he had that day carried out experiments on the actual cable which Mr. Mordey had tested. He used three methods of ascertaining what the power factor required by the cable was, and the mean of the three, which agreed very closely, showed that the power factor was ·033. Other experiments on cables made by the British Insulated Wire Company showed the power factor of ·024, while another cable (indiarubber covered) had given the power factor of ·028. It would be seen from his tests that Mr. Mordey's power factor was 400 per cent. too high. He had also experimented with a choking coil with no iron core, in order to reduce the current going into the cable and also to assist in the measurement of power taken. By connecting the choking coil in series with the cable, a low-voltage supply current with a very small difference in phase between the voltage and current had been obtained. In this case the wattmeter was working under its best conditions. It was well known that the current taken by a cable varied with the wave-form. He quoted figures from tests made at the Central Technical College to show the increase in the ratio of 73 to 49 in the current taken by a condenser when the alternator supplying the current was changed.

Mr. O'Gorman said there was a great discrepancy between the various classes of cables, and therefore experiments on one condenser were no guide whatever of the effects obtained with another. In a cable made of a uniform dielectric the fall of potential was quite regular. If the first part of the dielectric were made of pure indiarubber, the fall of volts was exceedingly great in that layer. He found as the result of experiments that the loss should be 26 times greater with a rubber cable than it would be in a perfectly homogeneous dielectric. The loss depended upon the distribution of potential in the dielectric, and that explained the extraordinary discrepancies between various classes of cables. In fact, the loss varied as the square of the potential gradient. Paper cables had the advantage in having liquid dielectrics.

Mr. W. E. Gray remarked that they had heard that cable makers did not know much about making cables any more than dynamo makers knew how to make dynamos. Be that as it might, there certainly were great differences in the several classes of cables manufactured. When dealing with the question of dielectrics there were many things to be taken into consideration. The quality of the cable was one, and that depended upon the process of manufacture followed as to the capacity given. But no one, he believed, could make a cable which would be perfectly stable. It was possible to build a cable which would not vary in capacity any more than in insulation. He was prepared to say that Mr. Mordey tested a certain form of cable, and that Mr. Mather and Prof. Ayrton tested another form of cable, and this would account for the difference in the results.

Prof. Threlfall considered that if a cable could be made without any moisture in its dielectric, it would reduce the loss to less than 10 per cent. of its ordinary value. That could only be done by using pure celluloid paper prepared by drying it at a temperature of 130deg. C. under vacuum. There had been much said about dielectric hysteresis, which Mr. Steinmetz was said to have discovered in 1892. If Mr. Steinmetz's paper were looked up, it would be found that he had only suggested that the loss he had observed might be dielectric hysteresis. As a matter of fact, most of the loss was due to leakage. Again, Mr. O'Gorman was wrong in saying that the loss varied as the square of the potential gradient. He (the speaker) had proved that it varied between the 1·6 power up to the square of the gradient, and that the higher value could only be obtained by using absolutely pure material.

Mr. T. H. Minshall referred to some experiments which he had carried out at Croydon, with the intention of proving that Mr. Mordey's figures were much too high. He found it was impossible to make a commercial test of capacity unless you had some means of making perfectly certain that you were using a sine wave-form of E.M.F. The next thing was to measure the power taken by the cable. He thought that the discrepancies which occurred in this direction were due to the fact of the insulation resistance not being taken into account. He proceeded to give figures obtained on a cable at Croydon which had insulation of only half a megohm, and on which a power factor of ·1 was obtained. He had tried to vary the result by different means of measurement, but always got practically the same result. He believed in working with a low insulation resistance, and the figures given by him showed that the loss in consequence of the low insulation resistance was much about the same as the loss in dielectric hysteresis.

Mr. Mordey, in reply, said he was very glad the last speaker had given him a little encouragement, and that Mr. Sparks and himself were not the only people who had found that there were appreciable losses in cables through dielectric hysteresis. If all the professors in the world were to tell him that there was no loss in dielectric hysteresis, he should be perfectly certain that they would be wrong. He had received a letter from an old member (Mr. Gisbert Kapp) saying that he agreed with him, and it was a confirmation that that gentleman found that the cables on light load became appreciably warm, which must mean a power factor of ·3 or ·4. Even the figures given by Prof. Ayrton confirmed him up to a certain point. The cable makers had asserted that they often had experiences of cables which on light load got quite warm simply due to dielectric hysteresis. They had had an exceedingly useful discussion, and he hoped for the sake of the industry that he would be found to be wrong in the figures he had given. He must say, however that he had never claimed for one moment that the power factor he found in the cable tested was of universal application.

QUESTIONS AND ANSWERS.

If thou hast knowledge, let others light their candle at it.

Under this heading we insert questions and answers of a practical character relating to central-station work, tramway work, or construction work; and for each suitable question offer *one shilling*, and for the best solution of any question we offer *ten shillings*. We also give *five shillings* for every other answer we print. The answers to any question should be sent within 10 days after the question has appeared. We would call the attention of those sending in answers to the fact that the neatness of any sketches (which must be in *ink*) sent in is considered when marking the relative values of these answers. All formulæ should be carefully written to prevent mistakes as to symbols, and all loose sketches should be signed by the author. The matter must be written on one side only of the paper. Questions may be sent at any time.

QUESTIONS.

353. In designing a shunt regulating resistance for a large dynamo, how should the resistance be proportioned between the different contacts of the regulating switch in order that each movement of the latter shall give, say, one volt variations throughout its entire range?—PLUMER.

354. Describe a suitable arrangement of wood strips, to take the place of steel guard wires for protecting trolley wires, to be strong enough to withstand the fall of a bunch of telephone wires, such as occurred at Liverpool lately. Give sketches showing method of carrying.—T. R.

ANSWERS.

Question No. 347.—Describe the connections of a switchboard and an effective type of synchroniser for three-phase generators supplying motor circuits. Is there any method of starting up the motors as a whole from the generating station?

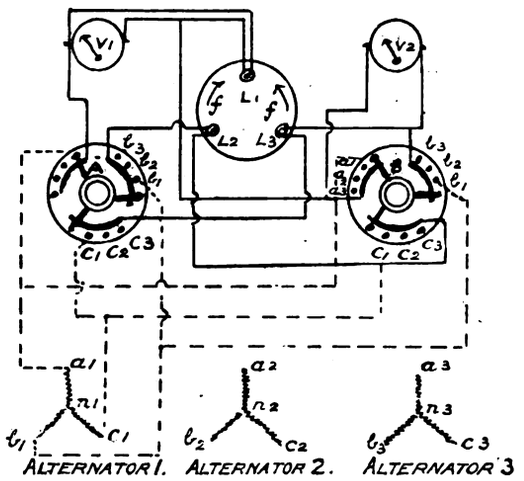
Best Answer to No. 347 *(awarded* 10*s.)*.—Paralleling alternators require special precautions to avoid strains upon the machines, and two conditions must be fulfilled. They are: (1) the two machines must have the same voltage and frequency; (2) at the moment of switching them into parallel the instantaneous voltages of the two machines must be equal and of the same sign.

It is easily seen that if a_1 a_2 and b_1 b_2 are corresponding terminals of the machines (see sketch), there will be only zero potential difference between a_1 and b_1 or a_2 and b_2 when the E.M.F. of the two machines are identical in frequency and phase, even though the voltmeters between

Digitized by Google

the terminals of the machines read alike. If the machines are switched in parallel without being accurately synchronised, the result will be a sudden rush of abnormal current through these armatures. A simple method of detecting when the machines are in synchronism or not is by connecting a_1 and a_2 and b_1 and b_2 by means of incandescent lamps. This device forms a good indicator as to whether there is a difference of phase or not between the E M.F.'s of the machines, but does not indicate which machine is running the quicker.

The Siemens and Halske synchroniser gets over this difficulty. The phases, a_1 b_1, b_1 c_1, c_1 a_1, of the first alternator are connected to the terminals, a_1 b_1 c_1, of two triple-pole switches, A B, which are themselves coupled in parallel. The phases of the other two alternators are respectively connected to the terminals, a_2 b_2 c_2, a_3 b_3 c_3, of two other switches. The lamp device is still used, but now there are three terminals to each machine, and three lamps are used as indicators between corresponding terminals of the machines already connected to the 'bus bars and the incoming machine. The extinction of the three lamps does not occur simultaneously, but successively, and if the lamps are mounted in a triangle, as shown in the diagram at L_1, L_2, L_3, the order of extinction will travel round the triangle in a clockwise or counter-clockwise direction, according as the incoming machine is slower or quicker than those already on the 'bus bars. The direction of the order of extinction of the lamps tells at once whether the incoming machine is running too quickly or too slowly. Suppose it is desired



to parallel machine 2 with machine 1, which is already connected to the 'bus bars. The first thing to do is to see that the voltages of both machines are alike by means of the voltmeters. Having done this, the switch B is left on the terminals, a_2 b_2 c_2, and the switch A is placed on the terminals, a_1 b_1 c_1, of the alternator 1. The direction, f or f_1, of the order of the extinction of the lamps is then noted; if the order is f, the incoming alternator has to be accelerated, and if the order is f_1, it has to be retarded. The main switches are closed at the instant that the lamp L_1 is dark, when the rate of extinction shows that the speed of the machines is almost exactly the same. To increase the sensibility, a voltmeter, V_1, is between the terminals of the lamp L_1, and should register zero voltage at the instant of switching on.

In reply to the second part of this question, it would be necessary in case of motors of large size to have a special starting device in order to prevent the abnormally large currents which circulate in the field and armature coils from burning up the insulation. Small motors may, however, be started without fear of any damage to the coils.—F. B. A.

Question No. 348.—How would you arrange connections so that an ordinary double-pole throw-over switch can put two dynamos in series or in parallel? When the switch is on the top contacts the machines to be in parallel, and when on the bottom in series.

Answer to No. 348 (*awarded* 7*s.* 6d.).—The two dynamos referred to may be considered the same size, for they must give the same voltage to work in parallel, and the same current to work in series. As the question does not state whether they are series, shunt, or compound wound, all three cases must be considered. Two shunt-wound machines when running in series have a tendency to reverse one another if the field winding of each is connected across the armature belonging to the same machine; and,

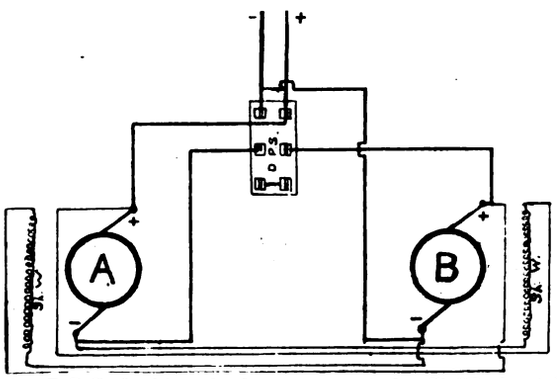


FIG. 1.—D P S, double-pole throw-over switch; Sh W, shunt field winding; A and B, armatures of dynamos.

though they can be run in series so connected, better results can be obtained by having the field of each excited by the other, as then, if the current is reduced in the shunt of one, the voltage of the other which has caused this reduction is reduced also, but if this should take place with the shunts connected in the ordinary way, as soon as the current is reduced in the shunt it drops the voltage of the machine that is tending to maintain the current in it. This drop causes a further reduction of current in the

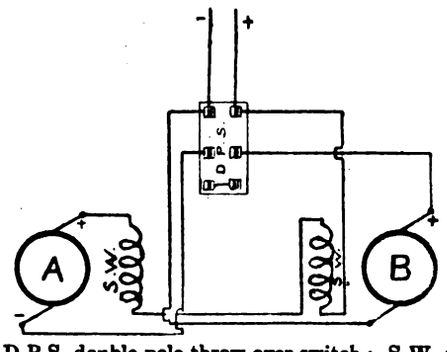

FIG. 2.—D P S, double-pole throw-over switch; S W, series field winding; A and B, armatures of dynamos.

shunt, and, finally, a complete reversal of polarity. Fig. 1 shows connections desired for shunt-wound dynamos, in which it will be seen that one machine, A, excites the field magnets of the other, B, and that B excites the field magnets of A for reasons just explained. If the throw-over switch is closed upwards, the two dynamos are in parallel, and if it is closed downwards they are in series.

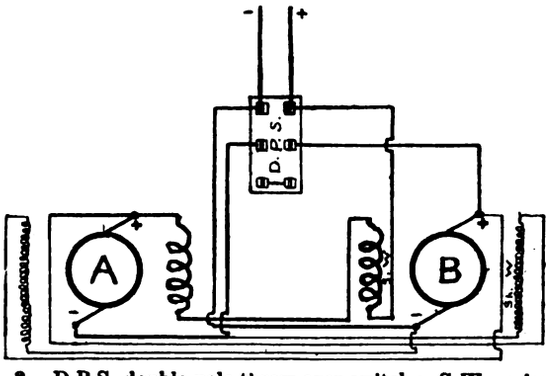

FIG. 3.—D P S, double-pole throw-over switch; S W, series field winding; Sh W, shunt field winding; A and B, armatures of dynamos.

The two dynamos must be run before either can excite. If one should be accidentally shut down, no harm will be done if the two had been running in parallel, as the voltage of both will drop as the one slows down. Fig. 2 shows the connections if the dynamos are series-

Digitized by Google

wound. It will be seen that no equalising wire is used, which is the best and most usual method of running series or compound-wound dynamos in parallel, but it cannot be used under the conditions given, as the throw-over switch would have to have a third pole to allow this. To prevent one dynamo reversing the other when they are running in parallel, the field magnets of both are excited by the current from one armature only; this will ensure the fields being the same strength and the same polarity, though it will cause the machine, A, that excites the magnets to do a little less work, owing to its internal resistance being increased and that of the other decreased.

The connections for two compound-wound machines are a combination of the two just described for the series and shunt machines, and are shown in Fig. 3. It will be seen that the difficulty of not being able to use the equalising wire is got over in the same way as in the case of the series dynamo, and to prevent any liability to reverse the shunt current, the shunt windings are connected as described for the shunt dynamos.—A. J., SWANSEA.

Answer to No. 348 (*awarded* 7*s.* 6*d.*).—Figs. 1 and 2 refer to throw-over switches, the pivots, A, of which are used for contacts; Figs. 3 and 4 to switches with independent contacts. The connections for both types of

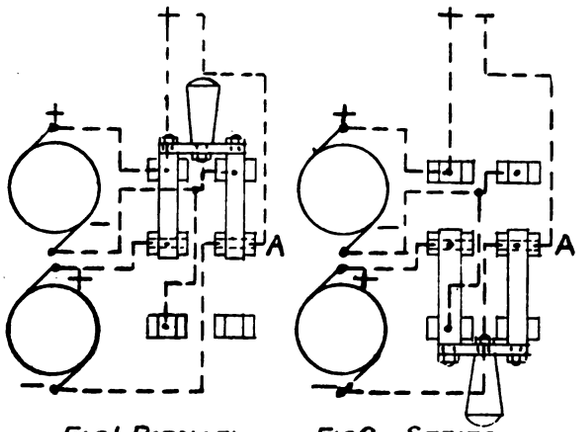

FIG 1. PARALLEL. FIG 2. SERIES.

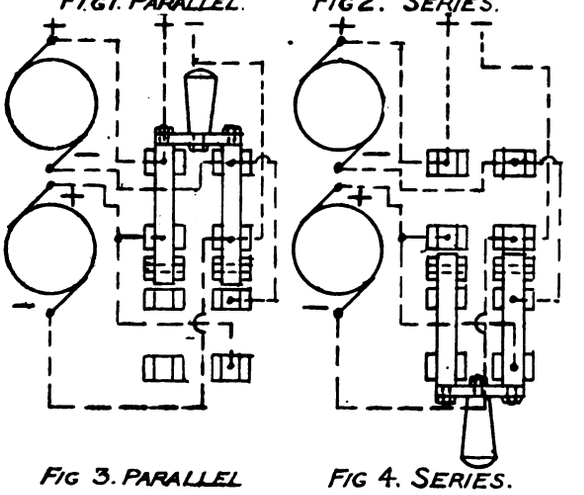

FIG 3. PARALLEL FIG 4. SERIES.

switch can easily be traced from the diagrams. When the switches are on the top position, they will also act as a simple single-pole switch when either dynamo is working singly.—W. A. J.

Answer to No. 348 (*awarded* 5*s.*).—The only proviso that must be made in connection with the scheme of connections shown herewith is that some of the lugs or back contacts of the double-pole throw-over switch must be capable of taking two conductors each of sufficient size to carry the main current of one dynamo. Granted this condition, the arrangement can be as shown in the sketch. A, B, C, D, E, F represent the six contacts of the throw-over switch; D_1, D_2 represent the two dynamos. The connections are shown by the thin lines, the blades of the switch by the thick lines. Fig. 1 shows the switch in position for parallel running, while Fig. 2 represents the dynamo in series. The direction of the currents in each case is shown by arrows. It will be seen that on lugs A and D two connections must be made, while contact F is in reality superfluous.—J. A. S.

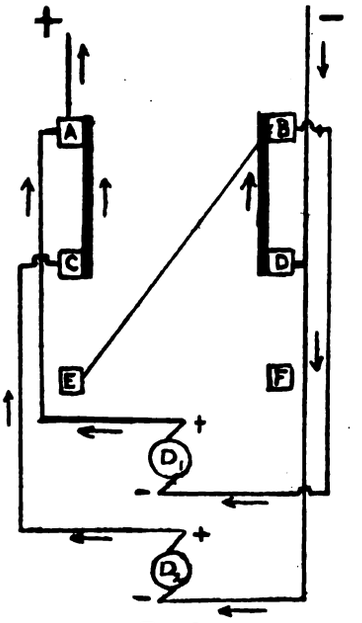

FIG 1.

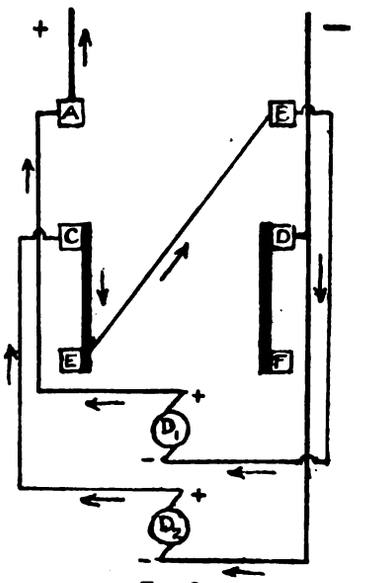

FIG. 2

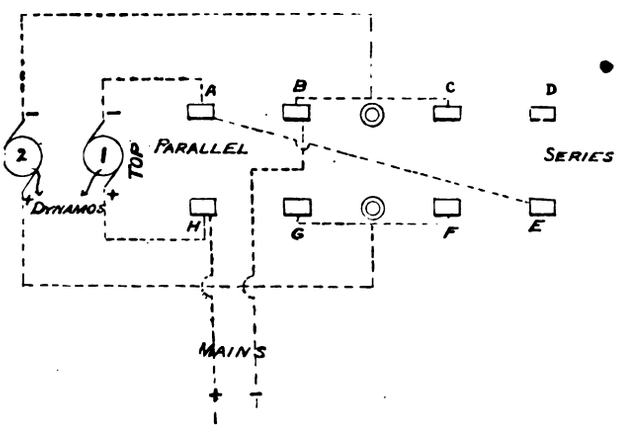
Answer to No. 348 (*awarded* 5*s.*).—A good method for connecting two machines in parallel or series with a double-pole switch is shown in the sketch, where 1 and 2 are the dynamos, and *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h* are the contacts.



To avoid complication the levers of the switch have not been shown. It will be observed that the contacts A E, B C, and F G are connected together, which is done at the back of the switch, by means of copper strip. To connect the two machines in parallel, it is easily seen that by throwing the switch over to the side marked "parallel," the currents from the two machines will take

Digitized by Google

the following courses—namely, from the positive of No. 1 machine on the contact, H, to positive main; at the same time it can flow from the positive of No. 2 machine to G through the lever to H, also to positive main. From the positive main it goes through the lamps, or whatever there is in circuit, on to negative main to B, where it divides, part going to the negative of No. 1 machine through the lever, and part to the negative of No. 2 machine through the connecting wire. When it is required to connect the two machines in series the switch must be thrown over to the side marked "series." The current then flows from the positive of No. 1 to H on to positive main, then to negative main on to B, from B to the negative of No. 2 machine through the machine to G, through the lever to E, from E to H, on to "negative" of No. 1 machine.—R. F. W.

COMPANIES' MEETINGS AND REPORTS.

METROPOLITAN DISTRICT RAILWAY.

The half-yearly meeting of this Company was held on Thursday week at the Westminster Palace Hotel, S.W., Mr. James S. Forbes (chairman) presiding.

In moving the adoption of the report, the **Chairman** said the accounts only too sadly fulfilled the forecasts he gave at the last meeting of the Company. As he had said before, the present state of affairs was almost entirely attributable to the working of the "twopenny" tube. During the half-year they had lost in round figures 101,000 first-class passengers, 272,000 second class, and 964,000 third-class passengers, the loss in money being £2,000, £3,225, and £10,121 respectively. With regard to season tickets, they had lost 1,700 of their subscribers, representing £4,168. The total loss all round was £19,000. The working expenses, on the other hand, had only increased by £1,200, due chiefly to the high price of coal, and he was sorry to say that during the current year they would have to pay somewhat more for coal than for the last six months. The deplorable falling off in the traffic and the revenue was solely due to the causes explained at the last meeting, but the questions involved must not be solved in panic. The diversity of advice as to the best means of retrieving their position was so great that they must only be influenced by it to the extent which the circumstances and experience in the conduct of the affairs justified. Electrical traction, of course, was the saving grace if it could be brought about, as they trusted it might, but there were some other measures they might take which would require a great deal of skill and knowledge—viz., the reduction of fares, uniform class, etc. He foresaw that on some parts of the line they would have to do this on account of competition. More than 40 per cent. of their traffic was contributed from places beyond the "District" line proper, and it would be rather a serious matter to reduce the fares at places, say, like Hammersmith. If they did, they stood to lose a great deal more than they gained. The Central London Railway Company were not troubled with these matters, as they had only six miles of line and nothing beyond. After paying the interest on the debentures and the rent charges, there was a very small balance—so disagreeably small that it would not even pay the dividend on the guaranteed stock. Instead of paying 4 per cent., they could only pay at the rate of £2. 6s. 8d. per annum on the half-year. The question was, how was the money to be raised to mend this state of things? He himself was prepared to take a very drastic course—viz., to raise the money over the heads of everybody who would be benefited in the end. They had drawn up a Bill with that intention. Of course, the Board had the sanction of the shareholders to raise £500,000 worth of ordinary stock and £166,000 of debentures, but founded on the market value that would not raise nearly enough money. Unless they resorted to artifices such as lump sum contracts etc., where was the other money to come from? But if they did that, it would be because the shareholders were not wise enough to take the proper course—to raise the money over the heads of everybody who would be benefited by that money. The results of the working of the Central London Railway were not so extremely brilliant to the investor as to make him believe that there would be a very great run of money to support the designers of the many proposed electrical railways in London. The Metropolitan District Company would have to do the best they could to defeat the schemes which would compete with their system. He moved the adoption of the report and accounts.

Mr. L. H. Isaacs seconded.

Mr. S. C. Noble asked for information as to whether or not the Board intended to proceed with Clause 8 of the Company's Bill, which provided for the reduction of the preference shareholders' dividend from 5 to 3½ per cent., and to make it non-cumulative, where it had been up to now cumulative.

The **Chairman** said the directors could do nothing in the matter until a Wharncliffe meeting had been held, which was a parliamentary institution for the express purpose of putting it beyond the power of the directors to carry on any measure affecting the interest of the shareholders without their consent. The preference shareholders must make sacrifices with the others. If they drifted on as they were, and did not equip the railway electrically, things must go from worse to worse. They were advised by eminent gentlemen like Sir Wm. Preece in the matter, and they had got to determine the system of electric traction to be adopted. There were nine different systems suggested, but the directors had a preference as to one of these systems, because it was insisted upon by their technical advisers as being the best. They must have a system which would be applicable both to their line and to that of the Metropolitan Company. Their experts advised them that the system for which they had shown a preference was a great advance on any other system. The Americans said it was not. That was the sort of conflict going on.

Mr. Perks, M.P., said he did not take such a pessimistic view of the situation as some. The only alleged novelty of the system which had been so strongly advocated in the Press was that the initial cost was somewhat smaller as well as the cost of working. They could not afford to experiment with a system which would in the end turn out not to be the best, and he was glad to see that the directors had not committed themselves as to the one to be ultimately adopted.

In reply to a shareholder, the **Chairman** said the case was not so bad that they would have to go into the hands of a receiver and then to arbitration.

The report and accounts were adopted unanimously, and the dividends recommended in the report declared.

Mr. Isaacs and Dr. George Wyld having been re-elected directors, the proceedings closed with a vote of thanks to the chairman.

The report for the half-year ended Dec. 31, 1900, states that the dividend for the remaining four months of the half-year will be at the rate of £1. 10s. per cent. per annum. On the occasion of the recent special meeting to authorise the raising of capital for the "electrisation" of the Company's railways, the causes which have led to the deplorable falling off in the traffic and revenue were fully set forth, and were properly attributed almost wholly to the competition of the Central London Railway and the novel principles upon which that company has started its business. The questions involved must not be solved in panic. Apart from the vital question of adopting electric traction, there may be found means of qualifying in favour of the older companies the severity of the competition now existing. It need hardly be said that the subject is one involving the Board and management in great anxiety and responsibility, and that much caution is requisite to ensure that any proposed remedy may not be worse than the disease. Having regard to the resolutions passed at the extraordinary meeting, the directors believe that it may not be necessary to proceed with the financial clauses of the Bill deposited by the Company, but as it contains further powers with regard to the electrical working and some minor matters it may be found necessary to submit it to the proprietors in Wharncliffe meeting at a future date. Numerous Bills have been deposited in Parliament by various promoters for the construction of electric railways, some of which if sanctioned would seriously affect the District Railway.

SMITHFIELD MARKETS ELECTRIC SUPPLY.

The third ordinary general meeting of the proprietors of the Company was held on Friday last at Winchester House, E.C., Mr. Herbert S. Leon (chairman) presiding.

In moving the adoption of the report and accounts, the **Chairman** said he thought, taking it altogether, they would not be dissatisfied with the balance-sheet for the year; they might, in fact, mildly congratulate themselves upon it. It must be noticed that the present figures were for only 12 months, as compared with 15 months on the last balance-sheet. As to the business of the Company during the last 12 months, it had increased by 6,279 8-c.p. lamps, which represented 57 new customers. There remained still in the markets about 100 new shops to be lighted, and, believing as they all did in the vast superiority of electric light over other illuminants, they had every hope that these hundred shops would in the course of time come on the list. These shops would be profitable customers, inasmuch as they would be long-hour consumers. They had so placed their present machinery that they could take them all on without any increase to their capital outlay. In fact, they were a bit ahead of their requirements at the present time, and were ready for any reasonable demand. At the end of 1900 they spent something like £3,000 on a new boiler, dynamo, and new engines, all of the latest improvements. They were practically all in working order now, and they hoped they would get through the summer at a considerable decrease in working expenses. The necessary money was secured by issuing 3 800 second debentures, raising this issue to 8,000. This did not appear on the balance-sheet. As regarded the future policy of the Board, it would be to limit any further issue of new capital to works which would show a direct and immediate profit to the Company. If they could not see this, it was their intention to maintain their equipment from revenue. In the balance-sheet there was placed £1,000 to depreciation, and the policy of the Board was to maintain, if not increase, that sum. This, he thought, must appeal to everybody as a sound policy, and it was not only the surest way to maintain the machinery in the highest state of efficiency, but it also afforded a lasting foundation for their financial credit. He should like to see the depreciation fund stand at no less than £10,000 in cash. During the year the cost of coal had been £4,155, as against only £2,600 for the previous period. It was a regrettable incident, because it had occasioned very heavy working expenses. As far as one could foresee, the price of coal would be somewhat lower in 1901, and he was glad to say they had made no unfavourable contracts in this respect. The gross profits amounted to £4,459.

Digitized by Google

9s. 3d., and but for the very high price of coal a much better result would have been obtained. Although the directors were unable to declare any dividends, the proprietors might rest assured that the business of the Company was being built up on a very safe and solid foundation. This year the directors had claimed their right, and taken a portion of their fees, which he was sure they would agree was perfectly fair. They intended to popularise the Company in the market, and unless this were done there was a very poor chance of future prosperity for them.

Mr. E. Schenk seconded.

In reply to questions, the **Chairman** stated that the new machinery had not replaced any of the old. It was additional. On the question of the directors' fees, he was quite willing that anyone should take his place as chairman of the Company, and with it his £200 a year. He declined to work any longer for nothing.

The report was then adopted.

Mr. J. Browne Martin having been re-elected a director, the proceedings closed.

NATIONAL TELEPHONE.

From the directors' report for the half-year ended Dec. 31, to be presented to the meeting on 21st inst., it appears that the income for the half year amounts to £732,093, as compared with £663,523 for the corresponding period of 1899, being an increase of £68,570. The working expenses for the half year amount to £404 653, as compared with £359,303 for the corresponding period of 1899, being an increase of £45,350. The net result for the half-year (after deducting the Post Office royalties, amounting to £71,609) is a profit balance of £255,831, as compared with £240,044 for the corresponding period of 1899, being an increase of £15,787. The rentals carried forward for unexpired terms of running contracts amount to £696,568, as compared with £631,590 at the corresponding period of 1899, or an increase of £64,978. Out of the available balance of £204,698 shown by the net revenue account the Board recommends dividends at the rate of 6 per cent. per annum on the first and second preference shares, 5 per cent. per annum on the third preference shares, and 5 per cent. per annum on the ordinary shares. The Board also proposes to transfer £85,000 to the reserve fund, and to carry forward £5,698. The sum of £468,548 has been expended on capital account during the half-year in the erection of 11 794 additional exchange and private lines, and in the construction of underground lines. In the year 23,490 additional exchange and private lines have been erected—a larger number than in any previous year. Of these, 16,776 have been for subscribers on the message-rate system, paying a low annual charge in respect of the cost of installation, and the addition of a sum of 1d. for each call made. So far as this experiment has gone, it has had the effect of reducing the average receipt per subscriber without any commensurate reduction in the working expenses. The working expenses on the whole have considerably increased, owing largely to an exceptionally heavy outlay in repairing damages caused by snowstorm in the early part of the year. The effort to popularise the telephone may possibly justify the message-rate business when it has been further developed. The policy of the Company in the face of possible competition must be to maintain the effort to attract new subscribers and increase as far as practicable the universality and efficiency of its services.

CENTRAL LONDON.

The report of the directors for the half-year ended Dec. 31 states that the amount expended on capital account during the half-year was £158 416. The railway was opened for public traffic on July 30, and the revenue derived from that date to Dec. 31 amounted to £119,890. The working expenses, which were seriously increased by the abnormally high prices of fuel and materials which prevailed during the same period, amounted to £70,434 (58¾ per cent. of the receipts), leaving as net profit for the five months £49,456. The total net revenue amounts to £49,576, and after providing for interest on debenture stock there is an available balance of £39,152. The directors recommend that a dividend be paid on the share capital of the Company for the six months now under review at the rate of 2½ per cent. per annum. To this dividend the various classes of shares will be entitled at the following rates of distribution: undivided ordinary shares at the rate of 2½ per cent. per annum, preferred half shares at the rate of 4 per cent. per annum, deferred half shares at the rate of 1 per cent. per annum. There will remain £3,527 to be carried forward. The number of passengers carried on the railway from the date when it was opened for public traffic to Dec. 31, 1900, was 14,916,922. A Bill has been deposited in Parliament to authorise the construction of a loop extension from the Bank Station and an additional station in Liverpool-street, also for a small loop at the Shepherd's Bush terminus to enable the Company to provide for the carriage of a much larger number of passengers by a more frequent service of trains running in a continuous circuit.

EASTERN TELEGRAPH.

An extraordinary general meeting of this Company was held at Winchester House on Wednesday for the purpose of confirming a resolution passed at the meeting on the 28th ult. as to the alteration of a certain article of association. A motion to this effect was carried.

WATERLOO AND CITY RAILWAY.

At the half-yearly meeting of this Company on Thursday week, **Sir Wyndham S. Portal**, who presided, in moving the adoption of the report, said the receipts had considerably increased, and the working expenses were less than the 55 per cent. limited by the working agreement. He considered that was a satisfactory state of affairs. After paying 3 per cent. on the ordinary stock, there remained £76. 19s. to be carried forward. The passengers carried during the six months numbered 2,038,000, an increase of 268,000. There was also a steady increase in the revenue, and he believed the future of the line would in all respects be satisfactory. In reply to a question, the chairman stated the Company had nothing in prospect with regard to extending the system. All the other electric lines were entirely separate from the City and Waterloo Railway.

The report was agreed to, and a resolution was passed for the declaration of a dividend at the rate of 3 per cent. per annum on the ordinary stock. The retiring directors, Colonel Campbell, Mr. A. F. Govett, and Mr. F. J. Macaulay, were then re-elected.

LIVERPOOL OVERHEAD RAILWAY.

On Tuesday the half-yearly meeting of this Company was held at Liverpool, Mr. Richard Hobson, deputy-chairman, presiding.

In moving the adoption of the report, the **Chairman** said the gross revenue receipts amounted to £43,964 and working expenses to £29 187. During the half-year over 5,500,000 passengers had been carried, which was a considerable increase on the corresponding half of the previous year. This was due to the opening of the electric tramway line at the north end, which had proved a valuable feeder to the railway. The traffic on the railway itself was rather below the corresponding period of 1899, when the receipts were considerably augmented in consequence of the departure of troops for South Africa. The expenses had gone up by a large amount owing to the enhanced price of coal and most other materials, the coal bill being exactly double that of a year ago. A good deal had also been spent in keeping the railway in a high state of efficiency.

The report was adopted.

BLACKPOOL AND FLEETWOOD TRAMROAD.

The half-yearly meeting of this Company was held in Manchester on Tuesday.

Mr. George Richardson, who presided, pointed out that there had been a slight increase in the cost of maintenance over the previous half year. Engine power had increased by about £600, rents were a little less, but rates and taxes were about £250 more. An extra receipt this year was £362 for sale of current. This arose in consequence of the breakdown of the Corporation tramways and the Company were called upon to supply the current, upon which they made a satisfactory profit. The dividend was down 1 per cent., but they were not the only tramway or railway company which had had to submit to a reduced dividend. There was a probability of such building extensions being developed between Blackpool and Fleetwood as would lead to their gaining a residential traffic, and so earning a more even revenue.

The report was adopted.

After a dividend at the rate of 9 per cent. per annum had been declared, the chairman and deputy-chairman were re-elected directors of the Company, and the proceedings closed.

EDINBURGH STREET TRAMWAYS.

The fifty-ninth ordinary meeting of this Company was held in Edinburgh last week, Mr. R. Vary Campbell, chairman, presiding. The report and accounts having been adopted, a special meeting was held to authorise the issue of additional capital in pursuance of the powers of the Company's special Act of 1892.

The **Chairman**, in moving the resolution, said the amount of share capital which the Company were authorised to raise was £75,000, with a fourth more by way of mortgage if required, which was ample, even if the Company were to introduce electricity over their system. The amount of this share capital which the directors advised to be now authorised was £15,000. They might have seen from the newspapers that there had been some negotiations with the Corporation of Leith as to the possibility of introducing electric traction. They (the directors) had their report upon that from a skilled engineer, and he might say a very favourable report. Whenever it was matured and entirely ready, the scheme would be submitted at a special meeting, provided the directors were satisfied.

Mr. Peter Taylor seconded, and the resolution was adopted.

DUBLIN UNITED TRAMWAYS.

The half-yearly meeting of this Company was held in Dublin on Tuesday.

Mr. W. M. Murphy (the chairman), in moving the adoption of the report, said the directors had declared the same dividend as this time last year—namely, 6 per cent. on the ordinary shares—but the aggregate profits to be carried forward were less by £3,702. The United Tramway system showed an increase of £12,639 in the receipts for the half-year. The Southern District Company's accounts for the Dublin and Dalkey line showed an increase of £1,119 in the traffic receipts. The Chairman, in con-

Digitized by Google

clusion, pointed out that the net profits of both made a total of £53 722 for the half-year.

In the course of a discussion which followed, it was suggested that there should be an amalgamation to simplify the accounts, and an observation was made that the fares were too cheap and might be raised.

A **Shareholder** also complained that the expenses were too great. The report was ultimately adopted unanimously.

APPOINTMENTS VACANT.

Electrical Engineers.—Bath Town Council, £350 per annum, Feb. 28. Details in our advertisement columns.—Isle of Thanet Electric Tramways and Lighting Company, to take charge of power station, Feb. 27. Full particulars in our last issue.

Accountant Clerk, Institution of Electrical Engineers, £200 per annum, March 9. Details in our advertisement columns.

Motor Inspector, Bradford, must have had first-class experience in fixing and running direct-current motors of all sizes, and be able to carry out repairs, 34s. per week of 50 hours. Details in our advertisement columns.

Foreman Electrician, must be accustomed to taking charge of men, have practical knowledge of wiring of ships and houses for incandescent lighting. Details in our advertisement columns.

Draughtsman wanted by a firm of consulting engineers, 25s. Details in our advertisement columns.

Mechanician wanted by a firm of meter manufacturers. Details in our advertisement columns.

Electrical Engineer and Manager, Lincoln Corporation, to take entire charge of the electricity works, £300 per annum, March 11.

Shift Engineer, Manchester Corporation, March 4.

CONTRACTS FOR ELECTRICAL SUPPLIES.

CONTRACTS OPEN.

King's Lynn.—The electrical engineer has been directed to invite tenders for the supply of 150 tons of anthracite and 80 tons of steam coal.

Manchester.—The Tramways Committee invite tenders for the electrical equipment of 87 cars. Tenders by March 4. Details in our advertisement columns.

Leeds.—The Tramways Committee invite tenders for supplying and fixing trolley wires and attachments. Tenders by March 8. Details in our advertisement columns.

Middleton.—The Corporation invite tenders for the supply, delivery, and erection of a traction switchboard. Tenders by Feb. 28. Details in our advertisement columns.

Hastings.—Tenders will shortly be advertised for the supply and erection of the necessary boiler power, feed pumps, etc., which it is estimated will cost about £4,494. 10s.

Ploesti (Roumania).—The Municipality invite tenders for the laying down and working of electric tramways for 30 years. The provisional deposit is £2,000. Tenders by April 3.

Sofia.—The District Finance Department require tenders for various telegraph and telephone materials, amounting to about £2,800. The deposit is 5 per cent. Tenders by March 8.

Southampton.—The Corporation invite tenders for insulated electric cables, frames, and covers, including excavation and reinstating of roadways. Tenders by March 11. Details in our advertisement columns.

Leeds.—The Tramways Committee invite tenders for supplying and fixing trolley wires and attachments. Specifications, etc., may be obtained at the City Engineer's Office, Municipal Buildings, Leeds. Tenders by March 8.

Cardiff.—The Corporation invite tenders for the erection of an electric tramway power station at Roath, Cardiff. Specification, etc., may be obtained at the office of Mr. W. Harpur, M.I.C.E., borough engineer. Tenders by Feb. 28.

Wallasey.—The Urban District Council invite tenders for the overhead equipment of about 10 miles of tramways and for the supply and erection of section boxes and the bonding of rails. Tenders by March 4. Details in our advertisement columns.

Leeds.—The Tramways Committee invite tenders for cast-iron pipes, with the necessary drawing-in boxes and wires, and supplying insulated conductors and drawing the same into the pipes. Tenders by March 8. Details in our advertisement columns.

Alcaraz (Albacete, Spain).—The Municipal Authorities invite tenders for the installation and working for 20 years of electric lighting. An annual payment of 23 pesetas will be made per 10-c.p. lamp. The provisional deposit is 276 pesetas. Tenders by Feb. 28.

Cardiff.—The Corporation invite tenders for steam-pipes, exhaust pipes, injection and overflow pipes, feed pipes, drain pipes, engine-house flooring, and switchboard gallery and central service gangway. Tenders by March 18. Details in our advertisement columns.

St. Pancras.—The Guardians invite tenders for the installation of an electric fire-alarm system at the St. Pancras infirmary, Dartmouth Park-hill, N. Specification, etc., may be obtained at the office of Mr. Alfred A. Millward, clerk, Town Hall, Pancras-road, N.W. Tenders by Feb. 28.

Stockport.—The Gas and Electricity Committee invite tenders for supply and erection at their electricity works, Millgate. Stockport, of a condensing plant capable of dealing with 20,000lb. of steam per hour. Specifications can be obtained from Mr. S. Meunier, engineer. Tenders by March 6.

Bournemouth.—The Corporation invite tenders for the supply of three steam dynamos and two steam-driven surface condensers, and other works in connection therewith. Specifications, etc., may be obtained of Mr. F. W. Lacey, M.I.C.E., borough engineer, Municipal Offices, Bournemouth. Tenders by March 2.

Luton.—The Town Council invite tenders for wiring for electric lighting purposes the Council-chamber, town hall, free library, corn exchange, and baths. Sketches of designs and full details of the proposed works to be given. Further information can be obtained of the Borough Engineer. Tenders by March 4.

Coventry.—The Sanitary Committee invite tenders for the work required in connection with the electric lighting of the new buildings at the infectious diseases hospital. Specification, etc., may be obtained at the office of Mr. J. E. Swindlehurst, city engineer, St. Mary's Hall, Coventry. Tenders by March 4.

Huddersfield.—The Corporation invite tenders for motorcarts suitable for conveying about five tons of coal from the local collieries to the electricity works. Further particulars may be obtained from the borough electrical engineer, Mr. A. B. Mountain, Electricity Works, Huddersfield. Tenders by March 5.

Bradford.—The Corporation invite tenders for the works required to be done in erection of a generating station at the electricity works, Valley-road, Bradford. Specifications, etc., may be obtained on application at the office of the Clerk of Works at the Electricity Works, Valley-road, Bradford. Tenders by March 5.

Bristol.—The Electrical Committee invite tenders for the erection of the superstructure of the Avonbank electricity works, Feeder-road, Bristol. The work comprises a large amount of steelwork, as well as brickwork and concrete work. Specification, etc., can be obtained at the office of Henry Williams, Esq., architect, 24, Clare-street, Bristol. Tenders by March 12.

Wolverhampton.—The Tramways Committee invite tenders for the supply of the necessary materials and labour for the construction of tramway track and contingent works in Tettenhall-road, Newhampton-road, Waterloo-road, Darlington-street, Queen-square, Lichfield-street, Fiveways, Piper's-row, Bilston-street, Cleveland-road, and Bilston-road, to the borough boundary, amounting to a route length of about 4½ miles, mainly double track. Specification, etc., may be obtained on application at the Borough Engineer's Office, Town Hall, Wolverhampton. Tenders by Feb. 26.

Bray (Ireland).—The Urban District Council invite tenders for the supply and erection of: (Section A) boiler-house plant—one Lancashire boiler and accessories; (Section B) engine-house plant—(1) one 150-kw. high-speed steam alternator, and (2) one 25-kw. rope-driven alternator and accessories, for the municipal electricity works. Specification, etc., may be obtained by manufacturers at the offices of Mr. Robert Hammond, M.I.C.E., the consulting engineer to the Council, 64, Victoria-street, Westminster, London, S.W. Tenders by March 14.

RESULTS OF TENDERS.

Hastings.—The tender of Parsons and Co., at £5,005. 10s., has been accepted for a 500-kw. alternator.

Bolton.—The Electricity Committee have accepted the tender of Glover and Co. for the supply of cables.

Whitehaven.—The tender of Messrs. J. Walker and Son has been accepted for the wiring, etc., of the electric light station.

Tynemouth.—The Town Council have accepted the following tenders: Siemens Bros., London, engine and dynamo for the electric works, £4,832; Yates and Thom, Blackburn, boiler, £1,070.

Harrogate.—The Town Council have accepted the tender of Messrs. Holdsworth and Sons, of Bradford, at £2 395, for two Lancashire steam boilers, with saddle gangway, economiser, and settings.

Bradford.—The Tramways Committee have accepted the tender of Messrs. Blackwell and Co., Limited, London, at £6,204, for the complete electrical overhead equipment of over five miles of tramway.

Brighton.—The tender of Messrs. Pedrette and Co., of £35,760, is recommended for acceptance for (1) concrete foundations for the Corporation's power-house at Southwick; (2) wharf and timber piling; (3) timber dam and concrete weir.

Eastbourne.—The Electric Light Committee have accepted the tender of Messrs. J. E. Johnson and Son, 90, High Cross street, Leicester, at £9,100, for the erection and completion of a proposed electric lighting station, with administration block.

West Ham.—Messrs Ferranti's contract for plant has been accepted, and also the tender of Messrs. Veritys, Limited, 31, King-street, Covent Garden, W.C., at £1 321, for two 25 b.h.p. oil-engines, two 15 kw. dynamos, one battery of accumulators, switchboard, etc., at Dagenham Hospital, Essex.

Sunderland.—Mr. B. Thomas, Cornbrook Telegraph Works, Manchester, is the successful contractor for the switchboard, and the Chatteris Engineering Company, Limited, Chatteris, Cambs, for the travelling crane. The tenders for condensing

Digitized by Google

plant and battery will come before the Lighting Committee on March 1.

Walsall.—The Town Council have accepted the tender of the Walsall Electrical Company, Limited, at £6. 7s. 6d., for connecting the Pleck sub-station with the generating station in Wolverhampton-street by telephone; also the tender of the Smethwick Boiler Covering Company, Limited, at £14. 16s. 11d., for covering the new boiler and steam-pipes.

Southampton.—The Town Council have accepted the following tenders: F. Osman, for the construction of tramways from the Docks Station to the Avenue, viâ St. Mary-street, and for the reconstruction of the existing tramway in Canute-road, £10,344; Robert W. Blackwell and Co., for the overhead electrical equipment of lines (St. Mary-street section), £2,079. 18s.; George F. Milnes and Co., Limited, for the supply of car bodies and trucks, £326. 10s. per car, subject to Challenger seats being substituted for Burns seats; and British Westinghouse Company, Limited, for the supply of motors and electrical equipments, £253. 15s. per car.

Bromley (Middlesex).—The following tenders have been received for sundry work in connection with the installation of electric light at the Poplar and Stepney Sick Asylum:

C. Cooper and Co.	£4 075	0	0
Speedy, Enon, and Co.	3,493	10	0
G. Weston and Co.	3 488	0	0
J. C. Christie	3 345	0	0
F. A. Glover and Co.	3,262	0	0
Strode and Co.	3 193	0	0
J. Bolding and Sons, Limited	2 899	15	0
R. Dawson and Co., Limited	2 876	0	0
V. E. Middleton	2,734	10	0
J. J. Roche and Co.	2,596	0	0
Frigell Bros. and Louis	2,550	0	0
National Wiring Company	2,540	0	0
H. F. Joel and Co. and T. Potter and Sons, United	2,439	0	0
Young and Marten, Limited	2 359	0	0
C. Peacock and Co. (accepted)	2,039	0	0
Whittaker Bros., Limited	1,756	19	6

BUSINESS NOTES.

TRACTION.

Rochdale.—The Town Council have approved the terms of the tramway agreement with Heywood.

Chatham.—The work of constructing the proposed electric tramways will be commenced shortly.

Keighley.—The Corporation are about to purchase the Keighley tramways undertaking for the sum of £8,900.

Seaton Carew.—A start has now been made with the construction of the tramway from Hartlepool to Seaton Carew.

Portsmouth.—The work of constructing the permanent way of the Corporation tramways was formally commenced last week.

Swindon.—It was stated at the monthly meeting of the Town Council that the overhead system of traction is to be adopted.

Garston.—The Urban District Council have determined to oppose the Manchester and Liverpool Electric Express Railway Bill.

Surrey.—The County Council have decided to oppose the London United Tramways Bill for the protection of county interests.

British Electric Traction Co.—Issue has been made this week of 30,000 six per cent. cumulative preference shares of £10 each at £11. 10s. per share.

Central London Railway Co.—The directors of this Company announce an issue of £876,000 4 per cent. debenture stock at the price of £118 per cent.

Gateshead Tramways Co.—A meeting of this Company was held on Wednesday at Gateshead for the purpose of confirming the Bill now before Parliament.

Southampton.—The specification for the construction of tramways in St. Mary-street and the reconstruction of the existing tramway in Canute-road has been approved.

Bushey.—The Parish Council have been asked by the promoters to give their consent to the Watford and district tramways scheme. The details are to be considered at a special meeting.

Dumbarton.—At the Town Council's meeting last week the Clerk reported that the applications of the electrical power companies had been ordered to be dealt with by way of private Bill.

Walthamstow.—At a public meeting convened by the District Council a resolution was carried that the meeting approved of the efforts of the Council in promoting an electric tramway scheme.

Holme Cultram.—The Urban District Council have notified the County Council that whatever scheme for electric tramways gave them communication with the West would be acceptable to them.

Wood Green.—At a special meeting of the Council held last week in connection with the East Middlesex Electricity Bill, it was agreed that the Council take no further proceedings in the matter.

East Suffolk.—At a meeting of the Roads and Bridges Committee of the County Council on Tuesday a resolution was passed that "every motorcar shall in future carry a number in front and a number behind."

Prestwich.—The District Council have approved the draft agreement with the Manchester Corporation as to the laying down and working of electric tramways in the Prestwich district by the Corporation.

Manchester.—The Corporation have carried out the greater part of the work of relaying the tramway lines for electric traction on the routes to Cheetham Hill and to Hightown, which altogether cover several miles.

Continental Electric Railway.—The electric railway from Fayet to Chamounix, which is 12 miles long and has several tunnels and earthworks will be inaugurated on July 1, having been completed within two years.

Flintshire.—The County Council have decided to oppose the Bill of the Chester Corporation for powers to lay down an electric tramway from the boundary of the borough to the Stone Bridge at Saltney unless the road be widened.

Huddersfield.—Major Druitt, Board of Trade inspector, has again inspected that part of the Lindley section of the electric tramways with which he had been dissatisfied, and the new cars were started at the end of last week.

Twickenham.—The District Council have refused at the present time to consent to the Middlesex County Council becoming the purchasing authority under the London United Tramways Bill. The Council have sealed a petition against the Bill.

Bury.—The Corporation have notified the Rochdale Corporation that, after due consideration of the question, they are of opinion that it would not be desirable to act in conjunction with the other authorities in the taking over of the existing tramways.

Sheffield.—Although tramcars have been running successfully to Owlerton for some weeks, the formal sanction of the Board of Trade is still required. On Tuesday Major Pringle, R.E., one of the Board's inspectors, inspected the track, to which he raised no objections.

Leicester.—At the last meeting of the tramways company some discussion took place with reference to the decision of the Corporation to purchase the undertaking, and the hope was expressed that the matter might be amicably arranged without resort to litigation.

Ashton.—The Town Council have resolved to proceed forthwith with the construction of the proposed tramways within the borough. The recommendation of the Tramways Committee that the undertaking be carried on wholly by the Corporation and not leased was adopted.

Newcastle.—At a meeting of the Tramways Committee last week it was stated that the Walker Council Board had resolved to accept the offer of the Newcastle Corporation as to running the tramcars to Walker. The committee decided to purchase a turbine for £170 for pumping purposes.

Paddington.—It is rumoured that a scheme of municipal tramways in the borough would meet with approval by a large number of the members of the Council. At the last meeting it was decided to oppose the West and South London Junction Railway and the London United Tramways Parliamentary Bills.

Perth.—On Tuesday a meeting of the Town Council in committee was held to consider the proposal to purchase the tramway system. It was agreed to recommend the Council to offer £20,000 for the system, failing the acceptance of which to make the necessary application to the Board of Trade for arbitration.

Bolton.—The tramway system, which has been in the hands of the Corporation a little more than 12 months, is developing so rapidly that the new car-shed, erected at a cost of about £20,000 for the accommodation of 70 cars, will be too small when completed. Already 59 cars have been delivered, and 22 are still on order.

Leigh.—The Town Council have decided to obtain statutory powers to enable them to construct and work tramways within the borough; and to request the South Lancashire Tramways Company to withdraw from their Bill such clauses as relate to tramways within the borough other than along the main road to Bolton.

Hackney.—The General Purposes Committee in their report recommend that the most strenuous opposition be offered to the City and North East Suburban Electric Railway Bill, and that the North-East London Railway Bill be also opposed; further, that the proposed London County Council tramway along Amhurst-road be approved.

Scarborough.—The Town Council have unanimously resolved to apply for a provisional order empowering them to construct electric tramways in the town. The total cost is estimated at £79,545, of which £70,011 represents the cost of the proposed tramways, and £9,534 the cost of the new street, street widening, generating station, and car sheds.

Edinburgh.—The Corporation have decided to ask the National Electric Traction Company to transfer the powers granted to that company under the Portobello and Musselburgh Tramways Order, 1900, for the construction of a tramway from the termination of the Corporation's present line at Joppa to the city boundary at Magdalene Bridge.

City and South London Railway.—The estimated cost of the subway at Islington to connect the Royal Agricultural Hall with the authorised extension of the line is put down at £40,592, but provision is made in the Bill for the creation of £200,000 additional capital for the purposes of this subway and for the general purposes of the company's undertaking.

Blackpool.—It is believed that the Fylde Water Board's mains are being more or less injured by the electric current from the

Digitized by Google

Corporation and the Blackpool and Fleetwood tramways. A committee of the Board having considered the question, recommend the diversion of the mains in some places, and a basis of settlement is expected to be shortly come to.

North Shields.—Although the Board of Trade inspection has taken place, the new electric tramway to Whitley is not yet open to the public. The reason assigned for the delay is that whereas the new power station was able to supply sufficient electricity for the inspection, a regular service could not at once be guaranteed. Within the next few days the trams will probably be running.

Southend.—The Corporation have come to terms with the Leigh Urban District Council as to the construction of the tramway in their district. A further effort is to be made to obtain borrowing powers to the extent of £2,600, the cost of providing new motor-cars and making the necessary alterations for the current to be received at the pier direct from the generating station in London-road.

London United Tramways.—Tests in regard to the possible effect of the electric current for the tramways at Kew upon the scientific instruments at the observatory are still being made. No arrangement has yet been come to with the observatory authorities, but it is confidently expected that this will be effected shortly. Just at present it is unlikely that cars will be run for the public.

Kingston.—The Town Council have addressed a communication to the Surrey County Council, suggesting that the County Council should unite with them in resisting the London United Tramways Bill, and that the County Council should themselves, in consultation with the local authorities concerned, obtain tramway or light railway powers, either by Bill or by order, as may be found the more expedient.

Hampton (Surrey).—The District Council still refuse to give their consent to the tramway company's Bill unless the company widen the Hampton-road in accordance with the plan submitted. The County Council are to be asked what terms they would be prepared to offer to the District Council in the event of the latter consenting to their request that they be allowed to become the purchasing authority.

Dundee.—A conference took place on Tuesday between a committee of the Town Council and a committee of the Dundee and Arbroath Joint Railway Company in regard to the opposition raised by the railway authorities against the Corporation Bill in connection with the tramway extension in Ferry-road. The railway representatives gave no undertaking as to how they would act, and the conference came to a close for further consultation.

Municipal Tramways.—At a conference on the subject of municipal tramways convened by the Educational Arsenal Co-operative Society recently, the following resolution was adopted: "This conference of co-operators and others heartily approve of the principle of municipal ownership of tramways, and pledges itself to support the London County Council in seeking to acquire and work the same, believing such action to be in the best interest of the people at large."

Hyde.—At the last meeting of the Town Council it was stated that application had been made to various members of Parliament, including Mr. E Chapman (the member for the Hyde division) to allow their names to be used as "backers" of the Bill for a joint scheme of electric traction for Hyde Dukinfield Stalybridge, and Mossley, and that Sir James Kitson, Mr. Ridley, and Mr. Platt-Higgins had consented, but that Mr. Chapman found himself unable to back the Bill unless he was assured that by doing so he would not be bound to all its provisions, some of which he objected to.

Barrow.—At present there are absolutely no arrangements for carrying on a tramway service for any length of time, as the official of the Board of Trade, who is in the town, declines to do more than grant a one-day license at a time. Another inspection of the permanent way has been made. So far the Corporation decline to pay the price—£30,000—asked for the tramways, on the ground that before very long they would have to go in for a complete electric service, and that this would entail great cost. The Trades Council have formed a committee to approach the Town Council and urge them to purchase.

Liverpool.—The Council intend to petition against the Manchester and Liverpool Electric Express Railway Bill for the purpose only of obtaining protective clauses. As a result of the recent electric wire accident claims for compensation for personal injuries have been made. The Tramways Committee have resolved that they cannot be entertained. At the adjourned inquest upon the bodies of the two men killed by the accident, expert evidence was given to the effect that the only effective method of averting the danger was to place the telephone wires underground. It was stated that the Telephone Company are doing this in Liverpool as rapidly as possible.

Birmingham Tramways.—From a detailed estimate of the cost of the proposed tramways extensions deposited in the Private Bill office by the City of Birmingham Tramways Company, Limited, it appears that the aggregate length of these extensions is just over 1¼ miles, which is made up of five short junction lines. The total cost of constructing the lines is put down at £14,172, but provision is to be made in the Bill to empower the Corporation of Birmingham to construct four out of the five extensions provided that the Corporation within three months serves a notice on the company stating its intention to do so. In the event of the Corporation constructing these tramways, a lease of them is to be granted to the company. In view of the proposed system of overhead traction to be laid down along the Bristol-road route a report is to be prepared as to the existing telegraph and telephone wires crossing the road, and the fullest precautions will be taken to protect the system against any accident of the kind reported from Liverpool.

Berlin.—The Grand Tramway Company of Berlin, which operates no less than 257 miles of track in the German capital, and employs 7,145 men, carried 236,000,000 passengers last year, as against 188,000,000 in 1899. The methods of working are the overhead trolley system of electric traction (453 cars), the electric storage battery method (420 cars), and horse cars numbering 1 371. The storage battery cars will probably be discontinued at an early date, and the horse cars will also be abandoned when the direct-current system has been introduced throughout the tramway network. Although the working expenses increased owing to higher wages and shorter working hours, and absorbed 59·65 per cent. of the receipts, the net profits for the year amounted to £289,893, as compared with £267,896 in 1899. After paying £89,440 to the Berlin Municipality and other local authorities, in accordance with existing agreements, the company is able to pay a dividend of 11 per cent. for 1900, as compared with 10½ per cent. in the previous year.—*Financial Times.*

Big Electric Railway Scheme.—A gigantic scheme for a direct electric railway route from East to West of England is reported to be on foot. The *Manchester Evening Chronicle* states that the promoters have in view the building of an entirely new railway from Harwich to Porth Dinlleyn in Wales, and another railway connecting with this at Leicester from Hull, the total cost of which, with necessary appliances and dock accommodation at Porth Dinlleyn, is estimated at about 20 millions sterling. The authors of the scheme are Messrs. Bennett and Ward-Thomas, consulting electrical engineers, of Manchester and London, and the promoters are a syndicate of London financiers, who have a preliminary capital of £50,000. The motive power will be provided from electrical stations placed at intervals along the route, and will be communicated to the train through the medium of a trolley wire or rod, on precisely the same principle as that used in overhead electric tram traction. The promoters think that a speed of 100 miles an hour, which would enable people to travel from Harwich to Porth Dinlleyn (which is near to Nevin) in under three hours, will be sufficient for their purpose. Negotiations which have up to the present been carried out indicate the probability of support from most of the county councils concerned, the Hull Corporation, and several of the railway companies.

London County Council.—At the Council meeting on Tuesday the Finance Committee reported, in regard to the tramways scheme, that the estimate of £623 500 provided for the reconstruction of lines between the Tooting terminus and the termini at Westminster, Waterloo-road, and Blackfriars Bridge, and also for the provision of a generating station which will be sufficient to supply power for the whole of the lines on the south of the Thames. The Highways Committee recommended that the expenditure be authorised for the purpose named. The recommendation was adopted. The tenders for the supply of boilers, etc., required for the generating station were opened. The Council have resolved that petitions be presented, if necessary, against the following Bills: Railway Bills—Metropolitan Tottenham and Hampstead Junction, Brompton and Piccadilly-circus (Extensions), Central London, Charing Cross, Euston, and Hampstead (No. 1), Charing Cross, Euston, and Hampstead (No. 2), Charing Cross, Hammersmith and District Electric, City and Brixton, City and North-East Suburban Electric, City and South London, Islington and Euston, King's-road, North-East London, Piccadilly and City, West and South London Junction; Tramway Bills—Bexley Tramways, London United Tramways. The Parliamentary Committee reported that in some cases it might be necessary for the Council to oppose on questions of principle, but in several instances the Council's opposition would only be carried on with a view to obtaining the insertion of clauses. An inspection was held last week at the tramways depôt, Camberwell New-road, of an electrically equipped car and a length of permanent way, similar to that to be laid down for the South London lines.

LIGHTING AND GENERAL.

Royal Tour.—The "Ophir" is to be fitted with a set of wireless telegraphy apparatus.

Dewsbury.—The Electric Power Bills for Yorkshire will be opposed by the Corporation.

Beckenham.—The question of extending the electric light in Beckenham-road is being urged.

Morecambe.—The Alhambra electric lighting dispute is still being carried on by the Council.

Paddington.—The Borough Council have decided to oppose the Metropolitan Electric Supply Bill.

Trowbridge.—The maximum price has been fixed at 6d., the Urban District Council consenting.

Paisley.—Mr. C. F. Parkinson, Morecambe, has been appointed electrical engineer of the borough.

Manchester.—Mr. G. F. Metzger, of Bath, was at Wednesday's meeting of the City Council appointed chief electrical engineer.

Taunton.—Application is to be made for sanction to raise a loan of £17,800 for extension of the Corporation's electric light works.

Leamington.—The Board of Trade have fixed March 1 next as the date for the commencement of the Electric Lighting Order, 1900.

Digitized by Google

Weston-super-Mare.—The Urban District Council are earnestly considering the question of lighting the Marine-parade with electricity.

Arbroath.—The Town Council on Tuesday decided that the Corporation should themselves carry out the work of introducing the electric light.

Keighley.—Mr. W. Mackintosh, from the Southport Corporation electricity works, has been appointed to the post of assistant electrical engineer.

Berwick.—We understand that the electric light company are in communication with the Harbour Commissioners with regard to ground for a station.

Harrogate.—The Corporation last week received the electrical engineer's report, and resolved that a third of the net profits be placed to reserve fund.

Pudsey.—A report has been obtained as to the cost of the electric light, which, however, put the expenditure at £25,000 for 65 lights, and was thus found too expensive.

Driffield.—Another attempt is being made to obtain telephone communication for the town, and seems likely to meet with success. Dr. Brand is the moving spirit.

London Gazette.—Mr. R. M. Burgess, chartered accountant, 38, Albion-street, Leeds, has been appointed trustee in the estate of T. A. Flather, 406, Meanwood-road, Leeds.

Tynemouth.—At a recent special meeting of the Town Council it was stated that they had got so many customers for electricity that it would be necessary to enlarge the power station.

Metropolitan Electric Supply Co.—The directors recommend a final dividend for the year ended Dec. 31 of 6s. per share on the original shares and 9d. per share on the new shares.

Ashton.—The Council have asked Mr. Hammond to attend a special meeting of the Works Sub-Committee to be held on an early date to discuss his report and the sub-committee's report also.

Tottenhall.—The District Council have consented to the application of the Midland Corporation for Power Distribution, Limited, for a provisional order for the supply of electrical energy in the district.

Chelsea Electricity Supply Co.—The transfer books of the preference shares and ordinary shares will be closed from Feb. 26 to March 6 (both days inclusive) for the preparation of dividend warrants.

Hastings.—Application is to be made for sanction to the borrowing of £9,500, particulars of which appear in other columns. The existing lighting at the White Rock baths is to be improved, at a cost of £72.

Chatham.—We understand that arrangements have been made for an expert from London to finally report upon the valuation of the electric lighting company's undertaking, which the Corporation are anxious to purchase.

Midsomer Norton.—Mr. Preece recently visited the district, in company with Mr. George Pearson, the surveyors and chairmen of both urban councils, *re* the proposed electric lighting, and his report is expected shortly.

Gateshead.—The Gateshead Electric and Mechanical Supply Company, Limited, has secured the contract for the electric lighting of the large confectionery works of Messrs. Edward Bone and Co., Gateshead-on-Tyne.

Jedburgh.—At a special meeting of the Town Council on Tuesday the agreement between the Council and Messrs. Crompton and Co., London, for the installation and maintenance of electric light in Jedburgh was agreed to.

Brompton and Kensington Electricity Co.—A dividend for the half-year ended Dec. 31 at the rate of 7 per cent. per annum, making with the interim dividend 6 per cent. for the year on the ordinary shares, is recommended by the directors.

Penzance.—A lengthy report on the proposed installation of electric light has been submitted to the Town Council. The scheme involves an expenditure of close on £30 000. Consideration stands postponed until the report has been circulated.

Portsmouth Telephones.—The following notice of motion has been given with regard to the proposed municipal telephones: "That the committee be instructed to have specifications prepared, advertise for tenders, and report to the Council."

Electrical Engineers (Dublin Section).—At a meeting of this society, at the Royal Dublin Society, on Feb. 21, at 7.30 p.m., a paper was read by Mr. Arthur Jacob, member, on "The Electrical Equipment of the Dublin United Tramway Company's System."

Newton Abbot.—An engineer employed by the Electric Supply Company visited Newton Abbot on Saturday for the purpose of selecting a site for the proposed electricity works, which are about to be erected in accordance with the provisional order granted to the company.

W. T. Henley's Telegraph Works Co.—Subject to audit the directors recommend a dividend on the ordinary shares for the past year at the rate of 20 per cent. (less income tax) less the interim dividend of 4 per cent. paid on Sept. 1 last, payable March 1, 1901.

Pacific Cable.—The Victorian Government are communicating with the Governments of Queensland and New Zealand with a view to forwarding a combined message to the Pacific Cable Board, suggesting a joint undertaking with the Eastern Extension Telegraph Company.

Woolwich.—The Electrical Engineer has reported to the Electricity Committee that he has arranged with the contractors to commence laying in the underground mains at Plumstead, weather permitting, in March next.

Stock Exchange.—The Stock Exchange Committee have ordered British Columbia Electric Railway Company's 20,000 ordinary shares of £10 each, fully paid, Nos. 1 to 20,000, and £250,000 4½ per cent. first mortgage debentures of £40 each, Nos. 1 to 6,250, to be quoted in the official list.

Sale of Plant.—The Electric Lighting Committee of the Hull Corporation are prepared to receive offers for four Willans-Siemens direct-coupled steam dynamos, together with spare armatures and other parts, switchboards and accessories. Particulars appear in another column.

St. Albans.—Mr. Hammond has been engaged as expert in connection with the electric lighting provisional order and to advise the Corporation upon the advisability of lighting up by electricity "on their own," or as to which of the three schemes before the committee was the best.

Burton.—The quantity of electricity sold during the past month was 32,600 units, showing an increase of 3,622 units in the corresponding month of last year. Notice has been given of a resolution in respect to an alteration in the price of electrical energy for power and heating purposes.

Evesham.—It has been resolved by the Gas Committee that a system of electric lighting, if introduced, should be in the hands of the Town Council, but that the information at present received does not warrant the committee in recommending the Council to incur the expense of an installation at present.

Partick.—A local paper says the streets are in a bad state just now owing to the operations connected with the laying of telephone wires and electric cables. It may be here mentioned that the Partick councillors did a good stroke of business in their negotiations with the National Telephone Company.

Calverley.—At a special meeting of the District Council on Monday several notices of application for the supply of electrical energy were discussed. A deputation was appointed to obtain further information from the applicants and from neighbouring councils as to the steps they were taking in the matter.

St. Marylebone.—The Lighting Committee are considering the whole question of street-lighting in the borough. They have sanctioned a notice from the Metropolitan Electric Supply Company as to the laying of a 5in. cast-iron pipe along the west side of East-street, from south side of Dorset-street to No. 19.

Lewisham.—The Borough Council have decided to inform the London County Council that it was desirable that a further conference should take place between the representatives of the County Council and the metropolitan borough councils on the subject of generating stations for the supply of electricity in bulk.

Grimsby.—The Lighting Committee on Monday decided that the streets should be lit with electricity after March 31, and that in the meantime the arc lamps now ready and others as they became necessary should be lighted from 7.30 p.m. to 10 p.m. on Thursdays and Sundays, and from 7.30 p.m. to 11 p.m. on Saturdays.

Heywood.—Borrowing powers have been obtained to the amount of £15,000 for the electricity works. An invitation to visit and inspect the electric lighting installation at the county lunatic asylum at Prestwich has been accepted by the Electric Lighting Committee. The vestibule at the electricity station is to be lined with glazed tiles at the height of 4ft. 6in.

Islington.—The former Electric Lighting Committee has been renamed Lighting Committee, and is now constituted as follows: Councillor S. Lambert (chairman), the Mayor (W. J. Crumphy, Esq., J.P.), Aldermen W. Beale and W. Matins, and Councillors P. Gast, J. D. Moore, J. A. P. Usher, W. H. Whadcoat, G. T. Wilson, A. Myers, F. G. Watkinson, L. Wilkins, and A. G. Wylie.

King's Lynn.—The engineer in his last report stated that six additional applications for current had been received during the month, the total number of lamps now applied for being 7,877 of 8 c.p. or equivalent, an increase of 238; and that street lamps had been fixed in Friars-street, Dilke-street, Paxton-terrace, Highgate House, Globe Cottages, All Saints'-street, and Austin-street.

Ormskirk.—A letter from the Ormskirk Urban District Council enquiring whether the Board of Guardians would be prepared to take a supply of electricity for lighting and motive power at the workhouse in the event of the Council being in a position to supply it on terms to be arranged, is before a sub-committee of the Guardians. The opinion appears to be in favour of a separate plant for the workhouse.

Electric Lighting Boards.—The directors of the Company of this name announce that a special demonstration of their electric lighting boards and strips was given recently before the Czar of Russia and several other Royal personages and members of the Government at St. Petersburg. Considerable interest was expressed in the system, the Czar himself personally manipulating the lights on the boards.

Bolton.—There are now 22 churches, chapels, and schools installed with electric light in Bolton supplied by the Corporation, and on Sunday the installation was utilised for the first time at Folds-road Independent Methodist Chapel. The work of installation has been done by the Bolton Corporation fittings department, under the supervision of Mr. Robert Baker, gas and electricity fittings superintendent.

Digitized by Google

Hampstead.—An artesian well has been sunk by the Hampstead Borough Council at their electric lighting works, Lithos-road. It is reported that at a cost of £600 the well has been sunk 500ft. and a yield of 600 gallons of water per hour obtained. It has been decided to proceed for another 100ft., at a cost of a further £160, in the hope that a yield of 4 000 gallons an hour can be obtained. This will save £500 per year, and ensure a permanent supply.

Cable Communications Committee.—A meeting of the Cable Communications Committee was held on Tuesday at St. Stephen's House. There were present Lord Balfour (chairman), the Marquis of Londonderry, the Earl of Hardwicke, the Earl of Onslow, Major-General Sir J. Ardagh, Rear-Admiral R. N. Custance, Mr. Roland Wilkins (secretary), and Mr. J. H. Lindsay (assistant secretary). The evidence of Sir Edward Sassoon, M.P., was taken.

Southampton.—The Guardians have decided to reduce the ratable value of the electric lighting works from £2 560 to £800 subject to the consent of the justices at the special rating sessions. The Council intend to apply for sanction to borrow £4.000, the cost of the new engine, foundations therefor, and other works connected therewith. The maximum load for the year was recorded on Christmas Eve, on which day it reached 630 kw., exclusive of the trams, which averaged 200 kw.

Heathman and Co.—We are informed that in consequence of increased business new factory buildings have been erected by this firm, the makers of the well-known telescope ladders, behind 72, Rectory-road, Fulham, to which they have removed their chief offices and the whole of their machinery and workmen. They will continue their west central show and sale rooms at 37, Endell-street, Long-acre, W.C., and their northern show and sale rooms at 7, Pentonville road, Angel, N.

Tunbridge Wells.—We learn that the municipal telephones established at Tunbridge Wells have been warmly supported. The subscribers are in excess of those on the books of the National Telephone Company, and further support has been promised. The municipal telephones are cheaper by about £2 a year. The National Telephone Company are now introducing the party system, under which subscribers are charged 2d. a day, and are otherwise endeavouring to meet the opposition of the Town Council.

Edison and Swan United Electric Light Co.—A payment on account of the dividend of the current year will be made at the rate of 5 per cent. per annum, less income tax, on the "A" shares of the Company, in respect of the half-year ended Dec. 31, 1900. This will work out at 1s. 6d. per share on the partly-paid £5 shares, £3 paid, and 2s. 6d. per share on the fully-paid £5 shares, less income tax. The payment will be made upon the register as it stood on Feb. 19, and the dividend warrants will be posted on March 1.

Court of Common Council.—On Thursday the City Lands Committee recommended the payment of £356 11s. for one quarter's gas supply at the Guildhall and other civic institutions, and of £743. 6s. 8d for three quarters' supply of the electric current at the Guildhall Attention was called to the large amount of the bill for electric lighting purposes, and it was explained that the Corporation paid 8d. per unit, and was bound to pay that amount, and they only received the benefit of 2d. per unit on a very small quantity of the current used at the Guildhall.

Whitehaven.—The electrical engineer has been authorised to obtain cable for carrying out repairs. Messrs. Babcock and Wilcox are making good progress with the erection of the new boilers at the electric light station. The chairman, vice-chairman, and Alderman Dees have been appointed a sub committee with power to arrange for the settlement of all claims as to raising of Ennerdale Lake. Mr. P. J. Watts, formerly electrical engineer to the Corporation, and now assistant electrical engineer to the Manchester Corporation, has been appointed borough electrical engineer.

Wire Cutting.—Robert Connolly, 31, labourer, on Wednesday obtained six months' hard labour for stealing, in December last, nearly 2,000 yards of telephone wire value £3. 10s., belonging to the National Telephone Company. Counsel said that the theft of wire from public places was of very frequent occurrence, and the matter was a serious one, as, in addition to the loss of the wire, communication was stopped from point to point. Mr. Hutton said the prosecuting company was highly satisfied with the work of Sergeant Scholes in tracing the man, and asked the Court to commend him.

Loftus.—The Bill which the Cleveland and South Durham Electric Power Supply Company intend promoting in Parliament is just now engaging the attention of the local authorities in the district, and some of them are not prepared to let it pass through the House undisputed. The Loftus Urban District Council appear to favour the measure on the ground that there is a need for electricity being introduced into the district even for lighting purposes, although the Bill contains a clause to the effect that the company shall not distribute the energy, as an illuminant, to private consumers.

Worksop.—The Clerk stated at Monday's meeting of the Urban District Council that he had been in communication with the promoters of the Derbyshire and Notts Electric Power Company's Bill, and had arranged for an interview, the result of which, he hoped, would be the insertion of a clause providing for the exclusion of the urban district of Worksop from the operation of the Bill. The present loan in connection with the electric lighting scheme will provide for the lighting of the main road from the station to the park gates; if there are demands from other parts of the town other steps will be taken to supply it.

Shields Bridge.—The Parliamentary Committee of the South Shields Corporation have considered the Bill which proposes to establish communication between North and South Shields by means of an aerial bridge. The Town Clerk, in a report to the committee, states that the promoters sought power to work the bridge by electricity, and it was proposed to confer upon the Corporations of South Shields and Tynemouth the power to supply the electric energy, to be used either within or beyond the areas of supply of the Corporations. The present boundary of supply is mid channel, and he (the town clerk) did not advise the committee to consent to such a clause being inserted.

Hampstead.—The Borough Council have adopted a recommendation of the Finance Committee with reference to the letter from the London County Council intimating that they were prepared to issue an order sanctioning the borrowing by the Council of the sum of £17 229 for further extension of plant at the electric lighting station as follows: "That the Council do agree that the cost of all plant and machinery covered by the loan of £17 229 which it may be necessary to renew or replace during the currency of such loan—viz., 42 years—shall be defrayed out of a sinking fund to be provided for that purpose or out of maintenance account."

Carlisle.—At the last Council meeting attention was called to the reports which had appeared in the newspapers as to the discovery at Blackpool whereby the danger arising from telephone wires on the streets might be done away with, and it was agreed that the surveyor and electrical engineer visit Blackpool to see the invention in operation. It was stated that a deputation had waited on the Works Committee of the Health Committee from the Telephone Company to see if they could get permission to put the wires underground. The Works Committee had no objection, but wished to get a proper and complete plan. So far as the committee were concerned, they would like to see the wires put underground.

Hackney.—The Electric Lighting Committee have considered the report given in full in our issue of Jan. 25. To the total of £262 740 the following is added: balance left unsanctioned, £373; extra cost of raising floor of buildings by 3ft., £420; extra cost of lining engine-house with crystopal tiles, £750; office lay by, etc., £3,150; general charges, £307—making the full amount £267 740, and it is recommended to increase the capital expenditure by £25,000. In view of the fact that materials under the engineering contracts are now being delivered on the site, it has been deemed desirable to appoint Mr. L. L. Robinson as clerk of works, who, on behalf of the engineer, will superintend the laying down of the plant at the generating works.

Huddersfield Telephones.—The Corporation are making every effort to secure inter communication between the subscribers to the municipal exchange and the subscribers to the National Telephone Company in the local exchange area. The following are the places included in the Huddersfield telephone area: the borough, Milnsbridge, Golcar, Slaithwaite, Marsden, Stainland, part of Elland, Rastrick Brighouse, Hartshead, part of Mirfield, Kirkheaton, Kirkburton, Farnley Tyas, Shelley, Skelmanthorpe, Shepley, Honley, Holmfirth, Netherton, South Crosland, and Meltham. All the Corporation departments are to be connected with the new exchange, and, in addition, 400 of the most important manufacturers, merchants, and tradesmen have promised to adopt the municipal system.

Vibration.—Vibration is in the air, in more senses than one. It appears that the recent cases against the Central Railway serve as an inducement to litigation elsewhere. Last week a case came before the Sheriff's Court in Aberdeen, where an indictment was sought against the proprietors of the Cults electricity station on account of vibration caused by the beats of their machinery, the noise of which was complained of. Considering that the same machinery has been going since 1894 the neighbours might have had time to become accustomed to the noise. When the case came before the sheriff-substitute he found that the working of the engines was such as to cause the pursuers material discomfort and annoyance, and to seriously restrict and diminish the use or enjoyment by them of their respective properties adjoining the station, and that it had diminished the value of their properties. He also found in law that the noise was a nuisance, and appointed the defenders to lodge a minute stating what measures they were willing to adopt to abate it. On appeal, Sheriff Crawford affirmed these findings, and in respect it was stated at the bar for the defenders that they did not intend to adopt measures for abating the nuisance, granted interdict. The defenders appealed, and the Court expressed opinion—without pronouncing any interlocutor—that the sheriffs were right on the question of fact that there had been a nuisance, and continued the case in order that the defenders might consider whether they could abate the nuisance by means of remedial measures. The same may be said of any machinery. Any noise is a nuisance and until every nuisance becomes actionable we shall have to grin and bear those which are not intentionally objectionable.

Swansea.—A serious conflict of opinion has arisen, says the *Western Mail*, between Mr. Manville, consulting electrical engineer to the Swansea Corporation, and Mr. Cawthra, the resident engineer, on the question of whether the Harbour Trust could be supplied with electric light at a certain price, and at a meeting of the committee on Friday both gentlemen strongly gave expression to their views, Mr. Cawthra stating that 1½d. per unit would result in loss and Mr. Manville that 1¼d. would result in profit. We learn that the Electric Lighting Committee have decided to recommend that the lighting of the docks should be

Digitized by Google

done by the Corporation at its present cost to the Harbour Trust, and that what this cost actually is shall, if necessary, be decided by arbitration.

Accident.—At Batley Carr, near Leeds, on Saturday the district coroner, Mr. Maitland, held an inquest on the body of William Woodcock, 25, who met with his death in a singular manner on the previous Thursday at the Chickenley Heath Colliery. While at work with a "tub," the latter left the rails, and, the ironwork coming in contact with the electric switch box, he received a fearful shock, the wire being charged with 500 volts. He was found lying on his side near the tub of coal; a fellow-workman on going to his assistance was knocked down by the electric shock, and could do nothing. A third workman said he also received a shock. It was shown that for 20 minutes Woodcock, who was found dead, had been receiving the full current through his body. Accidental death was the finding of the jury.

Carnarvon.—At a recent meeting of ratepayers a resolution was carried expressing approval of the attitude adopted by the Town Council in opposing the application for an electric lighting provisional order by Mr. Peterson. It was explained that the members of the Council were unanimously in favour of the construction of a tramway to Dinas Dinlle, and it was on the express understanding that it would be carried out with the electric lighting scheme that they promised Mr. Peterson their support. Since then, however, Mr. Peterson had declined to entertain in the proposed agreement any of the terms suggested by the Council as a safeguard, and his application for a provisional order contained no reference to the proposed electric tramway. The Town Clerk said that Mr. Peterson was now asking £1,000 for the provisional order in the event of his getting it.

Notting Hill Electric Lighting Co.—An extraordinary general meeting of the Company will be held on Feb. 27, at 5.30 p.m., for the purpose of passing a special resolution to confirm a Bill the Company is promoting in Parliament with the view of obtaining compulsory powers of purchase over two sites near the south-west boundary of the Company's area of supply. The land is required for a transforming station, but owing to the freeholder refusing his consent to the erection of a building to contain the transforming machinery, the directors have been compelled to apply for these compulsory powers. Should the special resolution be passed, it will be necessary to confirm it at a further meeting, and it is proposed to hold this on the same day as the ordinary general meeting on March 19 next, when the directors' report and the accounts for last year will be presented to the shareholders.

Hull Telephones.—At a recent meeting of the Hull Guardian Society, Councillor Brown (chairman of the Hull Telephone Committee) said the National Telephone Company could not reduce their charges because they were compelled to build up a reserve fund of £11,000,000 by the end of 1911. Ninety-eight out of every 100 messages were local, and therefore the question was not a national one. The Postmaster-General said, "If you take the question up in Hull we will give you every facility for working it, and we will hand our wires now in the town to you." The Post Office also said "If the municipality does not take it up, we will." Alderman Crook said the Corporation had no right to take up any industry unless it had a monopoly. It had no right to be a competitor. They could not borrow money at less than 4 per cent., and it was worse than madness to run into the expense of £70,000 or £80,000 in face of the possibility of the National Telephone Company coming down with their charges. The Chairman said that much would depend upon the number of subscribers.

Ballymena.—Mr. V. H. McCowen's scheme for electric lighting has been submitted. The motive power would be both steam and water, steam being used during the hours of heavy consumption, and water for carrying the night load and charging storage batteries. The three-wire low-tension continuous-current system, with storage batteries, had been recommended, current generated at a pressure of 500 volts, and supplied to consumers at 240 volts. The plant would be duplicated, and capable of supplying 3,000 8-c.p. lamps. The mains laid in the scheduled streets would have a capacity of 30,000 8-c.p. lamps, and, as before stated, the system could be increased to that amount with the addition of feeder mains and motive power and dynamos. The estimated cost of an 8 c.p. lamp per year of 700 hours would be 8s. 9d., or 7d. per unit. The estimated income of the scheme when the 3 000 8 c.p. lamps alluded to are connected would be about £1,500, and the outlay for producing same about £1,465, which would leave a balance of profit of £35. However, as the scheme provides for an additional outlay of, say, £2,500, the output of the current could be doubled and the price per lamp and unit very much reduced. The whole plants and mains were planned with the very latest and most improved machinery, mains, and appliances. A *plébiscite* of the town is to be taken as to whether gas or electricity should be adopted by the ratepayers.

Hove.—At a recent meeting of the Lighting Committee a letter was read from the Hove Electric Lighting Company, Limited, Mansion House-buildings, London, E.C., with reference to an interview which Mr. Smith had had with the surveyor (Mr. H. H. Scott) respecting casing for carrying the company's main underground where it was not possible or convenient to use the culvert system. Mr. Smith had pointed out the difficulties the company experienced in getting the Crompton-Davis casing at all at any price. A report was read on the subject from the borough surveyor, and it was resolved that consent be granted to the company to use a modified form of iron casing in lieu of Crompton-Davis casing, subject to the details being approved by the surveyor, and also subject to an endorsement being placed on the original deed of transfer at the cost of the company. The committee did not consent to the suggestion of using troughing or cast-iron pipes. The committee are proceeding with the lighting scheme as fast as they can, and the whole town will, it is expected, be completed by the end of the year. Referring to the application of the Hove Electric Lighting Company to the Board of Trade on the subject of a change in the voltage, it appears that the committee look at the matter in the same light as the Works Committee, who, when the company wanted to change the voltage to 220 instead of 110, stipulated that no change should be made except with the consent of the consumer. The company are now seeking to get that stipulation altered, so that practically the consumer would have to take the increased voltage whether he liked it or not. The application is not likely to be granted.

London County Council.—The Council on Tuesday agreed to lend the Bermondsey Council £21 140 for the erection of buildings for electricity purposes. The Highways Committee reported that the generating station erected by the Council on the Victoria-embankment for the purposes of the electric light installation for that thoroughfare and Westminster Bridge would be formally opened by the Chairman of the Council on Feb. 23. After the formal opening of the station the electric light will be switched on to some of the parapet lamps on the embankment, and they hoped to have the whole installation completed within a few weeks from the present date. They had directed that each member of the Council should have sent to him a card of admission to the ceremony. The Corporation of the city of London and of the Council of the city of Westminster had been invited to attend. One hundred and twelve applications were received for the appointment of resident foreman for the generating station, and the committee recommended that Mr. John Micklethwaite Harrison be appointed. The chief engineer had reported that the staff for the generating station should consist of two shift engineers and three cleaners and greasers, and two lamp-trimmers. After conferring with the chief engineer, the committee found that it would be sufficient if one shift engineer and two cleaners and greasers be appointed at once, and that the appointment of the others stand over for the present. They recommended that Mr. S. Macnaught be appointed as shift engineer. Sanction was given to the County of London and Brush Provincial Electric Lighting Company's notice, under the Wandsworth Order, 1892, of intention to lay low-tension mains along Tooting Bec-gardens.

Glasgow—The second annual festival of the employés of the Glasgow Corporation electricity department was held in the city hall on the 13th inst. Lord Provost Chisholm presided, and Bailies Maclay and Wilcock, Messrs. W. A. Chamen (chief engineer of the department), J. C. Ward (mains superintendent), R. B. M'Coll (chief clerk), Mr. Poole (chief station engineer), and Mr. Fuller (chief electrical engineer, Ayr), were also present. The Chairman, having expressed his pleasure at being present, referred to the letters that had been addressed to the newspapers complaining of the state of the streets, and said the question had been asked, Who was responsible for the upturning of the streets? If the truth must be told, they had the culprits before them; but he was prepared to say that, so far as he could gather, the department had done their work as rapidly and as effectually as could reasonably be expected of them. The Glasgow Corporation was credited with being one of the most advanced and enterprising corporations in the kingdom, if not in the world, and undoubtedly the success of the various works carried on by the Corporation was due to the employés in the various departments. He did not disparage the value of the great engineers they had at the head of the departments; they were men of high character and outstanding ability; but not one of them, nor all of them combined, could carry on their work without the cordial and loyal assistance of the men who were alongside them, and who carried out their instructions with an energy, loyalty, and intelligence which showed that they were no mere machines, but that their heart and soul was in their work The electricity department was practically in its infancy; there was before them a vast future. He should like the next great discovery in electricity to be made by some subordinate in the department, who would thus show that though he might be in the humblest position he had nevertheless set his mind to study the question. A concert and dance followed.—*Glasgow Herald.*

LEGAL INTELLIGENCE.

WORKMAN'S COMPENSATION CLAIM.

At the Liverpool County Court on Monday an important case under the Workmen's Compensation Act was decided by his Honour Judge Collier, who held that a tramway for electric or other motive power does not come within the Act.

The applicant was a labourer named John Henry Lowther, living in Hector street, Liverpool, and he sought compensation from the Bootle Corporation, by whom he was employed, for the loss of his left eyesight, consequent upon an accident on May 14, 1900, when he was engaged cleaning setts in Rimrose-road, Bootle, a piece of chipping striking him in the face with the result named. The applicant's average weekly earnings were £1. 1s., and he had received from the respondents £19 19s., being 19 weeks' wages. He now asked for half his weekly earnings for as long as his Honour might direct, or for a lump sum in settlement.

Mr. W. H. Quilliam was for the applicant, and Mr. Cuthbert Smith, instructed by Mr. J. R. Clarke, for the respondents.

His Honour, on a technical point, held that a mere intimation to the respondents that the applicant might, under certain circum-

Digitized by Google

stances, proceed to litigation, which might refer as well to the Employers' Liability Act as to the Workmen's Compensation Act, cannot be held to be a claim under the latter Act; and he therefore awarded that no claim for compensation having been made by the applicant within six months from the accident, he was not entitled to compensation. His Honour, proceeding, said that he was reluctant to decide the case on a merely technical point, and he had considered whether the applicant was entitled to compensation on other grounds. Having alluded to the circumstances in which the accident happened, and to the nature of the employment, his Honour said Section 7 of the Act provided that the Act shall apply only to employment by the undertakers as hereinafter defined "on or about a railway or engineering work." There was no doubt that the respondents were undertakers within the meaning of the Act, but he held that the tramway lines which were to be laid down did not come within the definition of the word "railway" in the Act. As to whether the applicant was employed by the respondents "on or in or about an engineering work," his Honour, proceeding, said the applicant was dressing stones which had been taken up from the street, and were to be laid down again when the tramlines had been placed in position. His connection with the tramway was remote, but he (the judge) thought that the employment came within the words "on or in or about" the tramway. Then came the question, Was the tramway an engineering work within the meaning of the Act? To arrive at a decision upon that point he must quote the definition of the expression "engineering work" so far as it applied to the present case. "Engineering work means any work of construction or alteration or repair of a railway, harbour, dock, canal, or sewer." He thought that the latter part of the definition relating to machinery did not apply. The question, therefore, according to his view, was reduced to the point—was the tramway being constructed by the respondents a railroad within the meaning of the Act? It was to be observed that there was in the same section a definition of the word "railway." In the definition of the words "engineering work," the word "railroad," a word seldom used in this country, was employed, so he assumed that it might be assumed that a "railroad" was something different from a "railway," but the word "railroad" was never applied to tramlines. Tramlines or tramways were quite well known in 1897, and if the expression "engineering work" was intended to apply to them, he could not think that the Legislature would have omitted to name them, and would have taken the roundabout and unintelligible course of calling them railroads He, therefore, found that the applicant's employment was not one to which the Act applied, and he awarded accordingly.—*Liverpool Courier.*

HARNESS BELTS.

Mr. C. B. Harness, late managing director of the Medical Battery Company, residing at Macaulay road, Clapham, applied on the 18th inst. at the Wandsworth County Court for his discharge

Mr. Achieson, assistant official receiver, stated that the receiving order was made against the debtor on Oct. 11 last. The liabilities amounted to £8,289, and the assets were nothing, and nothing had been realised.

A **Representative** of the proprietors of the *Electrical Review* opposed the application, they being creditors to the extent of several hundreds of pounds, costs of one or two notorious successful actions in the law courts.

His Honour suspended the bankrupt's discharge for three years.

NEW COMPANIES.

The registration of the following companies has been announced during the week:

John S Vaux and Co., Limited (Sunderland)—Capital, £5,000, in £1 shares. Object: to acquire the business of John S. Vaux and Co., and to carry on the business of marine, electrical, and mechanical engineers, etc.

Cleveland and Durham County Electric Power Company, Limited (Middlesbrough).—Capital, £25,000. Object: to produce, store, and supply electrical energy and power and electricity of all kinds for all purposes in the North Riding of Yorkshire and in Durham.

Pile-Bloc Battery Company, Limited (Charing Cross-road, W.C.).—Capital, £25,000. Object: to adopt an agreement with T. F. Harvey, H. C. Harvey, and E. P. Harvey, and to carry on the business of electricians, mechanical and electrical engineers, manufacturers of and dealers in pile-bloc and other batteries and electrical apparatus and appliances, etc.

Rock Bronze, Limited (Manchester). — Capital, £6,000. Objects: to acquire the business carried on at Rawtenstall, Lancs., by the Antifriction Bronze Company, Limited, and to carry on the business of rock bronze manufacturers, mechanical and electrical engineers, machine makers, founders, etc.

Howard Conduit Company, Limited (Manchester).—Capital, £20,000. Object: to acquire the benefit of an indenture of license made between A. H. Howard and W. T. Glover and Co., Limited, to make, use, and exercise a certain invention for improvements in and apparatus for the manufacture of pipes or conduits for electrical conductors, or for conveying liquids or gases, or for analogous purposes.

Kerbey Bowen Electric Syndicate, Limited.—Capital, £20,000. Object: to take over the freehold yacht-building and electric works on Eel Pie Island, Twickenham, and to carry on the business of ship and launch builders, engineers, electricians, electrical engineers, etc.

City and Suburban Electric Carriage Company, Limited.—Capital, £500. Object: to carry on the business of cycle, velocipede, carriage, vehicle, launch, and flying-machine builders, electricians, etc.

Designograph Company, Limited.—Capital, £10,000. Object: to acquire certain inventions by H. Mackintosh, of 23, Bank-street, Bradford, or any other inventions, and to carry on the business of designers, dealers in designs, machine makers, opticians, electricians, etc.

Braby and Tomlinson, Limited.—Capital, £10,000. Object: to acquire the business heretofore carried on at 15, Hart-street, Bloomsbury, W.C., by Messrs. Pritchetts and Gold, and to carry on the business of electrical, etc., engineers, electricians, etc.

C. Lindley and Co., Limited.—Capital, £60,000. Object: to acquire the business of merchants and manufacturers of engineers' stores carried on at London, Bradford, and Sheffield by Richard H. N. Lindley under the style or firm of C. Lindley and Co., and to carry on the business of electrical and mechanical engineers, electrical or other railway and tramway contractors, manufacturers of and dealers in electric, magnetic, telegraphic, telephonic, and other appliances and apparatus.

Okonite Company, Limited.—Capital, £120,000. Object: to acquire the undertaking and assets of the Okonite Company, Limited (in liquidation), to manufacture and deal in insulated and other wires and cables capable of use for telegraphic, telephonic, and other purposes, and for electric lighting and the conveyance of electricity, and to carry on the business of manufacturers of and dealers in okonite and other insulating materials and things used in connection with electricity, etc.

Walter Scott and Middleton, Limited.—Capital, £250,000. Object: to adopt an agreement between Walter Scott, John T. Middleton, and Charles T. Scott of the first part, Thomas T. Middleton, and the Company to carry on the businesses heretofore carried on by Walter Scott and Co., and to construct, equip, develop, administer, and control public works and conveniences of all kinds, including railways, tramways, docks, harbours, wharves, canals, electrical and other works, etc.

Beck and Moss, Limited.—Capital, £2,500. Object: to acquire the businesses carried on at Hanley by William Moss, Beck and Moss, and Larsen and Co., and to carry on the business of electric metallurgists, electrotypers, electroplaters, enamellers, fitters, electrical and general engineers, etc.

Plumpton Bros. and Co., Limited.—Capital, £100. Object: to carry on the business of electrical engineering in any form whatever, etc.

Primitiva Gas and Electric Lighting Company of Buenos Ayres, Limited.—Capital, £1,200,000. Object: to adopt an agreement between La Companhia Primitiva de Gas de Buenos Aires and H. Ward, to acquire gas or electric light works in the River Plate and other countries in South America or elsewhere, and to carry on the business of manufacturers, generators, and suppliers of gas, electricity, and other illuminants and force, engineers, engine and machinery builders, gas and electric stove makers, wharfingers, contractors, etc.

Woodcock and Co., Limited (Plymouth).—Capital, £25,000. Object: to adopt an agreement with W. T. F. Rowe, James Skewes, and Josiah Skewes, and to carry on the business of brass and iron founders, mechanical and electrical engineers, hardwaremen, etc.

London and Provincial Electric Construction Company, Limited.—Capital, £75,000. Object: to apply for, obtain, promote, and deal with Acts of Parliament and provisional or other orders or other authorities or licenses relating to the incorporation of a company or companies for the construction of underground or overground railways or tramways to be worked by electricity, to oppose any Bills or applications, to adopt an agreement between Louis Bernt of the one part and Elliott G. Mason (for the company), to construct, equip, maintain, and work by steam, electricity, cable, or other mechanical power any railways and tramways, and to carry on the business of railway, tramway, omnibus, and van proprietors, electricians, electrical and general engineers, etc.

PROVISIONAL PATENTS, 1901.

FEBRUARY 11.

2900. Improvements in and relating to fusible cut-outs for electric circuits. H. M. Salmony and Co., Limited, 11, Southampton-buildings, Chancery-lane, London. (Elektrizitäts Actien-Gesellschaft, vorm W. Lahmeyer und Co., Germany.) (Complete specification.)

2909. Improvements in or relating to overhead trolley wires or conductors for electric traction overhead, electric cables, telephone, telegraph, or like wires. Augustus Wyvill Hancock, John Leighton, and Robert Hacking, 111, Hatton-garden, London.

2933. Improvements in electrodes for secondary batteries or accumulators. Carl Adolf Wilde, 22, Southampton-buildings, Chancery-lane, London.

Digitized by Google

2877. Trolley guard wire safety device. Donald Smeaton Munro, 58, Kelvingrove-street, Glasgow.

2940. An improved system for transmitting messages, particularly telephone messages. George Croydon Marks, 18, Southampton-buildings, Chancery-lane, London. (Louis Warren Southgate, United States.)

2941. Improvements in thermo-electric batteries. Lucian Gottscho, 18, Southampton-buildings, Chancery-lane, London.

FEBRUARY 12.

2962. Improvements in guards for electric trolley wires. Arthur Henry Gledhill, Trinity Works, Halifax.

2982. Insulater for electrical conduction wires. Morton Harloe, 60, Woodstock-road, Finsbury Park, London. (Date applied for under Patents, etc., Act, 1883, Sec. 103, Sept. 19, 1900, being date of application in United States.) (Complete specification.)

3015. Improvements in electrical alarm and other like apparatus. Edwin Whiting and Robert Carr Myddelton, 115, Cannon-street, London.

3026. Improvements relating to closed conduit electric railways. Léon Dion, 45, Southampton-buildings, Chancery-lane, London. (Complete specification.)

3030. Improved method of and means for holding and connecting the wires of telephone receivers and the like. Francis George Bell and Max Byng, 165, Queen Victoria-street, London.

3035. Improvements in or relating to trolley or like current collectors for electric tramways and the like. Francis Edward Shaughnessy and George Johnston Thomas, 6, Lord-street, Liverpool.

3036. Improvements in or in connection with trolley or like current collectors for electric railways and tramways. Artemus Boutelle Eupham, 6, Lord-street, Liverpool.

3047. Improvements in apparatus for regulating pressure in electric mains connected to storage batteries. John Somerville Highfield, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Complete specification.)

3081. Electric generater. Joseph Stretch, 18, Southampton-buildings, Chancery-lane, London. (Complete specification.)

FEBRUARY 13.

3087. Improvements in electrical starting and regulating switches. Arthur Henry Hickley, 10, St. George's-crescent, Liverpool.

3111. Improvements in systems of electrical distribution. Benjamin Garver Lamme, Westinghouse-building, Norfolk-street, Strand, London. (Date applied for under Patents, etc, Act, 1883, Sec. 103, July 14, 1900, being date of application in United States.)

3112. Improvements in systems of electrical distribution. Benjamin Garver Lamme, Westinghouse-building, Norfolk-street, Strand, London. (Date applied for under Patents, etc., Act, 1883, Sec. 103, July 14, 1900, being date of application in United States.)

3113. Improvements in rotary field magnets for electrical machines. Benjamin Garver Lamme, Westinghouse-building, Norfolk-street, Strand, London. (Date applied for under Patents, etc., Act, 1883 Sec. 103, July 14, 1900, being date of application in United States.)

3123. Improved insulating conduit for the conductors of electric tramways. Paul Christian Seguy, 53, Chancery lane, London.

3127. Improvements in guards or protectors for trolley wires and other electric conducters. Simon Cristol, 6, Lord-street, Liverpool.

FEBRUARY 14.

3164. Improvements in electric ignitions for gas-engines and motors. Richard Hoyle and Silvestre Wilson, 4, St. Ann's-square, Manchester.

3177. Improvements relating to electrical traction systems. Egerton Goolden Pulford, 10, St. George's-crescent, Liverpool.

3179. Apparatus for governing the output of dynamos when driven at different speeds. Horace James Jordan Hummel, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London.

3181. Improvements in or applicable to dynamos and other electromagnetic machines. Felix John Howitt and P. R. Jackson and Co., Limited, 70, Deansgate, Manchester.

3190. Improvements in apparatus for controlling or breaking electric circuits. Andrew Thomas Smith, jun., and Percy Ruskin Allen, 55, Chancery-lane, London.

3192. Improvements in electric furnaces. Philippe Jurie, 70, Chancery-lane, London. (Complete specification.)

3206. Equalising appliances for interconnected polyphase currents. Siemens Bros. and Co., Limited, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Siemens und Halske Aktien-Gesellschaft, Germany.) (Complete specification.)

3221. Improvements in safety appliances for electric trolley wires or cables. William James Nash, 6, Lord-street, Liverpool.

3297. Improvements in telephone installations having a central microphone battery. Siemens Bros. and Co., Limited, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Siemens und Halske Aktien-Gesellschaft, Germany.) (Complete specification.)

3225. Portable X-ray apparatus. Augustus Rosenberg, 53, Chancery-lane, London.

3264. Improvements in or relating to electric ignition devices for explosion engines. Wilhelm Maybach, 111, Hatton-garden, London.

FEBRUARY 15.

3247. Improvements in or relating to safety guards for overhead electric wires. Thomas Warburton Redford, 57, Dorset-street, Bolton.

3250 Improvements in and relating to call registers for telephones. William Henry Turner, Burnley.

3281 A new or improved light ampere-meter for electrical measurements Herbert Ernest Hart, 73, St. Stephen's-road, Upton Park, London.

3284. Improvements in protectors for sparking plugs of petroleum motors with electric ignition. Robert James Paton, 18, Fulham place, Paddington, London.

3288. Improvements in or applicable to dynamos and other electromagnetic machines. Felix John Howitt and P. R. Jackson and Co., Limited, 70, Deansgate, Manchester. (Complete specification.)

3291. An anti-vibration base-frame for explosion and other motors, dynamos, and other mechanism, appliances, or apparatus. George Middleton, 8, Quality-court, Chancery-lane, London.

3310. Improvements in and relating to electrical ignition devices for internal-combustion engines. Tom Bousquet Browne and Francis Leigh Martineau, 70, Chancery-lane, London.

3313. Purifying beverages and liquids by means of manganates under influence of the electric current. William Phillips Thompson, 322, High Holborn, London. (Société Mangano Electrique pour la purification des eaux et des boissons, France.) (Complete specification.)

3321. Improvements relating to Rontgen-ray apparatus. James Mackenzie Davidson, 323, High Holborn, London.

FEBRUARY 16.

3350. Improvements in and relating to protectors for trolley wires of overhead driven electric tramways. James Townsley Pearson, St. James's Hall, Burnley.

3353. An improved safety guard to be applied to the trolley wires used for actuating electric tramcars. William Henry Cottam, 4, St. Ann's-square, Manchester.

3370. Improvements in battery electrodes. John Liddle, 154, St. Vincent-street, Glasgow. (The Globe Electric Company, United States.) (Complete specification.)

3376. Improvements in electric arc lamps and electrodes therefor. Charles Andrew Lee, 56, Paulton-square, Chelsea, London.

3386. Improvements in electrical heat radiators. John Coley-Bromfield and William Herbert Milnes, 33, Cannon-street, London.

3387. Device for automatically breaking circuit of trolley wires. Amos E. Barber, 222, High Holborn, London.

3388. Improvements in magneto-electric igniters. William Phillips Thompson, 6, Lord-street, Liverpool. (Joseph Boiron, France.) (Complete specification.)

3390. Improvements in switches or cut-outs for overhead electric wires. William Thomas Smith, 6, Bank-street, Manchester.

3391. Improvements in secondary batteries. Richard Frederick Yorke, 19, Holborn viaduct, London.

3397. Improvements in commutator brushes. Siemens Bros. and Co., Limited, Robert Dumas, and Charles Rowland Palairet, Birkbeck Bank chambers, Southampton-buildings, Chancery lane, London. (Complete specification.)

3398. Improvements in or relating to overhead trolley wires for electric traction, overhead electric cables, telephone, telegraph wires, or the like. Augustus Wyvill Hancock, John Leighton, and Robert Hacking, 111, Hatton-garden, London.

3401. Improvements in apparatus for use in the electro-deposition of metals. Sherard Osborn Cowper-Coles, 47, Lincoln's-inn-fields, London.

3402 Improvements in apparatus for use in the electro-deposition of metal upon tubes. Sherard Osborn Cowper-Coles, 47, Lincoln's-inn-fields, London.

3411. Improvements relating to electric accumulators. Michel Pisca, 45, Southampton-buildings, Chancery-lane, London.

3413. Improvements in and relating to electric motor starting, regulating, controlling switches and like apparatus. Hugh Hirst and William White, 165, Queen Victoria-street, London.

3416. Improvements relating to the construction of electrodes containing zinc for use in electric batteries and method of producing and employing the same. Wilhelm Erny, 18, Buckingham-street, Strand, London.

Digitized by Google

3417. Improvements in galvanic batteries. Wilhelm Erny, 18, Buckingham-street, Strand, London.

COMPLETE SPECIFICATIONS ACCEPTED.

To be published on March 9.

1900.

3124. Methods of and apparatus for manufacturing coils for use in connection with electrical instruments. Weston.

3264. Armatures of electric motors, specially applicable for use in meters for electric currents. Perdrisat.

3834. Electric generators and motors. Storer. (Date applied for under International Convention, July 28, 1899.)

4921. Electrical method for securing uniform time in clocks. Grant.

5786. Electric cables. Nisbett.

6616. Apparatus for forming a silence chamber for telephonic purposes and the like. Dewar and Sherman.

6826. Switches for electric currents. De Janisch.

6923. Loud-speaking telephones. Dussaud.

7356. Electrical incandescence lamps. Schattner and Harmer.

8668 Electric arc lamps. Interstate Electric Company and Melzer.

9552 Electric arc lamps. Bremer.

11547. Fittings for overhead trolley systems of electric tramways. Hill.

11824. Telegraphy and apparatus connected therewith. Bull.

19099. Electrodes for accumulators of electricity. Myers.

20186. Electrically and pneumatically controlled air brakes for railway and like vehicles. Abel. (Siemens und Halske Aktien Gesellschaft.)

21629. Tachometers. British Thomson-Houston Company, Limited. (Haskins.)

21217. Electric current regulators. Justice. (Erie Exploration Company.)

22233. Electric railways, tramways, and the like on a sectional conductor system. Kandó.

23100. Galvanic batteries. Allison. (Waterbury Battery Company.)

23107. Galvanic batteries. Allison. (Waterbury Battery Company.)

23387. Manufacture of braided cords or cables for electric lighting and like purposes. Schürmann.

23394. Electric brake systems. British Thomson-Houston Company, Limited. (Case.)

23743. Electric battery cells. Tiquet.

23890. Insulating and protective coatings especially applicable to electric conductors. Peust and Apel.

1901.

688. Construction of telephone cables. Tremain.

840. Electric safety fuses. Siemens Bros. and Co., Limited. (Siemens und Halske Aktien-Gesellschaft.)

NOTES.

Electrical Engineers Volunteers.—We are pleased to see that the services of the officers of the Electrical Engineers (R.E.) Volunteers who went to the front have been recognised. An order has just been made that the complimentary army rank corresponding to that which they held in the field is to be conferred upon them.

Institution of Electrical Engineers.—The secretary informs us that, through the kindness of the Institution of Civil Engineers, an extra meeting has been arranged for Thursday, March 7. If the discussion on Mr. Madgen's paper is concluded at this week's meeting, Mr. O'Gorman will read his paper on "Insulation of Cables."

London Chamber of Commerce.—The prize distribution in connection with the recent examinations under the commercial education scheme of the above chamber of commerce will take place at the Mansion House on Monday next, March 4, at 2 p.m. The prizes are to be presented to the successful candidates by the Right Hon. C. T. Ritchie, M.P. The "China" dinner will be held at the Trocadero Restaurant on the 20th inst.

Surface-Contact Rails.—We understand that recently the electric tramways in Paris worked on the surface-contact system have given considerable trouble due to leakage. The company owning these lines used salt to keep the same free from ice, with the result that there was a very considerable leakage over the surface of the roads. Actions for damages are talked of in consequence, as a number of horses and men were subjected to more or less severe shocks.

Trans-African Telegraph Line.—Considerable progress has been made with the laying of the African and Trans-Continental telegraph line. The surveying party, which recently arrived at Ujiji, Lake Tanganyika, report that the survey is pegged out to Karema, 150 miles north of Kituta, and the preliminary survey between Karema and Ujiji is being made. The line, which at present has been laid for about 60 miles north of Kassanga, will then go up from Ujiji, round the south-east coast of the Victoria Nyanza, cross the Uganda Railway, skirt the country west of Lake Rudolph and then follow the Abyssinia, work round slightly to the west, and so on to the Nile.

Probable Government Ownership of Canadian Telegraphs.—The Canadian Parliament will shortly have to consider the advisability or otherwise of purchasing the telegraph lines of the Great North-Western Telegraph Company and of the Canadian Pacific Railway Company. The Government will raise the question at an early date, and it is expected that the scheme will meet with the approval of the majority, having regard to the fact that the two concerns duplicate each other in almost all the important centres of Canada, and under Government ownership therefore the working expenses could be considerably reduced. The purchase price is put at between five and six millions sterling.

The Yorkshire Power Bills. — The Bradford Chamber of Commerce, after considering the matter at a special meeting last week, have decided to adopt a neutral attitude towards the two rival schemes for supplying Yorkshire with electric power. The solicitors to the scheme of the South Yorkshire Electric Power Company sent a letter contending that the provisions contained in their Bill were much more favourable to the consumer than those contained in the Electric Power (Yorkshire) Bill. Further, they asked that a deputation might be allowed to wait on the Chamber to explain the scheme in detail. It was, however, determined not to take any further action in the matter, an amendment that the Chamber should approve the principle of the two schemes being defeated

Magnetic Observatories.—From extracts which the *Electrical World* publishes of a report by the superintendent of the United States Naval Observatory at George Town, near Washington, we gather there are only two magnetic observatories which up to the present have been rendered useless in consequence of stray currents from electric tramways. We also understand that some two or three magnetic observatories are either planned or in actual course of construction in situations in which they should be free from magnetic disturbances for many years to come. The superintendent in question, however, calls for protection for his own observatory from the stray currents set up by the tramway systems near Washington. We are afraid, however, that here again the magnetic observatory will have to give place to the convenience of the public.

Enclosed Arc Lamps.—We understand that another combine in the United States has resulted in the Marks patents for enclosed arc lamps being acquired by the General Electric Company. As has previously been the case for so many electrical inventions in that country, a dispute between two rival concerns over the validity of the patents owned by one has resulted in the combination of the two firms. We see it stated in certain of our American contemporaries that the General Electric Company agreed to buy the Marks patents because they decided that they were valid and had value. Up to the present these patents have not been fought in the English courts, and their owners have not shown any great eagerness to put them to a trial. In spite of this a number of licensees are paying royalties under agreements by which they are debarred from ever taking the initiative in contesting the validity of the patents in question.

Birmingham Tramways Bill.—In a report which has just been laid on the table of the House of Commons the Examiners of Private Bills explain why the Birmingham (City) Tramways Bill was referred to the Standing Orders Committee. In view of the fact, the report runs, that when the latest alteration in the Standing Order applicable to the case was drafted, the invention of the system of electrical traction was not contemplated, the Examiners were of opinion that the words "when such Bill contains powers authorising any alteration or disturbance of the surface of any street or road" were limited in their application to the case of constructing an underground railway, and did not relate to the tramway; therefore, if anything ought to be done further for the protection of the public, or the owners and occupiers affected in view of the powers of the company to place posts and so on in the road, it would have to be done by amending the Standing Order.

Rontgen Society.—On the conclusion of the formal business of the ordinary meeting of this society to be held at eight o'clock on Thursday, March 7, smoking will be permitted and refreshment provided in the shape of tea and coffee. It is to be an exhibition evening. Skiagrams, negatives, and any objects of interest will be welcomed, but only such apparatus can be exhibited as possesses some special novelty, and has not been previously shown to the society. A lantern will be provided, and members are invited to bring slides of interest, a maximum of 12 slides for any individual member being the limit. Dr. G. B. Batten and Mr. George Sutton have promised to show a new rectifier for transforming alternating currents into direct currents, while Dr. E. Reginald Morton will show another for the same purpose. A 15in. spark semi-portable coil with Hedgehog core will be exhibited by Mr. Bowron. Other apparatus of interest include a coil of entirely new

Digitized by Google

design, a regenerating tube of new design, a new ward outfit, and a set of normal skiagrams. Mr. J. Macintyre, the president, will preside.

Steam-Turbines.—In the early days of town-lighting by electricity the area of the city of Newcastle-upon-Tyne was divided into two portions, over one of which the Newcastle-upon-Tyne Electric Supply Company had powers to supply electric light. The other area was placed in the hands of the Newcastle and District Electric Lighting Company, and the station of this company was equipped completely with Parsons steam-turbines. The success of these works has been largely responsible for the introduction of steam-turbines elsewhere. As was to be expected, the rivalry between the two companies in the same town was exceedingly keen, although they were not actually in competition in any part of the town. We are now informed that an order has been given by the Newcastle-upon-Tyne Electric Supply Company to Messrs. Parsons and Co. for a steam turbine-alternator, which conclusively shows that the engineers of the first-named company have been assured as to the success of the machinery used by their rivals. The output of this new alternator, which is for three-phase working, will be 1,500 kw., the voltage between any two pairs of wires will be 5,750, while the frequency will be 40 complete periods per second. We gather from particulars supplied that this new plant will be worked condensing, and that the air-pumps for the condenser will be driven by electric motors.

Berlin Tramway Accidents.—With a view to reducing the large number of fatal and other accidents which have lately occurred on the Berlin electric tramways, many reforms are proposed to be made on the system. This is the outcome of the official enquiry just concluded, which was undertaken by the Minister of Public Works and the Minister for Home Affairs in conjunction with the police authorities and the tramway company. For instance, brakes are to be introduced on the cars, and to this end a series of experiments with different types of brakes will be carried out. In the case of a passenger boarding the rear platform of a motorcar which is hauling a trailer car, the company has been asked to submit proposals for providing the space between the car and the trailer with a safety contrivance. The object of this would be to prevent passengers from falling between the two cars. Further, it is suggested that the speed of the cars should be somewhat reduced, especially on curves, at crossings, and where children may be playing, and that strict attention should be paid to the instruction of the drivers and conductors in the fulfilment of their duties, this being regarded as a guarantee for a reduction in the number of accidents. We understand that the majority of the accidents complained of occurred with independent vehicles driven by accumulators, and not with tramcars running on a definite track. In the latter circumstances, of course, the risks are considerably reduced.

Tramway Accident.—The jury's verdict respecting the tramway accident at Birmingham, by which a boy lost his life, was "accidental death," but the coroner added to the verdict certain remarks as to the protection of the public by means of fenders to be placed in front of the engines. Our readers will know that the Birmingham tramways are driven by means of steam-engines, and it was under one of these that the boy was killed. The space between the engines and the track is, we gather, exceedingly small, and the tramway company have guards fixed to reduce the clearance to the minimum. The rest of the evidence given at the inquest was to the effect that the car was going very slowly, and that the boy ran in front of it, being knocked down in the middle of the track. The question now arises as to how far it is possible to devise a fender which shall not cause more accidents than it prevents. The clearance between the track and the fender has to be exceedingly small if a child cannot be drawn in. The great objection to most of the fenders which have been devised up to the present is that they project a considerable way in front of the car. In consequence of this, when the tramcars are going round curves the fenders are not over the tracks, and they are also in the way of people trying to cross. The whole question is one which has to be considered on broad lines, and we believe that no one more than the engineers to the Board of Trade recognises the great difficulty there is in the design of a really efficient fender.

Telegraph Services.—One test which can be applied of the efficacy of the telegraph system of any country is that of the number of messages which are sent by it per annum. Inefficient service or high rates will keep down the number of messages, and the actual number sent per head per annum gives a very good means of ascertaining the final results. For the last year for which the Post Office report has been issued there were just over 90 million messages sent. With the population of the British Isles this comes out at about 2¼ messages per head, while the average cost per message was only 7½d. In the United States, on the other hand, somewhere about 80 million messages are sent per annum, but in view of the larger population the average is only about one per head. A point in connection with this is that the average cost in the United States is something like 1s. 3d. per message, or 100 per cent. higher than the average cost in the British Isles. It would not be fair to conclude at once that this higher cost is due to the fact that the telegraphs in the United States are owned by companies, whereas in England the telegraph system is owned by the State. This, no doubt, is a feature in the cost question, as the companies earn and distribute a considerable profit each year. Another point which enters into it, however, is that the 80 million messages sent in the United States per annum require a much greater total length of wire owing to the bigger area served. In view of the above figures, we, as a nation, have every reason to be proud of our telegraph system as it exists at the present time, but even now there is room for improvement, and we trust that the Post Office engineers will continue their efforts to increase the output which can be obtained from a given number of line wires.

Smoke Nuisance.—When the electric lighting of a town is in the hands of a corporation, a summons for smoke nuisance becomes almost a departmental matter. We are informed that at Bolton recently the Corporation, as owners of the electric light station, were summoned by their own medical officer of health because an order which was made on Sept. 15, 1900, for the abatement of the smoke nuisance arising from the chimney at the electricity works had not been complied with. According to the evidence brought forward by the medical officer of health, the chimney in question ejected thick black smoke for eight minutes consecutively on Jan. 9. The electrical engineer to the Corporation claimed that the department was being conducted with all due care, and that devices to prevent smoke nuisance had been erected since September last. He also added that a contract for a new chimney shaft was to be let in the course of a week. Under the present circumstances he could not see what more could be done, as the works had to supply the public with electrical energy under penalties. Our readers will notice that it is only about four months since the previous summons was heard, and from the evidence given we gather that the

Digitized by Google

electrical department have been looking into the matter, and are making improvements which will prevent the nuisance complained of. We think, therefore, that the chairman of the police court was hardly warranted in the caustic remarks he made. He said, for instance, the worst of the defendants was that if he fined them it was only fining one department of the Corporation to put the money into the hands of another department. On the advice of the town clerk the unlucky electric lighting department was finally let off with half a sovereign fine and costs, with the alternative of seven days' hard labour. We presume that this alternative would rightly have fallen on the chairman of the Electric Lighting Committee.

Uniform Tramway Gauge.—On the question of a uniform gauge for electric tramways, Mr. T. M. Healy last week in the House of Commons asked the President of the Board of Trade whether his department had considered the desirability of prescribing a standard gauge in future Acts, so as to enable towns to be electrically connected in this country, as in America, without break of gauge. The reply of Mr. Gerald Balfour was in these terms: "The Board of Trade are fully aware of the importance of a uniform gauge, and when opportunity offers press their views on the subject upon promoters. I think it would be a mistake, however, to insist on the adoption of the standard gauge as an absolutely invariable rule; in hilly districts and in towns with very narrow streets it is sometimes desirable to adopt a gauge less than the usual 4ft. 8½in." The same subject engaged the attention of a meeting of the executive council of the County Councils Association on Thursday week, when the two following resolutions were passed: "(1) that, while in the opinion of this committee it is generally desirable to have a uniform gauge of 4ft. 8½in. for both light railways and tramways, the committee have not sufficient evidence before them to justify them in recommending that a uniform gauge for light railways and tramways should be prescribed by law; (2) that application be made to the Board of Trade to allow county councils to be heard in any case where the main roads in their area are affected by a tramway and light railway, whether such main roads are maintained by urban authorities or not." While we quite agree with the remarks that a uniform gauge of 4ft. 8½in. cannot be always insisted upon in view of narrow streets and local conditions, we do think that where new lines have to be constructed in small towns within easy reach of large tramway systems with which these new lines may ultimately become connected, it should be a *sine quâ non* that they should be made of the same gauge so that through traffic may be possible.

Telephone Competition.—Some three years ago, it may be remembered, the Bell Telephone Company of America caused a great deal of astonishment by announcing that its service would be given all subscribers free in certain towns. The object of this movement was to crush a home company in Huntington, W. Va., who were formidable rivals of the Bell Company. The only result the manœuvre had, however, was to give the Bell subscribers in that town, as well as two others in the United States, a telephone service gratis, for, contrary to expectations, the home company were not affected in the least. In fact, their number of telephones increased, one reason being that the home company is owned largely by the residents. In consequence of the competition of another home company the subscribers of the Bell telephones in New Philadelphia, Ohio, are also reaping the benefits of a free service. Turning to our own affairs on this side of the Atlantic, we find that the Post Office has become the competitor of the National Telephone Company. As explained by Mr. J. S. Forbes, the chairman, at the meeting of the shareholders the other day, the Government have the power to grant licenses outside the Metropolis, whereas the company has a short life, 1911 being the end of their license. In fact, this was the main topic discussed at the meeting, and the general opinion seems to have been expressed that the Government are treating the company very unfairly. The chairman said they had "made their bed with the Government, and they must, to a certain extent, suppress their indignation." However, it was decided to fight the Post Office competition, one shareholder suggesting that a petition should be presented to the Houses of Parliament, and the Crown if necessary, setting forth their alleged grievances. In the end the Board were authorised by resolution to convert 590,000 fully-paid (issued) and 10,000 (unissued) ordinary shares into preferred and deferred stock, and to issue 200,000 of the unissued ordinary shares as preferred shares. On the subject of telephones, we notice that Mr. Gaine, the general manager of the National Telephone Company, has received from Lieut.-Colonel Arthur Davidson, the King's equerry-in-waiting, the following gratifying message: "I am commanded to inform you that the telephone service at Osborne was very well and efficiently conducted last month under circumstances of exceptional pressure, and I am commanded to thank you for the arrangements which were made which secured this satisfactory result."

Electrical Theory.—A clever article on electricity by Prof. Elihu Thomson is given in the New York *Sun* for Feb. 10. On the question of electrical theory the professor asks: "Has science any answer to make to the question, What is electricity? We think not," the article proceeds, "nor has it any answer to make to the question, What is energy? The most that science can possibly expect to do is to extend our horizon and permit us to acquire a deeper knowledge of the intimate relations of things. We speak of the ether as the electrical medium, and we acquire more and more knowledge of its properties and actions as the years go by. Facts are gradually being accumulated by workers in all departments of science, and there must follow generalisations which will bring into harmony the present discordancies where they appear. It will probably be found that the electrical properties of the ether are the fundamental ones on which the universe is built, and that the properties of matter which we speak of as mass, weight, inertia, cohesion and elasticity, etc., are dependent upon or have their origin in the ether properties. Perhaps, just as light and radiant heat have been shown to be electrical vibrations, gravitation and the other properties may follow. True it is that electrical laws are most simple, most definite. Electrical measurements can be made with the utmost accuracy and delicacy. Indications these are of its fundamental and universal character." The author goes on to point out that in order to account for the passage of light, radiant heat, magnetism, and other forces through space, science has need of what is called the ether, a medium filling all space and propagating waves of heat and light, as well as magnetic disturbances and gravitation. The sun radiates to the earth luminous waves and heat waves. Moreover, it has been shown that whenever there is a great cyclonic storm upon the sun, the earth sympathises or receives influences which disturb the compass needle. "What, then," asks the author, "is the nature of this ether of space? To this question no complete answer can as yet be given, except to say that it is the electromagnetic medium. It is as unlikely that the mystery of the material universe will ever be completely solved as it is that we can gain an adequate conception of infinite space or time. But we can at least extend the range of our mental vision of the processes of Nature as we do our real vision into space

Digitized by Google

depths by the telescope and the spectroscope. There can now be no question that electric conditions and actions are more fundamental than many hitherto so regarded."

Tramway Management.—While in Great Britain the construction of electric tramways is considered mainly from the fact that they will enable the working classes to live further from their work, and hence obtain more healthy homes, we have not yet had to consider so much the question of making traffic in order to pay dividends. In the United States, on the other hand, practically all the electric tramways, or the street railways, as they are called, are owned by limited companies, and these have the question of dividend always before them. We notice, for instance, in the *Street Railway Journal* a list of 34 street railway companies who own or control parks in the vicinity of the town in which they run the service. The object of these parks is to increase the return of the tramways in question, and the management not only run the cars to the parks at reduced fares, but also provide the amusements which are to attract the people. In the same issue of the above-mentioned journal there is an article by Mr. H. S. Cooper, as to how to make the non-paying roads pay. He divides the traffic on such lines up into five classes. The first is the fixed or regular traffic and the people who use the lines morning and night in order to go to and from their work; the next is those people who occasionally use the lines; and the third is the extraordinary or rush traffic, such as occurs in connection with football matches, etc., which demand a great temporary increase in the number of cars on a particular road. The fourth deals with the pleasure traffic on holidays, Sundays, and fine evenings, on which days people travel either for the pleasure of the ride or to get to some pleasure resort such as referred to above. This class of passenger, according to the author, can be largely increased by the owners of lines by the provision of adequate attractions at the ends of the roads. The last class is that created by special fares or privileges. The author's great contention, in considering how each of these various classes of traffic can be increased, is that no reductions in fares should be made until the effect of such reductions has been well considered. Whereas the decrease in fares gives satisfaction to the public, much harm is done if afterwards the fares have to be raised. At the same time he contends that although rushes, such as to athletic games, do occur, they are so infrequent as not to warrant a considerable reduction in fares. For the pleasure traffic, however, he urges that the fares ought to be kept as low as possible, and that they should be issued in combination with the various attractions at the end of the journey.

Central London Railway Competition.—As showing one of the results of the competition of the Central London Railway on the District and Metropolitan Railways and the omnibus companies, the following facts and figures will be found interesting. Taking first the number of passengers carried on these two railways, in the second half-year of 1900 there was a decrease of 2,967,000 on the Metropolitan Railway as compared with the corresponding half-year of 1899, while on the District there was a decrease of 1,230,000 in the number of passengers carried. This represents in money £26,000 and £19,000 respectively, which on a half-year's working is enormous. Turning to the two omnibus companies—the London General and the London Road Car—during the same period, in the case of the first-named an increase of 2,459,000 in the number of passengers carried was made, the advance in receipts being £3,000. As to the Road Car Company, although the number of passengers carried shows an advance of 96,000 on the corresponding half-year's working, there was a decrease in receipts of £2,000. While the General Omnibus Company exhibits a fair advance in the number of passengers carried, the increase in the receipts is proportionately very small, showing that the long-distance journeys were not so well patronised as heretofore. Except in the case of the District Railway Company, whose receipts have remained almost unvaried for some years past, the normal condition of the other companies was one of growth until the "tube" competition was experienced—in the case of the two omnibus companies, indeed, of very rapid growth. Some idea of the damage inflicted by the competition may be gained from the following figures: the average advances recorded in the number of passengers carried and the receipts in the five second half-years 1895-99 inclusive, are: Metropolitan Railway, 786,000 passengers = £8,200; District Railway, 120,000 passengers = £800; London General Omnibus Company, 6,236,000 passengers = £33,000; and London Road Car Company, 2,084,000 passengers = £11,200. From these figures, then, it will be seen that the average increase shown by these four companies in a second half-year is nearly 9¼ millions in the number of passengers carried and over £53,000 in receipts. In place of this satisfactory state of things, there was in the second half of the year 1900 a loss of nearly 1¾ millions in number and £44,000 in receipts. From this short statement of the financial position of the four companies in question, it is clear that the monopoly of the London traffic by two or three enterprises is no longer maintained. Competition has been introduced which is heartily welcomed by the general public, as affording them a better and cheaper means of communication between the different parts of the Metropolis.

Electric Traction in Germany.—It appears from the annual statistics of electric railways published in the *Elektrotechnische Zeitschrift*, that at the end of the past year there were in operation in Germany about 1,900 miles of electric railways, having a total length of track of 2,800 miles, as compared with 1,430 miles and 1,980 miles respectively for the previous year. The rest of the figures given take us only up to Sept. 1, 1900, when the aggregate output of the generators installed for working 2,660 miles of track amounted to 75,608 kw., as compared with 52,509 kw. for 1,760 miles of track in the previous year, or an increase of 44 per cent. On the other hand, the buffer and station batteries installed up to the same date show an increase of only about 25 per cent., as against 164 per cent. for the previous year, the total capacity of the accumulators amounting to 16,890, compared with 13,532 kw. on Sept. 1, 1899. Adding the output of the generators and accumulators, respectively, together, it will be seen that there is a total available output for working the lines of 92,498 kw. According to statistics published in the *Elektrotechnische Zeitschrift* last year relative to central electric lighting stations in Germany, there was installed in the same on March 1, 1900, an equivalent of 191,646 kw. in generators and 38,412 kw. in accumulators, together 230,058 kw., so that on Sept. 1, 1900, the total output of the generators and accumulators installed in German lighting and power stations amounted to 322,550 kw. in round figures, or, approximately, the equivalent of 440,000 h.p., which represents an increase of about 38 per cent. as compared with the figures for the previous year. A valuable feature of the statistics consists in that for all those lines supplied with current from independent generating stations, the number of kilowatts provided per mile of single track or per motorcar is computed. For 70 lines enumerated as belonging to this class the average

Digitized by Google

number of kilowatts provided per mile of track is shown to be 31·8, as compared with 32·8 in 1899 and 33·0 in 1898, while the average number of kilowatts per motorcar is given at 15·1, as against 14·3 and 14·2 in the years 1899 and 1898 respectively. Extreme cases have not been taken into account in making these computations. As regards systems, the overhead trolley still remains supreme. Up to date but three short stretches of line, totalling a length of not more than 2½ miles, are worked in Germany on the conduit system. Accumulator traction pure and simple is also in operation in only three cases, though it is noteworthy that this system has been adopted on two Bavarian full-gauge lines having lengths of over 31 and 37 miles respectively. In conclusion, it may be observed that the third-rail system has been adopted hitherto, so far as Germany is concerned, only in the case of the Wannsee Railway, which has already been fully described in these columns.

Glasgow International Engineering Congress. We are now in possession of the preliminary arrangements of the international engineering congress to be held in Glasgow on Sept. 3, 4, 5, and 6 next. The president is Mr. James Mansergh, president of the Institution of Civil Engineers, while on the vice-presidential list appears the names of the several presidents of the engineering institutions taking part in the congress. A general committee has been formed, with Mr. Mansergh at its head, and Sir Douglas Fox is named as the chairman of the London committee. Mr. Robert Caird is chairman both of the executive committee and the Glasgow local executive committee, while among the conveners of the reception committee and sub-committees we notice the names of Prof. Archibald Barr, Mr. C. C. Lindsay, Prof. J. H. Biles, and others. The meetings for the reading of papers will be held within the university buildings, which are in immediate proximity to the exhibition. As a rule, the sections will meet on the forenoons of Tuesday, Wednesday, and Thursday, Sept. 3, 4, and 5, at 10 a.m. Members of the congress will be entitled to attend the meetings of any or all of the sections. Visits to works in Glasgow and neighbourhood will be arranged by sub-committees representing the several sections, but the works will be open to all members of the congress. The subscription for membership of the congress, including free entry to the exhibition during the congress week, will be half a guinea. The congress, which is divided up into nine sections, will be of a thoroughly representative nature. Each section will be under the direct management of the institution representing that particular branch of engineering, with one or two exceptions. The following list of the sections and the office-bearers nominated, or the institutions which have accepted the invitation to take charge, will indicate the wide scope and general importance of the congress: Section 1.—Railways: chairman, Sir Benjamin Baker; hon. secretary, Mr. R. Elliott Cooper. Section 2.—Waterways and Maritime Works: chairman, Sir John Wolfe Barry; hon. secretary, Mr. L. F. Vernon-Harcourt. Section 3.—Mechanical: chairman, Mr. William H. Maw, president of the Institution of Mechanical Engineers; hon. secretary, Mr. Edgar Worthington. Section 4.—Naval Architecture and Marine Engineering: chairman, the Right Hon. the Earl of Glasgow, president of the Institution of Naval Architects; hon. secretary, Mr. George Holmes. Section 5.—Iron and Steel: chairman, Mr. William Whitwell, president of the Iron and Steel Institute; hon. secretary, Mr. Bennett H. Brough. Section 6.—Mining: chairman, Mr. James S. Dixon, president of the Mining Institute of Scotland; hon. secretary, Mr. James Barrowman. Section 7.—Municipal: chairman, Mr. Charles H. Lowe, president of the Incorporated Association of Municipal and County Engineers; hon. secretary, Mr. Thomas Cole. Section 8.—Gas (Institution of Gas Engineers): chairman, Mr. George Livesey; hon. secretary, Mr. J. W. Helps. Section 9.—Electrical: chairman, Prof. John Perry, president of the Institution of Electrical Engineers; hon. secretary, Mr. W. G. M'Millan. The general secretary of the congress is Mr. J. D. Cormack, The University, Glasgow.

Mond Gas.—Last week there was an important meeting in Birmingham, at which some explanations were given of the Mond gas and of the way in which it was proposed to use this gas for power and heating purposes throughout the manufacturing district. The meeting was presided over by Sir Alfred Hinckman, the chairman of the South Staffordshire iron trade council. The coal trade and the important collieries of the district were also represented, whilst numerous local authorities were also asked to send gentlemen to look into the question. It was explained to the meeting by Sir Alfred Hinckman that the Mond gas plant enabled use to be made of slack coal, which up to the present had been of little value in the district. The great advantage of the process was that the sulphate of ammonia was recovered, and this alone went a long way towards paying for the cost of the installation. The estimate given by this gentleman was to the effect that 8s. worth of sulphate of ammonia should be recovered from a ton of slack coal, and that after the expenses of the extraction had been paid there was still a margin of no less than 4s. 6d. per ton, which was ample to pay for the cost of the material from which the gas was produced. He also pointed out the convenience of the Mond gas for driving engines, in that it was quite free from sulphur, which was apt to deteriorate metal parts of machinery. He expressed the belief that the introduction of an up-to-date system of power gas distribution would be of great service to the districts over which the company propose to lay down their pipes. He hoped that the corporations who up to the present had in certain cases taken up an antagonistic position with respect to the matter would change their minds and support the scheme. Other gentlemen followed, speaking in favour of the undertaking, whilst Mr. Alfred Mond explained that the objections to the scheme were based as a rule under two heads—first, that the maximum price asked was too high, and next that the undertaking would not pay. In connection with the first point, he stated that the maximum price in the Bill was 4d. per 1,000 cubic feet for small consumers and 3d. for large, but he did not think the public would be asked to pay anything like this price. In any case the Act of Parliament would not force any consumer to take supply. As regards the other question of whether the undertaking would be a financial success, he explained that the scheme had all the financial support it required from six or seven commercial men in the Midlands, and hence the public would not be required to finance the undertaking. Some other figures were given as to the success of the Mond gas plant by Mr. H. Humphreys, the engineer connected with the same, in which he stated that 14 times as much gas was made from a ton of slack as was usually made from a ton of coal when producing lighting gas. This led one gentleman present to give his estimate that if 140,000 cubic feet of gas could be produced per ton of slack and sold at 3d. per 1,000ft., this, together with the sulphate of ammonia, would give a return of 42s. for every ton of slack used. Mr. Humphreys explained that in this estimate there was no allowance made either for labour or for the capital charges resulting from the first cost and upkeep of the plant.

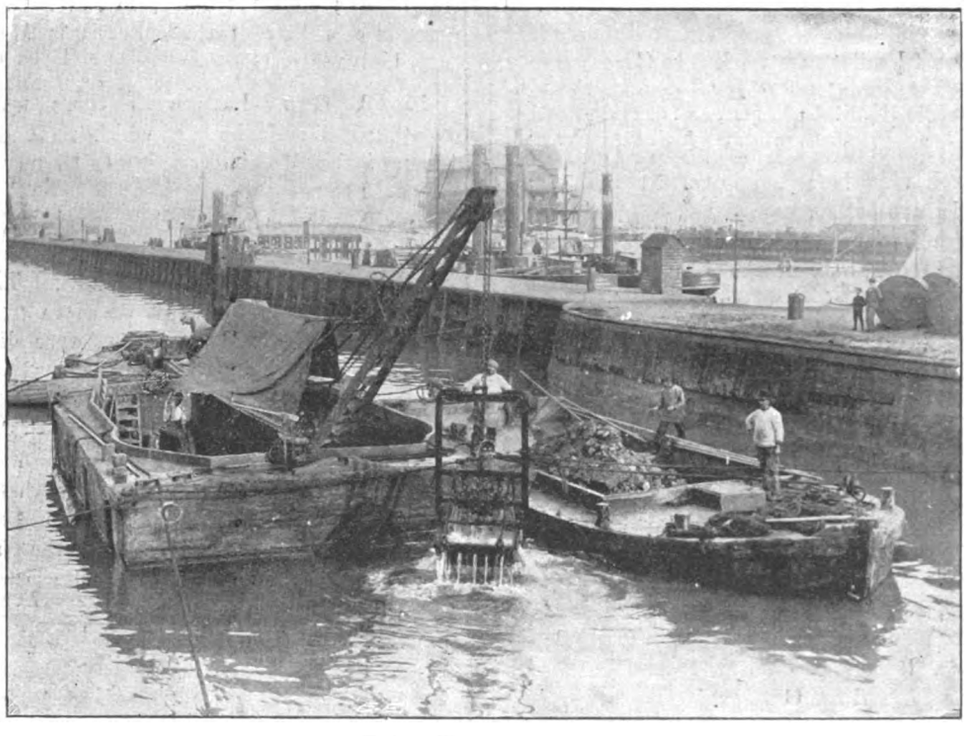
LOWESTOFT ELECTRICITY WORKS.

(Concluded from Supplement.)

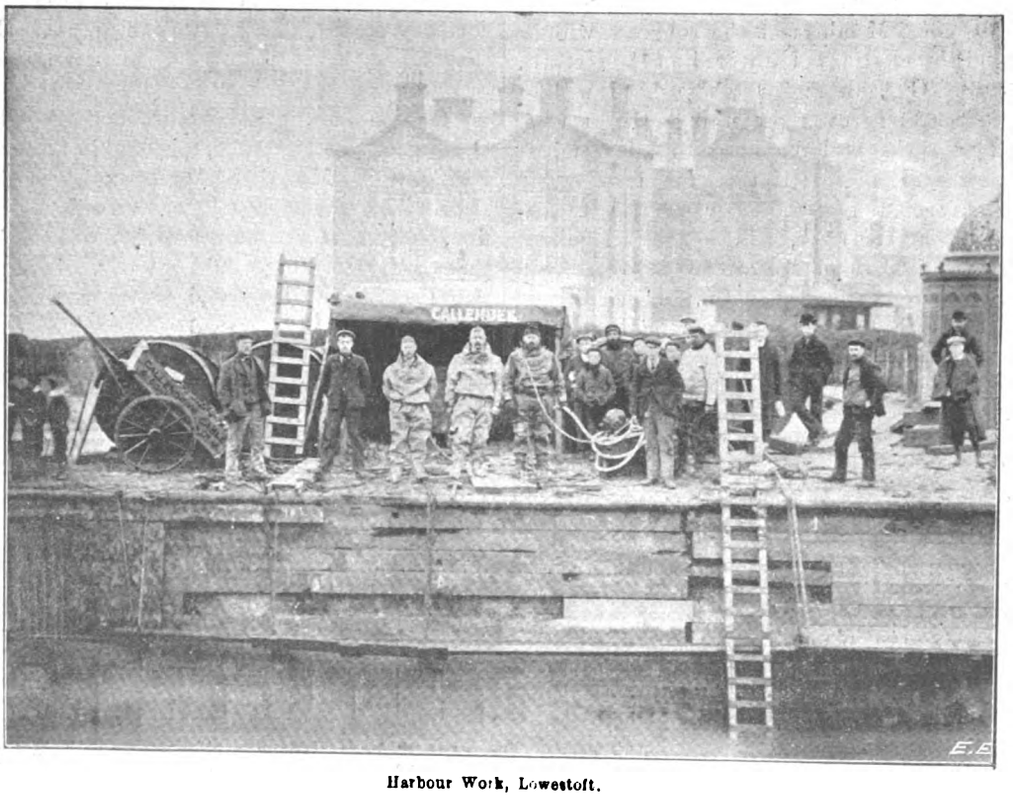
Arc lamps, of which there are 69, are fixed in the principal streets—viz., London-road South, London-road North, and the Esplanade—and are run four in series on the outers of the distributors, to which they are connected by $^{7}/_{18}$ single-conductor armoured cable.

The incandescent lamps on arc posts are connected to the mains by two single-conductor vulcanised bitumen cables laid solid in wooden troughs. All cables are laid 2ft. 6in. in roadway, and not less than 1ft. under pavements. The armoured cables under roadways are further protected by tarred boards. Disconnecting link network boxes are placed at convenient positions on the mains, so that any section of main can be shut off if necessary.

Lowestoft is divided in two parts by the harbour, and the traffic crosses by means of a swingbridge. To supply current to Southside the cables had to be laid under the harbour. Divers were employed to get out the necessary trench, and specially-made cables were used, consisting of single conductor with vulcanised bitumen insulation protected by two layers of wire armouring. Three spare 3in. stoneware pipes are laid in the same trench as the cables from the station, and run to convenient points of the town for future feeder extensions. Brick draw-boxes with cast-iron frames and covers are placed every 66 yards on these pipes for drawing in the cables. Two 3in. spare stoneware pipes are laid the whole length of the main thoroughfare from Pakefield-street to Belle Vue-park, in same trench as cables, for future telephone cables. The accompanying illustrations show the nature of this work at Lowestoft.



Harbour Work, Lowestoft.



Harbour Work, Lowestoft.

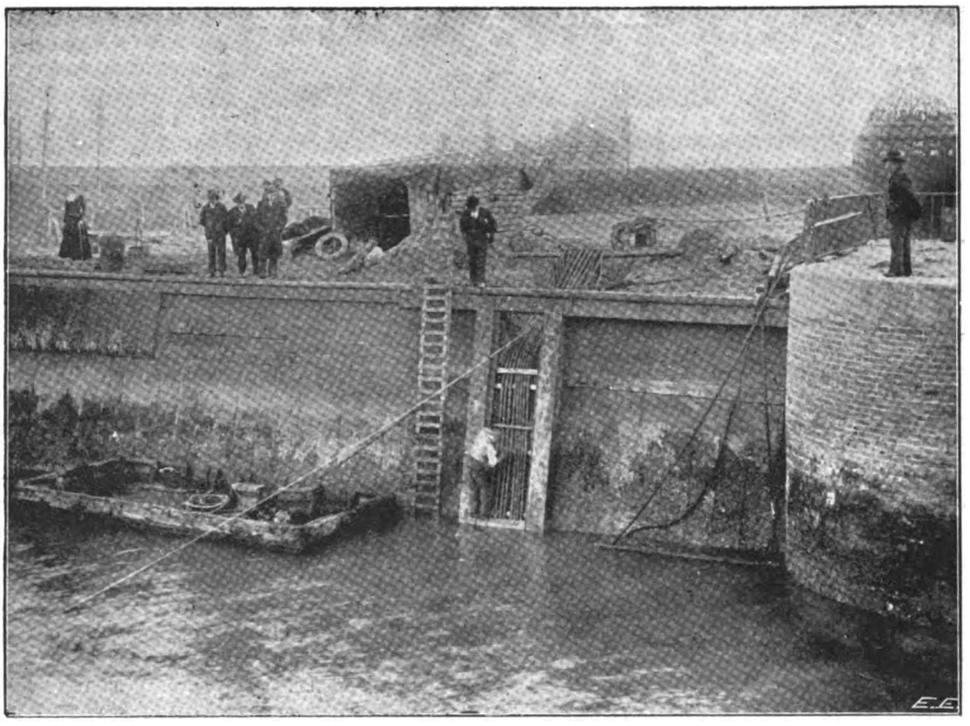
Street-Lighting.

The public street-lighting is carried out by means of five-ampere enclosed lamps of Crompton and Co.'s Chelmsford pattern, arranged for burning four in series across the outers of the distribution mains, the difference of potential being 460 volts. An automatic cut-out is provided in each lamp connected to a substitutional resistance in the base of the pillar, the cut-out being arranged to operate if the carbons stick or the arc falls from any cause, the remaining lamps in the circuit not being affected in any way. In the base of each pillar is provided a triple-pole isolating switch, by means of which a lamp may be entirely isolated from the circuit, the substitutional resistance being inserted in its place, thus making it possible to recarbon or remove one of the lamps whilst the others are burning. A quick-break switch and fuse is provided at either end of each circuit, by means of which the lamps are switched on and off. Each pillar is also



Harbour Work, Lowestoft.

Standard, Lowestoft.

Standard, Lowestoft.

Digitized by Google

provided with two ornamental brackets, and fitted with a 6in. oval prism globe with weatherproof holder, the globe containing a 32-c.p. incandescent lamp. The arcs are switched off at midnight and the incandescent lamps switched on to replace them. The leads to the incandescent lamps are also taken from the distribution mains, a quick-break switch and fuse being provided in the base of each pillar. The whole of the fittings in the base of the pillar are of very substantial design, all switches being arranged that they may be operated by means of a key passing through the door. The original contract was for 32 lamps, which are now running regularly. An additional 37 lamps are now in course of erection, and it is anticipated will be running early in March.

The cast-iron pillars have been supplied and erected by Messrs. J. W. Brooke and Co., of Lowestoft, the contractors for this part of the work. The central carriers were specially designed for Crompton and Co.'s enclosed lamps, and supplied by that company as sub-contractors. There are 22 of these central carriers on the sea-front, the bracket columns, of which there are 47, being used in the streets.

As previously stated, the installation was duly started on Tuesday, Feb. 12 last. The Council-chamber was crowded with members of the Corporation and citizens interested in the work. An interesting feature of this ceremony was the large exhibition of electrical apparatus by the General Electric Company, including a fine display of the Robertson incandescent lamp and a practical demonstration of glass-blowing.

Most of the photographs from which our illustrations are reproduced were taken by Messrs. Boughton and Sons, of Lowestoft.

THE FORTHCOMING VISIT OF THE INSTITUTION OF ELECTRICAL ENGINEERS TO BERLIN.

[BY OUR BERLIN CORRESPONDENT.]

The preliminary announcement of the forthcoming visit of the Institution to Berlin will doubtless recall to the minds of those members of the society who were fortunate enough to take part in the Swiss visit the dinner at Rheinfelden, at which Herr Rathenau, of the Allgemeine Elektricitäts-Gesellschaft, in proposing the health of the Institution, invited, in the name of his firm and of Messrs. Siemens and Halske, the members to come out to Berlin. Many will remember, perhaps with a blush, how the linguistical deficiencies of the English were then made apparent by the fact of their rising—after the speech, and in their happy ignorance of its contents—to drink to their own health. The undeniable success and popularity of the Swiss visit will, no doubt, induce many of those who participated in it to make a big effort to take part in the journey to Germany, but we are afraid that the date settled upon—viz, the end of June, which it has, unfortunately, been found impossible to alter—will preclude many of those from joining the party who would otherwise have so wished, this, of course, being due to the fact that the colleges will be still open at that date. It is to be hoped, however, that a large party will be got together in order to ensure to the visit that success which its great importance deserves; for the German capital is quite unique in its interest to the members of the electrical profession, being the centre of operations of three of the largest electrical manufacturing concerns in the world, and possessing also some of the best examples of electrical central stations which can be seen anywhere.

The programme which has been drawn up by the German Reception Committee, of which Mr. Gisbert Kapp is secretary, includes not only visits in Berlin, but, should members so desire, extensions to Dresden, where the meetings and visits of the Verband Deutscher Elektrotechniker are to take place, and also to Nuremberg and Frankfort, where are situated the manufactories of Messrs. Schuckert and Co. and Messrs. Lahmeyer and Co. We venture to think that all members who are able to face the trying ordeal of this round of visiting will return home with a feeling of pained astonishment that Germany is so far ahead of England in all that pertains to their profession, and fully awakened to the crying necessity that something must be done to resuscitate the industry, which must otherwise eventually pass into the hands of our foreign competitors. The extent to which the three-phase system has been developed is, we fear, overlooked in England, and in the meanwhile our neighbours are obtaining all the big orders in our Colonies, where this system is often the only practicable one in consideration of the distances to which in these big countries energy has often to be transmitted. We are afraid that the opponents of the polyphase systems, while often correct in stating that in England the continuous current is more suitable, overlook the fact that it is to an *export* trade that they should look for future prosperity.

Returning to the subject of the Berlin visit, a map will be given in a future number to give readers some idea of the location of the different manufactories, etc., which it is hoped to inspect. The machine and apparatus factories belonging to the Allgemeine Elektricitäts-Gesellschaft lie to the north of the city, about two miles from the Central Railway station in Friedereichstrasse. The machine factory is situated in the Brunnenstrasse, and covers an area of 125,000 square yards. Nearly the whole of the tools are driven by separate three-phase motors, and extensive use is made of portable electrically-driven tools which are taken to the work. The apparatus factory is in the Ackerstrasse, covering a ground area of 15,000 square yards, and being in four storeys the equivalent area is 75,000 square yards. The two works are connected by an underground electric railway nearly a quarter of a mile long. The manufacture of cables was transferred in 1897 to a splendidly equipped new factory at Oberspree, a village quite outside the city, and to the east. The works are pleasantly situated on the north bank of the Spree, and are noteworthy by the entire absence of steam plant, being driven entirely by three-phase motors, the energy being obtained from the neighbouring central station of the Berliner Electricitätswerk. Members will be brought out to the cable works by water, an electrically-driven launch being kindly provided by the Allgemeine Electricitäts-Gesellschaft. They will be entertained to luncheon in the cable works, and will have an opportunity of witnessing a display of Prof. Slaby's latest method of speech telegraphy and of Röntgen rays, the apparatus for which is constructed in a building attached to the works. The factories of Messrs. Siemens and Halske are in the town of Charlottenburg, on the south bank of the Spree. They are most pleasantly reached by a drive through the beautiful Thiergarten. The works cover a very large area, and everything appertaining to the electrical industry—including cables—is manufactured here.

To the north of the Spree, and not far from Messrs. Siemens and Halske's, is the factory of the Union Elektricitäts-Gesellschaft, which adjoins the celebrated tool works of Messrs. Ludwig Loewe and Co. This firm, which is the German branch of the General Electric Company of New York, is devoted principally to the manufacture of traction apparatus and appliances. It is a significant tribute to the value of German labour to find so many American firms with big factories established in Germany, and especially in Berlin. The combination of American brains and push and German labour is a thing to be feared in the future. The Berlin Elektricitätswerk own six central electric supply stations, built and equipped by the Allgemeine Elektricitäts-Gesellschaft, whose combined output amounts to nearly 150,000 h.p. The largest and most modern is that situated at Oberspree, close to the cable works of the Allgemeine Elektricitäts-Gesellschaft. The capacity of this station when completed will amount to 54,000 h.p. Three-phase current is generated here at a tension of 6,000 volts and taken by underground cables to the various sub-stations in the city, where it is transformed into low-tension continuous current for light and power. In this station may be seen the large 3,000-kw. generators, one of which was exhibited at the Paris Exhibition.

At Moabit is the next largest central station, the output of which is 36,000 h.p. generated as high-tension three-phase current. The other stations (Schiffbaurdam, Luisenstrasse, Spandaurstrasse, Rathausstrasse, Maurstrasse, and Markgrafenstrasse) have a combined capacity of 40,000 h.p., generating both continuous and three-phase currents.

The above figures will convey to our readers some idea of the great demand which has arisen in Berlin for electric

Digitized by Google

energy for lighting and other purposes. Up to the end of 1899 there were connected up to the street mains 400,000 incandescent lamps, 16,000 arc lamps, and 5,000 motors. The central station at Charlottenburg was erected in 1889 by the firm of the Elektricitäts Actien-Gesellschaft vormals W. Lahmeyer und Co., the order being obtained by this firm in open competition with Messrs. Siemens and Halske and the Allgemeine Elektricitäts-Gesellschaft, much, it is slyly whispered, to the disgust of these latter. It will be eventually taken over by the Muncipality, but is at present being run by the company. The station supplies light and power to houses and factories all over Charlottenburg, for which three-phase high-tension current is generated and transformed down at the sub-stations to 125 volts, and continuous currents at 550 volts, for the Charlottenburg portion of the Berlin and Charlottenburg electric tramways.

The above information will enable readers to form some notion of what there is to see if they are able to participate in the visit. We hope to be able to give a more detailed account of some of the works and stations in future issues. The German Reception Committee are doing their best to make the visit attractive. A ladies' committee has been formed to arrange for the comfort of those members of the gentle sex who will accompany the party. Although Berlin cannot offer the scenic splendour which made the Swiss visit so attractive, yet there is much of interest to be seen everywhere in this most modern of capitals. Noble buildings and broad tree-lined streets abound, and not least, as will be felt by those who have had some experience in the tiring work of visiting factories, ample provision for the refreshment of the "inner man" is to be found everywhere.

Although not included in the programme, members should try and arrange to see the splendidly equipped Technical High School in Charlottenburg. This huge building, where some thousands of students are educated, is in one of the best quarters of the town, and affords a very good example of the way in which Germany is equipping her children for the coming industrial struggle by the provision of numerous similar institutions, where a technical education of the highest order is given at an absurdly low charge. To those who would combine pleasure with business we recommend a trip to the Grunewald and Potsdam.

In conclusion, let us hope that members will show their appreciation of the great courtesy of our German neighbours in throwing open works to inspection by making every effort to be present, and that the party may be graced by the presence of a goodly number of ladies so as not to disappoint the expectant committee which has been formed for their entertainment.

THE ELECTRIC LIGHTING OF THE VICTORIA EMBANKMENT.

The opening of the London County Council station which is to supply the energy for arc lighting on the Victoria-embankment and Westminster Bridge took place on Saturday last. The inauguration of this arc lighting scheme recalls to memory that the first street-lighting to be carried out in London by means of electricity was also in connection with the Victoria-embankment. It was in 1878 that some 20 lamps were placed on the river side of this Embankment. In this instance the power was supplied from a small wooden shed on the west side of the Charing Cross railway bridge, in which were placed two of the early Gramme dynamos, which were driven by belts from a Ransomes and Sims engine. The actual lighting was done by means of Jablochkoff candles, and the experiment was so successful that an agreement was made with the company to continue the lighting for several years. This agreement expired in June, 1884, and was not renewed owing to the irregularity of the supply and the financial difficulties of the company. It was not until 1893 that the London County Council obtained powers in a general Act to put down plant for the lighting of the Embankment and Westminster Bridge. From the pamphlet which was given round at the opening ceremony last week, we gather that the Council considered it inexpedient to take the supply from any of the electric lighting companies in London, because different parts of the Embankment are in the area of different companies, any one of which could not, in the opinion of the Council, supply the whole of the Embankment. We do not think this reason a valid one, as the Council had the right to lay pipes along the Embankment, and it would not have mattered at which point along the route the supply was given.

FIG. 1.—Front View of the London County Council Electricity Station for the Embankment Lighting.

It was eventually decided by the Council to erect the present generating station on a vacant piece of land on the Embankment to the east of the Charing Cross railway bridge, and adjoining the station of the Metropolitan District Railway. In order to avoid the necessity of constructing a chimney shaft, which would have been unsightly in the position in question, it was decided to use gas-engines to supply the power for driving the dynamos. The outside view of the station is now completed, as shown in Fig. 1, while Fig. 2 gives the ground plan of the engine-room. Owing to the limited space, the dynamos have had to be placed in an excavation under the footway, while the ropes which drive the same pass through arches in the wall supporting the front of the building. In consequence of this, the engine-room floor is at a very con-

Digitized by Google

siderably lower level than the street. All the engineering work in connection with the station was done to the specification of Mr. T. P. Gunyon, the electrical engineer to the Council.

The gas-engines, which are built on the Otto cycle, were supplied by the well-known firm of J. E. H. Andrew and Co., Limited, of Reddish. The diameter of the cylinders by means of a flange to the cylinder. The exhaust-valve box is cast as a portion of the cylinder end so as to do away with the jointing between the exhaust-valve box and the cylinder end. The pistons are made of cast iron, and fitted with four cast-iron spring rings held in position by loose intermediate rings. The crankshaft is a mild-steel forging cut out of the solid, machined and polished and

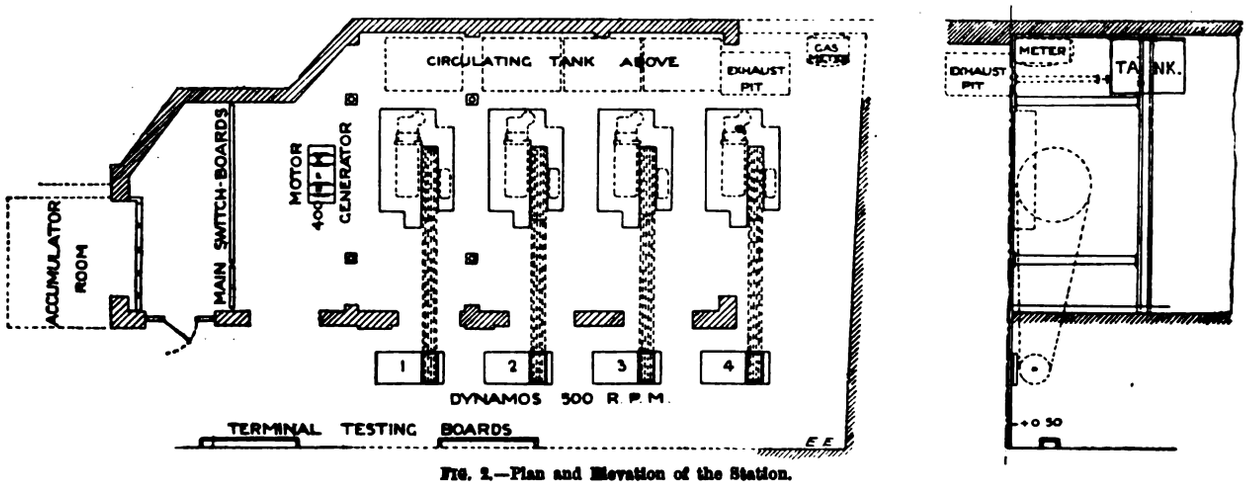


Fig. 2.—Plan and Elevation of the Station.

is 15in., stroke 22in., and each engine is able to develop a maximum of 68 b.h.p. when running at 210 revolutions per minute. The consumption of gas is guaranteed to be not greater than 17 cubic feet of coal gas per brake horse-power per hour. These engines (Fig. 3) are constructed to the standard design of the makers. Each engine is fitted with one massive flywheel weighing six tons, and having six 1¼in. grooves for driving the dynamos by means of ropes. balanced by means of counterweights secured to the crank webs by mild-steel straps, which pass round three sides of the webs of the cranks and terminate in screwed ends in recesses of the counterweight. Nuts on these screwed ends of the strap are screwed up tight and then locked by means of pins put through them. The connecting rods are of mild steel, both ends of the rods being of the marine type and fitted with phosphor bronze adjustable brasses with ample

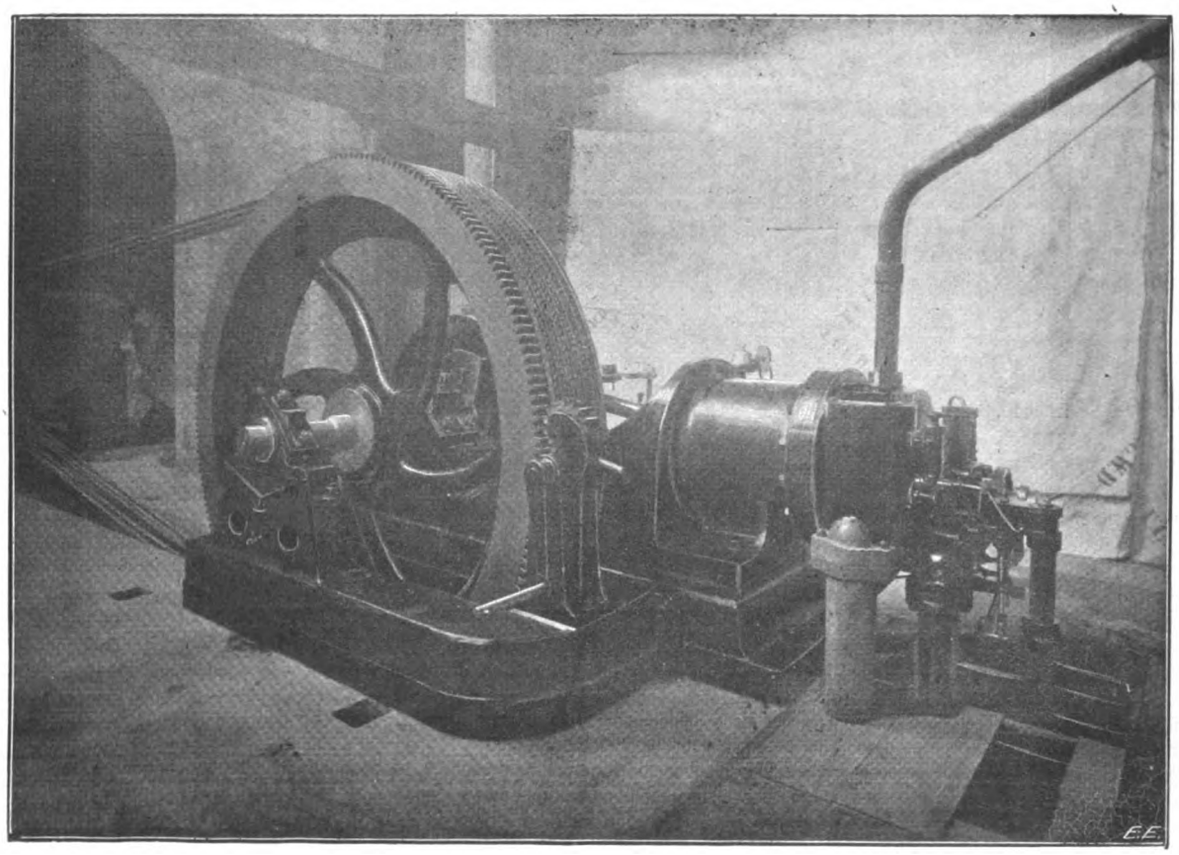

Fig. 3.—View of the Stockport Gas-Engine, showing the Barring Gear.

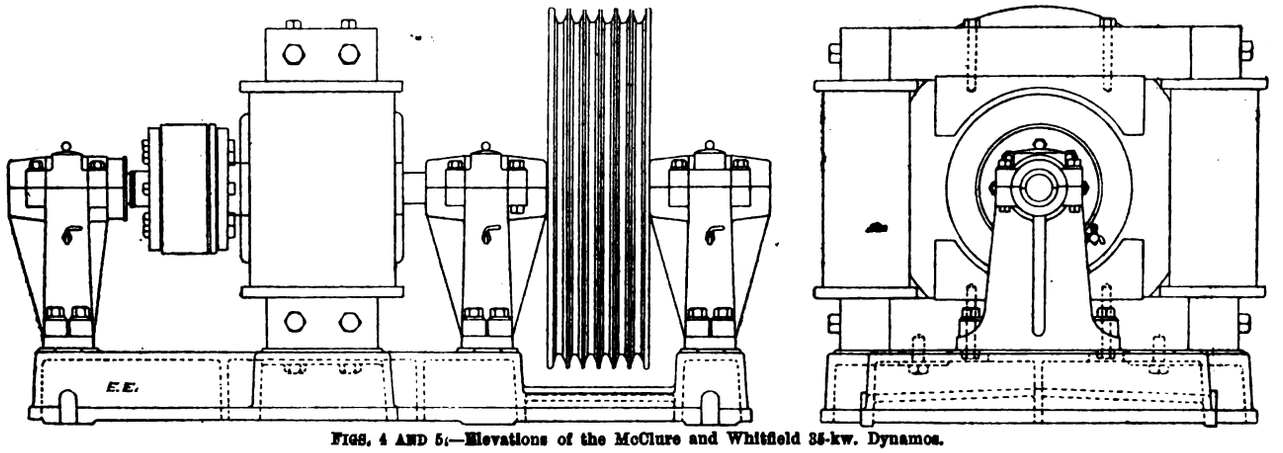
The flywheel is supported on the outer end of the shaft by an outer bearing which rests on a fender bracket, which fender bracket is bolted to the base-plate of the engine. The cylinders and frames are cast in one piece, so as to avoid the usual overhang of the cylinders that is so noticeable in many of the designs of gas-engines. The cylinders are also provided with a loose liner of specially hard metal accurately bored, and made to gauge. The cylinder ends or combustion chambers are separate pieces, and are bolted bearing surfaces. Each engine is fitted with a high-speed centrifugal governor driven by machine-cut noiseless gears. The engines are governed on the hit-and-miss principle. The engines are fitted with an ignition bracket, containing two timing valves and two tubes, so that in the case of one tube breaking the other tube can be instantly put into action. Automatic and continuous lubricators are provided for the cylinder, crankshaft bearings, crank-pin bearing, and piston-pin bearing. Each

Digitized by Google

engine is fitted with efficient splash guards and oil drains to prevent any oil being thrown from the engine, and all the oil escaping from the bearings is collected. The engines are started by means of the makers' patent self-starter, which can be seen in the illustration (Fig. 3). A simple device of pinion wheels, which gear into teeth cast in the inside rim of the flywheel, enables the attendant to quickly and easily put the engine into proper position for starting, and this barring device is so designed that as soon as the flywheel is put in motion by the engine itself the pinions are thrown out of gear. The arrangement is extremely simple, and entirely prevents any chance of an accident to the attendant, and was made according to the designs of Mr. Atkinson, the head mechanical engineer to the London County Council.

were made. It will be seen from these that the field-magnet system is of the Manchester type. The pulley for the ropes has a very considerable diameter, which will considerably lengthen the life of the ropes used. A third bearing outside the pulley takes half of the strain from the driving ropes. All the bearings have automatic lubrication. Each of these dynamos is geared to run at 500 revolutions per minute, and at that speed is capable of giving 70 amperes at 500 volts. In addition to the machines in question, Messrs. McClure and Whitfield have also supplied and erected the motor-generator which is shown in Fig. 6. This machine runs at 400 revolutions, and is of 20-kw. capacity. It is driven by the 500-volt current of one of the dynamos, and is used for charging a battery of 56 cells



FIGS. 4 AND 5.—Elevations of the McClure and Whitfield 35-kw. Dynamos.

When the engine is in the right position for starting—that is, with the crank at the top centre at about an angle of 90deg. with the connecting rod—gas is then pumped into the combustion chamber to form a mixture with the air contained therein. As the gas is being pumped in, a portion of the air is driven out through a small hole which communicates with the ignition tube. After a certain number of strokes of the pump an explosive mixture is formed, and this, escaping through the small hole, is ignited by the ignition tube. The explosion which then takes place starts the engine. The time required to start an engine is about five minutes, which includes the time necessary for heating the ignition tubes.

which is to be placed in the accumulator-room behind the switchboard. The machine will also be used to light the station from its low-voltage side, while the accumulators will supply the necessary light for the incandescent lamps when the motor-generator is not working. Mr. Gunyon has also arranged for three arc lamps in the station, which will be in series with three of the lighting circuits, and will thus serve as pilot lights. The above dynamos have been carefully tested over an extended run at full load, from which tests it was found that the temperature rise on the armatures and fields was so low as to conform with the stringent conditions of the contract. Thus, a rise of under 50deg. F. as a maximum was insisted

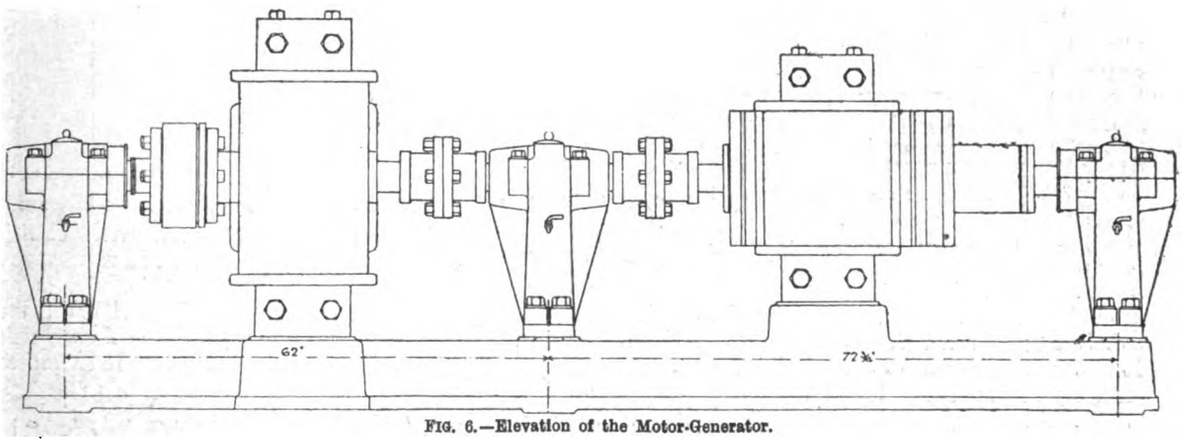


FIG. 6.—Elevation of the Motor-Generator.

Having regard to the position in which the engine-house is placed, it was absolutely necessary that the exhausts from these engines should be silent. A special arrangement of exhaust pits with silencing boxes has been devised, which ensures a quiet exhaust. Whilst the engines were being tested at the makers' works the variations of speed of the engines were taken by a Moscropp recorder, and it was found that the cyclical variation engine running idle was 1·15 per cent. above and below, engine running under full load 1·37 per cent. above and below, and that the governor regulated the engine to within 2 per cent. from no load to full load.

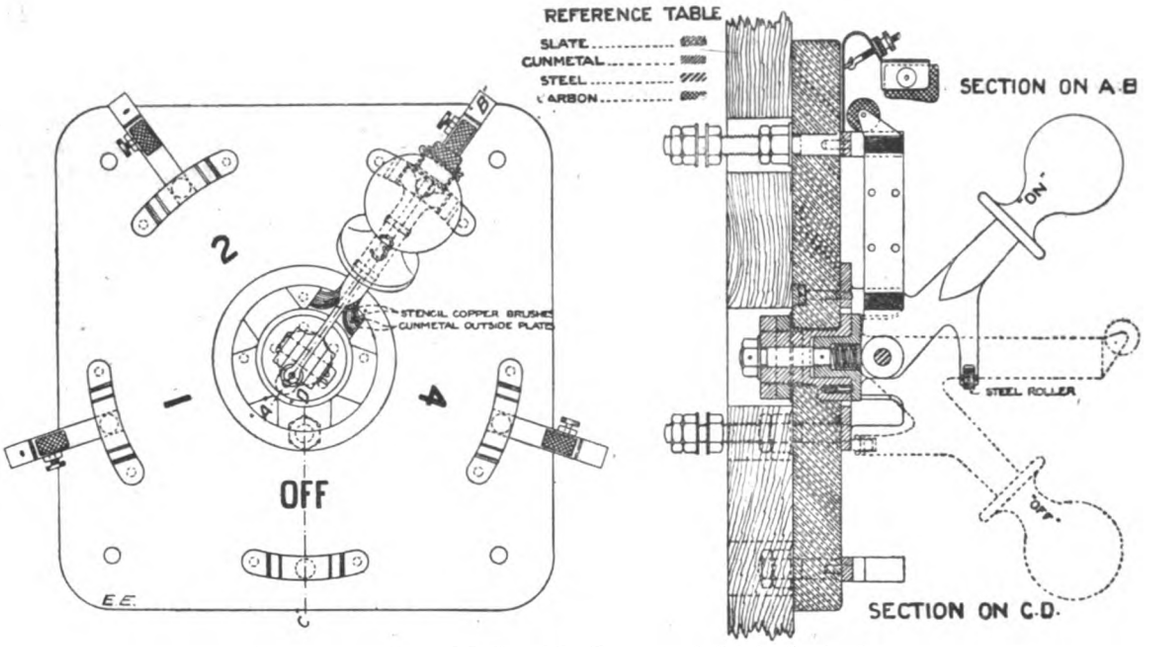
The four dynamos, each of which is driven from one of the above-mentioned engines, were manufactured by Messrs. McClure and Whitfield, of Stockport, who have kindly furnished us with the drawings from which Figs. 4 and 5

on and obtained. The efficiency of the dynamos at full load was 93 per cent.

From the dynamos the current is led to a main switchboard at the Westminster end of the station, whence, by means of a series of machine switches and circuit switches, it is distributed from the various machines amongst the various circuits, 15 in all, seven of which supply current to the 67 parapet lamps, and eight supply the 80 lamps on the Embankment kerbs and on Westminster Bridge and the approaches thereto. This switchboard, which was in Messrs. McClure and Whitfield's contract, was actually manufactured by Messrs. Hands, Limited, of Garlick-hill, E.C., to the detailed designs supplied by Mr. Gunyon. This switchboard is made to control four dynamos, at an output of 70 amperes 500 volts each; it also contains the necessary switch gear for a low-tension

Digitized by Google

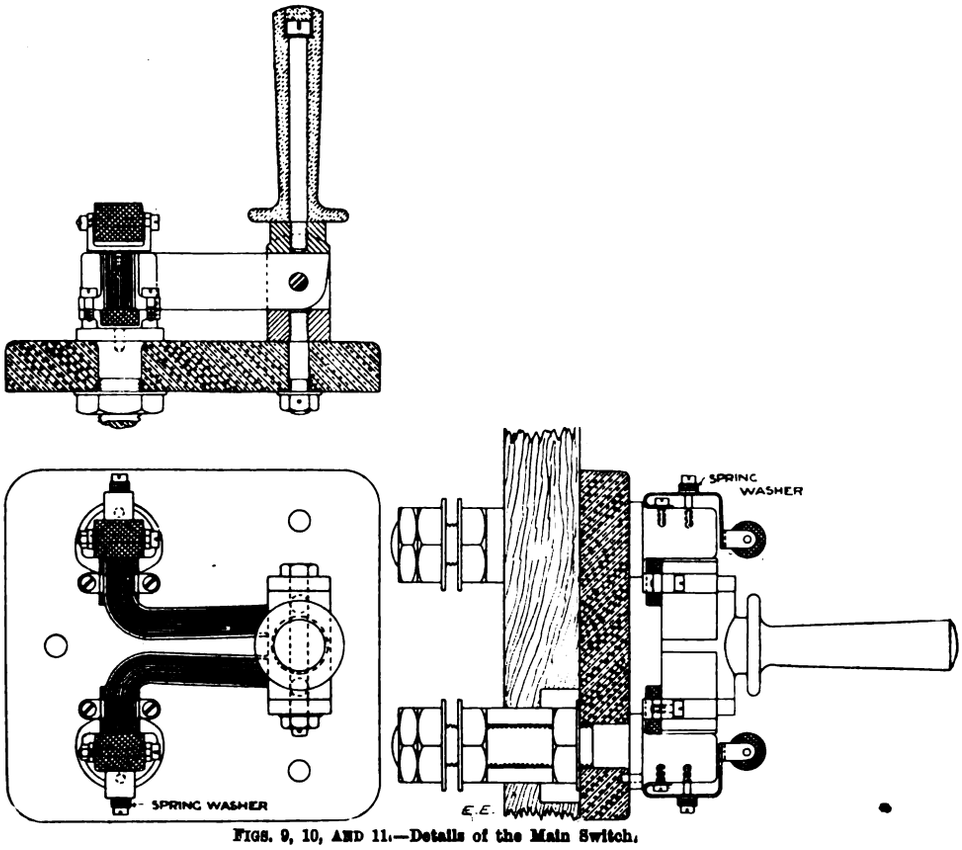
motor-generator for charging accumulators and for station lighting. The distribution panels are fitted with special four-way switches enabling any of the arc circuits to be fed from any one of the four machines. The details of these four-way change-over switches can be seen from Figs. 7 and 8, from which it will be gathered that the switch-lever is made to swivel round its centre. At each position the copper brush engages first at the centre contact, which gives the necessary alignment before completing the circuit at the outer contacts. A carbon break is provided at each outer jaw, so that the metal surfaces of the same are not damaged when the circuit is opened.



FIGS. 7 AND 8.—Plan and Section of the Change-over Switch for the Arc Lamps.

a terminal testing-board, fitted with disconnecting latches, thereby enabling any circuit to be isolated from all switch-board and machinery in the building. The cables used to connect up the lamps were supplied by the St. Helens Cable Company. They have paper insulation and are lead-covered, and armoured with steel. They are placed in a subway under the footpath of the Embankment. The connections to the lamps are so arranged that alternate lamps come on a different circuit, so that the lighting can be reduced at midnight.

The Council considered carefully the relative advantages of "enclosed" and "open" type arc lamps, and ultimately decided to adopt the latter. The order for these was placed with the Gilbert Arc Company, Limited, of Chingford, who have supplied a special long-burning "open" type of lamp. Thus the larger lamps on the kerb standards and on the bridge will burn, without retrimming, from 60 to 80 hours, and the smaller parapet lamps about 40



FIGS. 9, 10, AND 11.—Details of the Main Switch.

The main switch (Figs. 9, 10, and 11) shows how the same general construction has been adapted to heavier currents. All the switches and fuse blocks are separately mounted on slate slabs and surmounted on 1½in. teak panels. Apart from the main board switches, the external circuits are all intercepted at the point of entry to the building by

Digitized by Google

hours. In this way they gain to a considerable extent the advantages of long hours of burning of the "enclosed" arc in lamps of the "open" type. The parapet lamps are supported on the old standards which have for so many years past been used for the gas lanterns. The necessary modifications have been made to the lanterns, the upper parts having been cut off and the lower parts reglazed, and new upper parts to support the lamps having been provided and fixed in the old cradles. The handsome design of the old lamp standards (Fig. 12) is well known, and the Council considered that it would be quite unnecessary to obtain new standards for the present lighting, although some difficulty was encountered in drawing in the leads from the subway into these standards, owing to the arrangements which had been made in them for gas fittings. Some parts of these fittings could not be removed without taking down the columns, a very serious operation, which, however, by the exercise of considerable care and trouble in drawing in the leads, it was found possible to avoid.

The lamps on the parapets are designed to take six amperes, while those to be supported on the posts on the kerb lines will take 12 amperes. The arc lamp pillars supporting these larger lamps (Fig. 13) have been specially designed and manufactured for the position they are to occupy by Messrs. Walter Macfarlane and Co., Saracen Foundry, Glasgow. One of the principal features is the

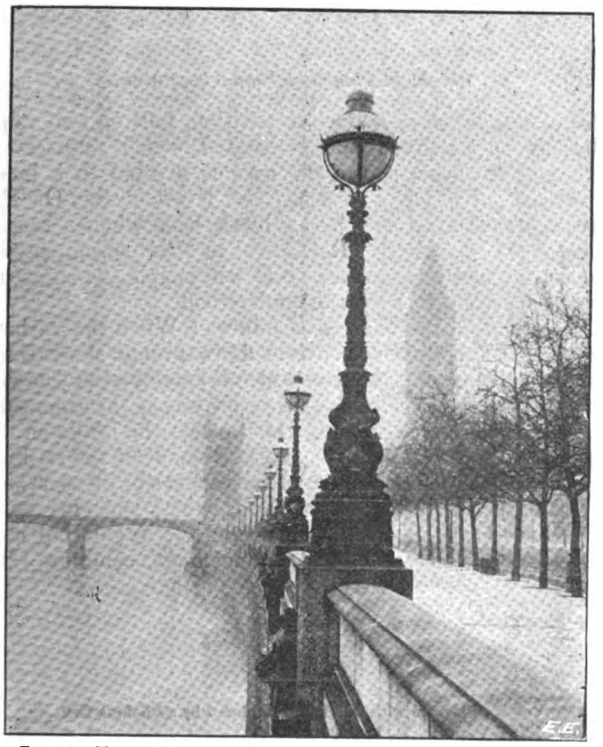


FIG. 12.—View of the Embankment Parapet and Lamp Standards with Arc Lamps in Globes.

massive, well-proportioned, and highly ornate pedestal base, bearing the London County Council coat-of-arms on the front and conventional arrangements of the Tudor rose on the side and back panels. There are no sharp corners, the object being to interfere as little as possible with the foot traffic. The transition from the oblong pedestal with its four corner pillars to the single round shaft above is successfully accomplished by the introduction of dolphins, to harmonise with the pillars already upon the Embankment wall. The bracket carrying the arc lamp springs from a Royal crown that forms the capital of the shaft and is entirely composed of wrought iron, combining in its form lines of elegance and strength. The line of the column or shaft is carried above the bracket, and terminates in a wrought-iron spiral, forming an appropriate finish. The projection of the arc lamp is 4ft. 6in. from the centre of the column, and the height is 24ft. from the ground line to the centre of the light. The Gilbert arc lamps on these pillars are arranged to lower for trimming. The automatic cut-outs, substitutional resistances, and switches, etc., used are all of the company's standard design. The circuits are arranged in series of 10, and are run off a constant potential of 500 volts, and we believe it is the first time that such small ampere arc lamps have been successfully used for public lighting in this manner. The lighting of the Embankment is not yet completed, but that the general effect will be good can be gathered by the success of Saturday's trial run.

A NEW ALTERNATING-CURRENT ARC LAMP.

We were recently invited to witness, at the Croydon Corporation electricity works, the working of a temporary installation of arc lamps of a type now being manufactured (under the patents of Mr. Frank Lewis) and introduced by

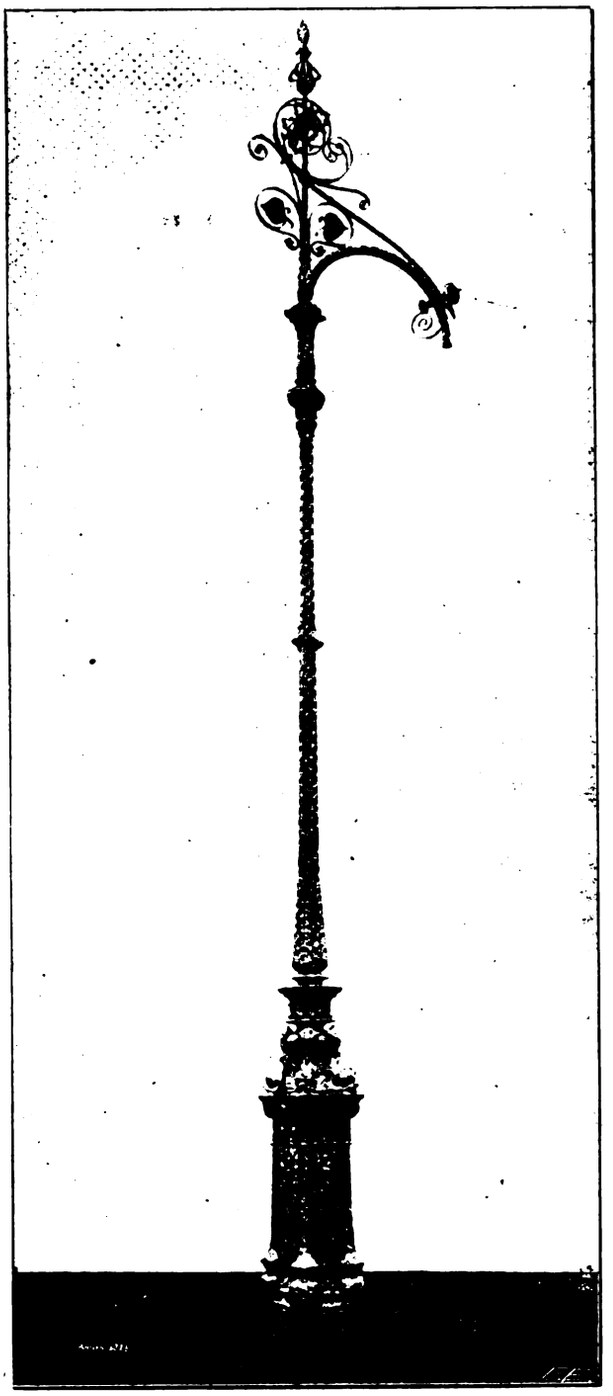

FIG 13.—The Arc Lamp Pillars to be used on the Embankment, designed by W. Macfarlane and Co.

the Reason Manufacturing Company, Limited, Brighton The lamp, it may be mentioned, has been designed to meet the requirements of a satisfactory series system of alternating arc lighting, and it now remains to investigate into how far these requirements are fulfilled. One of the advantages of series alternating enclosed lamps over parallel lamps, is that the large number of lamps in series have a steadying effect, and prevent large abnormal current rushes,

Digitized by Google

which with parallel lamps often occur. The effect of this is that in the case of the series lamps the ends of the carbon become of a hard gritty nature, which gives the light a much better colour than when the carbon tips are softer, while at the same time a greater candle-power is obtained for a given consumption of energy. It is well known that series systems of alternating arc lighting are in great vogue in the States, but these systems have generally consisted of lamps working with shunt coils, each circuit being run from a constant current transformer, thereby necessitating the use of a cut-out for each lamp, which may be objected to as constituting a weak point. Another method which has been employed both in England, America, and on the Continent of Europe is to arrange a choking coil in parallel with the lamp, which, in the event of the latter failing,

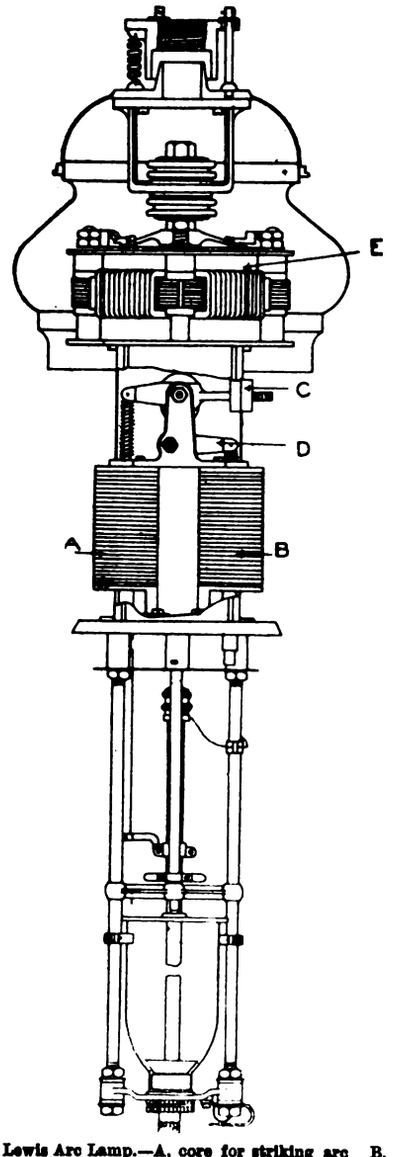

Diagram of Lewis Arc Lamp.—A, core for striking arc B. core for acting as a dashpot by braking striking lever C, balance weight; D, oblique approach; E, choker in parallel with arc.

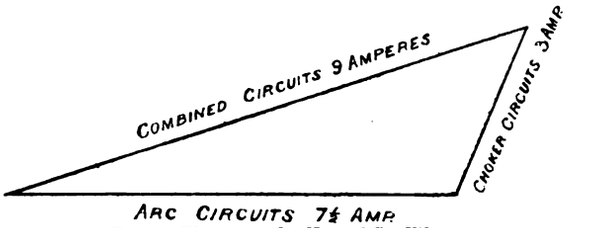
substitutes a self-induction equivalent to it. The pioneering work in this direction must, we think, be accredited to the Helios Company, of Cologne, whose system was briefly described in our issue of July 3, 1896.

It is in this direction that Mr. F. Lewis has been working, and he so proportions the choking coils which are in parallel with each lamp that under normal conditions they take three amperes, while the arc lamp takes 7½ amperes. When a lamp fails for any reason, the whole current of the circuit, nine amperes, goes through the choking coil. This causes the E.M.F. of self-induction to rise to such a value that when combined with the E.M.F. of the rest of the circuit, a constant resultant is obtained which is equal to the applied voltage.

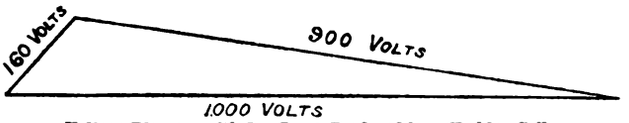
But the arc circuit for any such system to obtain good regulation must be extremely non-inductive, which, in other words, means that the controlling power for the carbons can only be weak. Should the lamp circuit be too inductive, in the event of failure of one of the arcs the circuit becomes affected unless a very large current is allowed normally to pass through the choker. The existence of a dash-pot involves to a considerable extent the necessity of large controlling power in arc lamps. When new and clean the dash-pot is a piece of mechanism which is not likely to cause trouble, but after prolonged use it is liable to introduce friction. In order to overcome this, arc lamp designers have hitherto provided as powerful controllers as possible consistent with keeping the price of the lamp within reasonable limits; but in the case of lamps provided with chokers in parallel to enable them to be run in series, such powerful controllers must be avoided, as previously observed, on account of their increasing the self-induction of the arc circuit. For this substantial reason Mr. Lewis has therefore contrived in his lamp to dispense entirely with the familiar dash-pot. In its stead he employs a solenoid, to the core of which is attached a strip which links on to a clutch acting directly on the upper carbon.



Current Diagram under Normal Conditions.

This clutch, when in its lowest position, falls on two stops, whereby an eccentric cam is rotated, which releases the carbon. The other end of the core is pivoted to a lever, to the axle of which a circular disc is attached. On this disc a brake lever and brake block bear when a second solenoid is energised. Reference to the accompanying illustration and explanatory notes will enable the construction of the lamp to be better understood.

The action of the lamp is as follows: When the carbons are together, an abnormal current flows through the striking coil and also through the coil which is employed as a brake, whereby the clutch is pulled upwards, but at the same time the second core is pulled up, which places the brake on the brake disc, and so prevents rapid movement of the striking core, hence also the possibility of the carbons being separated too rapidly. On the other hand, when the current is normal the brake is not in operation, the regulating core being free to move. This arrangement combines the



Voltage Diagram with One Lamp Replaced by a Choking Coil.

advantage that if the lamp is subjected to great vibration, as in the case of lamps suspended from trolley masts, and the carbons consequently tend to hunt, the braking apparatus comes into operation rapidly, while with a dash-pot the small movements are not effectively steadied. Apart from the controlling mechanism, several ingenious mechanical features have been embodied in the design of the lamp. Great care has, for instance, been taken to obtain perfect enclosure for the carbons. The use of asbestos for obtaining airtightness is dispensed with—since it has been found that carbon monoxide is able to pass freely through asbestos—and after the lamp has been running for a short time the gas inside is natural carbon monoxide and, of course, nitrogen. A universal joint is provided both above and below the enclosing globe and lower carbon-carrier, whereby it is possible to centre the lower carbon with the upper one by simply manipulating the globe. The spring suspension of the lamp is also neat, as will be seen from the accompanying illustration.

Now, as regards the commercial qualities of the lamp, it may be mentioned that it will burn for 70 hours without attention. A maximum number of 27 lamps may be run in series on a 2,000-volt circuit, or a minimum of five lamps on a 400-volt circuit. By virtue of the choker coil inserted in parallel with each arc, as above described,

Digitized by Google

which when a lamp fails supplies an equivalent self-induction, it is claimed that 30 per cent. of the total number of lamps on circuit may fail without seriously affecting the rest of the circuit. A liquid resistance is employed in switching a number of lamps in circuit so as to avoid blinking the light, but, as previously observed, no special transformer is required. The power factor of the circuit is ·75, and the normal E.M.F. on the arc 80 volts. One of the appended diagrams shows graphically the current in the arc circuit, the combined circuit, and the disc circuit, while the other shows roughly the effect of one lamp in a series of 12 on 1,000 volts falling. The temporary installation which we were invited to inspect consisted of 12 of the lamps arranged in series on a 1,000-volt circuit, eight of them being under cover and the rest in the open. We were favourably impressed by the steadiness of the lamps, as also by the inappreciable extent to which the rest of the circuit was affected when two of the lamps were made to fail simultaneously. We understand that about 70 lamps of the type described are on order for installation in Croydon, some of them to be suspended from trolley masts yet to be erected.

In conclusion, we may add that Mr. Lewis, the inventor of the lamp, does not claim to have introduced any essential novelty in principle, but rather to have effected a combination calculated to overcome the difficulties hitherto experienced in connection with series alternating arc systems, and in this we trust further experience will prove him to be correct.

CORRESPONDENCE.

"One man's word is no man's word,
Justice needs that both be heard."

THE LONDON COUNTY COUNCIL TRAMWAYS.

SIR,—On p. 653 in your contemporary, the *Electrician*, I have noticed the following paragraph:

"The only thing to be said for the London County Council conduit is that, as the yoke is only 26in. wide, the excavation will be *less than if the yoke spanned right across the track*. Seeing that track rails will have to be relaid, however, it is doubtful whether there will really be much saving," etc., which I feel justified in saying inadvertently cancels much of the praise of American conduits contained in the article, and which, at the same time, indicates the weak points in the admittedly sarcastic letter on the same subject in your last issue signed "M. B."

If "M. B." is an American, as I suppose he is, it would not be apparent to him that some of our London roads have been for many months in a condition of upheaval, which to an Englishman is by no means as acceptable as it would be in America, where, as he says himself, bad systems are continuously blowing up, and where, I may say, the roads are anything but satisfactory. There are more conditions to be considered in Great Britain than those of ingenious design and elaborate machinery, and this is why I quote the paragraph from the *Electrician*.

It gives the kernel of the more conservative English method, which prefers a system that does not necessitate the tearing up of the roadway to a great extent, and which is more simple and easy to repair. The relaying of track rails to a certain extent will always be necessary, and again I think that the English conduit exhibited at Camberwell will offer advantages over the much-praised American system in this respect.

The wood paving which "M. B." says predominates, and which the promoters of foreign conduits so object to, will not, as has been distinctly said, be used. It seems odd that the Americans should not feel complimented at our adopting mineral paving, which is the "predominating" feature of the roadways in the United States.

A good motto which "M. B." would do well to consider is *Via trita, via tuta*.

In England we look before we leap, and a conservative progress is better than the "sense of progress" which the American Demos get from the systems which "blow up" the day after they are laid.—Yours, etc.,

PRO BONO PUBLICO.

INSULATION TESTS.

SIR,—There appears to be some misunderstanding on the part of Mr. Pierson, for he has not evidently read my reply to question No. 342 in the right light. The first portion of the question asked for a description of some method whereby rough tests could be taken weekly to ascertain the insulation resistance of a three-wire network during working. I notice in Mr. Pierson's remarks that he has taken F in the formula

$$F = \frac{d^1 - d^2}{2\,d^2 - d^1} \cdot r^1$$

to be the resistance of the fault; but this is not the case, for $F = f_1 + f_2 + f_3$—*i.e.*, equal to the insulation resistances of the positive, neutral, and negative mains.

The above formula may be proved direct from Kirchoff's laws, but as this is a somewhat lengthy process, the following condensed proof is given according to Raphael:

If F = the insulation resistance of the network,

$$\frac{1}{F} = \frac{1}{f_1} + \frac{1}{f_2} + \frac{1}{f_3}.$$

Putting $G + r = g$, and $r^1 = s$, V = the difference of potential between any two sides of the system (1 and 2, or 2 and 3), we have:

$$\text{First reading} = d^1 = \frac{V}{g} \cdot \frac{\frac{1}{f_3} - \frac{1}{f_1}}{\frac{1}{F} + \frac{1}{g}} \quad \ldots\ldots\ldots (1)$$

$$\text{Second reading:} \quad d^2 = \frac{V}{g} \cdot \frac{\frac{1}{f_3} - \frac{1}{f_1}}{\frac{1}{F} + \frac{1}{g} + \frac{1}{s}} \quad \ldots\ldots\ldots (2)$$

$$\text{Whence} \quad \frac{d^1}{d^2} = \frac{\frac{1}{F} + \frac{1}{g} + \frac{1}{s}}{\frac{1}{F} + \frac{1}{g}} \quad \ldots\ldots\ldots (3)$$

From (3) we have

$$\frac{1}{F}(d^1 - d^2) = \frac{d^2}{s} - \frac{d^1 - d^2}{g},$$

$$\text{whence} \quad \frac{1}{F} = \frac{d^2}{(d^1 - d^2)\,s} - \frac{1}{g} = \frac{2\,d^2 - d^1}{d^1 - d^2} \cdot \frac{1}{g},$$

$$\text{and from this} \quad F = \frac{d^1 - d^2}{2\,d^2 - d^1}\, s,$$

being similar to the formula given.—Yours, etc., A. H.

Feb. 26, 1901.

DIRECT OBSERVATION, GUIDED BY SCIENCE AND TESTED BY EXPERIENCE.

SIR,—I have come to the conclusion, after a most severe test, that the time has come when my researches will be of use to the community at large, as I will explain. For the past 23 years, ever since a child, I have believed that by careful observation a man can understand the working of everything around him without the aid of books, to the extent most people think is necessary. For an example, as a boy I had the opportunity to study the working of a distillery, and by careful scrutiny I found myself able to follow the whole process from where the grain is fermented to where the spirit comes out finished. At an early age I left my native village and took up electrical engineering as a profession. After a few years of careful observation and hard work I find I understand both theory and practice of all branches of electrical engineering, and I can understand the means by which electricity is applied to attain any ends, by studying the results, and applying the results of my previous observations to them.

After several years, I started independently as an electrical and mechanical engineer in all the various branches. But I was not satisfied, and after a time I made up my mind to travel all over the civilised world and study the various systems of electrical and mechanical engineering in vogue. I worked in most of the principal shops in Europe and America, and my spare time I devoted to experiments

Digitized by Google

in various branches of science. Still unsatisfied, for a long time I studied the way in which habits govern people. By also studying closely my own habits, I find that the opinion I have formed as to the various organs of the body and their functions compares favourably with that of doctors. I have also studied, by direct observation, physiography and natural phenomena. I claim that what the world calls a genius is nothing more than a man with an abnormal memory, and that by putting certain facts which he has remembered together he produces his invention, and is acclaimed great by the world, for the simple reason he remembered and they forgot the facts on which the invention is based. In conclusion, in my opinion, by close observation and actual practice, a man will get better results than if he worked on scientific lines only, and, further, the value of so-called science is in most things greatly over-rated. If anyone should dispute this, I will be pleased to prove the truth of what I say. I am an unknown man, for I have not striven after wealth and fame, preferring to pursue my studies and experiments as a working-man, and learn my lessons in the hard school of experience.—Yours, etc., MAX HANKIN.

151, Minories.

DOUBLE-POLE SWITCH.

SIR,—What is a double-pole switch, and is it necessary that a double-pole switch should break circuit on *both* positive and negative poles when the D.C. machines are connected in series? As a friend of mine and myself differ in opinion upon the above subject, we should be pleased if you could enlighten us through your correspondence column, and very much oblige, yours, etc., G. M.

[The requirements of a double-pole switch are practically indicated by the name, as it is a switch which is so constructed as to break both the poles of an electric circuit.—ED. *E. E.*]

FEEDER REGULATION.

SIR,—I should be much obliged if any of your readers would kindly inform me as to the most modern method of regulating the voltage on feeder mains in the case where several feeders require to work from the switchboard at different pressures, and only one dynamo is used.—Thanking you in anticipation, yours, etc., J. K.

283, Wightman-road, Hornsey, N.

REVIEWS.

Polyphase Electric Currents and Alternate-Current Motors. By SILVANUS P. THOMPSON. Second edition. London: E. and F. N. Spon; New York: Spon and Chamberlain.

The original little book has now grown into a stout volume of some 480 pages and eight plates illustrative of polyphase machinery, mostly of Continental make. It is, perhaps, inevitable that every book on dynamo-electric machinery written nowadays should start with the elements of the science, but the author has wisely curtailed this elementary introduction as far as he could. There are no long-winded explanations how an E.M.F. is produced by a wire cutting lines of force, but the reader is at once introduced into the more practical part by being shown the E.M.F. curves as obtained from actual machines. Clock diagrams occur also very early in the book, so that the reader is saved much complicated mathematics. A neat way of finding the effective E.M.F. by planimeter from the polar E.M.F. curve is given on p. 16. This method is too little known by practical engineers, and the author has done well to give it. We notice that he does not use the term "effective," but "virtual" E.M.F. This is to be regretted, for the former term was adopted 12 years ago at the Paris Congress, and is used throughout the Continent and by the majority of English engineers. Whether "virtual" is preferable to "effective" we need not consider. The fact that the latter term is in almost universal use ought to weigh more than any real or imaginary advantage which the rival term may have from the point of view of the philologist.

The combination of magnetic fields is treated in the third chapter. Most readers will rather wonder that the combination of two fields at right angles is dignified by the term "Marcel Deprez theorem." On p. 73 the author treats the combination of three fields analytically, and arrives at the conclusion that the resultant field is 1·5 times as strong as each component and revolves with constand speed. This is theoretically true, but not true when the fields are produced in a real motor. The author ought to have pointed out that in the real motor the revolving field is slightly pulsating, and such a correction of the purely theoretical result of his investigations would have been the more desirable as he has previously, in Fig. 60, given a method of winding three-phase fields designed by Dobrowolsky for the very purpose of reducing these pulsations.

In the fourth chapter are introduced the polyphase generators. A very good feature is the clear representation of different forms of winding in Figs. 82 to 118. By using different colours to distinguish the phases, the reader is enabled to follow the winding with much more certainty and less fatigue to the eye than would be the case if the windings were distinguished by dotted lines or dots and dashes, as is usual. In the following chapter are given examples of polyphase generators, including a monocyclic machine made by the General Electric Company of Schenectady. The author calls the supplementary winding the "teazer," and states that the teazer gives almost entirely a wattless current. In the particular machine described the teazer has only one-quarter as many turns as the main winding; the pressure between each main lead and the third teazer lead is, therefore, only $\sqrt{(\frac{1}{4})^2+(\frac{1}{2})^2}=0{\cdot}57$ of the pressure between the main leads. Such a machine is, of course, mainly intended for supplying lighting circuits or single-phase motors, and the teaser is only of use in starting. Under these conditions, we agree with the author that the teaser carries normally a wattless current. He ought, however, to have told the reader that this is not the only way of building a monocyclic machine. In some cases it is necessary to provide current for three-phase motors; then the teaser must be made stronger so that the pressure between the three line wires is the same all round, just as in a regular three-phase plant, and then the teaser carries by no means only a wattless current.

In Chapter VI. we are introduced to polyphase motors, starting with the synchronous and then passing on to the asychronous type. The vexed question which part should be called the field and which the armature is solved by the author in a very simple manner. He employs neither one nor the other of these terms, but calls the parts "stator" and "rotor." He first deals with the structural aspect of the matter, shape of stampings, disposition of holes, windings, etc., and then proceeds to give an explanation of the manner in which the field progresses. This is shown very clearly in a succession of diagrams on p. 161, whilst the effect of magnetic leakage is very clearly illustrated on the next pages. Then follows the construction of the rotor, including its winding and starting resistance. The theory of the polyphase motor is treated in the next three chapters; in the seventh and eighth graphically, and in the ninth analytically. These expositions of the theory of the asynchronous motors are the best that have as yet appeared in the English language. They are clear and as simple as the somewhat complex nature of the subject permits, whilst for the practical engineer, who wishes, above all things, not to lose sight of the connection between the natural phenomenon and its mathematical representation, the example worked out on pp. 200 to 209 will be a great help. The graphic representation of leakage fields in Figs. 222 to 224 will also greatly aid the student. The backbone of the graphic treatment of the whole question is, of course, Heyland's diagram, given in Fig. 226 and in a more complete form in Fig. 227. Based on this, the author gives a complete investigation of a motor by Kolben, working drawings of which are given in Plate V. If the reader has mastered this example, he may skip Chapter IX., containing the analytical theory of polyphase motors. It is difficult to see what useful purpose is served by this theory, which by the author's own admission (top of

Digitized by Google

p. 248) is incomplete. He says there: "To make the theory complete, we must take account of the leakage self-induction, the changes in the magnetising current, and the core losses. The expressions involving all these terms become so complex that they are of no practical utility." In plain English, this simply means that the practical engineer will do well to eschew the analytical treatment and stick to clock diagrams.

In Chapter X. are given examples of polyphase motors. Then follows a chapter on hints for designs, another on the working of motors, including characteristic curves and behaviour at starting. In Chapter XIII. we come to single-phase motors, the theory of which is developed by substituting for the oscillating field the equivalent of two constant fields rotating in opposite direction. This chapter, as well as the next, on polyphase transformers, might with advantage be amplified. We doubt very much whether the author's suggestion for a "phase-transformer" will give the desired result. We do not mean to say that supplied on the primary side with a three-phase current it will not give on the secondary side a single-phase current, but we very much doubt whether the load on the primary will be equally distributed between the three phases. We know of no static phase transformer which fulfils this condition, but if the phases are unequally loaded, then the transformer is only a useless complication, for a single-phase current can always be obtained from a three-phase apparatus by the simple expedient of using only two of the three terminals.

In the same chapter the author discusses rotary converters, and shows how the converting ratio is influenced by the width of the poles. This is further exemplified by reference to a converter made by the Oerlikon Company, of which detail drawings are given. In this machine the converting ratio (continuous to three-phase current) has been increased from 0·577 to 0·666 by narrowing the pole arc. In the following chapters we find notes on the measurement of polyphase power, on the use of polyphase motors in factories, on distribution of polyphase currents (including short accounts of some Continental power stations), and a fairly exhaustive dissertation of the merits of polyphase railways. For the particular method of connecting two motors in series for railway work, which on the Continent is termed coupling up in "cascade," the author uses the much better term "tandem control." For long lines and heavy trains the author thinks polyphase currents much preferable to continuous—provided the stops are not frequent, we are quite ready to agree with him. But on the vexed question whether the transformers should be placed along the line, or be carried on the train, he is silent. Yet this is one of the most important questions to be decided before a line can be built. Both systems find advocates. Messrs. Ganz believe in transformers along the line; Messrs. Siemens and others prefer to carry the transformer on the train. As lines on both plans are being built at the present time, it is all the more remarkable that the author has nothing to say on so important a question. We cannot help feeling that in his advocacy of polyphase working he has been a little unjust to the continuous current. Thus he has omitted to take into account the great advantage of the continuous current for urban traffic, where each run only requires current for accelerating the train, the rest of the journey being done by coasting. Under these circumstances three-phase working, even if tandem control be used, is most wasteful, whilst the continuous current, supplemented by buffer batteries, is the ideal system.

Chapter XIX. has the title "Properties of the Rotating Magnetic Field," and is partly a historical account of the subject, as is also the following chapter on the early development of the polyphase motor. The symbolic method of treating vector quantities, and a list of British patents bearing on polyphase apparatus, conclude the book. Appended are eight plates giving working drawings of polyphase apparatus. The index, as is usual in the author's books, is very complete, and the get-up of the work is worthy of its publishers. We congratulate Prof. Thompson on having produced a very readable book, which will prove useful not only to the student but also to the practical engineer. G. K.

METROPOLITAN DISTRICT RAILWAY.

We understand from a note in the *Scotsman* of yesterday that Sir John Wolfe Barry, K.C.B., has retired from the Metropolitan District Railway. It is said that his resignation is due to a difference of opinion regarding the particular system of electric traction to be adopted on the Inner Circle. The report adds that Sir John Wolfe-Barry has been in favour of the acceptance of the Ganz Company's scheme, and that the Board are not of the same opinion in view of the high voltage which would be employed on the line wires.

FORTHCOMING EVENTS.

FRIDAY, MARCH 1.

Royal Institution.—At 9 p.m., discourse by Mr. Henry H. Cunynghame on "Enamels."

Board of Trade.—At 11 a.m., at the Westminster Town Hall, enquiry into the question of increasing the declared pressure of supply.

SATURDAY, MARCH 2.

Royal Institution.—The Right Hon. Lord Rayleigh on "Sound and Vibrations" (Lecture II.).

Institution of Electrical Engineers.—Students' visit to the generating station of the London United Tramways Company, Chiswick.

General Electric Company.—Annual dinner.

North-East Coast Institution of Engineers and Shipbuilders. At 6 p.m., general meeting at West Hartlepool. Mr. F. W. Jennings will reply to the discussion on his paper on "The Ventilation and Heating of Ships." Discussion on Mr. G. M. Brown's paper on "Some Attempts to Increase the Efficiency of Marine Boilers." Paper on "Some Remarks on the Commercial Organisation of Shipyards," by Mr. Walter Scott.

MONDAY, MARCH 4.

Society of Engineers.—At 7.30 p.m., ordinary meeting, at the Royal United Service Institution, Whitehall. Paper, "Notes on Certain Details of Drainage Construction," by Mr. Gerard J. G. Jensen.

Society of Arts.—At 8 p.m. "The Bearings of Geometry on the Chemistry of Fermentation," by Mr. W. J. Pope (Lecture IV.).

Royal Institution.—At 5 p.m., general monthly meeting.

TUESDAY, MARCH 5.

Institution of Electrical Engineers (Students' Section).—At 7.30 p.m., ordinary meeting. Paper on "Arc Lamps," by Mr. P. Laubach.

Institution of Civil Engineers.—At 8 p.m., ordinary meeting. Paper to be further discussed, "The Rotary Process of Cement Manufacture," by Messrs. W. H. Stanger and Bertram Blount.

WEDNESDAY, MARCH 6.

Society of Arts.—At 8 p.m., ordinary meeting. "Modern Artillery," by Lieut. Arthur T. Dawson (late R.N.).

THURSDAY, MARCH 7.

Institution of Electrical Engineers.—At 8 p.m., extra meeting. If the discussion on Mr. Magden's paper be concluded, the following will be read: "Insulation on Cables," by Mr. Mervyn O'Gorman.—At 3 p.m. (Students' Section). Visit to the works of the Thames Ironworks and Shipbuilding Company, Blackwall.—At 8 p.m. (Dublin Section). Visit to the Dublin United Tramway Company's power station at Ringsend.

Institution of Junior Engineers.—At 8 p.m., "Works Management," by Mr. A. H. Barker. (Lecture III.).

Rontgen Society.—At 8 p.m., ordinary meeting. Exhibition evening.

Civil and Mechanical Engineers' Society.—Ordinary meeting. Paper on "Authoritative Rules for Unit Stresses in Railway Girders," by Mr. J. Bell.

FRIDAY, MARCH 8.

Royal Institution.—At 9 p.m., discourse on "Vitrified Quartz," by Mr. W. A. Shenstone.

SATURDAY, MARCH 9.

Royal Institution.—At 3 p.m., "Sound and Vibrations," by the Right Hon. Lord Rayleigh (Lecture III.).

Institution of Junior Engineers.—At 3 p.m., visit to the Southall station of the Brentford Gas Company to inspect the carburetted gas plant, etc.

Glasgow and West of Scotland Scientific Society.—At 7.30 p.m., ordinary meeting. Paper on "The Progress of Electricity Supply," by Mr. J. G. Scott.

Birmingham Section, Electrical Engineers.—We can only say in this issue that the president (Dr. Oliver Lodge) of this section of the Institution delivered his inaugural address on Wednesday last.

TO CORRESPONDENTS.

All Rights Reserved. Secretaries and Managers of Companies are invited to furnish Notice of Meetings, Issue of New Shares, Installations, Contracts, and any information connected with Electrical Engineering which may be interesting to our readers. Inventors are informed that any account of their inventions submitted to us will receive our best consideration.

All communications intended for the Editor should be addressed C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street London, E C. Anonymous communications will not be noticed.*

TO ADVERTISERS.

Advertisements should be addressed to the Publisher, 139-140 Salisbury Court, Fleet Street, E.C., and should reach him not later than noon of Thursday. **Special Terms** *for a series can be arranged on application.*

SITUATIONS WANTED will be charged at three words for One Penny (prepaid and net), with a minimum charge of Sixpence.

TO SUBSCRIBERS.

"THE ELECTRICAL ENGINEER" *can be had by Order, from any Newsagent in Town or Country, and at the various Railway Stations; or it can, if preferred, be supplied direct from the Office on the following terms:*

	3 months.	6 months.	12 month
United Kingdom	3s. 3d.	6s. 6d.	13s. 0d.
Other Places	5s. 6d.	10s. 6d.	21s. 0d.

(Post Free, Payable in Advance.)

Cheques, Post Office and Postal Orders for Subscription and Advertisements should be made payable to C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, and be crossed "Union Bank."*

Now Ready, Vol. XXV., bound in blue cloth, gold lettered price 8s. 6d.

CITY OF LONDON ELECTRIC v. MAYOR, ETC., CITY OF LONDON.

Judgment in this case was given too late to refer to in our last issue. Its effects, however, seem to be somewhat far-reaching, and it will have to be considered in all future transactions with corporate bodies. The case is too well known to require lengthy reference. Briefly, then, three agreements were in dispute, and the judgment of Mr. Justice Farwell in regard to these agreements was appealed against. The legal proceedings will not give the true inwardness of the case; to know this it is necessary to know the whole history of electric lighting as regards the City. The topic is not a pleasant one, and redounds nothing to the credit of the Corporation. However, after years of negotiations of one kind and another these agreements were made—two with the Brush Company and one with Laing, Wharton, and Down. These three agreements subsequently came into the hands of the "City of London Electric," the work was carried out, and the City has been lighted under them since 1891. In 1898 the City Fathers repudiated the agreements, hence the litigation. The result of the appeal is that two agreements are held to be invalid—those with the Brush Company—and the third held to be valid. Practically, this ruling was owing to some members of the Corporation having been interested as shareholders in the Brush Company. The exact words concerning this important question show that London differs from every other municipality, and therefore what holds good in the latter does not in the former.

The words of the judgment are: "The conclusion I arrive at is that a shareholder, commissioner, alderman, or common councilman is interested within Section 42, and that the existence of his interest is sufficient to render a contract with his company null and void. The fact that express provision has been made by Parliament that a member of an ordinary municipal council shall not be precluded, by being interested only as a shareholder of an incorporated company, from taking part in making a contract between his company and the corporation of which he is a member, only emphasises the distinction in this respect between ordinary municipal corporations and the City Corporation, as to which no similar parliamentary provision exists, or apparently ever has existed."

Unfortunately, every Englishman in theory is supposed to be thoroughly conversant with every word of the law, but in practice, of course, such knowledge is impossible. Upon the face of it, this exception of the first city of the Empire is peculiar—the members of its governing body suffer under disabilities such as exist with no other authority in the kingdom. We had supposed that its members were as high above suspicion as the members of any authority, but the law seems to point differently. However, we need not now enter into these abstract questions; the fact remains that because two or three of its members had invested some five hundred pounds in a limited company, agreements under which between one and two hundred thousand pounds were expended and work carried on during a period of some seven years

Digitized by Google

with the impression that such agreements were good in law, the company is now told that its agreements have been illegal from the start. There is no suggestion of bad faith on the part of the company, yet it is put into a position very detrimental, or which may be very detrimental to its shareholders. It seems to us that the only honest course for the Corporation to have pursued was at the time the legality of the agreements was doubted to have examined into the *bonâ fides* of the whole matter, and if that could not be impugned to have made at once agreements that were valid. The attempt to break through an agreement honestly made after due consideration, is not in accordance with the honoured traditions of the City. Throughout the whole of its connection with electric lighting matters it may be said to have had no settled policy, but to have pursued a policy of shuffle, which is as unbusinesslike as it is detrimental. Any member of the Corporation, as the law stands, can render a proposed agreement with a limited company nugatory by purchasing a share in that company. Truly, if this is the view to be adopted, the law needs modification, and the Corporation of London to be put in a position at any rate not worse than that of any other municipality.

THE LIVERPOOL ACCIDENT.

On Wednesday, the 20th ult., the Liverpool coroner resumed the adjourned enquiry into the circumstanees attending the death of Thomas Hankey, carter, and David Singleton, butcher, who lost their lives through a fall of telephone wires on to trolley wires in Pembroke-place on the 4th ult., under circumstances already reported in these columns.

Mr. PIERCE, who appeared for the Liverpool Corporation, briefly explained the position of the Corporation in the matter. It had been decided, only after the most careful enquiry and consideration, that the form of traction best suited to the requirements of Liverpool was the overhead trolley system, and this was eventually adopted. Subsequent to making this decision the Corporation called in Dr. John Hopkinson for advice, and an experimental line was laid down to Dingle, which proved a success, and resulted in the reconstruction of all the tramways in the city and the electrical equipment on the same system. There was what was termed a guard wire and a guard strip over the trolley wire, and the Tramways Committee decided to adopt the guard strip. The Board of Trade certified that particular part of the tramways where the accident took place on Jan. 21, and the accident occurred on Feb. 4. On the night of the latter date there was a very exceptional snowstorm.

Several witnesses were next called to give evidence bearing on the exact circumstances of the accident and the attempts which were made to rescue the victims from the coils of the telephone wire with which they had become entangled. The medical evidence showed that death was due in both instances to exhaustion following upon an electric shock.

Mr. THOMAS DAVIES, civil engineer, Liverpool, who had made certain investigations into the case at the request of the coroner, explained that the telephone wires up to near the site of the disaster were underground. At Coustance-street, however, they entered the distributing box, from which point they were carried from a standard along London-road over the trolley wires to another standard in Oak-street, the span being about 350ft. It was the wires between this span which were alleged to have fallen. He had tested a piece of the wire taken from Singleton's body, and found the breaking strain was 161·5lb., whereas the ordinary breaking strain was 200lb. The maximum strain to which the wire would be subjected by stretching it into position was about 50lb., so that an extra strain of 109lb. was obviously introduced in some form before the wire broke. The most likely form was the weight of ice clinging to the wire and the force exerted by the wind at the time of the occurrence. The wire was of the customary weight used. He had made another test with a piece of the telephone wire taken down for him two days after the accident, and the breaking strain of that was 187·5lb. Two days after the accident he found that the trolley wires in London-road were without guards, but there were clips on the up line as though there had been guards when the accident occurred. In Pembroke-place there was a gap of about 2in. between the guards, which might have been caused by tugging at the wires, or the fall of the telephone wires might have disturbed the strip. He thought it advisable that the guard strips should be extended to the bow of the insulator. As to the means of cutting off the electric current, it seemed to him that the Corporation depended in a great measure upon the telephone service, and when it became disorganised they were prevented from communicating with certain individuals. It was also apparent that the guards and drivers of the electric cars, and also the policemen, were not familiar with the mode of cutting off the current. They should be instructed and provided with rubber gloves and nippers to cut wires. He could not suggest any stronger wire than that used by the Telephone Company, which was made of phosphor-bronze and had a breaking strain of 45 tons to the square inch. There was a divergence of opinion as to the respective utility of the strip guard and the wire guard. Both were unsatisfactory, but of the two he would prefer the wood guard, the chief objection to which lay in the fact that it was almost impossible to secure it to the trolley wire. With regard to the other guard there were more serious objections, the general view being that the more metallic things they had overhead the greater the danger. Assuming the Corporation had decided to maintain the trolley system, the proper course was to have the telephone wires laid underground, and do away with all overhead wires other than the trolley wires. Until the Telephone Company could do this they should encase their wires in cables.

WM. LAMB, a lineman employed on the Liverpool electric tramways, described the condition of affairs in Pembroke-place at the time of the occurrence. The guard strip on the trolley wire was in good order, but the telephone wires were coiled round it, and he had some difficulty in getting them away. Owing to the force he had to use the guard strip might have got displaced.

Mr. MATTINSON, K.C., representing the National Telephone Company, said Mr. Pierce had pointed out that the trolley wires were placed in the street under statutory authority. The telephone wires which crossed the trolley wires were also there by statutory authority. The only difference between the two cases was that the tramway system in Pembroke-place was only completed two or three weeks before the accident, whereas the telephone wires were in position there two or three years before. The wires in London-road were put up 18 months' previous to the accident, so were not only of first-rate quality, but had not been in position longer than was consistent with a large margin of public safety. The Telephone Company were, however, anxious to get rid of their overhead wires as soon as possible. At the present time all the main wires in Liverpool were underground. At the spot where the accident occurred cables had been substituted for wires as a temporary measure.

DANIEL SINCLAIR, engineer-in-chief to the National Telephone Company, said the wire the company used was tested to bear a breaking strain of 200lb. The life of a telephone wire of this class at the place of the accident should be about 10 years. When such atmospheric conditions prevailed as on the occasion in question, it mattered very little what kind of wire was erected, as down it would come. The reason why, with the knowledge of all this, no special precaution had been taken to minimise the effect of the falling was that at the time these works were designed there were no trolley wires there. The main point of protection was to have a wire elastic, strong, and light, so that if it did come down to the street it would do no harm to anyone. Everyone was thoroughly convinced that the right thing was that where there were trolley wires, the telephone wires should either be in cables overhead or underground. They had already handled 1,600 or 1,700 wires in cables overhead or in cables underground, and their promise to the Corporation was to go on until they had finished them.

At this point the enquiry was adjourned until the following morning, when the evidence was continued.

ARTHUR BENFIELD, foreman in the employ of the National Telephone Company, spoke as to the state of the poles and insulators in the vicinity of the accident the day after the occurrence. On examination he had found the poles and insulators in good condition. There were no insulators down in Pembroke-street. Other witnesses corroborated this evidence, which had an important bearing, in that suggestions to the contrary had been made.

This completed the Telephone Company's evidence.

In giving evidence on behalf of the Corporation, Mr. C. R. BELLAMY, general manager to the Liverpool Corporation tramways, said that by means of electric traction they had carried about 100 million passengers since the first route of the electric tramways was opened in November, 1898, and with the exception of the present case no fatal accident had occurred from electric shock. After the accident he made an inspection of

Digitized by Google

the site, and found the wooden guard strips in their place. As to the provision made for turning off the current, the system was divided into half-mile sections, and 36 assistants, who had keys of the section boxes, could on short notice cut the current off from each half-mile section. He had found the insulators on the telephone poles all right after the accident.

Mr. A. BROMLEY HOLMES, electrical engineer to the Liverpool Corportion, stated that for the purpose of catching fallen telephone wires there was not much to choose between the wood strip guard and the wire guard, but as regarded the safety of the system as a whole the wood guard was the more advantageous. The latter means of protection had been adopted in Liverpool on the advice of Dr. John Hopkinson. But neither form of protector was effectual for such a fall as the one in question. The only safe course was to carry the telephone wires underground, and the Corporation recognised that. He did not think that if any other form of protector had been employed the accident could have been avoided, but that was a matter of opinion. The wood strip dealt satisfactorily with ordinary falling wires, but not with tangled wires.

Major CARDEW, electrical adviser to the Board of Trade, said that in the case of the wooden strip no "earthing" was possible. Much difference existed amongst engineers as to which was the best form of guard. The guard strip as sanctioned for use in Liverpool was the outcome of a great number of Continental experiments. The real difficulty to fight against was the tendency of the telephone wires to twist into small coils; they became springy, and would insert themselves into almost anything. Where there were trolley wires the most effectual remedy was to put all cross-wires underground, unless they were put in cables overhead. The span of the trolley wires in Pembroke-place was long, but with the weight of wire used it was not unreasonable.

Mr. PHILIP DAWSON, chief engineer and managing director of Messrs. Robert W. Blackwell and Co., who supplied the overhead equipment for the Liverpool tramways, said so far as Liverpool was concerned he thought the guard strip was the best method that could be adopted for protecting the trolley wires. He was convinced that had there been guard wires instead of wooden guard strips the accident would have been more serious, inasmuch as the guard wires would have been burnt through, and would have fallen together with the telephone wires.

Mr. SAMUEL B. COTTRELL, manager and chief engineer for the Liverpool Overhead Railway, gave evidence to the same effect.

This concluded the evidence.

The CORONER, in summing up, said that the question for the jury to decide was whether all reasonable and proper precautions were taken by the Corporation and the Telephone Company. Was there anything else they could possibly have done to avoid accidents short of putting the telephone wires underground, to accomplish which work every reasonable effort was now being made? Had anyone been guilty of negligence which had caused death? He would advise the jury to be careful with regard to any recommendations they might make as to the means of avoiding similar accidents in future. The subject was receiving the most serious consideration, and their suggestions might hamper the authorities in coming to a safe conclusion.

The jury agreed upon a verdict of accidental death from electric shock, at the same time expressing an opinion that if the span between the telephone standards had not been so long the accident would not have occurred.

CATALOGUES.

We have received from the General Electric Company, Limited, a four-sheet supplement to their large catalogue, which deals entirely with the steel interior conduit work. The conduits which are described in this list are enamelled both inside and out, the tubes being made of steel of sufficient strength to give ample protection against any risk of damage by nails, etc. The elbows and bends are made with inspection chambers from which the wires can be withdrawn if need be. The ordinary sleeves for connecting up the lengths of tubes are provided with a groove at either end in which red lead can be placed before the sleeve is put over the two ends of the tube. In this way watertight joints are obtained at a very slight cost. The same means of rendering the joints waterproof is adopted in all the elbows, joint-boxes, reducing sockets, etc. We notice that the enamel bends advocated by the firm have a considerable radius, and these, we think, should be used wherever possible when carrying out insulation with these steel conduits. While the large radius may involve a certain amount of extra work in erecting, it renders the drawing in and out of the cables a much more easy matter. The same firm have just issued the eighth edition of their telephone (or K) catalogue, in which there are many excellent things put in an excellent way. The keen competition imposed by Continental makers is evidently an incentive to improvement, as we find several interesting and practical novelties, whilst, despite the general increase in cost of material and labour, the firm tell us they have generally reduced the prices of the older apparatus, the high quality remaining as before. A great feature is made of the "Handcom" telephone, in which the automatic switch hooks or cradles are dispensed with, the whole of the necessary functions being performed by a switch in the handle of the hand combination. This type is also developed into a most comprehensive inter-communication system, the instrument lending itself to fixture in any position. The "General" intercommunication system has also been improved in that private circuits can be fitted if required. Among other novelties we notice the magneto intercommunication "Handcom," the direct-working bell-push telephones (for connecting to existing electric bell wires), and the "reply and call" system. The latter completely does away with the cumbersome plugboard for sub-station intercommunication, and substitutes a line selector instrument, whilst the telephone proper has a two-way switch for reply and call. This type is particularly neat in the "Handcom" pattern. The "Municipal" is a new type built according to Continental practice; these have already been supplied to Glasgow, Tunbridge Wells, and Guernsey. A further novelty is the traction system, comprising telephones, both fixed and portable, for communicating from feeder pillars with the central station. Among telephones for special purposes we find mining, engine-house, military, police, etc. The last is a particularly neat pocket instrument in connection with the firm's police and fire calls, which are now being supplied to Walthamstow and Tottenham. An excellent system of electrically-controlled clocks is shown, and the catalogue ends with a comprehensive set of wiring diagrams and a very complete telegraphic code.

PHYSICAL SOCIETY.

The annual general meeting of this society was held on Feb. 8, Mr. G. Griffith (vice-president) in the chair. The report of the council was read and adopted. Prof. Willard Gibbs and Dr. Rudolph Koenig were elected to the two vacant honorary fellowships of the society. The following officers and council were elected for the ensuing year:—President: Prof. S. P. Thompson. Vice-presidents (members who have filled the office of president): T. H. Blakesley, C. V. Boys, Prof. J. D. Everett, and J. Walker. Secretaries: H. M. Elder and W. Watson. Foreign secretary: Dr. R. T. Glazebrook. Treasurer: Prof. H. L. Callendar. Librarian: W. Watson. Other members of the council: Prof. Armstrong, W. R. Cooper, G. Griffith, E. H. Griffiths, Dr. R. A. Lehfeldt, S. Lupton, Prof. Perry, Dr. Porter, W. A. Price, and R. Threlfall.

Prof. S. P. Thompson then took the chair and delivered an address. In opening, the President gave in detail the various ways in which the aim of the Physical Society to promote the progress and study of physics has been accomplished during the 26 years of the society's existence. Referring to the election of two hon. Fellows, Prof. Thompson said they had added to their roll two men distinguished in very different walks of physics. Prof. Willard Gibbs was a United States mathematical physicist, whose work in thermo-dynamics, elastic solid theory of light, and other specialised subjects, was of the highest order, and was valued for its beauty and profundity. Dr. Rudolph Koenig, of Paris, was known as a maker of acoustical instruments of perfect standard—tuning-forks in particular. He had, however, found time to extend the borders of acoustics, and to him they owed the manometric flames, the wave siren, and other instruments of research. He had also published works on the facts about the combinations of pure tones. The president appealed to all searchers of physics in the country to make use of the society and give it their active support. It was mainly in the interest of teachers and students that the society undertook the publication of *Science Abstracts* By means of the *Abstracts* teachers had at hand the latest information on the subject, and could thus continually supplement their text-book knowledge. Every teacher from time to time devised new or improved modes of presenting his subject. At the Physical Society the Fellows always welcomed contributions of that kind, even though there might be little of actual novelty in the principles so illustrated. The routine work and administrative duties of teachers, although hampering their usefulness to science and diminishing their fruitfulness, prevented their attention, without intermission, to one subject, and produced a direction of thought over various domains of physics which was to be welcomed rather than deplored. It has been the custom for Fellows of the Physical Society to bring models to illustrate physical principles. That practice of using models was regarded by our Continental brethren as a peculiarly English matter, and one that showed a sort of mental constitution they did not quite understand. Models had become a part of their mental furniture. It never occurred to them that there was anything unusual in the habit. Faraday had used them in connection with the electrostatic field surrounding charged bodies. Lord Kelvin had made models to convey his ideas of elasticity, of the elastic solid theory of matter, and of the constitution of matter itself. Maxwell's models of

Digitized by Google

heterogeneous dielectrics and the mutual induction between two circuits were well known. These models were useful for teaching purposes and for enabling one to grasp that which in its nature was abstract by contemplating the representation of it or its analogue in the concrete. The French physicist could not understand a complicated phenomenon until he had reduced it to a mathematical equation. The British physicist must construct a model which would produce mechanically the analogous operation. Both methods were right, but, judging by their fruitfulness, the method of Faraday had advantages over that of Poisson. Referring to the new teaching university of London, the president said that now was the time for Fellows to offer suggestions for the teaching of physics.

An ordinary meeting of the society was then held. A paper on "**A Mica Echelon Grating,**" by **Prof. R. W. Wood,** was read by Mr. Watson. This grating occupied a position midway between an ordinary grating and an echelon with thick plates. A number of sheets of mica were examined with the interferometer and one selected over a considerable portion of which the fringes were straight and unbroken. That portion was marked off and cut up into rectangles. The mica was about 0·05mm. thick, and the retardation of one of the rectangles was found to be 50 wavelengths for sodium light. Nine of these rectangles were used to form the grating, and they were put in position under a microscope, and cemented together at the edges with sealing wax. The grating space was 0·5mm. The battery was mounted on a square of cardboard over a rectangular opening of the same size, a clear space of 0·5mm. wide being left to serve as the first grating line of zero retardation. The number of lines was therefore 10. The resolution of the sodium lines was beyond the power of the instrument, but the yellow mercury lines were easily separated. The distance between the lines was one-third of the distance between the spectra. For the sake of comparison a grating of the same spacing and number of lines was ruled on a piece of smoked glass, and it was found that in the first order the grating was unable to separate the extreme red and blue ends of the spectrum. The Zeeman effect could be shown with an echelon made of four interferometer plates, the light being the green rays from a mercury tube.

The society then adjourned until Feb. 22.

At the ordinary meeting held on Feb. 22 Prof. S. P. Thompson, president, in the chair,

A paper on "**How Air Subjected to X Rays loses its Discharging Property and how it Discharges Electricity,**" by **Prof Emilio Villari** (hon. Fellow), was read by the Chairman. Air made active by X-rays in passing through a long tube coiled in many turns loses much more of its discharging power than it does in passing through the same tube if straight. During this process the tube charges itself to a certain potential. If active air is allowed to stream on masses of wire gauze or wound up ribbons, enclosed in tubes, the metals, independent of their nature, take a positive or negative charge, according to whether the active air rubs against them with force or lightly. Experiments have been performed to prove this. For instance, tubes of copper or lead, if short and straight, take negative charges, but if long and coiled they take positive charges. These phenomena cannot be attributed to chemical actions, but seem to be produced by a special rubbing of the active air upon metallic surfaces, as the result of which they assume one of the charges, and the other charge ought to manifest itself in the air. This is not the case, the charge of the air being often of the same kind as that of the metals. It has previously been shown by the author that active air by streaming against an electrified body is reduced either to ordinary air or to air charged with the electricity which disappears. Hence it may be supposed that the active air in rubbing upon the metallic surfaces develops the two electricities, one of which manifests itself upon these surfaces, and the other goes to reduce the active air to ordinary air, and, therefore, does not become manifest. The electroscope used in the experiments consisted of a fixed brass plate and a gold leaf, whose position was determined by means of a telescope with an eye-piece scale.

The **Chairman** said he had observed the fact that metals were charged sometimes positively and sometimes negatively by active air.

Mr. Watson asked if any experiments had been performed on the viscosity of gases rendered active by X-rays.

A paper on "**Cyanine Prisms,**" by **Prof. R. W. Wood,** was read by Mr. Watson. Prof. Wood has already described a method of making prisms of solid cyanine by pressing the fused dye between plates of glass. Until recently angles of about ½deg. were the largest that could be used with advantage on account of the small quantity of green light transmitted. A new supply of the dye has been found to transmit a large quantity of green light with an angle of over 1deg. By viewing the filament of an incandescent electric lamp through one of these prisms the anomalous spectrum is seen, the colours being arranged in the order: green, blue, violet, red, orange. Prof. Wood has crossed one of these prisms with a photographic copy of a diffraction grating having 2,000 lines to the inch. On viewing a naked arc lamp the diffraction spectra are deviated by the prism, the red ends being turned up and the blue-green ends turned down.

The **Chairman** said he had been trying to obtain some cyanine, but had not succeeded. Rosaniline has an anomalous dispersion, but could not be fused. The acetate of rosaniline might, however, be used.

The society then adjourned until March 8.

COMPANIES' MEETINGS AND REPORTS.

NATIONAL TELEPHONE.

The ordinary general meeting of the shareholders of this Company was held on Thursday week at the Cannon-street Hotel.

The **Chairman** (Mr. J. Staats Forbes) said the business of the year, taken as a whole, had created a record, and that notwithstanding some very adverse circumstances. The Government had now become their competitors in London; they had the power to grant licenses outside the Metropolis, whereas the company had a short life—1911 was the end of their license. What was going to arise in 1911? No one could tell. The Government under the license could every seventh year take over the concern by arbitration. If the Government persisted in competing with the Company at very low rates, he was afraid they would have a sorry tale to tell in 1904. After much deliberation and great individual anxiety on the part of the directors, they had come to the conclusion—subject to the sanction of the shareholders—to go on; to relax no reasonable effort to increase their subscribers, and to make the best of their property. Taking the year as a whole they had erected 23,490 additional exchange and private lines. Of those 16,776 had been for subscribers on the message rate system—namely, the payment of a low annual charge in respect of the cost of installation, and the addition of 1d. for each call made. He understood the Government intended to promote and extend that system. Well, he wished them joy if their result was to be anything like this Company's under it. On an outlay of half a million of money they had not made one farthing of interest. The Company could not afford to give services of that kind for nothing, but if they were forced by competition to do so they would have to take their chance. He moved the adoption of the report and accounts and the payment of dividends as recommended.

Sir Henry Fowler, M.P., seconded the resolution.

Mr. Lee Smith considered that the Government were treating this Company very unfairly.

The **Chairman** said they had made their bed with the Government, and they must to a certain extent suppress their indignation. No one was more astonished and nonplussed than the Board by the treatment the Company had received at the hands of the Government. The directors had tried to act with the Government in friendly competition, but all to no purpose. With the support of the shareholders they could beat the Post Office, because they were not tied round with red-tape. During the existence of the Company they had paid the Government 1¼ millions of money, and the authorities were now using it to fight them with.

The resolution was carried with one dissentient.

The **Chairman** then moved resolutions authorising the Board to convert 590,000 fully-paid (issued) and 10 000 (unissued) ordinary shares into preferred and deferred stock; to issue 200,000 of the unissued ordinary shares as preferred shares and the payment of a commission not exceeding 5 per cent. to persons for procuring subscriptions.

Sir Henry Fowler seconded, and the resolutions were agreed to.

Mr. Springman suggested that a petition, signed by every shareholder, should be presented to the House of Commons, and to the House of Lords and the Crown, if necessary, setting forth their grievances.

The **Chairman** stated that all suggestions made by the shareholders would receive the Board's consideration.

The proceedings then terminated.

CAMBRIDGE ELECTRIC SUPPLY.

The annual general meeting of this Company was held at the Company's offices, Cambridge, on Friday.

The chairman (Mr. D. Munsey) presided.

The report stated that during the year 1900 there had been added to the Company's mains the equivalent of 2,863 8-c.p. lamps, making the total 30,986. The number of units supplied has been 357,435, an increase of 59,043, or 19 per cent. In spite of the large increase in the price of coal the Company has been able to more than maintain its income without increasing the price of electricity. The Company, after paying all charges, placing £250 to the extinction of preliminary expenses, £448. 14s. 10d. to the extinction of suspense account, and £750 to depreciation account, has a balance of £4,278. 10s. 11d., which, added to £210. 15s. 2d. brought forward from last year, makes £4 489 6s. 1d. An interim dividend of £1,413. 16s. 2d., and interest on temporary overdraft and loan £193. 18s. 9d., have already been paid, leaving a net balance of £2,881. 11s. 2d., out of which the directors recommend the payment of a dividend of 4½ per cent., making with 2½ per cent. already paid, 7 per cent. for the year. This will absorb £2,843. 2s. 5d., leaving a balance to carry forward, subject to fractional adjustment of income tax, of £38. 8s. 9d.

The **Chairman,** in proposing the adoption of the report, said that during the past year they had made progress quite to their satisfaction, and he might also say that their prospects for the present year were exceedingly good. The staff, from the top to the bottom, had worked well.

The **Hon. C. A. Parsons** seconded the motion.

The report was adopted, and the dividend as recommended by the directors declared. Mr. D. Munsey and Dr. Latham were re elected directors, and after some other business had been transacted the proceedings terminated.

WESTMINSTER ELECTRIC SUPPLY.

Directors: Right Hon. Lord Suffield, K.C.B. (chairman); Captain Edmund I. Bax; Edmund Boulnois, Esq., M.P.; W. Hayes Fisher, Esq., M.P.; the Right Hon. Lord Kinnaird; J. Browne Martin, Esq.; R. W. Wallace, Esq., K.C. Engineer-in-chief: Prof. Alex. B. W. Kennedy, LL.D, F.R.S., M.I.C.E. Manager: L. H. Hordern, Esq. Secretary: Frank Iago, Esq.

Report of the directors (with abstract of accounts) for the year ended Dec. 31, 1900:

The supply of current, which on Dec. 31, 1899, was provided for the equivalent of 421,445 lamps of 8 c.p., had increased by Dec. 31, 1900, to the equivalent of 469,589 lamps At the present time there are on circuit the equivalent of 479,056, and applications have been received for a further 7,056 lamps of 8 c.p. The length of roadway in which mains have been laid now exceeds 54 miles, making about 219 miles of ways, into which upwards of 188 miles of copper (strip and cable) have been drawn. Since last meeting the directors have entered into an agreement with the Vestry of St. George (Hanover-square) for lighting the whole parish by electricity. The experimental lamps erected near Victoria Station, which have been in use for some time past, have given great satisfaction. The mains for this purpose are being laid, the lamp-posts are being rapidly erected, and in a short time a considerable section of the area will be lighted by arc lamps. The continued high price of Welsh steam coal has entailed an extra cost of about 50 per cent. for fuel, and has, of course, materially affected the profits of the past year. Since the supply of current has been given at 200 volts, the revenue has also been reduced by the allowance of 8 per cent. to consumers supplied at that pressure. All the consumers (5,651), with the exception of nine, are now on the 200-volt circuit. During the year, in accordance with resolutions passed at the extraordinary general meetings, ordinary share capital to the amount of £148,100 has been duly issued at par to the shareholders A large proportion of this sum has been expended on the joint undertaking of the St. James's and Pall Mall Company and this Corporation in the purchase of lands and erection of works at North Bank, Marylebone. This capital must necessarily, until the opening of the works for supply purposes, remain unremunerative. An interim dividend at the rate of 10 per cent. per annum for the half-year ending June 30, 1900, has been distributed. After allowing for depreciation, sinking fund, etc., the net balance available for dividend is £30,536. 19s. 4d., out of which the Board recommend the payment of a dividend at the rate of 11 per cent. per annum, less income tax, for the past half-year, carrying forward a balance of £3,860. The directors regret that during the year, owing to his appointment as Governor of Madras, their colleague, Lord Ampthill, has had to resign his seat at the Board. In accordance with Article 127 of the articles of association, they have elected Lord Kinnaird to fill the vacancy. In accordance with the articles of association, two of the directors, Lord Suffield and R. W. Wallace, Esq., K.C., retire, but, being eligible, offer themselves for re election.

The ordinary general meeting of this Corporation was held at the offices, Eccleston-place, Belgravia, on Wednesday.

Lord Suffield (the chairman), in moving the adoption of the report, regretted to have to state that there was a reduced dividend on that occasion, for though they had added to their circuits over 48,000 lamps during the 12 months, like all other users of Welsh steam coal they had been very hard hit by the great rise in price. Their profits were also affected by the rebate made to consumers taking their supply at 200 volts and by a considerable increase in rates and taxes. The shareholders would, no doubt, have been pleased to learn that after negotiations extending over a period of two years the directors had come to an agreement for lighting the whole of St. George's parish. The directors very much regretted the loss of the services of Lord Ampthill, who had taken a deep interest as a director in the work of the Corporation, but they considered that they had been very fortunate in obtaining the services of Lord Kinnaird in his place. Lord Kinnaird was known to a great many of the shareholders as a thoroughly business man, and he was prepared to devote the greater part of his time to promoting the interests of the Company.

Mr. Boulnois, M.P., seconded the motion, and the report and accounts for the past year were adopted unanimously.

WINDSOR ELECTRICAL INSTALLATION.

Directors: M. Drury Lavin, Esq. (chairman); H. L. Prior, Esq. (deputy-chairman); Tonman Mosley, Esq.; Edward Riley, Esq.; A. W. Shipley, Esq, and managing director; A. A. Somerville, Esq.; Rev. R. H. Whitcombe. Engineer-in-charge: Mr. A. E. Farrow, A.M.I.E.E.

The fifth annual report of the directors states that the Company's business is steadily progressing, as will be seen from the abstract of the accounts given herewith. The number of lamps and motors installed on Dec. 31, 1899, was equivalent to 13,878 of 8 c.p. During the year 3,930 were added, bringing the total to 17,808 at the end of the year 1900, of which 1,083 represent the motor power. The additions to the mains and machinery during the year have not been large, the expenditure on capital account amounting to £6,764. 14s. 4d., bringing the total capital expenditure up to £53,670. 3s. 5d. The principal expenditure was on mains, which included a new cable to Windsor Castle, where a considerable number of additional lights have been connected, and also in St. George's Chapel. A new battery of accumulators has also been provided, and is now working.

Digitized by Google

This, it is hoped, will be of sufficient capacity to supply the day load, and thereby effect a considerable saving. The net profit for the year is £4,372. 11s. 11d., and this would have been considerably increased but for the high price of coal. The favourable feature of the accounts is that over three-fourths of the profit has been earned from the supply of electric current. The total amount of profit available for distribution, including the balance of £690 12s. 3d. brought forward from the previous year, is £5,063 4s. 2d. Out of this the directors recommend the declaration of a dividend at the rate of 8 per cent. for the year, free of income tax. An interim dividend of 3 per cent. having already been paid, the remaining 5 per cent. will be distributed forthwith. After payment of the dividends, a balance of £1,400. 14s. 2d. will remain, out of which the directors recommend that the sum of £750 be added to the depreciation, renewal, and reserve fund, and out of the remainder the shareholders will be asked to vote the sum of £350 for directors' fees. The sum of £3,747. 9s. 6d. was received during the year, representing the premiums on the issue of the balance of the share capital less expenses, and the directors recommend that £1,500 of this sum be carried to the dividend equalisation account, and the remaining £2,247. 9s. 6d. to the depreciation, renewal, and reserve fund, bringing that account up to the very substantial total of £5 919. 10s., and the reserve for equalising dividends up to £2,000. The directors retiring in rotation are Messrs. Tonman Mosley, A. W. Shipley, and the Rev. R. H. Whitcombe. The two former, being eligible, offer themselves for re-election. Mr. H. R. de Salis, C.E., is recommended by the directors to fill the vacancy caused by Mr. Whitcombe's retirement.

BRITISH INSULATED WIRE.

The report of the directors for the year ended Dec. 31, 1900, to be submitted to the shareholders at the fifth ordinary general meeting to be held at the Adelphi Hotel, Liverpool, on Feb. 25, 1901 at 12 noon, states that the gross profits for the year amounted to £134,226. 0s. 11d., to which has to be added the balance brought forward from the previous year, £6,432. 14s. 9d., making a total of £140,658 15s 8d. From this have to be deducted the total cost of administration, legal expenses, patent fees, etc., £27,908. 11s. 4d.; depreciation off the buildings, plant, and machinery, according to scale, £13,098. 10s. 6d.; written off patents, £5,000; debenture interest for the year, £2,500; interest on preference capital for the year, £17,987. 18s. 6d.—total, £66,495. 0s. 4d.—leaving a balance available for dividend, reserve, etc., of £74,163 15s. 4d. Out of this balance the interim dividend at the rate of 10 per cent. per annum already paid on the ordinary shares absorbs the sum of £12,481. 7s. 9d., and the directors have decided to transfer to reserve the sum of £22,400, leaving a balance of £39,282. 7s. 7d. The directors recommend that a dividend be now declared of £32 518. 12s. 3d., making with the interim dividend already paid a total dividend for the year of 15 per cent. on the ordinary shares, carrying forward to next account a balance of £6,763. 15s. 4d. The amount now transferred to reserve, £22,400, together with the amount received as premium on shares make a total reserve of £200,000. During the year 30,000 preference shares of £5 each have been issued at a premium of 10s. per share, and 30,000 ordinary shares of £5 each at a premium of £5 per share. The premiums thus received, £165,000, together with £12,600 formerly received, make £177,600. The new copper-rolling and drawing department is now in active operation, and has fully justified the capital expenditure on these works. It will, however, be necessary to further extend them in the near future. The Company has acquired the freehold property commencing at "The Hollies," Warrington-road, Prescot, extending in a westerly direction and giving an important frontage on Kemble-street. The debenture issue of £50,000 matured on Dec. 31, 1900, but as the directors contemplated in the near future making a larger issue on more favourable terms, arrangements have been made with most of the holders to temporarily extend their bonds to June 30, 1901. The results of the year's working have been very satisfactory, and the business of the Company has considerably increased. Large additions have been made to the buildings and plant, for the purpose of coping with the great increase of the Company's business, and the directors have still further extensions in contemplation. Mr. W. Marriner Brigg and Mr. S. Z de Ferranti, who are the retiring directors, being eligible, offer themselves for re-election. Messrs. Chalmers, Wade, and Co., the auditors, also retire, and offer themselves for re-election.

The ordinary general meeting of the shareholders of this Company was held at the Adelphi Hotel, Liverpool, on Monday, Mr. W. Marriner Brigg (the chairman) presiding.

The Chairman, in moving the adoption of the report and accounts, said the profits had been fully maintained—indeed, increased. The bonus of 5 per cent. of the previous year had not been repeated on this occasion. The Company required all the strength it could possibly get, for they had a great amount of work in hand and in prospect. Further, the directors deemed it very desirable to establish a strong reserve, which now amounted to the very handsome sum of £200,000, this having been created to the extent of £177,000 by the premiums of the new shares issued last year, and by the sum of £22,400 now proposed to be transferred. Referring to the investments, the Chairman said these had been the means of obtaining for the Company valuable contracts.

Mr. Snape, J.P., in seconding the motion, said the past year had brought to the Company a larger amount of business than they had known in any previous year, and also the largest amount of profit. The work of the Company was likely to increase because not only was the Government extending its trunk telephone service by means of underground cables, but municipalities were following suit, and in Liverpool, owing to the recent accidents, the National Telephone Company were actively engaged in transforming their overhead system into an underground system.

The motion was carried unanimously, and the dividend recommended having been declared, the retiring directors, Messrs. W. Marriner Brigg and S. Z. de Ferranti, were re-elected unanimously.

The proceedings then closed.

BRISTOL TRAMWAYS AND CARRIAGE.

The report of the directors for the year ending Dec. 31, 1900, states that the gross receipts for the year amount to £165,115. 15s. 7d., and the working and general expenses and renewals are £110,794. 12s 3d., leaving a net revenue of £54,321. 3s. 4d. The following amounts have already been distributed—viz.: interest on 4 per cent. mortgage debenture stock and temporary loans, £5,985. 1s. 1d.; dividend on 4 per cent. preference shares and interest on calls in advance, £7,990. 16s. 8d.; interim dividend at the rate of 7½ per cent. per annum (subject to income tax) for the half-year ending June 30, £17,968. 15s.; and it is proposed to appropriate the balance as follows: dividend for the half-year at the rate of 8½ per cent. per annum (subject to income tax), £20,187. 10s.; to carry to reserve and renewals funds—leased premises redemption, £500; contingencies, £1,689. 0s. 7d. The reserve funds will be increased from £90,444. 11s. 6d., at which they stood at the end of the previous year, to £97,228. 9s. 2d. The receipts from the tramways department show an increase of £4,270, and those of the carriage department an increase of £2,126. The total number of passengers carried during the year on the Company's cars and omnibuses was 26 971,606. The directors are pleased to be able to report the completion of the electrical conversion and extension of the tramways, as well as the building of the central power station and additional depôts, works which have together involved the expenditure of capital to the amount of £650,000, and called for the unremitting energies of the Board and their officials over a period of 2½ years. At the occasion of last year's report it was hoped that this result might be achieved in time to secure the advantage of the summer's working by electric traction, but, in consequence of delay on the part of contractors in the delivery of the plant, the general opening of the new system for public traffic was not possible until the end of December. Bearing this fact in view, it may be regarded as satisfactory that the net revenue of the year, besides admitting of a slightly improved dividend, is capable of meeting, even in a greater degree than the preceding one, the heavy charge for dividends on temporarily unproductive capital outlay. It is gratifying to the directors to feel assured that the shareholders have good reason to be satisfied with the future prospects of the Company. During the year the 25,000 preference shares were fully paid up, and the issue of mortgage debenture stock was increased to £213,100. Since the close of the year the latter has been further augmented by an allotment to applicants from amongst the stock and share holders, making up the issue to £250,000—the limit for the time being.

Digitized by Google

The directors propose that the additional capital about to be created shall be issued by allotment when required as preference shares, ranking *pari passu* in all respects with the existing shares of that class—*i.e.*, with the right to cumulative preferential dividends at the rate of £4 per cent. per annum, payable half yearly on Jan. 1 and July 1, and also the right to rank upon the assets of the Company, for the amount of the share only, in priority to the ordinary share capital. The directors have to record, with feelings of deep regret, the deaths of their esteemed colleagues, Mr. William Butler and Mr. Charles Hoskins Low, both of whom had been associated with the administration of the Company for about a quarter of a century, Mr. Butler having been chairman from the inception of the undertaking in 1874, and Mr. Low a director for nearly as long a period. Mr. J. Clifton Robinson, C.E., and Mr. Samuel White have been elected to fill the vacant seats at the Board, and the latter appointed managing director in succession to Mr. George White, who has been elected to the chairmanship. Mr. Henry F. Cooper has been appointed secretary. Mr. Joseph Wethered, director, and Mr. Solomon Hare auditor retire at the ensuing meeting, and offer themselves for re-election

The annual meeting of the Company was held at Bristol on Thursday week, Mr. George White (chairman) presiding.

The Chairman, in moving the adoption of the report, stated that the receipts for the past year could not fail to be satisfactory inasmuch as during a part of the year the lines were in a state of upheaval, and the traffic over several of the sections was carried on under exceptional disadvantages. There was still some work at one or two of the old depôts, and the clearing up of various matters inseparable from the completion of so large a work as had been involved in replacing the horse cars by electric traction. They saw sufficient indication of increased traffic that they had considered it expedient to make provision for the early delivery of additional rolling stock. The Company carried last year 27 millions of passengers, and the total in the new year would probably be 40 millions. The central power station had been visited by men of the highest eminence in the electrical world, who had expressed their profound admiration at the work of their engineers (Messrs. Clifton Robinson and H. Parshall), who had given them the most complete system which had ever been devised in that or any other country.

Mr. J. Wethered seconded the motion, which after some discussion was carried.

Subsequently a special meeting was held, and approval given to increasing the capital of the Company to £1,000,000 by the creation of 25,000 new shares of £10 each.

TELEGRAPH CONSTRUCTION AND MAINTENANCE.

The ordinary meeting of the proprietors of this Company was held on Tuesday at the offices, 38, Old Broad-street, E.C.

Sir Robert Herbert, who presided, said he had the pleasing duty of announcing a dividend that, with bonus, amounted to 17½ per cent., free of income tax. Moreover, the Company, which had earned a net profit of £100,195 was able, with the assistance of the amount brought forward from the previous year, not only to pay this large dividend, but to carry forward £75 564. The Company had been busily employed in laying cables, repairing cables, and supplying store cable for companies to keep in stock. Their factories had been fully employed and new machinery had been laid down. A large amount of money in hand, as the amount of the reserve showed they possessed, was, the Chairman pointed out, necessary to them. They had, for instance, now to deal with the great Pacific cable, which would naturally entail upon them heavy outlay before they could receive their remuneration for the work. That cable had to be completed by the end of 1902, and the smaller portions by the middle of 1901; so it was desirable they should have their pockets full of money to meet all the expenses of that somewhat trying period. Out of their profits the Company contributed £10,000 to the pension fund for the staff in accordance with a plan which so, say, the junior clerk starting at £100 a year who paid £10 in the first year, gave a pension of £5 a year at the age of 65; and every year's service and additional payment would provide, with the contributions of the Company, for a proportionate increase in the pension.

The report was adopted by acclamation. Admiral Sir A. H. Hoskins and Mr. Colin F. Campbell, the retiring directors, were re-elected, and the proceedings closed.

ELECTRIC RESISTANCE AND HEATING.

An extraordinary meeting of the shareholders was held at Winchester House, E.C., on Tuesday, for the purpose of considering a resolution for the voluntary winding up the Company.

Mr. Cyril Wanklyn (the chairman), in moving the resolution, explained that if they continued to carry on the business of the Company with little or no funds they must incur a heavy moral and possibly a legal responsibility. As it was, their liabilities amounted to between £1 500 and £2,000, and it was doubtful whether the assets which could be immediately realised would cover that amount. They had considered the possibility of reconstructing the Company on many occasions, but it was impossible to do so without some adequate guarantee with regard to the provision of new working capital. The only guarantee offered up to the present was £5,000, and the directors were of opinion that unless they could make a new start with about double that amount they would only be inviting a repetition of the present state of affairs. One cause of their present position was that they did not receive enough capital to develop the patents. Another cause was that the process was undoubtedly represented as being in a much more advanced state than was actually the case when they came to test it by putting it into actual use. He would mention two or three points in which the directors were grievously disappointed. First of all, they were given to understand by experts that these resistances would work sparklessly, but from tests carried out it was found that the application of electricity to these resistances produced considerable sparking, which was not only dangerous, but detrimental to the resistances themselves. Another defect was that of jumping. As the sliding contact moved round the ring it "jumped," and on enquiry they found that this was due to their manager having built the ring in sections instead of as a continuous whole. The last defect he would call attention to was that of heating. After a fairly lengthy trial the rings became red hot, rendering them not only dangerous but very liable to speedy deterioration if used for any length of time. All the defects had now been overcome, and he did not by any means regard the position of the Company as hopeless. Since the production of the last ring the prospects of the Company in the future—and he trusted it had a future—were infinitely better than they were some month ago. He must admit that the directors launched the process before it was commercially proved, but if they made a mistake they made it in excellent company, for Messrs. Ganz, of Budapest, and Messrs. Verity, of London, were also led away by the reports submitted to them. If the motion were passed that day—and he hoped it would be, because it was absolutely the only course they could take—he also hoped that arrangements might be made whereby the business of the Company could be still carried on. He could assure them that the interests of the present cash shareholders would be preserved, and this could only be done by offering the shareholders the right to subscribe to the shares in the new company with a small assessment on them.

Captain E I Bax in seconding the resolution, said he was assured of the future success of the process. Every engineer to whom he had shown the material believed in its capabilities.

The resolution for the voluntary winding up of the Company was then unanimously adopted, Mr. Wm. Chaplin, the secretary, being appointed liquidator.

GALLOWAYS, LIMITED, MANCHESTER.

Mr. Chas. J. Galloway, presiding at the annual meeting of the Company on Tuesday, stated that the extensive structural alterations and additions at the Knott Hill works were now rapidly approaching completion, and the directors looked with confidence to very satisfactory results therefrom.

The report recommending a dividend of 6 per cent. was adopted.

TELEGRAPH CONSTRUCTION AND MAINTENANCE.

The report of the directors to be submitted to the members at the thirty-seventh ordinary meeting to be held on Feb. 26, 1901, at 1 p.m., states that the accounts for the year show a net profit of £100 195. 16s. 9d., after charging the interest on the debentures. To this sum must be added £53,803 6s 1d. brought forward from last year, making a total of £153 999. 2s. 10d. From this amount is deducted the interim dividend of 5 per cent., paid July 17, 1900, amounting to £22,410, leaving £131,589. 2s. 10d. to be dealt with. Of this sum the directors propose to distribute a dividend of £1. 4s. per share, together with a bonus of 6s. per share, absorbing £56,025, being at the rate of 12½ per cent., and making with the amount already paid a total dividend for the year of £2. 2s. per share, or 17½ per cent., free of income tax, leaving £75,564. 2s. 10d. to be carried forward to the next account. The business of the Company during the past year has been satisfactory, and the factories have been fully occupied in the manufacture of submarine telegraph cables and of insulated wire. The Company's steamships have been employed in the laying of submarine cables, and also in the carrying out of repairing operations. The factories at Wharf-road and Greenwich and the steamships have been maintained in a thoroughly efficient condition. The directors propose to add a further sum of £10,000 to the pension fund established in 1899 for the benefit of the Company's staff. The retiring directors are Sir Anthony H. Hoskins and Mr. Colin F. Campbell, who, being eligible, offer themselves for re-election. The meeting will have to appoint auditors for the ensuing year. Mr. John Gane (of the firm of Messrs. Gane, Jackson, Jefferys, and Wells), and Mr. Patrick A. Clegg (of the firm of Messrs. Welton, Jones, and Co.), who retire, offer themselves for re election.

YORK TRAMWAYS.

The report of the directors for the half year states that the gross receipts amount to £2,273. 19s. 7d., and the working and general expenses to £1,773. 12s. 10d., showing a balance of £500. 6s. 9d, which is proposed to appropriate as follows: interest on 5 per cent. debenture stock (less income tax), £145; dividend at the rate of 6 per cent. per annum (free of income tax) on share capital, £266. 5s; balance carried to reserve fund for renewals and contingencies (bringing the fund up to £1,066. 7s. 1d.). £89. 1s 9d. The number of passengers carried during the half-year has been 511,697. The contract for the purchase of the undertaking by the York City Council has been sealed by the Council and the Company, and its provisions, which were approved by the shareholders at the extraordinary general meeting held in December last, became effective on the 29th ult.

QUESTIONS AND ANSWERS.

If thou hast knowledge, let others light their candl at it.

Under this heading we insert questions and answers of a practical character relating to central-station work, tramway work, or construction work; and for each suitable question offer *one shilling*, and for the best solution of any question we offer *ten shillings*. We also give *five shillings* for every other answer we print. The answers to any question should be sent within 10 days after the question has appeared. We would call the attention of those sending in answers to the fact that the neatness of any sketches (which must be in *ink*) sent in is considered when marking the relative values of these answers. All formulæ should be carefully written to prevent mistakes as to symbols, and all loose sketches should be signed by the author. The matter must be written on one side only of the paper. Questions may be sent at any time.

QUESTIONS.

355. In the event of a short-circuit occurring at night on a low-tension distributing network, what is the best course to pursue?—A. K. T.

356. Describe a tramway scheme with distribution carried out on the three-wire system at 1,000 volts. Consider insulation and balancing difficulties; also saving in copper as compared with two-wire system at 500 volts.—A. J., SWANSEA.

ANSWERS.

Question No. 349.—What is the method of calculating the sizes of cables and mains for two-phase and three-phase currents?

Best Answer to No. 349 (*awarded* 10s.).—In order to determine the sizes of cables to transmit a given power it is necessary to know (*a*) the current to be carried by each line, and (*b*) the permissible voltage drop between the beginning and end of the line.

The current in each line is as follows, according to the particular arrangement of lines in use:

Let W = the total apparent watts to be delivered $= \frac{\text{Total true watts to be delivered}}{\text{Power factor of the load}}$;

V = voltage measured between two lines, as shown in Figs. 1 to 4.

Then

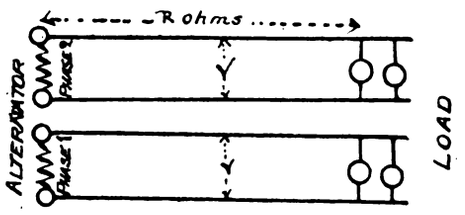

FIG. 1.

1. For a four-wire two-phase transmission, as in Fig. 1:

The current in each of the four lines $= \frac{W}{2V}$

and all four lines should be made of equal section

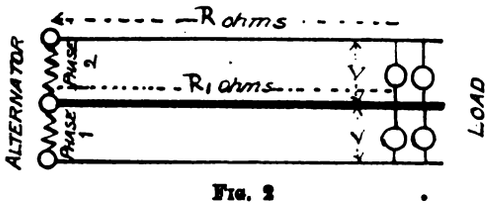

FIG. 2

2. For a three-wire two-phase transmission, as in Fig. 2:

The current in each of the two outer lines $= \frac{W}{2V}$;

the current in the common centre line $= \frac{W}{\sqrt{2}V}$.

The section of the centre line should, therefore, be made $\sqrt{2}$ times as large as either of the outer lines.

3. For a three-phase transmission with three lines, as in Fig. 3:

The current in each of the three lines $= \frac{W}{\sqrt{3}V}$,

and all three lines would be of equal section.

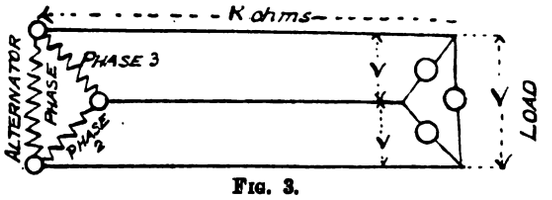

FIG. 3.

4. For a three-phase transmission with three main lines and a fourth neutral line, as in Fig. 4:

The current in each of the three main lines $= \frac{W}{3V}$,

where V is the voltage between any one of the main lines and the neutral wire, and is equal to V_1, the voltage between any two main lines, divided by $\sqrt{3}$.

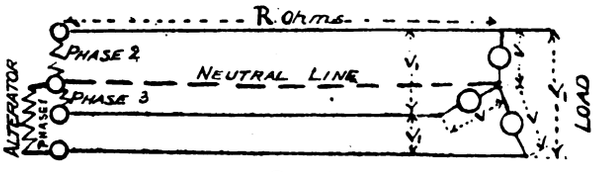

FIG. 4.

All the above values are calculated on the assumption that the load is equally distributed amongst the phases. If the load consists entirely of motors this would naturally be the case, and even in the case of a mixed lighting and power load great care is usually taken to ensure equal distribution of the load, as any distinct departure from this state leads to bad pressure regulation. In the case of a three-phase transmission which has an unevenly distributed load, the four-wire arrangement (Fig. 4) should preferably be used; whilst for a two-phase unequally loaded case, the four wires (Fig. 2) are best. The section of the neutral wire in Fig. 4 is quite indeterminate, depending entirely on the closeness with which the phases are balanced; and if the balancing is exact, it can be dispensed with altogether.

Turning to the second point—the pressure drop—the determination is considerably more involved than for ordinary continuous-current lines. This arises from the fact that the drop depends not only on the ohmic loss in the lines, but also on the inductive drop and on the power factor of the load.

The ohmic loss can be calculated as follows:

Let C = the current in each main line determined as above;
R = the resistance of one main line;
v = the ohmic loss in voltage at a current = C amperes.

Then for a two-phase four-wire system (Fig. 1)

$$v = 2RC;$$

for a two-phase three-wire system (Fig. 2)

$$v = RC + \sqrt{2}\,C R_1 \cos 45\text{deg.}$$
$$= C(R + R_1);$$

where R_1 = the resistance of the central line, and $= \frac{R}{\sqrt{2}}$, if all the lines are worked at the same current density, as is usually the case.

For a three-phase three-wire system (Fig. 3)

$$v = 2CR \cos 60\text{deg.},$$
$$= RC.$$

And for a three-phase four-wire system (Fig. 4), assuming all three phases equally loaded, and no current in the neutral wire: $v = RC$.

The inductive drop depends on the current in the line, on the size of the wire, and on the distances apart and relative positions of the different wires, and may be readily obtained for any given conditions by the aid of such a table as that published in the *Electrical Engineer* for June 25, 1897, p. 813. The inductive drop in each phase

Digitized by Google

of a two-phase four-wire, two-phase three-wire, three-phase three-wire, or three-phase four-wire (equal load distribution) system may be taken as practically the same as in a single-phase system transmitting one-half the apparent power at the same voltage and periodicity. This is on the assumption that the lines are properly arranged on the posts to prevent interference between the different phases, as described in the above-mentioned paper.

Having decided the distance apart of the wires and the arrangement of wires on the parts, a size of wire (giving a reasonable current density) must be tentatively selected. The ohmic drop and the inductive drop must then be obtained as described above, and combined together by the following diagram in order to determine the net resultant drop. Set off A B (Fig. 5) to represent the current in

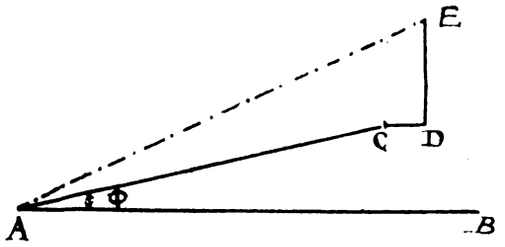

FIG. 5.

one phase. Draw A C (to represent the required voltage at the end of the line to some scale) at an angle ϕ to the line A B, such that cos ϕ = the power factor of the load for which the drop is to be determined. From C set off C D parallel to A B and equal to the ohmic drop to the same scale as before. From D draw D E at right angles to A B and equal to the inductive drop. Join A E. Then the difference between A E and A B is the total drop, and if this exceeds the permissible amount, the calculation must be repeated with a larger wire or with the wires placed further apart.—Q.

Answer to No. 349 *(awarded* 5*s.).*—The size of cable depends on (*a*) the system to be used, (*b*) the working pressure, (*c*) the power transmitted, (*d*) the loss permissible in the line. The total weight of copper required for transmission by two-phase currents employing four wires is, with the same loss in the line and same working pressure, exactly the same as required for single-phase transmission, though in the former case each wire has, of course, half the sectional area. This is on the supposition that the same type of motor is used, as it would not do for comparison to assume non-synchronous motors in one case and synchronous motors in the other. Call this weight 1. If for the two-phase transmission we use three wires instead of four, making the third, which replaces two, common to both circuits, this third wire need not be double the area of each of the other two, but only 1·4 times, and under these circumstances the weight of copper will be ·85 against the former 1. If three-phase transmission with three wires is used, the figure for the relative weight of copper depends entirely upon what is assumed as the standard of comparison with reference to the strain upon the insulation of the line and the apparatus connected to it.

Assuming there is between any two of the three wires the same difference of potentials that there is between each pair of wires comprising a circuit of the two-phase system, the weight of copper is represented by the figure ·75. So far, the weights are :

1. Single-phase system, two wires	1·0
2. Two-phase system, four wires	1·0
3. Two-phase system, three wires	·85
4. Three-phase system, three wires	·75

The second factor determining the size of conductors is the pressure to be adopted, this being one of the first things which has to be decided when a transmission scheme is being worked out. The pressure influences very materially the cost of line construction, as the weight of copper in the conductors is, for transmission of the same power with the same loss in the line, inversely as the square of the pressure. Assuming the pressure is decided upon, the table below gives the current in amperes per brake horse-power necessary to be transmitted. The pressure is in all cases taken at the motor end of the line, the pressure at the generator having to be higher by such amount as corresponds to the loss in the line.

TABLE I.—Current Required per B.H.P. at Various Pressures.

Pressure, in volts.	Amperes.
220	5·0
440	2·5
1,000	1·11
2,000	·55
3,000	·37
5,000	·222
10,000	·111

In the case of two phases, half the above current flows in each circuit. For three phases, the pressure in the table would apply to the difference of potentials between the common junction of the three conductors and either of the lines, and one-third of the current given in the table would flow in each wire.

The current being ascertained, the volts which it is permissible to lose in the line will determine the size of the conductors. In Table II. are given the volts lost in the conductors per mile of transmission for different current densities, and from this, knowing the fall of pressure allowable, the best density to work at can be determined.

TABLE II.—Volts Lost per Mile at Different Current Densities.

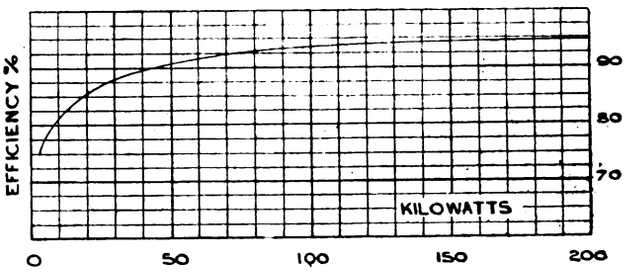
Amperes per square inch of section of conductor.	Loss of pressure in volts per mile.
2,000	172
1,500	130
1,000	86
800	69
700	60
600	52
500	43
400	34
300	26
200	17·2

If the plant is three-phase, the volts lost per mile must be taken as half of what is given in Table II.

The sizes of conductors for carrying any current at any density can be obtained from cablemaker's list.—F. B. A.

Question No. 350.—Would the combined efficiency of a continuous-current steam generating set be the same whether the plant consists of a single generator coupled to an engine, or whether, in the place of the former, two machines each of half the capacity were adopted ?

Answer to No. 350 (*awarded* 7*s.* 6*d.*).—The variation in the combined efficiency of a continuous-current generating set under the conditions named depends upon the output of the machines, and while it may be considerable with very small, will be almost negligible with large generators. Reference to the dynamo efficiency curve below will make



this apparent, and it will be seen that at 200 kw. the rate of gain with increase of size is very slow, since the curve is almost flat at this stage. At 200 kw. the efficiency is 94·95 per cent., and at as large a size as 750 kw. 95·5 per cent. is seldom exceeded, so that for outputs varying from 200 kw. to 750 kw. the gain is less than 1 per cent., and it is obvious that the change in combined efficiency due to the substitution of two machines for one will be slight. To show to what extent the thorough efficiency is affected at the lower outputs, it will suffice to take three cases at, say, 200 kw., 100 kw., and 50 kw. respectively.

Kilowatts, output.	Efficiency, single generator.	Efficiency, two generators.	Difference.
200	94·75 per cent.	93·5 per cent.	1·25 per cent.
100	93·5 ,,	91·0 ,,	2·5 ,,
50	91·0 ,,	87·0 ,,	4·0 ,,

The difference in the horse-power developed by the

Digitized by Google

steam-engine will be too small to appreciably affect its efficiency, and this being so the figures in column 4 represent the variation in combined efficiency. It is not within the scope of the question to discuss the difference in the cost of two generators as compared with one, or to mention the difference in floor space occupied, but these and other less important considerations point to the advantage of using a single generator when the system of generation and transmission will permit it.—E. G. B.

Answer to No. 350 (*awarded* 7*s.* 6d.).—This question may be dealt with in two ways: (1) the substitution of two generators for the one, both being driven off the same engine; (2) the substitution of two complete steam plants in place of one. The question is very vague and wanting in detail, for much must depend upon the size of the plant; results obtained from a comparison made between a 5-kw. and 10-kw. steam plant would be quite inapplicable, when considering the difference between a 500-kw. and 1,000-kw. steam plant.

1. If we consider that it is only a question of making one engine drive either one or two generators we eliminate all discussion on the engine efficiency, and have only to deal with the generator losses. Now, the chief sources of loss in a dynamo may be tabulated as follows:

1. Mechanical loss due to (*a*) friction in bearings, (*b*) friction between commutator and brushes.

2. Magnetic losses due to (*a*) hysteresis in armature core, (*b*) closed local magnetic circuits in pole-pieces.

3. Electrical losses due to (*a*) shunt current, (*b*) compound current, (*c*) armature current, (*d*) heating of brush gear, etc., due to the passage of the current.

With regard to the mechanical losses, if the bearings are made so that x kw. may be transmitted by the shaft without undue heating, there will only be very little extra loss provided the bearings are properly lengthened and the shaft increased if $2x$ kw. are transmitted; but if for the second x kw. a second machine is added, the mechanical loss will be exactly doubled, since all the bearings and moving parts are doubled. Whilst the friction due to the brushes may remain the same, it will probably increase slightly, as the number of brushes with two machines will probably be more than that put on one of double the capacity, a margin in each case being left for temporary overload. So that we see the mechanical loss will be increased to a certain amount. With regard to the magnetic losses, the hysteresis effect is dependent upon the mass of iron, the induction across the iron, and the number of reversals per unit time; and according to the design of the machine these losses may be more or less for one machine than for two, but with well-designed generators we may consider these losses equal for the two types.

The same remark applies to a great extent to all the electrical losses, with the exception of the shunt current, and they may be considered equal if proper sizes are adopted. The percentage of the shunt current to the total output is higher for a small machine than for a large one, and may vary from 12 per cent. to 1·25 per cent., according to the size of the generator. So that we finally find that the efficiency of the one-generator arrangement will be higher than that of the two generators, owing to the fact that in the latter arrangement there are (1) greater mechanical losses, due to multiplication in the number of bearings; (2) greater electrical losses, due mainly to the higher percentage of the shunt current.

Attention must be drawn again to the fact that much depends upon the size of the generators. With a 10-kw. or 20-kw. dynamo an efficiency of 88 per cent would be good, while a 40-kw. generator might have an efficiency of 91 per cent., where a saving of 3 per cent. would be effected with the one-generator arrangement. But many firms will build a 500-kw. generator having an efficiency of 97 per cent. or even more, and if in place of two of these a single generator of 1,000 kw. were installed, it would be impossible to get 3 per cent. increased efficiency or anything like it. The increased efficiency would be there if equal care and skill were exercised in the design and building of all the machines, but it is possible that it might be so microscopic as to be hardly worth consideration, so that we arrive again at our first remark—that much depends upon the size; with all sizes the one-generator type will be the most efficient, but if the output is large it will not be of much moment which arrangement is adopted. (2) The same argument holds good when we consider two separate plants, except that we have the increased friction in the engines, and this will be of more importance than in the generators, not because of the friction in the bearings, but rather because of the friction in the stuffing boxes and of the piston rings. If the number of these is increased the friction losses must also be proportionally increased, and hence it is certain that there is, with equally well-designed sets, a perceptibly higher efficiency with one large unit over that obtained from two units of half the size.—M.

Answer to No. 350 (*awarded* 5*s.*).—The wording of this question leaves it rather doubtful whether, in the second case, two separate plants, each consisting of an engine and dynamo, are meant, or only that in place of the large generator, two smaller ones are coupled to the engine. Taking the latter as the correct reading, it may be said that as far as the losses between the engine cylinder and dynamo terminals go, it makes little difference to the combined efficiency whether one large or two small dynamos are coupled to the engine, provided, of course, that the dynamos are equally efficient. For instance, if the large dynamo has a full-load efficiency of 92 per cent. and receives 200 kw. from the engine, the power available at its terminals will be 200 − 8 per cent. = 184 kw. Now, if this dynamo is replaced by two smaller one, each having an efficiency of 92 per cent. at full load, and each receiving 100 kw. from the engine, then the power available at the terminals of each will be 100 − 8 per cent. = 92 kw., and 92 + 92 = 184 kw. As, however, with two machines there will be at least one extra bearing, the friction will be increased, and the engine must indicate rather more power before it can supply 100 kw. to each of the two small machines.

The practice of coupling two generators direct to one engine is an American idea, and a survival of the system of driving half a dozen machines from one engine by means of belting and countershafts. Where each circuit is supplied by a separate dynamo, such a system has advantages, as it permits of one large engine being used in place of several smaller ones, with a corresponding gain in economy and floor space. Two dynamos are also sometimes coupled to one engine and connected in series to supply a three-wire system direct without the use of boosters or accumulators. This is a convenient arrangement in very small stations.

In ordinary cases, however, where the circuits are all run in parallel from a common set of 'bus bars, it is more economical to couple the engine to one large generator than to two small ones for the following reasons: The first cost of two small machines is about 25 per cent. more than the cost of one large machine with an output equal to that of the two small ones, the annual charges for interest and depreciation are therefore greater. Then two machines take up more floor space, require more attention, cost more for repairs, and use more oil than one large one. It is also possible that with a small total load it might not be possible to procure two dynamos which would give as high an efficiency as a single machine of double the size, as small dynamos are usually less efficient than large ones. Then with two machines there is always the chance of one of them becoming disabled, in which case the engine must run at half load at a great loss of efficiency, as some engines consume 50 per cent. more steam per horse-power at half load than they do at full load, and a consumption of 25 per cent. more at half load is a common occurrence.—R. D. S.

LEGAL INTELLIGENCE.

CITY OF LONDON ELECTRIC LIGHTING COMPANY v. TH MAYOR, ETC., OF THE CITY OF LONDON.

On Friday, the 22nd ult., Lord Justices Rigby, Vaughan Williams, and Stirling, sitting in the Court of Appeal, gave their reserved judgment in this case. It was an appeal by the Corporation from the decision of Mr. Justice Farwell to the effect that

Digitized by Google

the plaintiffs were entitled to a declaration that three several agreements: (1) an agreement dated May 19, 1890, and made by and between the Brush Electrical Engineering Company, Limited, and the Commissioners of Sewers of the City of London; (2) an agreement dated May 28, 1890, and made by and between the Laing, Wharton, and Down Construction Syndicate, Limited, and the said Commissioners; and (3) an agreement dated Feb. 5, 1891, and made by and between the Brush Electrical Engineering Company, Limited, and the said Commissioners, were valid and subsisting. The contracts in question, which were transferred to the plaintiffs by two indentures dated Aug. 21, 1891, were for lighting the City by electricity. The defendants, who were the successors in title and office of the Commissioners of Sewers, contended that the contracts were null and void by virtue of Section 42 of the City of London Sewers Act, 1848, which enacts "That no person, being a commissioner, or a member of the Court of Aldermen or of the Common Council of the City, shall be directly or indirectly interested or concerned in any contract which shall be made or entered into by or on behalf of the Commissioners for the execution of any works by this Act directed or authorised to be done or executed, or for furnishing materials or labour, or for any other matter or thing whatsoever, upon pain that every such contract shall be null and void, and that the person who, being a commissioner, or a member of the said Court of Alderman or of the Common Council, shall be so interested or concerned therein shall for every such offence forfeit and pay the sum of £100 to any person who shall sue for the same, to be recovered in any of the superior Courts by action of debt or on the case." The Act also enabled the Commissioners to contract for the supply of water and to contract with gas companies or other persons to supply gas or light to the City by any other mode (Section 116). By the Act of 1851, which was passed in order to continue the earlier Act (which would otherwise have expired) with such variations and additions as had been shown to be necessary, it was (by Section 53) enacted as follows: "That no person, being a commissioner, who is a shareholder in, or surveyor, solicitor, or agent for any gas company, water company, paving company, or any work, undertaking, or speculation the contracting with or the promotion or carrying out of which shall be discussed at any meeting of the Commissioners, shall be eligible to sit or vote as a commissioner while such subject is under the discussion of the Commissioners." Mr. Justice Farwell was of opinion that the Act of 1848 contemplated that the Commissioners would enter into contracts of two sorts: (1) for the construction of works or supply of materials to the City which would become their own property, and which he called "construction contracts"; and (2) for the supply of water for cleansing or of gas or other illuminant for lighting the City by companies or persons owning waterworks or gasworks or the like, that the contracts in question in this case fell under the second head; that Sections 33 to 42 formed a group of sections dealing with construction contracts; and that notwithstanding the generality of the language of Section 42 that section applied to construction contracts only. Moreover, Section 42 ought to be read with Section 53 of the Act of 1851, and (in his opinion) it would be idle to enact that a commissioner who was a shareholder in any contracting company should not be eligible to vote on the contract if the mere fact of his being a shareholder rendered it impossible that any contract could be entered into. Lastly, he thought that if Section 42 were ambiguous, as he held it was, the more reasonable construction ought to be preferred. He therefore made a declaration in favour of the plaintiffs. The defendants appealed.

Mr. Swinfen Eady, K.C., Mr. Danckwerts, K.C., and Mr. A. J. Walter were for the defendants; and Mr. Cripps, K.C., and Mr. Roskill for the plaintiffs.

The Court allowed the appeal.

Lord Justice Vaughan Williams read the following judgment of Lord Justice Rigby's, in which he concurred: After careful consideration of the provisions of the Act of 1848, of the judgment of Mr. Justice Farwell, and of the arguments addressed to us, I am quite unable to concur in the construction put upon the Act by the learned judge. This, speaking broadly, consists in treating all the sections of the Act from 33 to 42, both inclusive, as dealing only with what the learned judge calls construction contracts, leaving all other contracts—as, for instance, lighting contracts—outside their provisions, with the remarkable result that, notwithstanding the provisions of Clause 42, there is nothing to prevent any commissioner, alderman, or common councillor from having the largest interest in any contract with the Commissioners not a construction contract. In contradiction of this construction, I hold that the sections above mentioned do, in one part or another, deal with every possible contract that the Commissioners can enter into by virtue of the Act, and that the proviso contained in Section 42, whatever its effect, is to be applied to every such contract. His Lordship here referred to the different clauses bearing on the point, and proceeded as follows: It does not require argument to prove that all contracts dealt with in Section 33 are also referred to and dealt with in Section 42, and it is almost impossible to suppose such one-sided legislation as would apply the stringent provisions of that section to construction contracts only, and leave it lawful to any commissioner, alderman, or common councilman to have the largest interest in any contract with the Commissioners that is not a construction contract. As to the meaning of Section 42, the important point for decision is whether a corporator or shareholder of an incorporated company is or is not interested directly or indirectly in any contract entered into with the company. It was admitted on behalf of the plaintiff company that as a general rule he is so interested. But beyond what I think may be fairly called the main contention—viz., that only construction contracts are within Section 42—the plaintiffs have contended, and the learned judge has in their favour held, that the Act of 1851, and particularly Section 53 thereof, proves that under the special legislation affecting the Commissioners of Sewers a shareholder is not considered as being interested in a contract made by his company, though he must necessarily share in any profits or loss that might be the result thereof. Section 53 is a section not relating to concluded contracts, but to discussion and votes antecedent to contracts. It refers only to commissioners, and not to aldermen or common councilmen, though they are dealt with by Section 42 of the Act of 1848. The section was obviously intended to extend still further the disabilities of commissioners, and there is nothing to indicate that any relaxation of the provisions of the earlier statute was intended. There is, in fact, no necessary connection between Section 42 of the earlier and Section 53 of the later Act, and it would be illogical and merely conjectural to assume that the later section should interpret the earlier. The conclusion I arrive at is that a shareholder commissioner, alderman, or common councilman is interested within Section 42, and that the existence of his interest is sufficient to render a contract with his company null and void. The fact that express provision has been made by Parliament that a member of an ordinary municipal council shall not be precluded, by being interested only as a shareholder of an incorporated company, from taking part in making a contract between his company and the corporation of which he is a member, only emphasises the distinction in this respect between ordinary municipal corporations and the City Corporation, as to which no similar parliamentary provision exists, or apparently ever has existed. With regard to the central and western districts, the Brush Company obtained provisional orders, with the consent of the Commissioners of Sewers as local authority, and those orders were confirmed by an Act of Parliament not containing any statutory power of assigning the contracts which might be made with the promoters. The Brush Company entered into contracts with the Commissioners of Sewers, dated, as to the central district, May 19, 1890, and, as to the western district, Feb. 5, 1891, as to electric light. At each of those dates a Common Councilman was a shareholder in the Brush Company, and each of the two contracts was null and void *ab initio*. Notwithstanding this, by a deed dated Aug. 21, 1891, the Brush Company affected to convey the contracts to the plaintiff company, but this assignment could not render valid the contracts which were already null and void. We have only to give effect to the provisions of the statutes, and have not a dispensing power, even if we were disposed to exercise it. With regard to the contract as to the eastern district, dated May 28, 1890, it appears that the Laing, Wharton, and Down Construction Syndicate, Limited, the contracting parties, had no shareholder whose existence would render null the contract; and, although it appears that the Board of Trade might have revoked the provisional order but for the assurance of the Commissioners of Sewers that the syndicate would be financed and the contract taken over by the Pioneer Company and the City of London Company respectively, and that both those companies were disabled from entering into any valid contract with the Commissioners of Sewers, yet, on the assumption, which I see no reason to doubt, that the contract of May 28, 1890, was originally entered into in good faith, I can find no provision in the Acts of 1848 and 1851, or either of them, entitling us to set it aside.

Lord Justice Stirling read a judgment to the same effect.

The Court declared that the first two contracts were invalid, but did not interfere with the third; and, on the ground that each party had in part succeeded and in part failed, no costs were given in either Court.

We are indebted to the *Times* for the above report.

APPOINTMENTS VACANT.

Electrical Engineer, Manchester Corporation Tramways Department, March 9.

Accountant Clerks.—Institution of Electrical Engineers, £200 per annum, March 9. West Bromwich electricity department, £100 per annum, March 13. Details in our advertisement columns.

Motor Inspector, Bradford, must have had first-class experience in fixing and running direct-current motors of all sizes, and be able to carry out repairs, 34s. per week of 50 hours. Details in our advertisement columns.

Electrical Engineer and Manager, Lincoln Corporation, to take entire charge of the electricity works, £300 per annum, March 11.

Shift Engineer, Manchester Corporation, March 4.

Assistant Inspector of Lamps, Islington, £2. 10s. per week.

Charge Engineer.—Plymouth Corporation electricity works, £120 per annum, March 12. Full particulars in our advertisement columns.

Engineer, Manchester Corporation tramways department, to take charge of permanent-way work, March 9. Full particulars in our advertisement columns.

Assistant Electrical Engineer, Lowestoft electricity works, must have had experience in low-tension three-wire system with batteries, £2 per week. Details in our advertisement columns.

Fitter-Driver, Huddersfield power station, 35s. per week, March 11. Details in our advertisement columns.

Electrician, experienced in ship wiring. Details in our advertisement columns.

CONTRACTS FOR ELECTRICAL SUPPLIES

CONTRACTS OPEN.

Sutton Coldfield.—The Corporation invite tenders for house wiring. Tenders by March 11. Details in our advertisement columns.

Shoreditch.—The Council invite tenders for their annual contracts. Tenders by March 12. Details in our advertisement columns.

Sunderland.—The Corporation invite tenders for indiarubber-covered cables, etc. Tenders by March 29. Details in our advertisement columns.

Manchester.—The Tramways Committee invite tenders for the electrical equipment of 87 cars. Tenders by March 4. Details in our advertisement columns.

Leeds.—The Tramways Committee invite tenders for supplying and fixing trolley wires and attachments. Tenders by March 8. Details in our advertisement columns.

Hastings.—Tenders will shortly be advertised for the supply and erection of the necessary boiler power, feed pumps, etc., which it is estimated will cost about £4,494. 10s.

Ploesti (Roumania).—The Municipality invite tenders for the laying down and working of electric tramways for 30 years. The provisional deposit is £2,000. Tenders by April 3.

Sofia.—The District Finance Department require tenders for various telegraph and telephone materials, amounting to about £2,800. The deposit is 5 per cent. Tenders by March 8.

Buxton.—The Urban District Council invite tenders for a 250-kw. steam dynamo and a Belliss engine coupled to two 43-kw. dynamos. Tenders by March 12. Details in our advertisement columns.

Shipley.—The Urban District Council invite tenders for the supply of house terminal boxes and switch gear, motors, wiring installations, &c. Tenders by March 19. Details in our advertisement columns.

Southampton.—The Corporation invite tenders for insulated electric cables, frames, and covers, including excavation and reinstating of roadways. Tenders by March 11. Details in our advertisement columns.

Leeds.—The Tramways Committee invite tenders for supplying and fixing trolley wires and attachments. Specifications etc., may be obtained at the City Engineer's Office, Municipal Buildings, Leeds. Tenders by March 8.

Warrington.—Tenders are invited for electrical light installation for the new police buildings. Specification, etc., can be obtained from the architects, Messrs. Cackett and Burns Dick, 24, Grainger-street West, Newcastle on-Tyne.

Belfast.—The Harbour Commissioners invite tenders for the lighting by electricity of the harbour office and the harbour workshops, Belfast. Specification, etc., may be obtained from the harbour engineer, Mr. G. F. L. Giles. Tenders by March 4.

Wallasey.—The Urban District Council invite tenders for the overhead equipment of about 10 miles of tramways and for the supply and erection of section boxes and the bonding of rails. Tenders by March 4. Details in our advertisement columns.

Leeds.—The Tramways Committee invite tenders for cast-iron pipes, with the necessary drawing-in boxes and wires, and supplying insulated conductors and drawing the same into the pipes. Tenders by March 8. Details in our advertisement columns.

Aberdeen.—The Electric Lighting Committee invite tenders for supply of fuel economiser and additional Babcock and Wilcox boilers. Specification, etc., may be obtained from Mr. J. Alex. Bell, city electrical engineer, Cotton-street, Aberdeen. Tenders by March 15.

Cardiff.—The Corporation invite tenders for steam-pipes, exhaust pipes, injection and overflow pipes, feed pipes, drain pipes, engine-house flooring, and switchboard gallery and central service gangway. Tenders by March 18. Details in our advertisement columns.

Cheltenham.—Tenders are invited for the electric lighting of St. John's Church, Cheltenham. Specifications, etc., can be had from Mr. Weaver, Carlton-place, Hewlett-street, Cheltenham. Tenders by March 25.

Dagenham (Essex).—The West Ham Town Council invite tenders for the erection of a dynamo house at their small pox hospital, Dagenham Essex. Specification, etc., may be obtained at the Borough Engineer's Office, Town Hall, West Ham. Tenders by March 12

Hull.—The Corporation invite tenders for the supply of one steel Lancashire boiler, 30ft. by 8ft., with mechanical stoker, for the tramway power station, Osborne-street, Hull. Specifications, etc, may be obtained from Mr. A. E White, city engineer, Town Hall, Hull. Tenders by March 8.

Stockport.—The Gas and Electricity Committee invite tenders for supply and erection at their electricity works, Millgate, Stockport, of a condensing plant capable of dealing with 20,000lb. of steam per hour. Specifications can be obtained from Mr. S. Meunier, engineer. Tenders by March 6.

Luton.—The Town Council invite tenders for wiring for electric lighting purposes the Council-chamber, town hall, free library, corn exchange, and baths. Sketches of designs and full details of the proposed works to be given. Further information can be obtained of the Borough Engineer. Tenders by March 4.

Coventry.—The Sanitary Committee invite tenders for the work required in connection with the electric lighting of the new buildings at the infectious diseases hospital. Specification, etc., may be obtained at the office of Mr. J. E. Swindlehurst, city engineer, St. Mary's Hall, Coventry. Tenders by March 4.

Huddersfield.—The Corporation invite tenders for motorcarts suitable for conveying about five tons of coal from the local collieries to the electricity works. Further particulars may be obtained from the borough electrical engineer, Mr. A. B. Mountain, Electricity Works, Huddersfield. Tenders by March 5.

Bradford.—The Corporation invite tenders for the works required to be done in erection of a generating station at the electricity works, Valley-road, Bradford. Specifications, etc., may be obtained on application at the office of the Clerk of Works at the Electricity Works, Valley-road, Bradford. Tenders by March 5.

Wimbledon.—The Urban District Council invite tenders for cables, joint-boxes and jointing material, transformers, meters and demand indicators, lubricating oils, and Welsh steam coal, for the year ending March 31, 1902. Specification, etc, may be obtained on application at the Electric Lighting Works, Durnsford-road, Wimbledon. Tenders by March 15.

Bristol.—The Electrical Committee invite tenders for the erection of the superstructure of the Avonbank electricity works, Feeder-road, Bristol. The work comprises a large amount of steelwork, as well as brickwork and concrete work. Specification, etc., can be obtained at the office of Henry Williams, Esq., architect, 24, Clare-street, Bristol. Tenders by March 12.

Barnsley.—The Electric Lighting Committee invite tenders for the electric lighting of the workhouse: (Specification No. 1) (Section A) boiler; (B) feed pump, feed pipes, exhaust injector, steam and exhaust pipes, etc. (Specification No. 2) (Section A) wiring and cables; (B) steam dynamo and booster; (C) switchboard and accumulators. Specification, etc., may be seen at the offices of the consulting engineers, Messrs. Lacey, Clirehugh, and Sillar, London and Manchester. Tenders by March 6.

Bray (Ireland).—The Urban District Council invite tenders for the supply and erection of: (Section A) boiler-house plant—one Lancashire boiler and accessories; (Section B) engine-house plant—(1) one 150-kw. high-speed steam alternator, and (2) one 25-kw. rope-driven alternator and accessories, for the municipal electricity works. Specification, etc., may be obtained by manufacturers at the offices of Mr. Robert Hammond, M.I.C.E., the consulting engineer to the Council, 64, Victoria-street, Westminster, London, S.W. Tenders by March 14.

London County Council.—The following tenders have been received:

Name of firm tendering.	Number of boilers.	Amount of tender. Boilers.	Stokers.	Total.	Times for completion in weeks.	Percentage of efficiency	Type of stoker.
(1) Stirling Boiler Company, Limited, Edinburgh (accepted).	16	£17,953	£3,034	£20,987	35	74·5	Proctor's
	,,	,,	£4,829	£22,782	,,	,,	Chain grate of improved and extra strong pattern
(2) B. R. Rowland and Co., Limited, Redditch.	9	£21,480	£5,166	£26,646	60	75	American underfeed
(3) R. Hornsby and Sons, Limited, Grantham.	18	£26,922	£1,521	£28,443	61	75	Union Ironworks
	,,	£27,874	£3,111	£30,985	,,		Vicars (midfeather wall)
	14	£25,872	£1,215	£27,087	,,		Union Ironworks
	,,	£26,672	£2,756	£29,428	,,		Vicars (midfeather wall)
	10	£24,627	£1,666	£26,293	,,		Union Ironworks
	,,	£26,310	£3,390	£29,700	,,		Vicars (midfeather wall)
(4) Babcock and Wilcox, London.....	18	£26,520	£4,300	£30,820	24	75·8	Chain grate
	14	£29,418	£4,000	£33,418	,,	,,	Ditto
(5) W. R. Renshaw and Co., Stoke-on-Trent.	12	£26,995	—	—	60	—	None
(6) Edwin Danks and Co., Limited, Oldbury.	18	£37,500	£3,200	£40,700	120	—	

Digitized by Google

RESULTS OF TENDERS.

Dundee.—The offer of Dick, Kerr, and Co. to supply light railway material has been accepted for the gasworks.

Southampton.—The Corporation have accepted the tender of the Leeds Steel Company, at £8 per ton, for the supply of 20 tons of tramway rails.

Shoreditch.—The Borough Council have accepted the tender of Johnson and Sons, Leicester, at £16,633, for new electricity station, Whiston-street, Haggerston.

Brighton.—The Town Council have accepted the tender of the St. Helens Cable Company, Limited, Warrington, for the supply, delivery, drawing in, and jointing complete of the required feeder cables, distributing cables, test cables, and telephone cables, at £4,045.

Brighton. — The Corporation have accepted the following tenders: Bruce Peebles and Co, Edinburgh, three steam dynamos, £7,530, negative booster £440; R. W. Blackwell and Co, Limited, 59, City-road, London, E.C., tramway switchboard, £745. 10s.

Hackney.—The Borough Council have approved the variation of the specification under the contract with Mr. John Greenwood, so far as relates to the use of white glazed bricks for lining the interior walls of the engine-room from the dado, and sanctioned the use of "Crystopal" for this purpose, at a cost of £750.

Aberdeen.—The British Insulated Wire Company have secured the contract for the electrical equipment of the bathing station tramway route, comprising the supply and erection of all overhead material—the poles being provided by the Corporation—and the supply and laying of lead-covered, paper or fibre insulated cables.

BUSINESS NOTES.

TRACTION.

Middlesbrough.—The extension of the tramway system in the town is to be commenced on March 1 next.

Brighton.—The Town Council have granted a license for the extension of Volk's electric railway on certain terms.

New Malden.—The District Council have approved the heads of agreement with the London United Tramways Company.

Cardiff District and Penarth Tramway Co.—The directors recommend a dividend at the rate of 5½ per cent. per annum.

East Ham.—The overhead wire system has been adopted by the Borough Council for their electric trams, which will begin running very shortly.

Huddersfield.—The question of a Sunday tramcar service was discussed at last week's meeting of the Council, and adjourned for two months.

Merthyr Tydvil.—Major Druitt, on behalf of the Board of Trade, will inspect the new tramlines of the electric railway on the 12th inst.

Watford.—At a special meeting of the Bushey Parish Council the Watford and District Tramways Bill was approved subject to certain conditions.

Bury.—The Joint Water Board have submitted protective clauses for insertion in the Corporation Tramways Bill and the South Lancashire Tramways Bill.

Manchester.—It is reported that parliamentary powers will be sought for in the session of 1902 for the construction of an underground electric railway on the same lines as the Central London Railway.

Kinver.—We understand that an effort will be made to secure the opening of the electric tramway for traffic at Easter. The first tramcar has been run over the line to test certain parts of the roads.

Dieppe-Paris Boat Trains.—The boat trains running between Dieppe and Paris in connection with the 10 a.m. services from London and Paris are now composed exclusively of corridor carriages fitted with the electric light.

Chester.—A rumour is abroad that in consequence of the opposition of the Hoole District Council and the Flintshire County Council to the Tramways Bill, the proposed extensions to Hoole and Liverpool-road and to Stonebridge, Saltney, are to be abandoned.

Bournemouth.—The Local Government Board have sanctioned the borrowing by the Council for the purposes of the tramway undertaking authorised, in respect of permanent way, land, and buildings £106 357; electrical equipment, £45,564; and cars, £22,800 - making a total of £174 721.

Maryport.—The Urban District Council have adopted the recommendation of the General Purposes Committee: that formal consent be given to the West Cumberland Tramway Bill, reserving to the Council the right to oppose any details which might not be arranged by mutual agreement.

Tunbridge Wells.—At a town's meeting on Wednesday afternoon a resolution to the effect that the Corporation be asked to develop a system of electric tramways was rejected by 31 votes against 19. At an evening meeting, as far as could be gathered from the show of hands about as many voted one way as the other.

Londonderry.—At the meeting of the Lighting Committee on Tuesday, the electrical engineer submitted a report on the estimates for the electrical equipment of the tramway system as follows: overhead equipment, £2,250; underground system of feeders, etc., £1,128; rail-bonding, £203; cars, £4,140—making a total of £7,721.

"Big Electric Railway Scheme."—We are informed that Mr. Alfred M. Fowler, of Manchester, is joint civil engineer to this scheme, reported in last week's issue. The proposal, it will be remembered, is to construct an electric railway from Harwich to Port Dinllwyn in Wales, the total cost of which is estimated at 20 millions sterling.

Aberdeen.—During the last 35 weeks there has been a deficiency of £1,110 on the horse tramcar service in the city, whereas the electric service shows a surplus of £522. 16s. 9d. during the same period. In consequence of this financial loss, the car service has been reduced. All the routes are partially affected, the Rosemount in particular.

Scarborough.—The Corporation have received a letter from the electric tramways company offering to hand over their Bill to the Corporation if the latter will pay all expenses incurred up to the present time. A sub-committee has been appointed to meet the representatives of the company so as to ascertain the exact amount of these expenses.

Gosport.—The District Council have decided, subject to the necessary permission of the ratepayers, to apply the rates under their control to the payment of the expenses attending the opposition to the Bill now being promoted by the Portsmouth Street Tramways Company to construct further tramways in the urban district of Gosport and Alverstoke.

Hammersmith.—The consent of the ratepayers has been obtained to the opposition by the Borough Council of the following parliamentary Bills: Charing Cross, Hammersmith, and District Electric Railway; Central London Railway; London County Council (Tramways and Street Widenings); and London United Tramways, Limited.

Dublin.—A Bill has now been deposited for this session on behalf of Arthur Guinness, Son, and Co., Limited, to empower them to construct tramways in the city of Dublin in connection with their St. James's-gate Brewery, and for powers to work the same and its existing tramways by mechanical or other power. The cost of these tramways is estimated at £10,342.

Stirling.—In connection with the tramways question, the Lighting Committee have met Mr. Lea, of the British Electric Traction Company, and discussed the proposals submitted by his company. The committee suggested certain alterations on the terms proposed, and it was arranged that Mr. Lea should communicate with his company and ascertain whether they would agree to the committee's proposed alterations.

Rochdale.—The conference of local authorities on the question of the taking over of the Bury, Rochdale, and Oldham tramway undertaking has appointed a committee to approach the tramway company with respect to the matter. It was reported that Bury declined to fall in with the scheme. The Tramways Committee of the Town Council are considering what type and style of cars to adopt for the municipal tramways.

Edinburgh.—At last week's meeting of the Special Committee on Tramways it was reported that the construction of the Portobello power house was going on rapidly, and that the structure would soon be ready for the roof. Tenders, amounting to between £5,000 and £6,000, were accepted for the boilers which are to furnish the motive power to the machinery. This decision has been confirmed by the Lord Provost's Committee.

London United Tramways.—The engineer's estimates of the cost of constructing the extensions proposed in the company's new Bill amount to £665,943. The London County Council decided on Tuesday to refuse to give its consent, required by the Standing Orders of Parliament, to the construction of such of the tramways proposed in the Bill promoted by the London United Tramways Company as would be situated within the administrative county of London.

Liverpool.—Following upon a report of the city electrical engineer, the Tramways Committee have authorised the general manager to arrange for an adequate provision of indiarubber gloves at police stations, etc., near the line of tramways. The committee have also instructed the engineers to prepare a plan showing the overhead wires at present existing over the tramway lines, and the owners of the same as far as can be ascertained, and to report as to the position of the Corporation with respect to such overhead wires.

Stockton-on Tees.—At the fortnightly meeting of the Rural District Council on Wednesday a letter was read from the Imperial Tramways Company stating that the directors could not entertain the claim of the Council to part of the alleged surplus profits of the company. The Clerk said under the provisional order obtained by the company the surplus profits after 8 per cent. had been paid had to be divided amongst the three Corporations and the Council according to the ratable value. He was authorised to confer with the other authorities interested, as joint action would be necessary.

Private Bills.—The Examiner on General Orders resumed consideration of the Paisley District tramways order on Thursday week. The consent of the Corporation of Johnstone has already been proved. The promoters have failed, however, to obtain the consents of the County Council of Renfrew and of the Corporations of Paisley and Renfrew, and a non-compliance with the requirements of the general order will be reported by the examiner in that respect. It will be competent for the promoters to ask the chairmen of the two Houses of Parliament to dispense with consent of these authorities, and it is expected this course will be followed,

Digitized by Google

Leicester.—Messrs. Kincaid, Waller, and Manville have been commissioned by the Corporation to mature a scheme for applying electric traction to the whole of the Leicester tramways, as well as to a large extension of the present system, which has now been sanctioned. It is roughly estimated that the total expenditure on the acquisition of the present lines, and the completion of the new ones, will considerably exceed half a million sterling, if not reach three-quarters. After the experience at Liverpool there is a growing determination on the part of the special committee to declare for the conduit system, though it must entail a large addition to the initial cost.

Sunderland.—Some three weeks ago two of the principal sections of the electric tramways system were completed, but no official from the Board of Trade arrived to make an inspection of these. The Corporation, therefore, took the matter into their own hands, and last week commenced running without the necessary authority. The cars were extremely well patronised, but a peremptory telegram from London was received on Wednesday night ordering the immediate cessation of the service until the arrival of the inspector. Previous to this, a special meeting of the Tramways Committee had decided that it was inadvisable to run cars over the lines which had not yet been inspected by the Board of Trade. Accordingly, instructions were given to the traffic manager, with the result that the cars were immediately withdrawn. We trust that a permanent start may be made soon.

Bolton.—At a meeting of the Tramways Committee last week the consideration of the question of laying a portion of the new tramways on the Demerbe system was deferred for further information to be obtained. A letter was read from the Board of Trade forwarding the certificate of the Board that the Deane tramways were found to be fit for public traffic, together with the order sanctioning the use of electric power thereon. The borough engineer submitted a plan for the proposed relaying of the tramways in the central portion of the borough, and the plan was approved of subject to the suggestions now made. Centre poles were ordered to be placed in Trinity-street, and double-line tramways in Bradshawgate as far as possible. The engineer submitted a plan showing the reduction of passing places proposed to be made near Bob's Smithy, Chorley Old-road, and the plan was approved of.

Stoke-on-Trent.—Mr. Gerald A. R. Fitzgerald and Colonel Boughey, Light Railway Commissioners, have held a public enquiry as to the expediency of granting the application of the Potteries Electric Traction Company, Limited, for an order authorising various extensions of the Potteries light railways. The Commissioners said they did not consider it necessary to postpone their decision. In their opinion the opposition of the North Staffordshire Railway Company, important as it was, was not sufficient to justify them in withdrawing the case from the consideration of the Board of Trade. With regard to the time of purchase, they thought that Stoke should be put on the same footing as the other boroughs—viz., 31 years. As to the little projected extensions to Townsend (Bucknall and Sneyd Green, Hanley), they would be disposed to view them favourably if there was no opposition.

Automobile Demonstrations.—The Automobile Club on Tuesday gave a demonstration of the powers of various machines in the presence of the chairmen and clerks of various county councils and chief constables of neighbouring counties. A conference was afterwards held at the clubrooms, Whitehall-court, when several subjects were dealt with. The question of speed was not raised. The most important point discussed was that of the numbering of motorcars, and the opinion of the members was strongly adverse to any system of numbering. Some 22 county councils were represented. The club also gave a demonstration of motorcars at Chelmsford last week, to which the Highways Committee and other members of the Essex County Council were invited, but these gentlemen did not avail themselves of the opportunity of taking part in the trials. A lecture on the subject was afterwards given. It is proposed to hold a motor exhibition at the forthcoming Essex agricultural show. The East Suffolk Roads and Bridges Committee, before whom trials have taken place, have passed a resolution in favour of the abolition of the speed limit for motorcars, while the Kent County Council have passed a resolution to the effect that they do not consider 12 miles an hour an excessive speed.

Cardiff.—At a meeting of the Tramways Committee last week the Borough Engineer presented a report with reference to the lowering of the Bute-street Bridge in connection with the tramways. He had ascertained that the Board of Trade required, and would insist upon, a clear headway of 6ft. between the top of the car and the underside of the bridge, and, taking an ordinary type double-decked car, it would mean the lowering of the bridge pit to the extent of 15in. Even with the clearance which he had indicated, the Board would require all cars to be brought to a stand before passing under the bridge. The opinion was expressed that it would be quite possible to meet the difficulty to a large extent in the design of the cars. The report was ordered to be printed and circulated for further consideration. The Electrical Engineer reported that a special arrangement had been made by which it would be possible to fix centre poles in Cathedral-road for the carriage of the electric wires. The chief subject of discussion at the meeting of the General Purposes Committee on Monday was the taking over of the tramways by the Corporation. The terms proposed by the company are that they should reconstruct the lines for electric traction by the beginning of 1902, that the valuation of the depôts should stand over until a later date, and that the Corporation should pay all parliamentary and engineering expenses incurred by the company in promoting the several orders. The matter stood adjourned.

London County Council.—At the last meeting of the Council on Tuesday the Highways Committee submitted the following report: "As the designs for the generating station to be erected at the Camberwell depôt could not be proceeded with until the type of the boilers to be used there should have been determined upon, and the amount of space required for them should have been ascertained, we, as the first step towards a commencement being made of the conversion of the tramways for electrical traction, caused advertisements to be issued inviting tenders for the supply of the boilers required for the station. It was stated in the advertisement that tenders for the supply of any type of water-tube boiler which was in successful use on a large scale in actual work, would be considered. The tenders received were referred to us by the Council on Feb. 19, and the following is a list and particulars of them, from which it will be seen that only six firms have tendered, but that, as some have sent in several tenders, there are 13 in all. (See "Tenders.") We referred these tenders to Dr. A. B. W. Kennedy, the electrical engineer under whose supervision the work of reconstructing the lines and the provision of the necessary machinery and plant will be carried out. In a report presented to us this day, Dr. Kennedy states that, as regards the alternative tender of the Stirling Boiler Company, which is the lowest in amount, boilers of the type specified in the tender, and almost identical with those proposed for the station, have been in use in Edinburgh for about two years, and have been thoroughly satisfactory. He further states that the output of the boilers referred to has exceeded the guaranteed amount, and that they have cost very little for maintenance and repairs. The report contains observations with regard to all the other tenders; but Dr. Kennedy states that, as the alternative tender of the Stirling Boiler Company is very much lower than that of any of the other firms, and as the type of boiler specified by the company has, in his experience, given just as good results as those specified in the other tenders, he recommends that it be accepted. Having regard to the opinion expressed by Dr. Kennedy, we recommend that the tender of the Stirling Boiler Company to supply, for a sum not exceeding £22,782, the boilers and mechanical stokers required for the electricity generating station to be erected by the Council at the Camberwell tramways depôt be accepted."

LIGHTING AND GENERAL.

Gillingham.—The Urban District Council have decided to purchase the electric lighting works from the local company.

Share Market.—Electric shares all kept steady during the week. There was a good deal of business in electric tractions.

Middlesbrough.—The Fire Brigade Committee are providing their men with rubber gloves in case of electrical cable accidents.

Skelton and Bretton.—The Urban District Council have decided not to oppose the Cleveland and Durham Electric Power Bill.

Nantwich.—The agreement between the Urban District Council and the electrical engineers, Messrs. Trentham and Peers, has been sealed.

Darlington.—Applications continue to come in for installations of the electric light by private persons, and for power by manufacturers.

Sheffield Markets Electric Supply Co.—We are informed that the general offices of the Company have been removed to 57, Charterhouse-street, E.C.

Huddersfield.—The minutes of the Electricity Committee show that the surplus profit for the year ended Dec. 31 was £110, against £2,828 in the previous year.

Holmfirth.—A conference has taken place between representatives of the South Yorkshire Electric Power Company and the members of the Holmfirth Council.

Derby.—Mr. H. P. Boulnois has held an enquiry into the application of the Corporation to borrow £35,850 for machinery and the extension of electric lighting mains.

Tamworth.—The Guardians are about to institute enquiries as to the lighting of the workhouse by electricity. They are in favour of putting in their own plant.

Western Telegraph Co.—The directors have declared an interim dividend of 3s. per share, or at the rate of 6 per cent. per annum, for the quarter ended Dec. 31, payable 25th inst.

Personal.—We learn that Mr. W. Fisher is resigning his connection with Messrs. Crompton and Co. after a period of 10 years spent in Colonel Crompton's and the company's service.

Barnard Castle.—The District Council are enquiring into the provisions of the Cleveland and Durham County Electric Power Bill, as they might want to supply electric light themselves in Cockfield.

Aberdeen.—The Plans Committee of the Town Council at their last meeting discussed the plans of the new electrical station on the site of Dee Village, the value of which building is estimated at £23,000.

Hartlepool.—The West Hartlepool Corporation propose to apply for a telephone license, and desire to include Hartlepool in their area. The Hartlepool Town Council, however, have decided not to agree to this.

Chelsea Electricity Supply Co.—A dividend of 6 per cent. on preference and 5½ per cent. on ordinary shares for the year has been recommended; £10,000 is transferred to reserve and depreciation fund.

Digitized by Google

Books Received.—"Practical Electrical Testing in Physics and Electrical Engineering," by G. D. Aspinall Parr, A.M.I.E.E. Longman, Green, and Co. 8s. 6d.—*Science Abstracts* for February. E. and F. N. Spon, Limited.

Rishton.—The District Council have consented to the application to the Board of Trade by Mr. Charles Chadwell for the granting to him of a provisional order for supplying electrical energy within the urban district of Rishton.

Carnarvon.—Mr. Trotter, of the Board of Trade, held an enquiry on the 26th ult. into the application for an order for the electric lighting of Carnarvon being made by Mr. Peterson, of London, and opposed by the Carnarvon Town Council.

Wireless Telegraphy on the Irish Coast.—A number of stations are to be erected along the south coast of Ireland to enable communication to be made by the Marconi system of wireless telegraphy with passing Atlantic liners when necessary.

Falkirk.—The Town Council are endeavouring, with reference to the Board of Trade's proposal to reduce the maximum unit price from 8d. to 6d., to get the Board to allow the price to remain at 8d., but, failing this, to have it fixed at not less than 7d.

Grimsby.—The public lighting of the streets is to commence on March 31, the end of the Corporation financial year. In the meantime those which are ready are to be lighted on Thursdays and Sundays from 7.30 to 10, and on Saturdays from 7.30 to 11.

Newton Abbot.—Mr. J. C. Wigham, engineer to Edmundson's Electricity Corporation, Limited, who has obtained a provisional order for lighting the borough, visited Newton Abbot on Saturday for the purpose of inspecting sites which have been offered for the works.

Enquiry.—The Board of Trade will hold an enquiry at the Town Hall, Westminster, to-day at 11 o'clock, with reference to the proposed alteration in the proviso to No. B (6) of the regulation made by the Board under the Electric Lighting Acts, 1882 and 1888.

Newbury.—It appears that the Corporation are not able to come to terms with the Urban Electric Supply Company, and are still pressing the Board of Trade for an enquiry so that the inhabitants should have an opportunity of expressing their views on this question.

Aldershot.—The Clerk formally reported at the last meeting of the Council that the Local Government Board enquiry, with reference to the loans of £20 000 and £5,200 for the purposes of the electric light and the parish clerk's land respectively, had been duly held.

Electric Welding Co.—The offices of this Company have been removed from 21, Hindon-street, Pimlico, S.W., to 28, Basinghall-street, E.C. The department for jobbing work has been transferred to Messrs. Smith, Parfrey, and Co., 141, Buckingham Palace-road, S.W.

Fleetwood.—At a meeting of the ratepayers' association last week a committee was appointed to enquire into the question of urban councillors holding shares in the Fleetwood and District Electric Lighting and Power Syndicate. The action of the association is much resented locally.

Post Office Telephones.—The chief exchange from which the Government telephones will radiate is now being fitted up in the building which the savings bank has hitherto occupied in Queen Victoria-street. The Post Office officials expect that the system will be inaugurated in about six months.

Shildon.—The Cleveland and Durham County Electric Supply Company having requested the Council to pass a resolution in favour of their Bill, the Urban District Council have decided to reply that they have already made arrangements for their supply, and they therefore could not support the Bill.

Gloucester.—After a lengthy discussion on the electric light charges, the Electric Lighting Committee have resolved: "That while they are anxious to supply electricity on the most favourable terms, they will make no change in the scale of charges until the result of the first year's working has been ascertained."

Aylesbury.—A resolution to the effect that the Council apply to the Board of Trade for an extension of time for the electric lighting order, and that in the meantime treat for land and ascertain companies willing to undertake the work, was before the last meeting of the Council. After discussion the matter was adjourned.

Pacific Cable.—Mr. Mulock, the Postmaster-General, has given notice of a resolution authorising Canada to contribute five-eighteenths of the £2,000,000 which are to be advanced by the Imperial Government for the laying of the Pacific cable. The estimate of the cost of this undertaking provided for last session was £1,700,000.

Hoylake and West Kirby.—Mr. Ernest Marples, at present engaged as clerk of works, has been appointed electrical engineer. The position was not advertised because when Mr. Marples was appointed clerk of works it was understood that if he gave satisfaction, he should, when it became necessary, be appointed electrical engineer.

Dartmouth.—Mr. J. C. Wigham, engineer to Edmundsons' Electricity Corporation, Limited, who has obtained a provisional order for lighting the borough of Dartmouth by electricity, visited Dartmouth on Saturday last for the purpose of inspecting sites which have been offered for the works. The work will probably be started in July.

Pritchett and Gold.—We are informed that owing to the continued increase in their battery business, this firm have disposed of the business of electrical engineers and contractors lately carried on by them at 15, Hart-street, London, W.C., to Messrs. Braby and Tomlinson, Limited, who will continue at the same address. In future they will devote their whole time to the manufacture of storage batteries at Feltham, Middlesex.

Removals.—The Sturtevant Engineering Company, Limited, mechanical and electrical engineers and contractors, have removed their offices to 147, Queen Victoria-street, E.C.—Mr. Arthur Koppel, manufacturer of portable and permanent railway materials, has removed to 27, Clement's-lane, London, E.C.—The Schattner Electricity Meter Company, Limited, Timberhite, Norwich, has removed to Tyndale Works, Upper-street, Islington, N.

Burnley.—The Corporation Electricity Sub-Committee have approved of a scheme for the extension of the electricity supply works, so as to provide electrical energy for traction purposes in connection with the town's electrical tramway scheme. The scheme provides for two new boilers, the raising the existing chimney 30ft., new accumulators, a traction switchboard, and alterations to buildings, involving an estimated expenditure of £7,345.

Patent Decision.—The case of the opposition to the German patent for Messrs. John Gibbs and Son's (engineers, of Duke-street, Liverpool) safety motor switches, brought by Messrs. the Elektricitäts-Aktiengesellschaft vorm. Schuckert und Co., of Nuremberg, has at length been decided in favour of Messrs. John Gibbs and Son, and letters patent finally granted. The result of this decision will be to considerably enhance the value of Messrs. John Gibbs and Son's patents.

Hanley.—The Hanley electricity works were opened in July, 1894. In the first year the private supply of energy was 55,000 units. In 1900 the supply was 64 000 units, the gross profit being estimated at £3,600. The amount of interest paid out of this sum was £2,100 and £2,148 has been transferred to the sinking fund, leaving £640 deficient. But against this has to be placed the amount paid in the reduction of capital, £7 786. The working last year resulted in a profit of 12 to 13 per cent.

Stock Exchange.—The Stock Exchange Committee have appointed March 5 special settling day for the Brisbane Electric Tramways Investment Company, Limited, 75 000 ordinary shares of £5 each, fully paid, Nos. 1 to 75,000; 75,000 5 per cent. cumulative preference shares of £5 each, fully paid, Nos. 1 to 75,000; and provisional certificates (fully and partly paid) for £400,000 4½ per cent. first debenture stock, and have also ordered the said securities to be quoted in the official list. Applications have been made to the Exchange Committee to allow the following securities to be quoted in the official list: British Insulated Wire Company, Limited, further issue of 30,000 ordinary shares of £5 each, fully paid, Nos. 40 001 to 70 000; and 30,000 6 per cent. cumulative preference shares of £5 each, fully paid. Nos. 40,001 to 70,000; Nernst Electric Light, Limited, 115,000 7 per cent. preference shares of £1 each, fully paid, Nos. 1 to 115 000 (renewed application); W. T. Henley's Telegraph Works Company, Limited, further issue of 5,000 ordinary shares of £5 each fully paid, and 5,000 4½ per cent. cumulative preference shares of £5 each, fully paid.

Okonite Tape.—The following details of the procedure to be adopted when insulating joints in electrical conductors with okonite tape will be of interest to those who are not already familiar with the tape in question. We may say that okonite tape as at present supplied by Messrs. Geipel and Lange is a modification of the well-known insulating compound introduced by the Okonite Company. To secure a tubular, waterproof, high-insulation joint with this tape it is necessary to take the usual precautions of removing the damaged rubber near the joint, and thus getting the surface of the dielectric clean and free from the fibre of the braiding, etc. The okonite tape is then wound over with a half lap until it covers the conductor, and at least 1in. of the dielectric at each side of the joint. A little heat is then applied from a match or clear flame, and the joint slightly kneaded while still warm. A second layer is then put on wound in the opposite sense and similarly treated. The joint when cooled will now have an insulation resistance equal to the body of a 600 megohm cable. The makers add that this insulation will be permanent and never show signs of the gumminess of ordinary rubber-insulated joints made with rubber solution, etc., to secure adhesion of the layers and turns. Additional layers will secure higher insulation in accordance with the grade of cable used. It is easy to demonstrate the tubular, and, therefore, waterproof nature of such a joint by splitting it longitudinally, when, if properly made, a tape will be found consisting of diagonal short pieces of the original tape firmly jointed one to another. The question of satisfactorily insulating joints affects every person interested in the electrical industry. The central-station engineer has an immense stake in the permanence of his joints, the wiring contractor has an equal stake, as much of work is valued by the insulation tests of the wiring and the permanency of the joints. Beyond the insulating of the joints and its permanence under favourable conditions, is the consideration of the maintenance of the insulation in the presence of chemical compounds. Tests taken in great detail by Dr. J. A. Fleming have proved that okonite is chemically resistant to water, oils, alkalies, and commercial acids, so that there seems to be little to fear from okonite insulated joints even under very adverse conditions. Dr. Fleming's tests confirmed those of the late Dr. John Hopkinson, who was particularly struck with the permanence of this material in oils, a point of considerable importance in view of the wide extension of the use of screwed barrels to contain wires, and the inevitable presence of greasy matters in many situations where electric cables are necessities.

Digitized by Google

Ham.—The District Council have assented to the Richmond Electric Light and Power Company's application to the Board of Trade for a provisional order to extend their mains to Ham. It is understood that the average price will be 5d. per unit.

Brighton.—Considerable discussion took place at the last Town Council meeting over the Sanitary Committee's proceedings concerning the rewiring of the abattoir for electric lighting. It was stated that the new work was to be done by contract, whereas before it was done by the Lighting Committee.

Newcastle.—Mr. A. A. G. Maleb has held an enquiry into the application of the Corporation to borrow £10,000. The Town Clerk explained that the loan was needed for the purpose of lighting by electricity the principal thoroughfares in the centre of the city in which the tramways were being laid. Mr. Le Rossignol described the system of electric lighting.

Bridgwater.—The Town Council have been informed by the Local Government Board with regard to their application of last year for sanction to borrow £20 000 for purposes of electric lighting, that unless the Town Council pass a resolution renewing the application, the Board propose to regard the original application as withdrawn. No action has been taken by the Town Council as yet.

R. W. Blackwell and Co.—We have received a somewhat belated but sufficiently large wall callendar issued by Messrs. R. W. Blackwell and Co., Limited, 59, City-road, E.C., agents for the Peckham Manufacturing Company (successors to the Peckham Truck Company), manufacturers of Peckham's system of "single" and "double" electric car trucks, Price friction power brakes, and Ruggles rotary snow ploughs, etc.

London Gazette—The discharge of A. G. Inrig (carrying on business as the Globe Electrical Company), 46, White Post-lane, Victoria Park, London, has been suspended for two years; bankrupt to be discharged as from Jan. 24 1903. His assets were not of a value equal to 10s. in the pound on the amount of his unsecured liabilities, and he had omitted to keep such books of account as are usual and proper in the business carried on by him.

Kingston.—By the Act of last session the Corporation obtained powers to wire consumers' premises, and they are now prepared to enter into arrangements with owners and consumers as authorised by the Act. The work is to be carried out by a contractor. The total cost of each installation is to be repaid by quarterly instal ments spread over a period not exceeding five years, such payments to include 5 per cent. interest on the outstanding capital cost.

Penge.—The Council last week adopted the draft agreement made between the Penge Council and the Lewisham District Electric Supply Company, Limited. The agreement referred to is practically the same as that accepted by the Lewisham Borough Council as regards the price and main conditions, the following clause being added: "The streets to be scheduled for the initial installation of the light shall be Anerley, Beckenham, and Croydon roads."

Bedford.—The Town Council have decided that from March 31 the charge for electric lighting be 5½d. per unit, less a discount of ½d. per unit if the account be paid on or before the date specified on the demand note delivered to the consumers. The Electric Light and Traction Committee have made a contract with the Rev. C H Farrar, M.A., to supply current to his school on condition that he contributes £40 to the total cost of £150 for carrying out the work, enters into a contract for seven years, and guarantees his annual custom of at least £150.

London County Council.—On Tuesday it was agreed to lend the Battersea Borough Council £10,600 towards the electric light installation. The Finance Committee recommended the Council to support the views of the Electrical Trades Union. Instead of 8½d. to 9d. per hour, as at present, wiremen are to receive from 9d. to 10d., and charge men, for a 54 hours' week, are to be remunerated at from 10d. to 10½d. The Council sanctioned the laying of mains along a portion of Sumner-street, Southwark, by the City of London Electric Lighting Company.

Islington.—The Lighting Committee will recommend to day that, having regard to the extension and development of the electric lighting undertaking, and to the capacity and conduct of the chief officials, the Council be recommended to make the following increases of salary: Mr. Albert Gay, the electrical engineer, £100 per annum; Mr. C. H. Yeaman, the assistant electrical engineer, £50 per annum; Mr. Stephen Stone, clerk, £6 per annum; and Mr. H. Knorr, the superintending electrician, £1 per week, latter by annual increments of 5s. per week.

Dalkeith.—The Town Council have adopted an agreement with Messrs Deacon and Co., the solicitors for Messrs. Crompton and Co., for the lighting of the town. Messrs. Crompton will provide the lamps and maintain the same in the streets of the burgh at the charge of 3d. per unit. At the Town Council meeting the readiness of Messrs. Crompton and Co. to carry through the arrangements on the terms offered by their Edinburgh agent, and to thus equip the lamps, although they themselves had never intended this, was most favourably commented upon.

Loughborough.—The Borough Surveyor, as a matter of urgency, last week laid before the General Purposes Committee of the Town Council an application by the Brush Electrical Engineering Company for the consent of the authority to the laying of a pipe across the Rempstone footpath to carry cables between the foundry and the car shops at the Falcon Works, instead of carrying them overhead; and it was resolved, subject to the company entering into such agreement as the town clerk may deem necessary for the protection of the Corporation, to comply with the application.

Ballycastle.—A subscription has been raised by a meeting of ratepayers in order that a competent engineer be employed to examine the various water supplies in the district, and find if sufficient power could be obtained for generating electric light. The following committee are in charge of the proposal: Rev. J. Conway, Dr. M'Ilroy, Dr. Woodside, Messrs. John Byrne, J. P. O'Kane, Daniel M'Kinley, and H. A. M'Alister. During the proceedings Messrs. J. Taggart and J. Dean, of Bushmills, had the court house lighted by electric light from a small dynamo erected by them in Mr. M'Guigan's mill.

Coventry.—The Electric Light Committee on Tuesday recommended an extension of the electric light works at an estimated capital expenditure of £23 200. The expenditure includes £14 891 for works extensions, £3,300 for distribution, and the sum of £5,009 expenditure already incurred. A long discussion took place, but the report was eventually passed. The last quarterly statement shows that the quantity of electricity supplied during the quarter ending Dec. 31 was 125,454 units, against 86,295 units in the same quarter of 1899, the number of consumers being 328 against 198, and the rentals being £2,005. 10s. 7d., against £1,340. 11s. 2d.

Swansea.—At the last meeting of the County Council it was proposed that the town clerk be authorised to undertake, on behalf of the Corporation, to supply the Dock Trustees with current for harbour lighting purposes at a price per unit equal to the present cost to the Trustees, and in the extent of disagreement as to what that actual cost per unit is to the Trustees, that the question be referred to a third person to be agreed upon between the parties. This would have meant the omission of a clause providing that the borough electrical engineer should be satisfied that the price so to be charged covered the cost of production. On a division the motion was lost by 17 to 10.

Cardiff Telephones.—Subscribers to the Post Office telephone service will be glad to hear, says the *Western Mail*, that the Postmaster-General has decided to abolish the terminal charges for speaking to National subscribers in other towns. Up to the present, if a Cardiff Post Office subscriber had wished to speak to a National subscriber in Newport, the charge would have been 6d. for three minutes' conversation. This charge is now to be reduced to 3d., which is the same amount which a Post Office subscriber in Cardiff would pay for speaking to a Post Office subscriber in Newport. Therefore, a subscriber to the Post Office service can now speak to subscribers to the National in other towns without extra charge.

Bath.—The Electric Lighting Committee recently recommended the Council to adopt a report of the engineer (Mr. G. F. Metzger) proposing that in all £11,500 be laid out in extending the plant at the works in order to cope with the increasing demands for lighting The power at the works is limited to 30,000 8 c.p., and already 28,000 8 c.p lamps are in operation, so that if the applications come in for lighting like they had come in recently in the course of a very little time the committee will have to refuse business. After discussion last week it was agreed to withdraw the report so far as it referred to the extension of the plant, with the understanding that the mayor would render every assistance in the future in facilitating its being carried out.

Catalogue.—Messrs. Ludw. Loewe and Co, Limited, announce that on Jan. 1 last they took over the agency for the Bullard Machine Tool Company's product, makers of vertical boring mills. These machines are stocked by Messrs. Ludw. and Co. for delivery, and are exhibited in actual work, fitted with the latest forms of tools, in their showrooms at 30 Farringdon-road, E.C. In the catalogue of the Bullard Machine Tool Company a reproduction of the first 37in. boring and turning mill built by the firm in 1893 is given against a model of the 1900 machine. A comparison of the two convinces one of the great strides that have been made in the improvement of design and workmanship in this direction. The machines are turned out by the firm in sizes ranging from 30in in diameter and 14in. in height to 76in. and 48in. respectively.

Llandudno—The Electric Lighting Committee in their last report, which has been adopted by the Urban District Council, confirmed the receipt of a letter from Messrs. Strode and Co., London, stating that the price fixed by the Council for supplying Lady Forester's Convalescent Home, Llandudno, with electricity was not sufficiently low to enable them to recommend the trustees to give up the erection of their own mains. They asked that the price should be reconsidered in view of the fact that the minimum of £15 000 fixed by the Council would be considerably exceeded. The Council was recommended to supply the trustees at the following rate: 4½d. per unit, with a minimum of 15 000 units; 4d. per unit, minimum 20,000; and 3½d., minimum 25,000. The Manchester Steam Users' Association reported on the safety of the boilers for a pressure of 150lb, which were in good order. For working extra hours on the occasion of the visit of the Incorporated Society of Musicians the sum of 29s. was voted for division among the staff at the works.

Glasgow.—Mr. W. A. Chamen, Glasgow city electric engineer, in a report just issued, states that the cost of opening streets in Glasgow for 2½ years from January, 1898, to November, 1900, amounted to £74,450, and that the sum paid during the same period to the statute labour department of the Corporation for reinstating the streets was £22,880, making a total of £97,330. The cost of the actual mainlaying and of the opening and closing of streets, however, had not been kept separately, as the same men performed both operations, and the question of cost was further complicated by the fact that the wages paid by the electricity department included the construction of manholes and the laying of services to consumers' premises. Approximately, how-

Digitized by Google

ever, £37,250 out of the wages paid by the electricity department might be reckoned as the cost of opening and closing streets, which, together with the statute labour charges of £22,880, made a total of £60,000 as the approximate cost of opening and making good the streets during the time named.

Battersea.—The Council are granting an application of the General Post Office for general permission to lay distributing pipes from the main telephone cables in order to reach the premises of the subscribers in those cases in which overhead wires will not be run on the following conditions: The Postmaster-General shall make good any damage which may be done in the execution or maintenance of the work to the satisfaction of the surveyor. The Postmaster-General shall give notice in writing to the Council in case at any time any of the said pipes shall be used or required to be used to connect exchanges of the National Telephone Company, or exchanges of the National Telephone Company and post offices. On receipt of such notice as last aforesaid, the Council shall be at liberty, by notice in writing, to withdraw the consent hereby given so far as relates to any pipes to be used as aforesaid, and the Postmaster-General, if he objects to such withdrawal, shall take immediate steps to obtain a determination of the difference thus arising in manner prescribed by the Telegraph Act, 1878.

Wolverhampton.—Lieut.-Colonel A. C. Smith held an enquiry on Thursday last week into the application of the Town Council for the sanction of the Local Government Board to borrow £58 942 for the purposes of electric lighting. The Town Clerk said that the amount was required for building and foundations, £4,620; boiler-house equipment, £18,140; engine house equipment, £19,580; feeders, distributors, and pilot mains, £15,000; and £1,602, an amount over-spent on a loan of £28,870. The machinery at present in Commercial-road had a capacity of 640 kw. With the two sets on order, together with the two sets which it was proposed to purchase, the capacity of the machinery would be brought to 2 640 kw. The demand for electric lighting in Wolverhampton had been increasing at the rate of 33 per cent. per annum. At the end of March 31 of 1894-5 the total quantity of units sold was 23,372, and in the year ending 1899-1900 the quantity of units sold was 482,277. The Corporation had under consideration the question of electric traction on their tramlines, and for that reason they had to look ahead, so as to make provision for the necessary storage capacity. The item of £15,000 included extensions to the distributing system for the next two years. The total amount of loans authorised was £87,669. 18s. 9d.

Cambridge.—At the annual meeting of the Cambridge Electric Supply Company, Limited, last week the Hon. C. A. Parsons, who seconded the adoption of the report, spoke in highly eulogistic terms of Mr. J. H. Barker, who was going shortly to Newcastle-on-Tyne to manage the Heaton Engineering Works. With regard to his successor, they had every confidence in Mr. H. B. Harvey's ability to succeed Mr. Barker. Mr. Harvey had had three years under Mr. William Hunter at the Newcastle and District Electric Lighting Company, which this year was paying a dividend of 8½ per cent. Mr. and Mrs. J. H. Barker entertained the employés of the Cambridge Electric Supply Company, Limited, on Thursday, who, in order to show their appreciation of the value they set upon Mr. Barker as the virtual manager of the company during the past nine years or more, presented Mr. and Mrs. Barker with a token of their esteem in the shape of a beautiful silver salver. Mr. D. Munsey (chairman of the directors of the electric supply company) occupied the chair. The usual speeches and songs enlivened the evening. The piece of silver bore the following inscription: "Presented to John H. Barker, A.M.I.C.E., M.I.E.E., by the employés of the Cambridge Electric Supply Company, Limited, on resigning his appointment as engineer, March, 1901." On Wednesday evening Mr. and Mrs. Barker entertained the workmen's wives and families to tea and a magic lantern entertainment.

Devonport.—The work at the Corporation's new electricity works in Newport-street, Stonehouse, has been progressing for a considerable while under the direction of Mr. Charles Furness, the Corporation electrical engineer, but only last week saw the ceremony of laying the foundation stone (or rather the memorial stone). The Mayor of Devonport (Mr. Harman J. H. Graves), the chairman of the Stonehouse Urban District Council (Mr. F. Maitland), each wearing his chain of office; the town clerk of Devonport (Mr. A. J. Pilling), the clerk of Stonehouse Urban District Council (Mr. R. R Rodd), Alderman J. B. James, the members of the Electricity Works Committee, members of each Council, the surveyors, and a large number of private residents were present. Amongst the customary speeches it was mentioned that in the first place the estimated expenditure had been about £69,000, but the committee had carefully economised, and it was expected that the outlay would be £7,000 less than the sum that had been mentioned. The Mayor laid the foundation stone, which bore the following inscription: "Devonport Corporation Electricity Works. This stone was laid by his Worship the Mayor, Harman John Howland Graves, Feb. 21, 1901. Alderman J. B. James, J.P., chairman of the committee; A. N. Coles, builder; C. Furness, engineer." His worship was presented with a silver trowel, with ivory handle, by the chairman and members of the committee, and with a silver-mounted oak mallet by the builder.

Sunderland.—An enquiry was held on the 21st ult. by Mr. M. K. North into the application of the Corporation for sanction to borrow £73,035 for purposes of electric lighting. The Town Clerk said that of the £73 035 asked for, all, with the exception of £18,615, was for the erection of a power station and machinery upon what was known as the Hylton-road electric lighting station, a new site, in respect of the purchase of which sanction had already been given by the Local Government Board. The first station, at Dunning-street, had already been charged to its fullest capacity, and the Corporation had had to refuse customers for the electric light. Of course, a considerable quantity of the power was required for the electrical trams, but the new station would be used solely for the production of power for lighting purposes. The loan was divided as follows: buildings, chimney, etc., £20,950; boilers, economisers, pumps, stokers, and elevators, £9,260; two 200 h.p. and three 450-h.p. dynamos, £23,010; switchboard, etc., £1 200; and new feeders, etc., £18,615. Mr. J. F. C. Snell said in 1895 they started with 83 consumers, and now they had 611, and 60 prospective customers had been kept back, but would be taken on if the loan were sanctioned. During the half-year ending Sept. 30, 1899, the Corporation sold 197,000 units, and in the corresponding half of last year the sale was 289,000 units. Since September last the sale had been 630,000 units, and when the year was completed the sale would probably have increased to 1,200,000 units.

Stirling.—The National Electric Wiring Company, Limited, have resolved to terminate the agreement between them and the Town Council so far as regards the supply to any additional customers, but without affecting the terms of the agreement regarding work already done. In reference to the specifications for the new plant at the generating station, Messrs. Kennedy and Jenkin state: "We have included two boilers in the specification, as we consider it advisable to put the two in at once, as they will be required to balance the engine power, as stated in our report. The only saving in delaying the matter would be the interest on the additional capital in 12 months, and the chance of obtaining the second boiler at a slightly lower price a year hence. These expenses will, we think, be more than balanced by the extra expense involved by the contractor having to send to Stirling twice to erect and fix the boiler, and also the steam pipe work having to be carried out on two separate occasions instead of all at once." Mr. Goudie has been instructed to prepare the plans for the additional building at the station. At a meeting of the Lighting Committee Mr. Hanson submitted the following report: "I have received reports from two towns in England where small-current arc lamps are in use for lighting, and although in each case the lamps are satisfactory in their working, it is found that with seven amperes the illumination between the lamps is not sufficient if the posts are more than 60 yards apart. If we may take this as being correct, and I may say that the result agrees with my experience, it will be necessary, if five or six ampere lamps be used, to either rearrange and contract the areas to be lighted, or to be content with a poor light in these districts. The arrangement of lamps proposed in my reports is with posts at an average distance apart of about 75 yards, and if these distances were maintained with five or six ampere lamps there would be dark places between the posts. There is another point in connection with these small-current lamps, and that is that for effective lighting they would have to be hung lower than the present type of lamp. This would, of course, destroy the uniformity of the system of street-lighting, and would be very objectionable in the case of the town eventually deciding to use 10-ampere lamps. As for the trial proposed by Messrs. Kennedy and Jenkin, the only useful trial is, of course, one in position on the streets, but to get this it would be necessary to obtain five pillars suitable for the small current lamps, and erect them first, leaving the remainder to be erected after the trial was completed—say, three months. This course would involve great delay and considerable expense, and is not one that I could recommend. For these reasons I should not advise the use of lamps taking less than eight amperes, which, although they would not give as great a light as the 10-ampere lamps presently used, would probably be sufficient for the districts included in this extension. In this case it would not be necessary to alter the height of the lamps, and the present type of pillar could be employed. The adoption of eight-ampere lamps would effect a saving of about £4 per lamp per annum." The committee, having considered the same, were of opinion that the recommendation of the engineer should be adopted, and that eight-ampere lamps be used. It was agreed to submit the report to Prof. Kennedy before proceeding further.

St. Annes.—During the last few weeks the electricity works have been rapidly proceeded with under the direction of the Council's electrical engineer, Mr. Tiddeman, and it is expected they will be in working order very shortly. The following details of the new works appeared in the *Blackpool Gazette*: The generating station, which is situated north of the gasworks, has been erected by Messrs. Moore Bros., and is a substantial building of red brick, with freestone facings, and contains boiler-house, engine-room, accumulator-room, testroom and workshop, store-room, and engineer's office. The boiler-house contains two multitubular boilers (by Stephenson and Co., Preston), each of 250 h.p., and working at a pressure of 140lb. per square inch. The draught is induced by special machinery (supplied by the Sturtevant Engineering Company, London), which has been placed in the building to take the place of a large chimney, which unfortunately the contractor could not build on account of the unsuitability of the land for the foundations. There is ample room for the introduction of more boilers when necessary. A steam feed pump, feed-water heater, and storage tank to hold 2,000 gallons, complete the boiler-room equipment. The engine-room (which is equipped with a gantry crane by Spencer and Co., Hollinwood, travelling the whole length of the room, and capable of dealing with a load of 10 tons) contains two high-speed compound vertical engines by Willans and Robinson, Rugby, coupled direct to and on the same bed-plate as the two dynamos (supplied by T. Parker, Wolverhampton). The latter, jointly,

Digitized by Google

have a capacity of 160 kw., or, in other words, will be capable of supplying an equivalent to 5,000 8 c.p. lamps alight at the same time. The switchboard is of black enamelled slate, and has been supplied by Crompton and Co., Chelmsford. It is suitably framed in teak, and mounted on a platform raised 2ft. above the floor of the engine-room, and railed off. On it are placed all the necessary voltmeters, ampere-meters, watt-meters, regulating switches, automatic cut-outs, fusible cut-outs, reversing switches, rheostats, feeder connections, etc. The accumulator-room contains a battery supplied by the Tudor Accumulator Company, Dukinfield, and consists of 260 cells of 300 ampere-hour capacity, arranged on single-tier stands, and fitted with all necessary cable connections and accessories. The services will be laid from the mains to the consumer's premises where required, and safety fusible cut-outs and meters fixed free of charge to the consumer (in cases where the service is of greater length than 20 yards, the Council have the option of charging a fee for such connection). Meter rents are to be charged at a rate to be decided on all meters so fixed, but the consumer, if he so wishes, can buy his own meter. The system of supply is that commonly known as the three-wire low-tension direct-current, with a pressure of 480 volts across the outer wires; consumers being supplied at a pressure of 240 volts. The mains have been laid by the British Insulated Wire Company in all the streets where it is intended to at present place the light, and 30 arc lamps of 620 watts each, along with 150 incandescent lamps of 32 c.p., are already fixed in their places. The mains are laid on the solid system in wooden troughing. It is proposed to charge consumers on the Brighton system at 7d. per unit for the first hour of burning every day, and 4d. per unit for all energy consumed afterwards. This system of charging will encourage the long-burning customer, as he gets his light at a cheaper rate. It is also proposed to charge the street lamps at a fixed rental per lamp per annum, and thus save the cost of meters for this purpose. The local contractors who have been engaged in the work are included in the following list: general contractors, Messrs. Moore Bros., St. Annes; brickwork, Mr. J. Hull, St. Annes; plumbing, Mr. B. P. Smith, St. Annes; painting, Messrs. Matthews and Ratcliffe, St. Annes; plastering, Messrs. Gillett and Sutton, St. Annes.

PROVISIONAL PATENTS, 1901.

FEBRUARY 18.

3429. Improvement in ducts of stoneware, clay, concrete, or other plastic material for carrying electric or other cables for light, power, traction, telegraphs, telephones, etc. William Garnett, The Laurels, Porchester, Hants.

3434. Improvement in electrical switches. Maunsell Mercier and William Osborne Andrews, 337, Lower Broughton-road, Manchester.

3438. An apparatus for recording the time an electric car passes a station. Christopher John Spencer, Sunbridge-chambers, Bradford.

3450. Improvements in accumulator plates. Bernard Mervyn Drake and John Marshall Gorham, 66, Victoria-street, London.

3451. Improvements in the electrolytic break. Mortimer Arthur Codd, 5, Roxborough-park, Harrow-on-the-Hill.

3468. Improvements in or appertaining to electric alarm clocks. Sönke Paulsen, 89, Princess May-road, London.

3481. Improvements in apparatus for wireless telegraphy. John Ambrose Fleming and Marconi's Wireless Telegraph Company, Limited, 24, Southampton-buildings, Chancery-lane, London.

3487. Improvements in or connected with the carrying of strikers upon motor vehicles for mechanically operating electric switches. William Kingsland, 33, Chancery lane, London.

3488. Improvements in or connected with electric ignition apparatus, particularly applicable to explosive engines. Frank Frederick Wellington, 33, Chancery-lane, London.

3491. Improvements in arc lamps. Joseph Alberto Rignon, Tito Livio Carbone, and Alfonso Moreno, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Complete specification.)

3493. Improvements in the method for obtaining electric currents from the earth. Emil Jahr, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Complete specification.)

3494. Improvements in electrical glow lamps. Arthur Couch, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Complete specification.)

FEBRUARY 19.

3549. Process of simultaneous and separate extraction of hydrogen and oxygen gases from the body water by electrolysis. Charles de Ricaris, 4, Rue Beethoven, Paris, France.

3554. Improvements in and connected with apparatus for transmitting and receiving electromagnetic waves or impulses. James Tarbotton Armstrong and Axel Orling, 40, Varbry road, Stamford-hill, London.

3556. An electrically-lit watch or clock case. Henry Vaughan Manger, 110, Hatton-garden, London. (Complete specification.)

3563. Improvements relating to electromagnetic driving mechanism. Jean Soulat, 45, Southampton-buildings, Chancery-lane, London.

3570. Improvements in telautographs and methods of telautographic transmission. Philip Arthur Newton, 6, Bream's-buildings, Chancery-lane, London. (The Gray National Telautograph Company, United States.) (Complete specification.)

3576. Improvements in electric switches. Peter Heinrich Felix Spies and Jacob Norden, 53, Chancery-lane, London. (Complete specification.)

3613. Improvements in and relating to electric percussive rock drills or the like. Albert Moore Barnes, 1, Queen Victoria street, London.

FEBRUARY 20.

3636. Improvements in devices for connecting electrical circuits to earth in case of emergency, chiefly for use with overhead wires. Edward Massey Holingsworth, Alexandra Villa, Prescot-road, St. Helens.

3660. New or improved automatic guard for electric street cars. Adolph Königslöw and Carl Pilgrim, 115, Cannon-street, London

3669. Magnetic toy. Edward Alaric Falconer, 151, Adelaide-road, Hampstead, London.

3679. Improvements in electric switches. Frederick Hagger Headley, 322, High Holborn, London.

3686. Improvements in electrical switches. William Henry Fullarton Murdoch, 53, Chancery-lane, London.

3699. Improvements in trolley heads for use in connection with overhead systems of electrical traction. John Alexander Orme, 46, Lincoln's-inn-fields, London.

3710. Improvements in or connected with the regulation and starting of single-phase and polyphase alternate-current motors with magnetic rotating fields. Paul Jacques Mathurin Girault, 47, Lincoln's-inn-fields, London.

FEBRUARY 21.

3713. An improvement in electrolytic brakes. Edmund Henry Howlett, 4, Wright-street, Hull.

3744. Improvements in means for protecting or guarding overhead electric trolley or like electric wires. Edwin Quarmby and Ernest Albert North, Market-place, Huddersfield.

3753. Improvements in connections for electric conductors. Joseph Devonport Finney Andrews, 75, Fulham Park-gardens, Fulham, London.

3763. Improvements relating to Rontgen tubes. Carl Heinrich Florenz Müller, 45, Southampton-buildings, Chancery-lane, London.

3793. A new and improved compound or material for insulating electrical wires. Hartwell William Webb, 11, Queen Victoria-street, London.

3794. A new and improved die or mandrel and mounting therefor for facilitating the uniform coating of electrical wires with insulating material in a viscid state. Hartwell William Webb, 11, Queen Victoria-street, London.

FEBRUARY 22.

3796. Improvements in surface-contact electric traction systems. William Aitken, Pine Glen, Muswell-avenue, Muswell Hill, London.

3797. Improvements in or connected with the welding or uniting of aluminium surfaces. Sherard Cowper-Coles, Grosvenor-mansions, Victoria-street, Westminster, London.

3799. An improved method and apparatus for the prevention of accidents from trolley wires. Robert Cornelius Quin, Ambleside, Palatine road, Blackpool.

3803. Improvements in electrically-illuminated letters for signboards. George Smith and Herbert Hampton Hall, 57, Barton-arcade, Manchester.

3823. Improvements in and connected with conduits for electric wires and cables. Richard Ames, 82 Mark-lane, London.

3832. Improved steadying resistance for Nernst lamps. Charles Cornfield Garrard and the Nernst Electric Light, Limited, 82, Victoria street, London.

3833. Improvements in Nernst lamps. Bernard Mervyn Drake, Charles Cornfield Garrard, Eustace Graham Sheppard, Maurice Solomon, and the Nernst Electric Light, Limited, 82, Victoria-street, London.

3834. Improved means for starting electromotors with rotating fields. Paul Jacques Mathurin Girault, 47, Lincoln's-inn fields, London.

3860. Improvements in electromagnets. Eustace Graham Sheppard, Maurice Solomon, and Nernst Electric Light, Limited, 82, Victoria-street, London.

FEBRUARY 23.

3881. Improvements relating to overhead conductor electrical traction systems. Charles Frederick Elliott, 10, St. George's-crescent, Liverpool.

Digitized by Google

3929. Improvements in or relating to electric lamps. Ernst Andreas, 111, Hatton-garden, London.

3930. Improvement in the art of telephony. Orazio Lugo and John Arthur Barratt, 1, Temple gardens, London.

3933. Improvements in and relating to means for heating the ironing roller or rollers of ironing machines by electricity. Frederick Hagger Headley and Charles Hart, 322, High Holborn, London.

3935. Improvements in or in connection with the laying of underground conductors for distribution of electrical energy. Frank Jones, 6, Lord-street, Liverpool.

COMPLETE SPECIFICATIONS ACCEPTED.

To be published on March 16.

1900.

1133. Incandescent electric lamps. Boult. (Sauvalle.)

3390. Typewriting, typesetting, or analogous machines and telegraphic apparatus. Dundas and Kershaw.

3588. Device for finding the electric poles. De Mare.

3917. Electricity meters. Lorwa.

4803. Electric incandescent lamps. Fessenden. (Date applied for under International Convention, Aug. 25, 1899.)

5137. Incandescent electric lamps. Gale.

5187. Automatic telephone call recorder. Lamkin.

5191. Electric heating systems for cars. Westinghouse Brake Company, Limited. (Newell.)

5650. Method and apparatus for determining the size and position of bodies by means of Rontgen rays. Thompson. (Voltohm Electrical Company.)

7070. Telephones. Kneale and Hartley.

7272. Carbon electrodes. Baker.

7285. Electric railways operated on the conduit system. Parsons, Belfield, and Chapman.

7737. Arc lamps. Tribelhorn.

11560. Electric incandescent lamps. Wurts and Hanks.

13751. Automatic device for the safe operation of electric conductors, with or without guard wires. Sintas y Orfilo and Schultz.

14893. Electrical measuring instruments. Atkinson.

15951. Automatic switch for groups of transformers with members of various capacity. Schlatter.

17757. Electrode plates. Thompson. (Akkumulatoren und Elektricitäts-Werke Aktiengesellschaft vorm. W. A. Boese und Co.)

22926. Electric wave telegraphs. Boult. (American Wireless Telegraph Company.)

22698. Process of extracting and reducing metals by electrolysis. Frasch.

1901.

1471. Electric arc lamps. Bogia.

1485. Electrical measuring instruments. Ball.

Supplement to "The Electrical Engineer,"

MARCH 1, 1901.

LOWESTOFT ELECTRICITY WORKS.

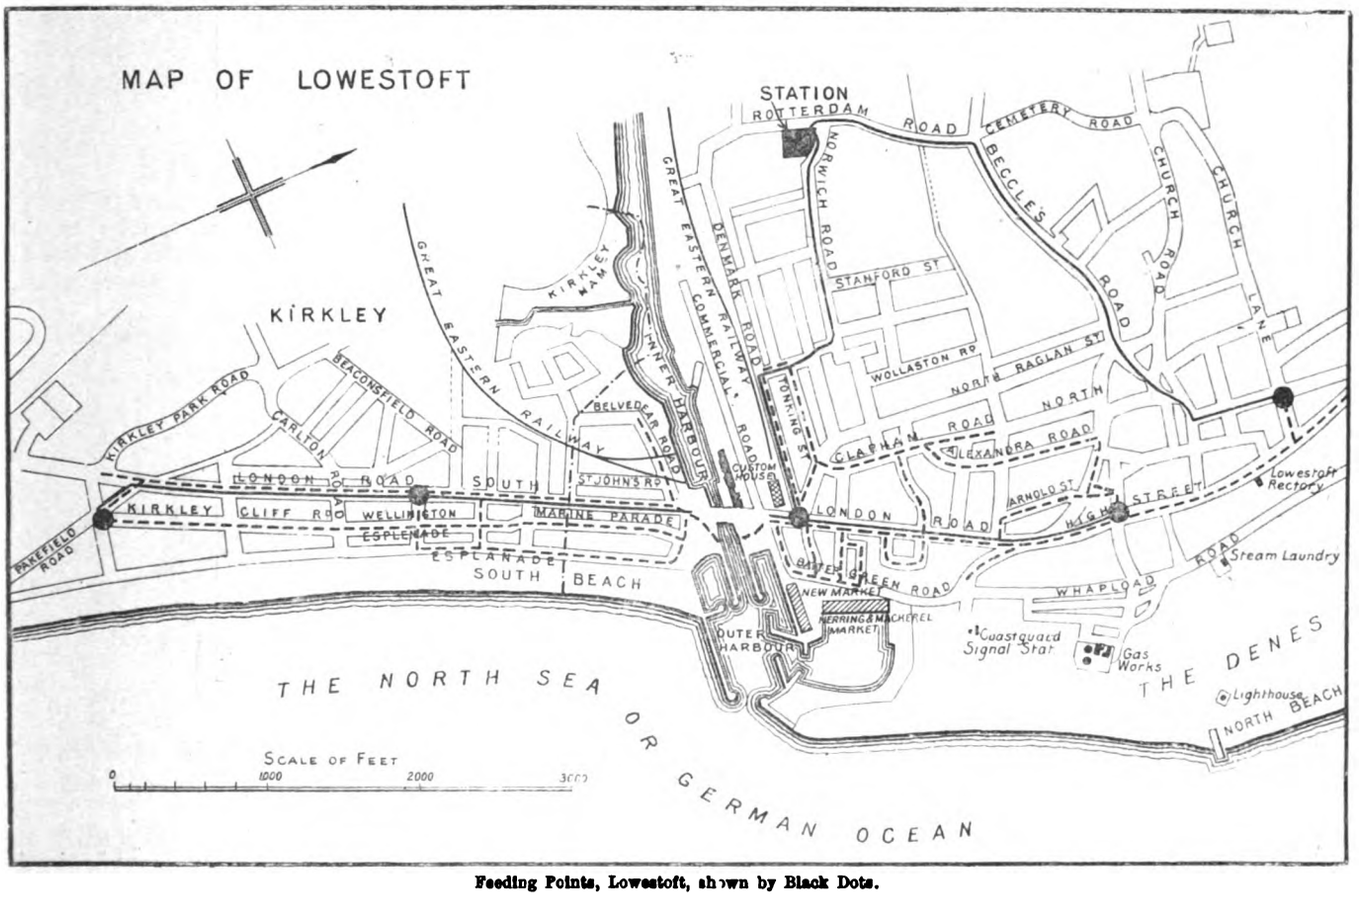
Mr. W. C. C. Hawtayne, M.I.E.E., is Dominion born, having as his birthplace Quebec. He was educated at Dover College, and subsequently at the School of Electrical Engineering and Finsbury Technical College. His professional life commenced with the United Telephone Company, he afterwards becoming district engineer to the Northern District Telephone Company. Subsequently he joined the staff of the London Electric Supply Corporation, and then went to Messrs. Crompton and Co. at Chelmsford. In 1890 he joined the Brush Company, and after varied experience commenced consulting practice in 1892. At the present time Mr. Hawtayne has a number of schemes in hand, though some, like that of Lowestoft, are almost or quite complete.

MR. W. C. C HAWTAYNE,
CONSULTING ENGINEER, LOWESTOFT.

ALDERMAN J. BECKETT,
MAYOR OF LOWESTOFT.

COUNCILLOR FRY,
CHAIRMAN ELECTRIC LIGHTING COMMITTEE.

Mr. G. A. Bruce, A.M.I.E.E., served an apprenticeship of 4½ years at electrical and mechanical engineering. His first appointment was at Newcastle, at the Elswick Works of Sir W. G. Armstrong, Whitworth, and Co., Limited. He was then employed in the ordnance department and in the manufacturing department in the construction of alternators, direct-current



Feeding Points, Lowestoft, shown by Black Dots.

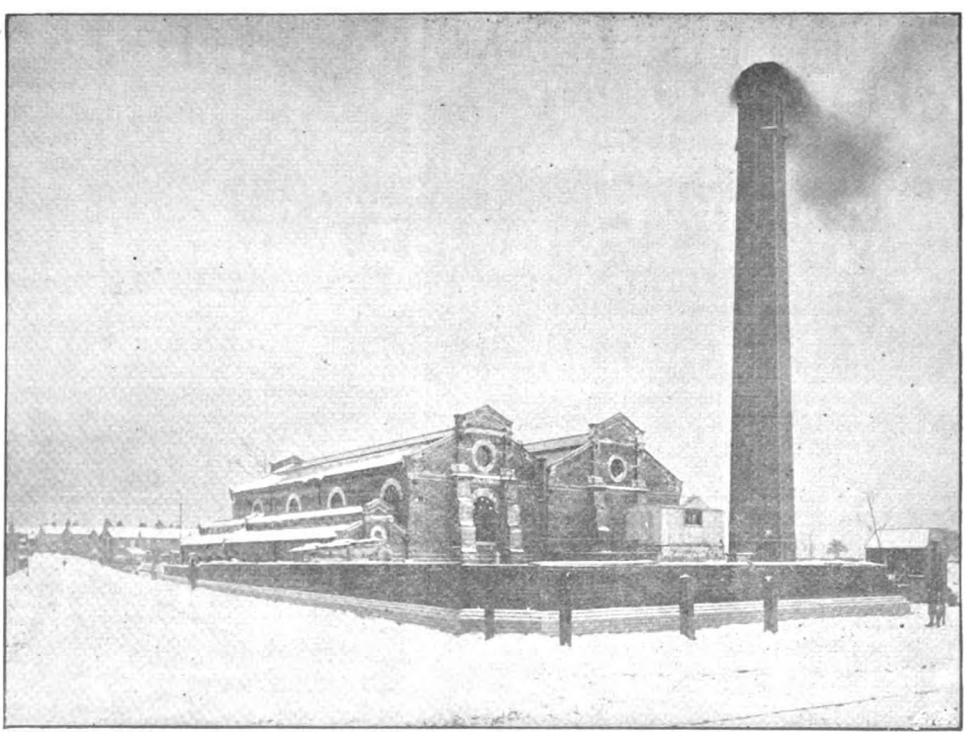
Digitized by Google

machines, and motors. From this position he was subsequently transferred to take charge of the ship-lighting and power at both the Elswick and Walker shipyards. On leaving this company he took up a more responsible position as electrical engineer to Messrs. Harfield and Co., Limited, of London and Blaydon, and subsequently left them to become assistant engineer to Mr. Hawtayne, and while with Mr. Hawtayne was closely connected with the work at Lowestoft. From this connection he was deemed a most

MR. G. A. BRUCE, ELECTRICAL ENGINEER, LOWESTOFT.

suitable man to be given charge of these works, and thus became the electrical engineer to the Corporation.

Is there a good history of Lowestoft? was the question put to a member of the Council by a stranger while dining together at "The Royal"—common guests to a genial host. The reply was, "Gellingwater's; new edition." This interesting little volume is now before us, but while it is great in interest, it fails just where most local histories fail, in that it does not trace the development of the "work" of the governing body, and it has no index. However, we gather from it that the charter of incorporation was officially received in September, 1885, that the sewerage of the town has been brought up to date, that street improvements have been made, and that the water and gas are in the hands of companies. Probably the latter fact, together with the attempts made by electrical companies to obtain possession of Lowestoft, spurred on the Council to take up the question of electric lighting themselves, to obtain an order, and inaugurate the works formally opened last week. Maps two or three centuries old spell the name of the town Lestoff or Lestoffe, and while Gellingwater calls the peninsula upon which the town stands Lothingland, Camden tells us that 300 years ago some called it Lovingland, and some more truly Luthingland. Of the town this author tells nothing, except in these words: "A little town hangs (as it were) over the sea."



Lowestoft Central Station.

BUILDINGS.

The site chosen for the central station is perhaps very suitable as regards position, but the subsoil is not good for foundations to carry heavy weights or moving machinery without artificial assistance. The situation is adjacent to the Norwich-road, upon what is known as Smith's Marsh. Some experience had been obtained as regards the foundations from the building of the refuse destructor, the chimney shaft of which also serves as the shaft of the electricity works. Singular to say, a firm foundation was found for the shaft, while that of the works about to be described was of another character.

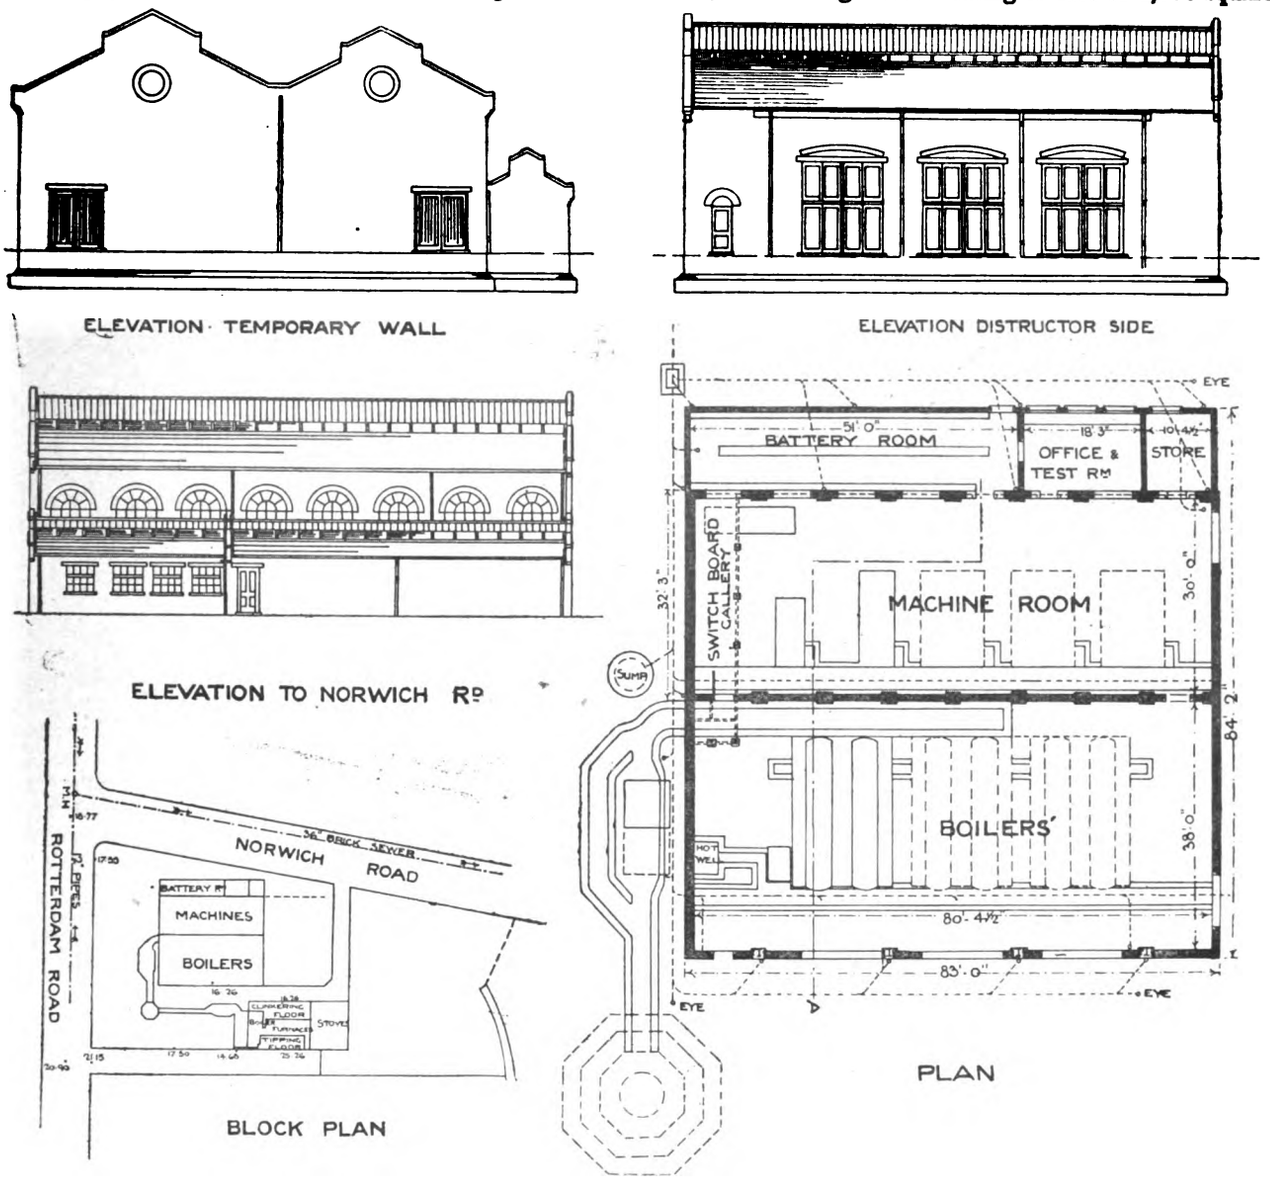
The buildings were designed by Mr. A. E. Pridmore (London) and erected by Messrs. Hawes and Co. (Norwich). They consist of an engine-house 80ft. by 30ft., a boiler-house the same length, but 8ft. wider, an accumulator-room, offices, workshops, stores, and lavatories. The accompanying plan will show the arrangement adopted, and the photograph will give some idea of the station. It is built of red brick with stone facings. The ground below the engine-house was excavated to a depth of 4ft. and the whole concreted, the concrete being tied together with iron rails, and on this the machinery is erected. Three lines of 1½in. bolts have been embedded in this concrete raft foundation, to which girders can be fixed for mounting additional machinery. The boiler-house is also provided with a concrete foundation over its whole extent. The engine-house is built in bays with brick piers supporting a gantry which carries a travelling crane.

Crane.—The crane is by Carrick and Ritchie, of Edinburgh, is one of their standard eight-ton type, and constructed to carry a safe test load of 13 tons. The main carriage consists of two steel beams, fitted into cast-iron end carriages of a box section. These carriages are mounted on double-flanged rail wheels, fitted to steel axles running in double bearings. Travelling gear is fitted to both ends of the crane, so that it shall run parallel along the rails. The crab has single and double purchase lifting gear, having a special quick lift for loads up to three tons.

Digitized by Google

The load is lifted by a steel-wire rope, and return block, and swivel hook, and the hook runs in ball bearings. Traversing gear is fitted to the crab of such power that two men can move it with the full load. All the motions are worked from the ground. All the shafts run in bearings fitted with covers, a very desirable object, so that any shaft can be taken out for examination or repair without taking the crab to pieces, as in cheaper designs. The span of the crane is 28ft. 7in.

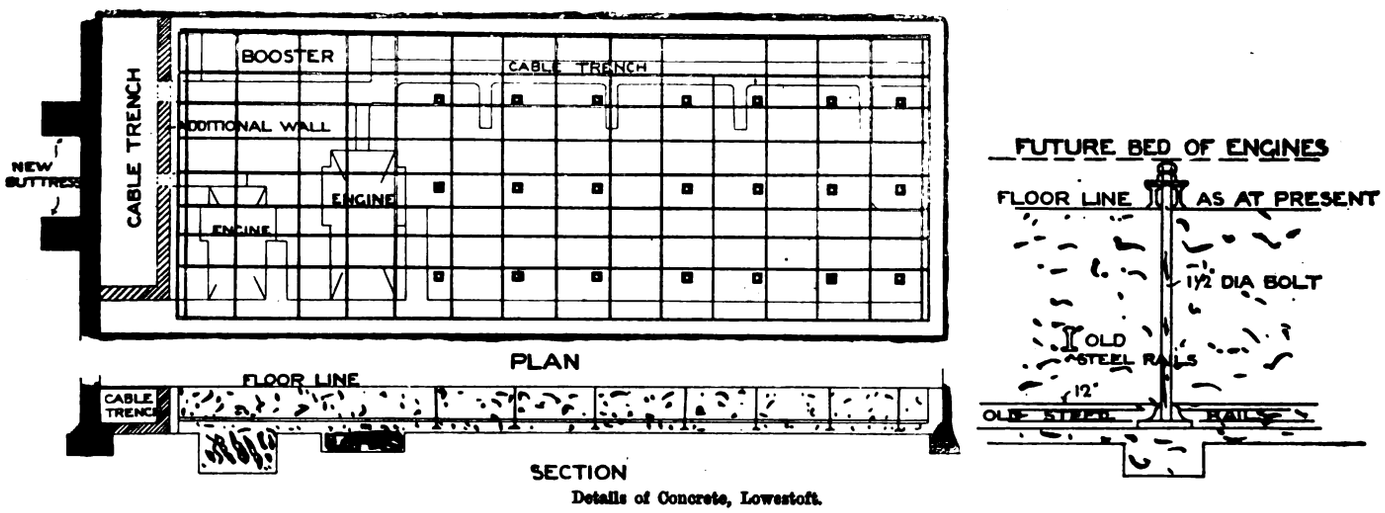
Shaft.—The chimney shaft is of red brick, 120ft. high, and 8ft. internal diameter at the top, lined throughout with firebrick.



Details of Central Station, Lowestoft.

Boilers, Economiser, etc.

Boilers.—This plant consists of four Babcock-Wilcox boilers, each having a total heating surface of 1,790 square feet, set in two batteries of two boilers each—one set being installed, the other being on order. Each boiler is composed of eight sections of tubes, each section 10 tubes high; the bottom row of tubes so arranged as to form a double-combustion chamber, constituting what is called the "Scotch furnace," for burning bituminous fuel. The tubes are 4in. diameter and 18ft. long, and there is one steam and water drum on each boiler 42in. in diameter and 23ft. 7in. long. The boilers are constructed for a

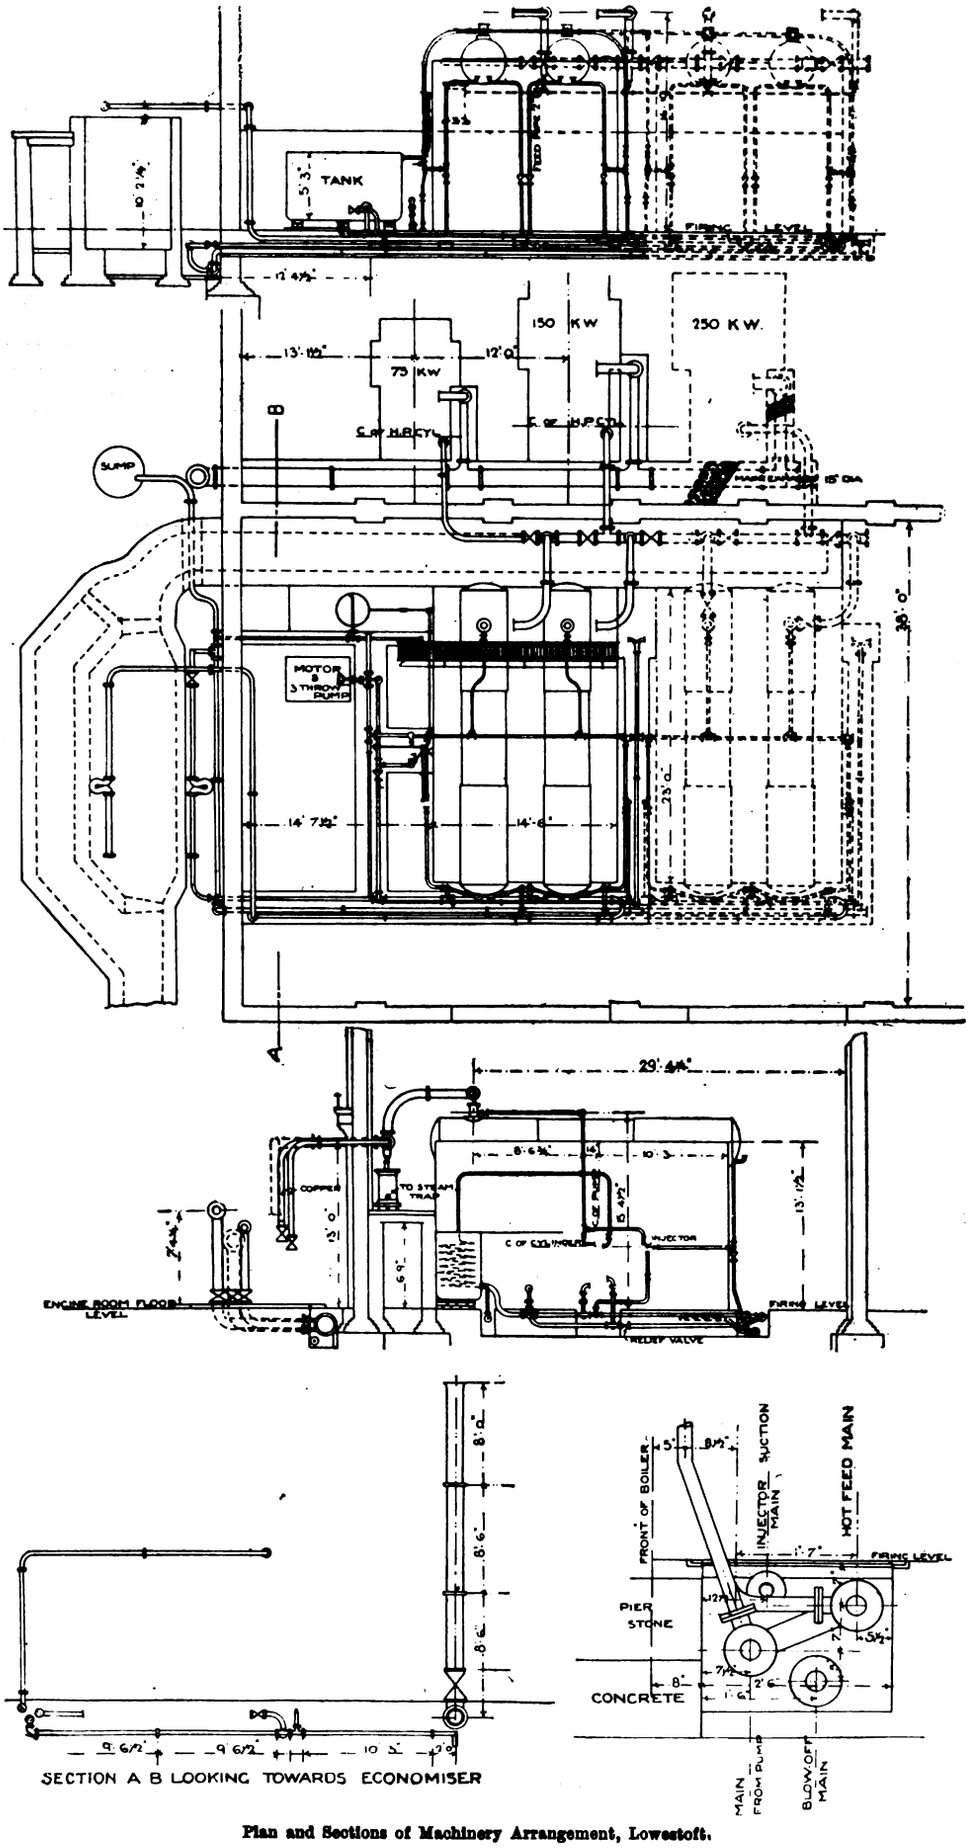


Details of Concrete, Lowestoft.

Digitized by Google

daily working pressure of 200lb. per square inch. The two boilers now being erected are fitted with steam superheaters. The fittings are of Messrs. Hopkinsons' make. There are two feed pumps, each capable of supplying 1,500 gallons of water per hour—one being driven by steam, the other by a motor, which latter can be worked from accumulators if necessary.

Economiser, etc.—A Green's high-pressure economiser is placed in the main flue leading to the chimney containing 96 tubes, representing nearly 1,000 square feet of heating surface.



Plan and Sections of Machinery Arrangement, Lowestoft.

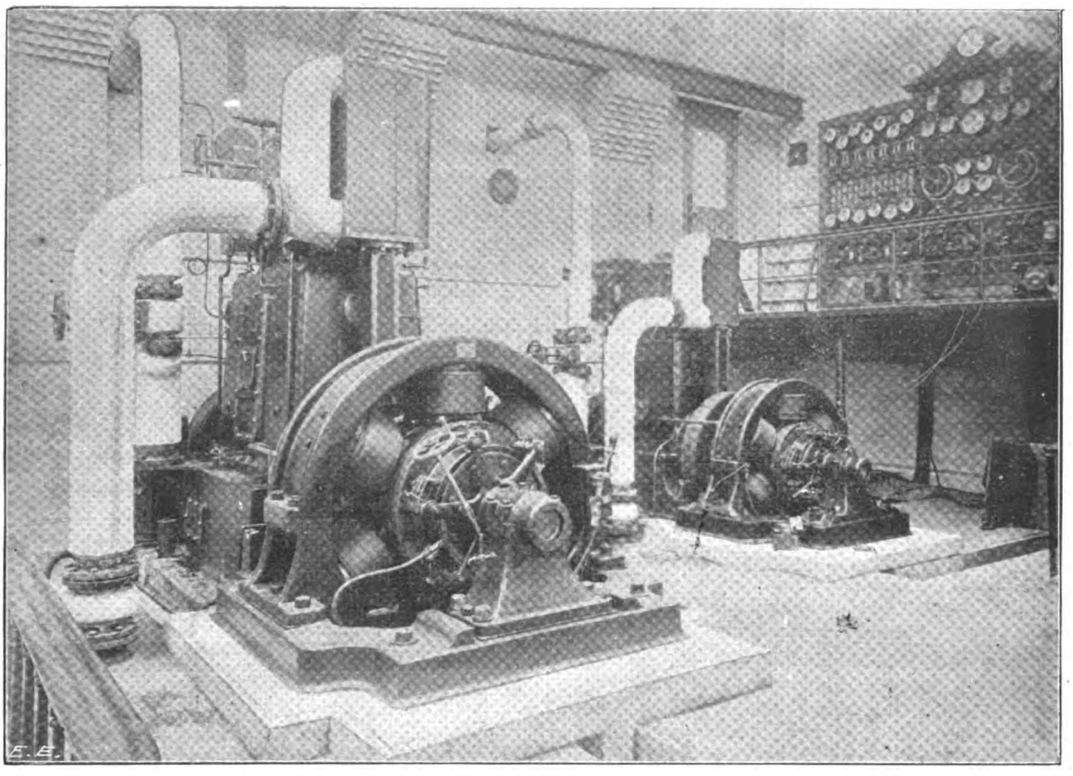
A feed tank of 1,000 gallons capacity is provided, also a tank for a reserve of water having a capacity of 7,000 gallons.

Digitized by Google

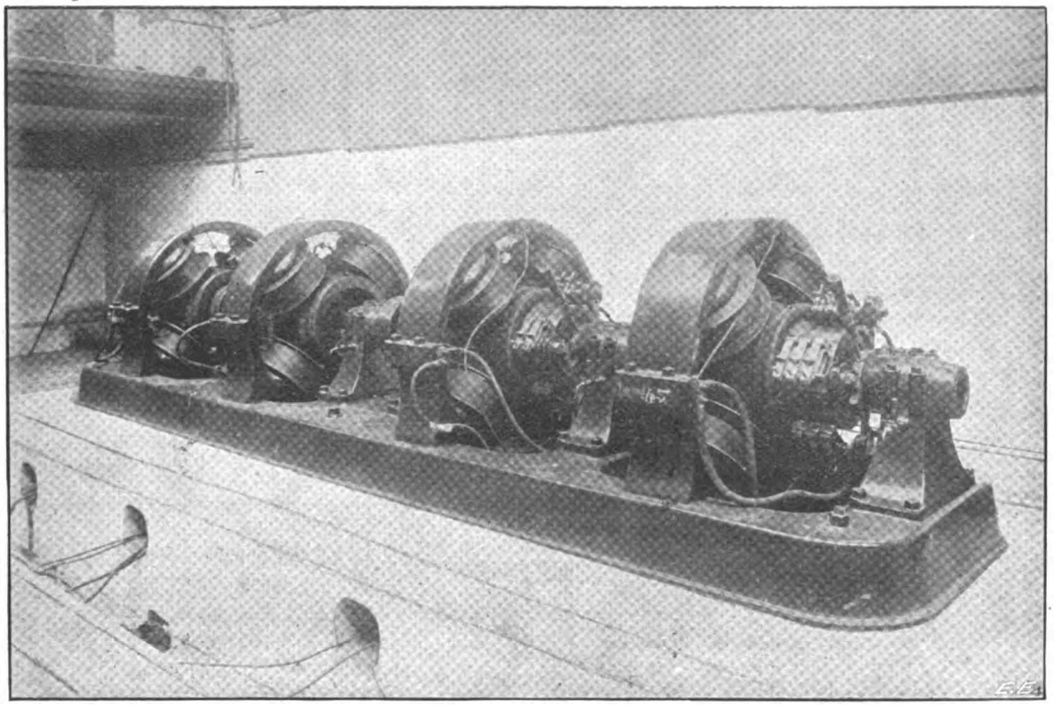
ENGINES.

The engines are of the Musgrave enclosed type, with cylinders arranged side by side, provided with large oil-tight doors, specially designed to afford easy access to all the internal parts. The cylinders are mounted on the top of the standard, and are fitted with the firm's improved piston valves, the high-pressure valve being controlled by an automatic governor. The high and low pressure cylinders are made in one casting with receiver cast on in the form of a belt. Separate liners are forced into the cylinder barrels and valve chambers. Separate eccentrics are used for working the valves so that each valve can be adjusted by its own eccentric. The crankshaft and cranks are of Siemens steel forged in one piece, the cranks being placed at right angles and balanced. The crankshaft is prepared at one end for coupling direct to the dynamo shaft.

The crankshaft pedestals are cast with the foundation plate and fitted with bell metal steps lined with white anti-friction metal. Special care has been exercised in designing the lubrication arrangement of the engine, as this is a very important point in the satisfactory working of quick-speed engines. The system the firm have adopted is on the forced lubrication principle, and all the working parts are lubricated by this system without moving joints. The engines are fitted with all the usual fittings. The engine for driving the 75-kw. generator has cylinders 10in. and 16in. diameter, with 9in. stroke, and runs at 400 revolutions per minute; while the engine for driving the larger—150-kw.—generator has cylinders 14·5in. and



Combined Sets, Lowestoft.



Booster Sets, Lowestoft.

Digitized by Google

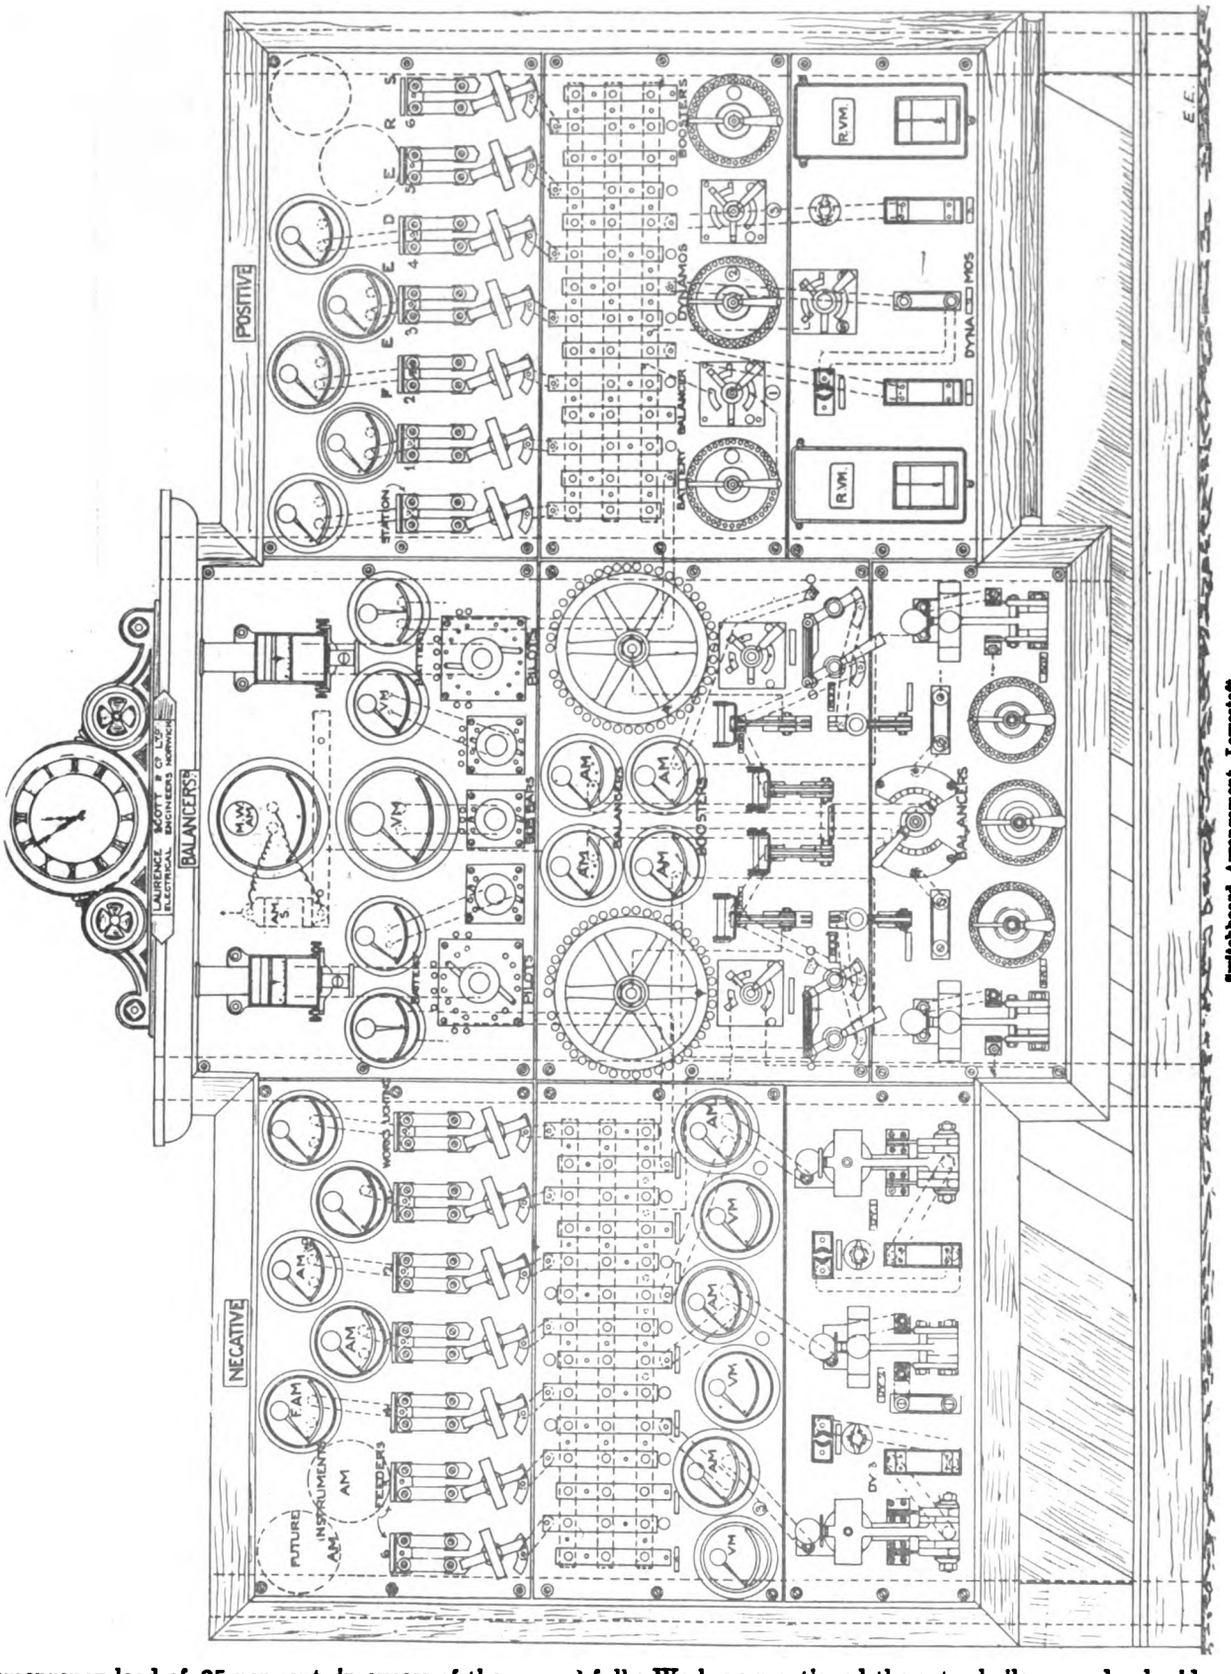
23in., with 11in. stroke, and runs at 330 revolutions per minute.

Dynamos.

The dynamos are of the British Thomson-Houston Company's make. One of the dynamos is capable of developing 150 kw. at 330 revolutions per minute, and the other 75 kw. at 400 revolutions. Each set is also capable of giving an emergency load of 25 per cent. in excess of the normal full load for one hour without injury. This is a consideration, for the peak of the load of an electric lighting station is of short duration, and may be often treated almost in the light of an emergency load, so that these machines can really do more than would appear possible at first sight. Owing to the probability of the early introduction of electric tramways into the borough, the dynamos have been designed for either traction or lighting purposes.

Extensions

In consequence of the manner in which the light has been taken up, the outlook is very favourable, and, as is so often the case, extensions of the first tentative estimate had to be arranged before the completion of the first instalment. We have mentioned the extra boiler on order, besides which Messrs. Browett, Lindley, and Co. have on order an enclosed high-speed self-lubricating two-crank vertical engine, having cylinders 16in. and 26in., with 11in. stroke, to run at 350 revolutions, driving a 250-kw. dynamo. The dynamo is of the multipolar type, by the Lancashire Dynamo and Motor Company.



Switchboard Arrangement, Lowestoft.

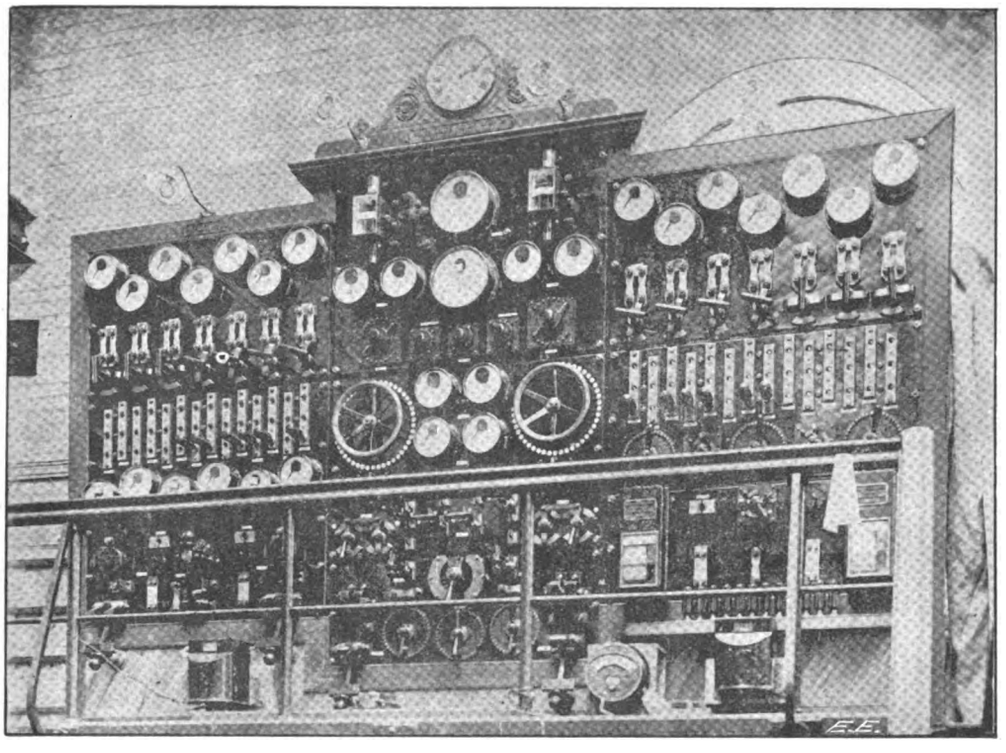
Digitized by Google

ACCUMULATORS.

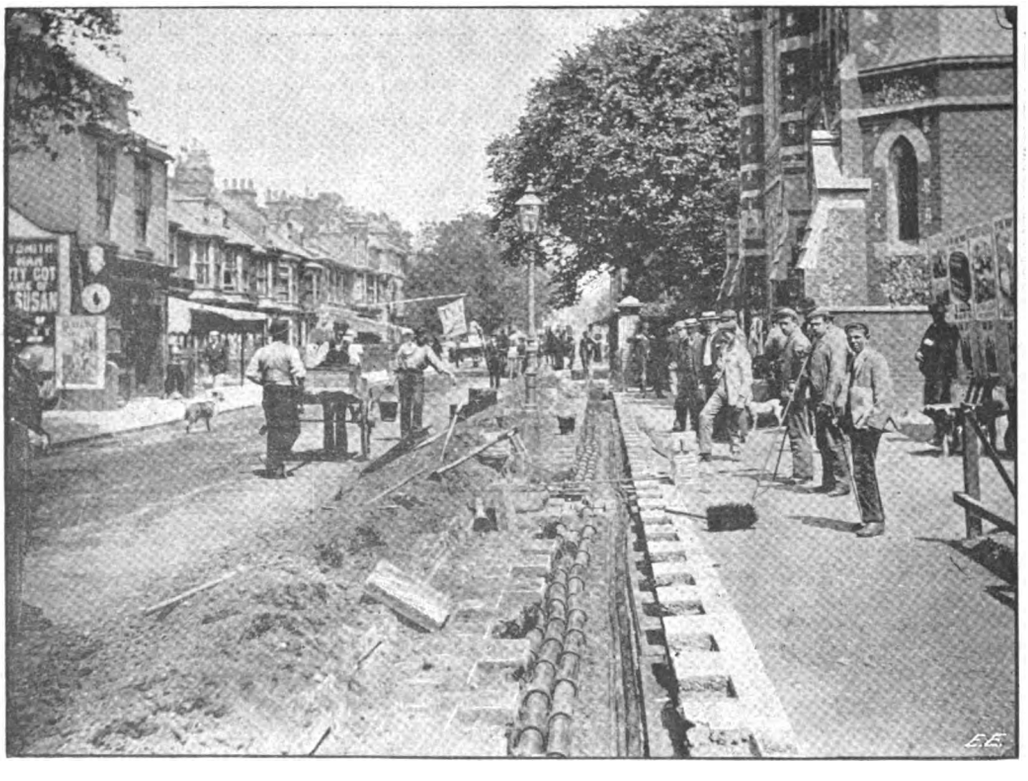
Two batteries, manufactured by the Chloride Electrical Storage Company, are installed, each consisting of 135 cells, 45 of which are regulators. The normal discharge rate is 100 amperes for four hours, and in case of emergency the cells can be discharged at the rate of 270 amperes for one hour. The containing boxes are of glass, each containing 12 positive plates and 13 negative plates, which are suspended in the boxes on glass hangers. The cells are supported on the usual pitch-pine trays and glass oil insulators, and are arranged in three tiers. The stands consist of pitch-pine bearers mounted on cast-iron frames.

SWITCHBOARD.

The switchboard is of the usual type for low-tension work, and is constructed of enamelled slate, supported on an iron frame, with a moulding round the sides, which is the only woodwork. The dynamos, feeders, boosters, and batteries can all be connected by a plug board having three 'bus bars at the back. The centre panel of the board is that connected with the middle wire of feeders. The centre panel contains the cell-regulating switches, also the throw-over switch, by means of which the cells, after being plugged on, are thrown on to the 'bus bars direct. Two throw-over switches are provided for the boosters No. 1 and No. 2, the fields of the same being excited off the 'bus bars. There is also the double-pole starting switch for the balancers and the field rheostats of the latter and of the booster on this panel. The



Switchboard, Lowestoft



Street Work, Lowestoft.

Digitized by Google

board allows of six feeders being connected, four of which are in use, also the station circuit. Instruments and cut-outs are also provided for three machines, two only being in use at present. Arrangements have also been made that any one feeder can be boosted up separately. The switchboard was manufactured by Messrs. Laurence and Scott, of Norwich.

Street Work, Lowestoft.

MAINS, FEEDERS, DISTRIBUTORS, ETC.

The whole of the mains cable was supplied and laid by Messrs. Callender. The feeders consist of four armoured cables laid direct in ground, and run to the following feeding points: No. 1 feeder, ·3, ·3, and ·3 square inch triple-concentric to London-road North; No. 2 feeder, ·4 square inch concentric to High-street; No. 3 feeder, ·25, ·25, and ·25 square inch triple-concentric to Royal Plain on Southside; No. 4 feeder, ·25 square inch concentric to London-road South. With each feeder is laid a three-core $^{7}/_{20}$ armoured pilot cable to indicate the voltage of each feeding point at the station. The distributors consist of three single-conductor cables of vulcanised bitumen insulation, laid in wooden troughs, and filled up with refined bitumen. The size

Street Work, Lowestoft.

cable used is ·125, ·062, ·125, but a few of the extensions are ·062, ·035, ·062.

NOTES.

The Yukon Telegraphs.—It is reported that the two parties engaged on the building of the Yukon telegraph line from Quesnelle, B.C., to Telegraph Creek have failed to make connections. The line was being built from the northern and southern ends simultanously, and it is asserted that the work of construction has overlapped and the two ends are in different valleys with two ranges of mountains between. It is thought that one of the sections will have to be abandoned.

An English Precedent.—One outcome of the visit of the American Institute of Electrical Engineers to this country last year is that the council of that institute have now decided to follow the English institution's example in holding a conversazione. We understand that if this should prove a success it is likely to become an annual affair. This first conversazione is to be held in April, and while it will be largely social in character, a special feature is being made of electrical apparatus and inventions, which will be accompanied by extensive experiments. A large number of prominent men in the States have already promised the loan of apparatus, and as Mr. W. J. Hammer has that part of the programme in hand its success is assured.

Electricity.—A lecture on this all-important subject was delivered before the Harrogate Naturalist Society at the end of last month. We do not give the lecturer's name, because one cannot be sure how far the local reporter is responsible for the details of the lecture before us. For instance, a statement that "a novel feature of the evening was the brilliant light of the carbon arc lamp" is hardly one we should expect at the present day, even if the lecturer did supply his audience with a full description of the mechanism and principle on which such lamps work. When, however, the reporter goes on to state that "the working of electric belts" was demonstrated, we begin to wonder whether the lecturer was altogether free from blame. Perhaps he explained to his audience the way in which the public had been worked by unscrupulous adventurers who have used electric belts as gold extractors.

Electric Fire-Engines.—With the introduction of electric traction in our large towns, we see no reason why more use should not be made of electrically-driven pumps for extinguishing fires. The steam fire-engines are limited in power, whereas an electrically-driven pump, taking its supply from the tramway wires, could be made to give any desired output. It could also be got to any point on the main routes of a town remarkably quickly when once an arrangement for hastening the ordinary traffic on the lines has been made. We notice that in one town in America a modification of the above proposal has been carried out. In this case a platform on the tramway lines is used to convey a steam-driven fire-engine up to a point near the outbreak. The firemen in charge of the engine thus have a basis of supply, as the platform, besides containing the engine, would have a large amount of the stores which are usually forwarded to a fire in auxiliary fire-cars.

"The Electrical Bulletin."—Messrs. Mather and Platt, Limited, have just brought out the first number of an eight-page periodical, entitled the *Electrical Bulletin*. As pointed out in the introductory remarks, the *Bulletin* will serve to set forth some of the examples of electrical work selected from the practice carried on from the Salford Ironworks. Further, it is intended to describe and illustrate new applications of electricity, and with the object of showing the development of new features, examples of public supply plants will be given from time to time. In the number before us we notice that reference is made to the development of electric generators for public supply works. An illustrated description of the large multipolar continuous-current dynamos which are being constructed for the Salford Corporation occupies the first pages of the *Bulletin*, which also contains a description of an electrically-driven pump. An article on a new form of electrical conveyor completes the interesting issue.

Head-Lights.—We gather that a serious accident recently occurred on an interurban line in America owing to the fact that the head and tail lights on the electric cars were supplied from the ordinary circuits. In this instance the current to the line was interrupted, and the cars were coasting down an incline in order to get as far on their journey as they could in spite of the interruption in the power supply. The first car had got down the incline, and was waiting at the bottom, when the second car ran into it in the dark. A considerable number of passengers were injured in consequence of the collision. It must be remembered that these interurban lines in the States are run more like railways than tramways, and at considerable speed. It therefore becomes most important that an independent system of light for the lamps fixed in front and rear of the car should be adopted. In the case of tramways in British towns, where the speeds are moderate and the streets are lighted, the need for such an independent system of signalling lamps is not so important.

Insulators.—We notice in the *Scientific American* a new insulator which has been devised by Mr. H. W. Woolbert, of Pittsburg, Pa., with the idea of rendering the insulator more durable. In the ordinary earthenware and porcelain insulator a sharp blow will cause the insulating material to fly to pieces, and then the wire falls down on to the cross-arm. Mr. Woolbert, in order to avoid this, has introduced a glass insulator in which wire is embedded much after the same way as sheet glass is often strengthened by the insertion of an iron wire netting. The forms of the insulators are not quite the same as those usually employed, as the glass is moulded to form recesses which support the wire without any binding. The claim of the inventor is that when the glass is broken the iron wire insertion still keeps the parts together, and prevents the wire from dropping on to the ground or on to the cross-arm. The insulation would without doubt be less than when the insulator was unbroken, but it would be considerably more than what would be the case if the wire were to fall.

Aluminium Cables.—The jointing of aluminium cables continues to be a somewhat vexed question, and although a number of solutions have been devised which are said to enable a good joint to be made between lengths of such cable, there is little evidence as to the durability of the joints so made. It will be remembered that at the Institution of Electrical Engineers, a short while ago, one speaker pointed out that any soldering on to aluminium had up to the present been defective, owing to the alloy which was formed at the surface of the aluminium, and which was unstable. The most recent suggestion we have seen on this question is that by Mr. W. C. Heraeus, of Hanau-on-the-Main. This gentleman, who has had considerable experience in working with aluminium, suggests that the wire should be welded together, and he claims to have succeeded in obtaining good joints by such a welding process as before has only been used in the case of iron. Apart from this solution, most of the joints between aluminium conductors which are employed at the present day rely for their mechanical strength on the twisting of the wires. A solder is only employed in filling up the interstices of the joint, and is not relied upon to give any mechanical strength.

Digitized by Google

Conduit Tramways.—An ordinary meeting of the Institution of Mechanical Engineers will be held on Friday evening, the 15th inst., when a paper of more than ordinary interest will be read and discussion invited. "Combined Trolley and Conduit Tramway Systems" is the title, and Mr. A. M. Connett the author of the paper, which deals with a subject of particular interest to electrical engineers just now when the overhead system of electric traction is being so generally criticised. From the syllabus of the paper it appears that reference is made to three methods of "mixed" electric traction—trolley and accumulators, trolley and surface contact, and trolley and open-slot conduit. The general type of conduit, side-slot and centre-slot construction, troubles caused by slot switches and side-slot construction, the mechanical and electrical details to be considered in the construction of a conduit, are among the interesting points dealt with. The author then goes on to give information as to the durability and mode of fastening insulators, the precautions to be taken against switch accidents, etc. Devices for raising, lowering, and allowing lateral movement of the plough are described, and the author concludes by giving estimates of the cost of these conduits. An instructive discussion is expected.

Electric Train-Lighting.—The Great Central Railway Company has recently had one of its dining cars equipped with electric light on a system which Messrs. Vickers, Sons, and Maxim are introducing into this country. The equipment consists of a small dynamo which is driven from the car axle, and also a battery of accumulators which are charged by the dynamo when the speed of the train is more than about 15 miles per hour. The chief interest centres round the means by which the voltage on the dynamo is kept constant in spite of variations of speed, as there are no means provided for keeping the speed of the dynamo constant. The regulation of voltage is effected by means of resistance in the field circuit of the dynamo, and this resistance is varied by means of a small motor actuated by a relay. One of the earliest forms of train-lighting in this country was arranged on the same principle, but has not survived the test of time. With the improvement, however, in the design of dynamos, the objection which formerly existed to running machines with their full current output and a weak field has to a certain extent been done away with. In the case in question, also, the accumulators render the dynamo more stable when working under these somewhat trying conditions. Sixteen accumulators are used in each coach, and a sufficient number of incandescent lamps is provided in the cars to give a most brilliant effect. We also gather that the apparatus required for a single coach weighs complete about 1,000lb.

Graphite-Carbon Resistances.—In an illustrated article contributed to the *Elektrotechnische Zeitschrift*, Mr. F. R. Dietze describes in detail the construction of a type of starting switch which since its introduction by a German firm some two years ago has been largely adopted with satisfactory results. A mixture of graphite and carbon is used in this switch as a resistance, whereby exceedingly fine graduation is obtained, in virtue of which the apparatus is claimed to be especially suitable for elevator and crane installations, where the motors must necessarily be started up on load and frequently switched in and out of circuit. It is well known that the gradual and uniform withdrawal of resistance from the motor circuit obtained with a very finely graduated controller tends to minimise the sparking and wear at the commutator. The ingenious manner of employing graphite in the form of a powder as a variable resistance is fully described. It may be mentioned that the switch contact passes through the powdered graphite. The variation, it is claimed, is effected as gradually and uniformly as with a liquid resistance; while the material is not liable, as in the case of a liquid, to either evaporation or decomposition. By adding a larger or smaller proportion of carbon with the graphite, the same apparatus may be adapted to any working pressure between 65 and 600 volts. The author suggests, in conclusion, that in virtue of its incombustibility and other desirable qualities as a variable resistance, graphite admixed with carbon may find further useful applications for switch gears.

Speed Regulation.—A good many inventors working on the question of the regulation of speed of electric motors have tried to reach the desired result by altering the position of the field magnets with respect to the armature. This method of weakening the field in order to increase the speed is, however, mechanically cumbersome, and does not compare favourably in consequence with the ordinary method of inserting resistances in the shunt circuit. We notice that Mr. F. A. Johnson, of Binghamton, New York, has again attempted the problem of moving the field. In his case, however, the arrangements are somewhat novel to any we have seen before. In the illustrations now before us, which appear in the *Electrical Review* of New York, he shows a two-pole enclosed type of motor, in which the upper pole alone is wound with exciting coils. The core of this pole is made hollow except just at the end where it embraces the armature. In the cylindrical space inside the pole a core of wrought iron is placed, and the position of this internal core is altered by means of a hand-wheel acting as a nut on a vertical screw. The inventor claims that by means of the hollow shell, the strength of the magnetic flux at the pole-tips is kept the same even when the internal core is drawn right back. This would hardly seem to be rigidly accurate, but it would apply much more than in the case when the whole magnet is withdrawn. The extra cost of making the hollow magnet of the mechanical gear for drawing back the internal core would seem to us to debar the machine from commercial use. It must be remembered, in connection with such machines, that the percentage change of speed obtained by withdrawing the pole does not exceed that which can be got by inserting resistances in the field-magnet circuit.

The Institution Discussions.—The discussions at the Institution of Electrical Engineers are being much improved by the efforts of the President to restrict each speaker to 10 minutes. We quite agree with him in his remarks last week to the effect that any speaker who prepares his remarks beforehand can easily give his arguments and conclusions within that time. One point, however, in which there is room for improvement is in the selection of speakers. On every occasion this session there has been a superabundance of members who have wished to take part in the discussion, and, in consequence, only those who have sent in their names and are called upon by the President get an opportunity of expressing their views before the meeting. As is remarked at the conclusion of each debate, others who have not been called upon have the *Journal* of the Institution at their disposal for airing their views on the subject. It is very important that the speeches for and against the proposals in discussion should be somewhat equally divided. Taking as an example the discussion of the last two weeks on Mr. Madgen's paper, it could not but be noticed that the one side had the most of the opportunities. This is apt to give a false impression as to the feelings of the Institution. There were in all only two speakers who strongly combated the general conclusions of Mr. Madgen's paper, and neither of these was a municipal engineer of the class from which the opposition of the Power Bills is brought. We do not

know if these municipal engineers offered to speak, but there were a number present in the room, and we think it would be much more conducive to the general interest of the Institution if they had expressed their views in public instead of confining their opposition to the parliamentary proceedings. As it was, half of the speakers at the discussion were financially interested either as engineers or as promoters of power schemes.

The Yorkshire Power Bills.—The promoters of the two rival power schemes for Yorkshire have recently been interviewed by various chambers of commerce in the towns affected. Much information respecting these Bills and their respective claims for support was elicited by the Halifax Incorporated Chamber of Commerce on Wednesday week. From a report of the proceedings we gather that in the case of the South Yorkshire Electric Power Bill the promoters propose to leave themselves entirely in the hands of the various corporations respecting supply in municipal districts. In this they would follow the precedent of the Power Bills which passed into law last year. The rival Bill, which is called the Yorkshire Electric Power Bill, evidently is to contain a clause which will protect manufacturers in such municipal areas. We gather from remarks which the engineer to the scheme made in answer to the town clerk of Halifax, that in the event of any corporation not supplying power to large consumers at as cheap a rate as the power company would be able to do, it is to be open to the Board of Trade to give the company the right to supply such a consumer. This reference to the Board of Trade seems to us to be a most reasonable suggestion, as it can only be made in the event of a corporation not supplying power consumers at a low rate. It will be obvious that the Board of Trade would be quite able to prevent any undue competition which aims at obtaining consumers with attractive rates with an idea that these rates could afterwards be increased. In the meanwhile, however, the corporations do not favour the reference to the Board of Trade, and prefer instead to be quite independent. This they are not at the present time, and we trust they never will be. The action of Parliament last year in nearly granting a company powers to make good the neglect which the Corporation of Dublin had shown in electric lighting matters was a salutary warning to others.

Exhibition Lighting.—In the American *Electrical Review* for Feb. 16 Mr. Henry Rustin has a good article on the subject of the electric lighting of exhibitions, in which he points out that a more pleasing illumination can be accomplished, both as to evenness of distribution of light and decorative effect, by dividing the individual lights into as many units as possible and still keeping the points of light proportionate in size to the objects to be decorated with light. Referring to the laying-out of the lighting features of the Pan-American Exposition, Mr. Rustin says the authorities selected the incandescent lamp as the illuminant, and established the unit as 8-c.p. and 16-c.p. lamps. The author warns us, however, that it must not be inferred from this that a good illumination could not have been effected if acetylene, illuminating gas, or arc lights had been selected to serve the same end. It is certain, however, that the best results cannot be obtained by entering these several illuminants in competition with each other in decorative lighting The chief advantage which the incandescent light has in an exposition is that it can be burned in any position and almost under any conditions. Again, it is easily made a part of any sculptural, architectural, floral, or even water effect. In decoration work the incandescent light is specially favoured. The arrangements for lighting the Pan-American Exposition are such that it will be possible to reach a gradual increase of lighting leading toward the stately electric tower at the base of the T-shaped courts, and which is to be the climax of the fountain and electrical display at night. The number of lights and the quantity of light will exceed that of any other equal area ever artificially illuminated, and it will be evenly distributed. Beautiful spectacular effects will be produced by the many combinations of light and water, while an impressive scene will be the electric tower basin, which is to be the stage of the display of a combination of 1,500,000 gallons of water per hour in fountains with the light of 100 large-sized searchlights.

Chicago Trams.—A commission appointed by the Chicago City Council to look into the whole question of what are termed street railways in America, has now issued its report. An abstract of this report is given in the *Street Railway Review* for February, and complaints are made in an editorial notice on the recommendations of the committee. One of these recommendations is that in all future franchises granted by the city of Chicago the repurchase clause of the British Tramway Act of 1870 shall be inserted. The editor points out that this repurchase clause, which enables the tramways or street railways to be taken over at the end of a period of 21 years at the then value, has proved disastrous to the tramway enterprises of Great Britain. The introduction of a similar clause in the new franchises is thus strongly deprecated by the editor. With this we agree, but we do think that there are other points in the report which show that the commissioners have avoided the issues which they should have been able to solve. Amongst these is the question of the fares to be paid by the public, and the annual charges to be enforced on the street railway owners on behalf of the town. We gather from the clause dealing with this that the commissioners could not decide as to whether they could insist on a low fare being given to the public, or on a comparatively high rent being paid by the new concessionaires to the City Council. Another point which may give rise to considerable trouble is that of the referendum which it is suggested should be given to the mass of the people. In other words, when any concession is to be given it should be referred to the vote of the ratepayers before being confirmed. This seems to us to be an exceedingly cumbersome way of doing business. Another point in the report deals with the labour question, and suggests that the companies should be forced to arbitrate in the event of labour disputes. It seems to us that such an arbitration would only be binding on the employers of labour and not on the men employed. As this is so, the ordinary procedure in labour disputes should be allowed to stand.

An Electrically Oporated Bridge.—Mr. H. G. Tyrrell describes in the *Electrical World* a new bridge across the Connecticut River at Middletown. The whole bridge is some 1,300ft. long, and consists of four fixed spans and one movable span of 450ft. This revolving span provides two clear waterways, each 200ft. wide. The swing portion of the bridge is operated by three 25-h.p. electric motors of the railway type, one of which turns the span, while the other two are in use in connection with the blocking up of the ends. For this work a much smaller motor would have done, but the engineer, Mr. Tyrrell, considered it well to keep all the motors of the one size. There is also a duplicate set of turning machinery, which can be applied at will to assist the first motor in case of unbalanced wind pressure or a breakdown in the first driving machinery. These two motors are worked independently. The power to operate the bridge is taken from the street mains at Middletown through a cable laid from the river bed, and brought up at the central pier. It was originally intended that the gates at the end

Digitized by Google

of the fixed spans should be worked electrically from the operating house, and the full design of the requisite gear was prepared. Up to the present, however, this has not been installed. The two motors which are used to block up the ends of the bridge work on to a pair of toggles at each corner. These are drawn together by two bronze nuts working a right and left hand screw, which is turned by bevel gearing from the motor. To prevent these nuts from jamming, there are electric signals arranged to tell the operator when to switch off the current. The arrangements are such that a lifting force of 50 tons is applied to the bridge and over a space of 1½in. in 10 seconds. To open the bridge requires half a minute on an ordinary day, and the revolving part is so accurately balanced that in calm weather only 5 h.p. is required to turn it. Electric tramway lines are laid across the bridge, the joint at the revolving section being made by an ordinary split rail, which can be adjusted with the seasons in order to minimise the jar from the changing temperature.

Electric Cranes.—An interesting review of the progress made during the past five or six years in the construction of electric cranes is contributed by Alfred Kolben to the *Elektrotechnische Zeitschrift*. He points out how it was first sought to adapt the electromotor to the peculiarities of early types of transmission gears, the single-motor crane marking the period of transition from the old system to the new. But this practice did not always yield satisfactory results. Sometimes the rope pulleys of old cranes were substituted by belt pulleys driven by electromotors, after the winding gears, square shafts, and auxiliary apparatus previously in use had become worn out and consequently unserviceable. But manufacturers at first showed little disposition to discard designs which had been evolved from much thought and experience; hence it was only natural that the most clumsy and dispensable portion of the early type of overhead traveller—*i.e.*, the rope transmission—should be the first to concede its place to the electromotor. Gradually, however, manufacturers began to adapt their designs to the conditions of electric driving, and to-day there is no doubt but that the epoch of the single-motor crane is near its end. A decided majority of modern cranes are so constructed that each of the principal movements is accomplished by a special motor. The endeavour to dispense with transmission gear between motor and machine constitutes to-day a recognised principle of construction. Quick-movement gears are now constructed in order that they may be coupled direct with the electromotors, while for a like reason the motors are designed for slow speeds. Apart from the fact that a large number of workshops, foundry depôts, etc., cannot find constant employment for their cranes, the use of several motors offers the important advantages common to easy and fine control of speed, in addition to which the automatic braking effects which can be obtained with series-wound continuous-current motors are very valuable. In cranes designed for extra high speeds, such as are employed, for instance, in steelworks and foundries, multi-motor cranes come almost exclusively into consideration. The article goes on to describe the constructional features of some typical cranes of modern design, which might be studied with advantage by those interested especially in crane work.

Electric Tramways and Railways.—Mr. R. W. Hogarth delivered a lecture before the East of Scotland Engineering Society last week on "Electricity as a Motive Power for Railways." In this lecture he also gave some data respecting the electric tramways and light railways of this country. Thus he stated that at the end of 1900 some 52 electrical tramways and light railways were in operation, representing about 600 miles of route and much more in track, while 25 undertakings with over 300 miles of route were authorised or under construction. The capital invested by British electric traction companies had risen from 8½ millions sterling in 1897 to 19½ millions in 1899, and over 26 millions in 1900. Eleven municipalities had in 1899 expended some £1,170,000, and this increased in 1900 to 18 municipalities, with an expenditure of some £2,750,000; thus the expenditure more than doubled itself within 12 months' time. As an illustration of a line using electric locomotives, a brief description of the Central London Railway was given, and it was suggested that had a multiple-unit system been adopted the overcrowding now experienced on this line in the mornings and late afternoons might have been obviated by increased service, which for the moment is not possible, since 2½ minutes are required to change the locomotives at the terminals of the line. The lecturer then discussed the reasons which led him to the conclusion that the electric locomotive had no future, and showed that the multiple-unit system on the broad lines of flexibility of operation, safety, economy, and improved service was the system which must necessarily displace the locomotive for passenger lines at least. Some interesting data regarding train acceleration were next given, and the lecturer advocated the use of polyphase high-tension currents for transmission on the longer lines, with continuous-current distribution from sub-stations. He did not think that direct working with three-phase currents (which involved the use of double trolleys) would come into general practice in this country. For railway work the overhead trolley line would be as far as practicable superseded by the third rail fixed alongside the track rails. It was premature just yet to talk of electrically operating main-line railways until further data were forthcoming regarding the actual results obtained on the shorter lines.

Residual Magnetism.—In an article contributed to the columns of a foreign contemporary Mr. Paul Holitscher considers the phenomena relating to the residual magnetism in one and the same iron ellipsoid after it had been reduced to its original state of magnetisation by thorough and controllable demagnetisation. The ellipsoid was composed of Jura iron, the respective lengths of its semi-axes being 18cm. and 0·144cm. A magnetometer was employed to determine the magnetic moment. In the first place, the influence of the duration of the magnetisation on the residual magnetic moment was determined. The fact was disclosed that for increasing periods of magnetisation the residual moment, M_r, increased at first, but after a certain period the "period of saturation" reached a certain limit, at which it remained constant. This time required for saturation increases with the strength of the magnetising force, its maximum limit corresponding to that strength of field for which M_r is a constant value. This fact pointed to the necessity of continuing all magnetisation processes in the further course of the experiments for the period of maximum saturation, which was found to be 2 minutes 30 seconds. These experiments related to the influence of the number of the successive impulses and the method of magnetisation on the residual moment. By magnetising uniformly in one direction the residual moment continues to increase with the number of the successive impulses. The increase is at a quick rate during the initial impulses and afterwards slow, but, contrary to the generally accepted idea, does not attain the maximum with a small number of impulses, since even after a succession of 20 impulses a further succession of 100 impulses causes an additional increase of M_r. When magnetising both ways M_r is independent of the number of the impulses. Similarly M_r is independent of the duration of the magnetisation, but not of the demagnetisation.

Digitized by Google

If the latter takes places suddenly, M_r is invariably of less value than if it is effected gradually. The gradual demagnetisation need not, however, be uniformly continued, though no steps greater than 3 per cent. should be made. That for magnetisation uniformly in one direction the residual magnetic moment becomes greater in proportion to the number of the successive impulses was confirmed for each magnetising current, but the ability to increase the M_r produced by the first impulse by frequent repetition varies greatly for different magnetising forces.

A Promising Discovery.—In the course of an article containing numerous graphic illustrations and tables, Mr. Ewald Rash describes in the *Elektrotechnische Zeitschrift* a new method of producing electric light. This method, it appears, consists in establishing an arc between two electrodes of some fire-resisting substance, such as magnesia, lime, oxide of thorium, oxide of zirconium, etc., the arc so produced representing, in virtue of physical qualities differing essentially from those of the carbon arc, an extremely economical source of light. Experiments have shown that such incombustible electrodes of low conductivity will form excellent arcs, provided they are first of all rendered sufficiently conductive by the application of heat from some external source. It is suggested that in arc lamps this preliminary heating might be effected in a simple manner by means of an auxiliary arc of the ordinary carbon type. The watt density at the incandesced ends of the arc formed between the fixed electrolytes is shown by the results of the experiments to be very great (30 to 40 watts per square millimetre and above). Moreover, the temperature of the arc is probably the highest which it is possible to obtain with substances at our disposal. It corresponds to the exceedingly high vapourising and melting temperatures of the stable electrolytes in question. For this reason, alone, it is obvious that the economy obtained must be higher than in the case of any system of lighting hitherto in vogue. The experiments fully confirmed this view. It also appears that the desire for a selective abnormal emission of light is, in the case of this new system of lighting, for the first time fully realised. Hence the production of a light with a spectrum having few invisible ultra-red rays, but, on the other hand, a great preponderance of effective yellow and green rays has been solved. The laboratory experiments embraced the manufacture and testing of electrodes having diameters up to 5mm., all tests having, perforce, to be conducted with alternating currents. It is probable, as in the case of the carbon arc, that greater efficiency would be obtained with continuous currents and larger electrodes. However, the experiments proved that even with alternating currents the useful light yielded by the electrolyte arc is greater than can be obtained with any other known system of artificial lighting. Both electrodes of 2·5mm. and 5·0mm. diameter, yielding an equivalent of from 600 to 1,000 candles, showed an efficiency of from three to four candles per watt. The actual observed consumption, in fact, for these sizes amounted to from 0·25 to 0·3 watt per effective candle, which is equivalent to more than double the economy obtained with the continuous-current carbon arc. It was also proved possible to construct highly economical lamps of the electrolyte type for small powers, say 100 c.p. In other words, the above figures mean that the new light (even when a relatively high price has to be paid for current) may be produced at a much cheaper rate per effective candle-power than incandescent gaslight. It is claimed as an additional advantage that the electrodes for the new light, being incombustible, will have a much longer life than carbon electrodes, and, moreover, require to be only of very small diameter, besides being cheap to manufacture. To quote particular experiments with electrodes 5mm. in diameter and a current of 5·3 amperes, it was found that a voltage of from 36 to 45·5 was required, while the candle-power varied from 700 up to 1,000. The variation in the candle-power does not seem to correspond to variations in the voltage, from which we presume that the light was not absolutely steady. This new proposal opens out a wide field for speculation and experiment, while the success of Mr. Rash seems to warrant hopes for the commercial outcome of his invention. Naturally, the experimental details are not given *in extenso* at this early stage.

False Spectra.—Mr. Theodore Lyman contributes to the January number of the *Physical Review* the results of his experiments on false spectra which can be obtained from the Rowland concave grating. To give the gentleman's conclusions first, he finds from experimental evidence that (1) the first spectrum produced from the Rowland concave grating is not pure, but is complicated not only by underlying spectra of higher order, but by the presence of a number of spectra of lower dispersion than the chief spectrum; (2) the number and dispersion of these false spectra obey no simple law; (3) the number, dispersion, and clearness of these spectra differ with different gratings; (4) the lines due to the false spectra are most clearly visible in the extreme ultra-violet owing to the absence of strong real lines, and are so pronounced as to screen the feeble real line that may occur in this region. In explanation of these conclusions, the author states that it seems probable that in developing the theory of the grating some assumptions have been made which are not according to fact. It is in the error of such assumptions that we must seek the solution of the problem. It is generally assumed in treating the grating that the lines of the ruling are of equal width, and are separated by equal spaces. In the very nature of things it is evident that this cannot be the case, in view of the very minute distances involved and the almost inconceivable rigidity of the ruling engine which would be necessary. These variations, slight in absolute amount, may be a considerable fraction of the distance from line to line. It is clear, moreover, on experimental as well as on the theoretical ground, that these variations are not local, but extend over the whole surface of the grating. It appears, then, that the departure from equal spacing assumed in the theory of the concave grating is not the random departure which is next in theoretical simplicity, but a more or less systematic departure which has emphasised disproportionately certain of the subordinate maxima called for in the conventional theory. If the position of the false maxima occurred in the ratio 1 : 2 : 3, or in any other simple ratio, the phenomena would invite an analytic discussion. As an experimental fact, however, our lines are not harmoniously placed with respect to the slit, nor are they arranged according to any discoverable system. Moreover, they are different in character and position when obtained by different gratings ruled by the same engine. It seems most likely that the phantom lines are due to a number of superposed first spectra of varying dispersions, and that these false spectra owe their existence in some manner to the variation in width and separation of the grating lines. The author also adds that gratings of large radius do not show the false lines with as much clearness as gratings of small radius. So feeble indeed are the false lines obtained with the 21ft. grating, that it is improbable that they would be noticeable in ordinary spectrum investigations. It is impossible, apparently, to predict the nature of the false spectra of one grating from the false spectra produced by another of the same ruling and radius.

THE QUIN PATENT SAFETY DEVICE FOR PROTECTING OVERHEAD TROLLEY WIRES.

As an outcome of the Liverpool accident considerably more interest has been taken in this device, which for the past two years has been in use in connection with the Blackpool tramways for the protection of the public against any chance of receiving a 500-volt shock. Through the courtesy of Mr. Quin and the British Insulated Wire Company, who have purchased the patent rights and are manufacturing the apparatus, we are able to give herewith some drawings of the apparatus, together with the diagram of connections. Thus Fig. 1 shows the switch pillar, in which four of these Quin automatic switches are placed in order to protect the four sections of trolley wire, which are connected up to the main feeder through the section box in question. The details of the switch gear on

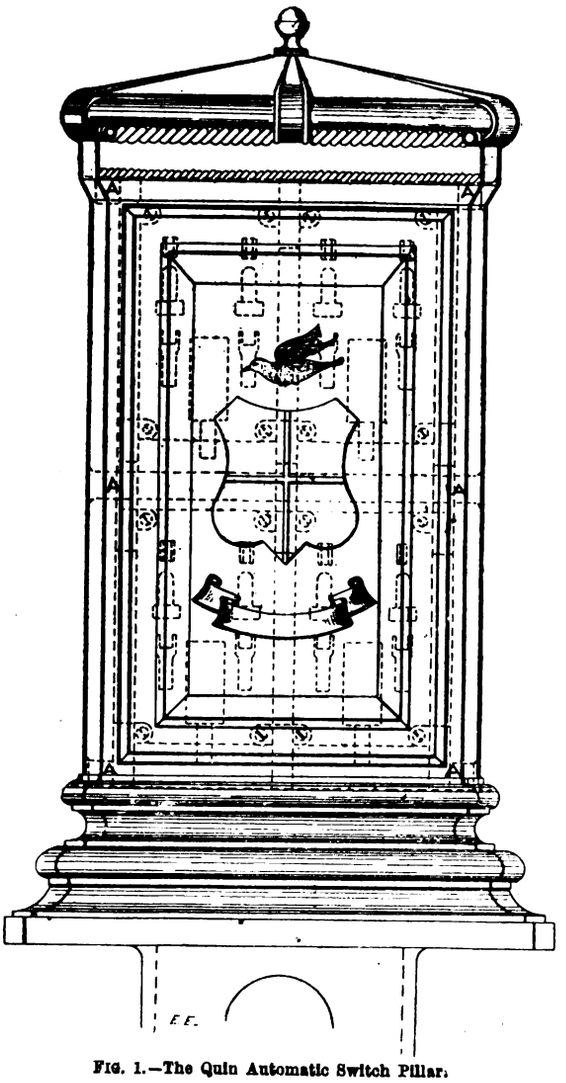

FIG. 1.—The Quin Automatic Switch Pillar.

each of the four panels are shown in Figs. 2 and 3, while Fig. 4 gives a diagram of the connections employed. The object of the device is twofold. The first and most original is that the trolley wires shall be instantly rendered dead in the event of a fracture occurring in any part of its length. The other object of the device in which there is not so much novelty, is that the connection between the feeder 'bus bar and the trolley wire shall be interrupted in the event of an excess current passing through the same. To deal with the first point, Mr. Quin introduces an overhead pilot wire between the switch pillar and the farther end of the section which has to be protected. This wire is brought back to a shunt coil on the switch, which, when energised, holds on the switch lever, which otherwise would fly off and break the circuit. In the event, then, of this pilot wire becoming dead, as would be the case if the trolley wire were interrupted in any part of its length, the shunt coil will lose its magnetism, and the switch will fly off and thus break the connection between the feeder and the section of the trolley wire which is falling to the ground. We notice in the diagram of connections that the pilot wires are shown to be placed overhead, but we should think it would be preferable for many reasons to place them underground, which although slightly more expensive, reduces the number of overhead wires which have to be protected from falling telephone and telegraph conductors. In addition to the shunt coils on each switch, there is also a series coil through which the current from the feeder has to pass on its way to the trolley wire. This acts on the switch much in the same way as all excess current cut-outs, and breaks the circuit when the current through it exceeds a certain predetermined limit. When earthed guard wires are placed over the trolley wire as a means of protection the following alternatives apply. In the first case, if the telephone or telegraph wire in falling only makes connection with the earthed guard wire,

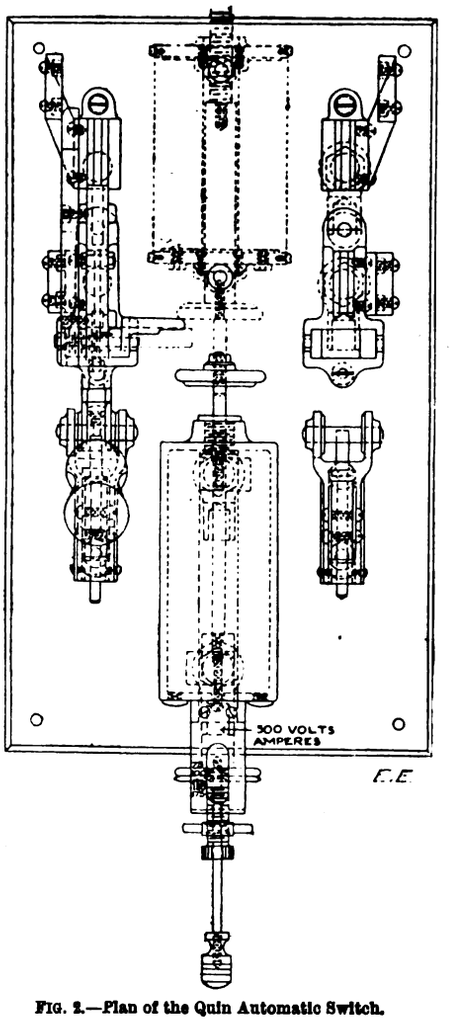

FIG. 2.—Plan of the Quin Automatic Switch.

there is no danger from electric shock to anyone in the street below, although there still remains the mechanical danger which arises from the falling wire. If, however, as is frequently the case, the initial strains in the wire which is falling cause it to coil round both the earthed guard wire and the trolley wire, a short-circuit takes place, which causes the series coil of the automatic switch to act and break the circuit. At some recent experiments carried out at Blackpool it was proved to a large number of gentlemen that the Quin automatic device gave absolute protection against either a trolley wire breaking or against falling telephone wires.

AN AUTOMATIC EARTHING DEVICE FOR TROLLEY WIRES.

Having regard to the fatal accident which recently occurred in Liverpool under circumstances already fully

Digitized by Google

reported in these columns, we would call attention to an article by Mr. R. Ulbricht which appeared in the *Elektrotechnische Zeitschrift* for May 7, 1896. An arrangement is

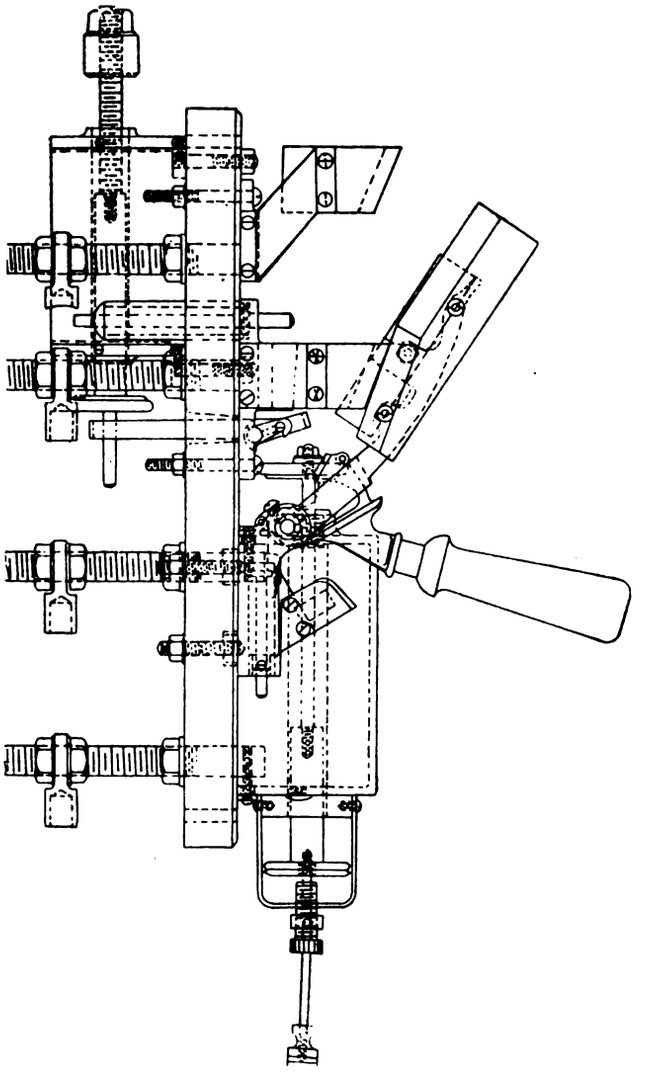

FIG. 3.—Elevation of the Quin Switch.

described therein for guarding against accidents due to the falling of telephone or other wires across trolley lines. It is based on the principle of a momentary connection between the trolley wire and earth causing a direct connection between the same, which remains until the apparatus is reset by one of the tramway officials. The efficiency of the system is largely dependent on the employment of an automatic earthing device of very simple construction, which may serve to protect simultaneously several points crossed by telephone or other wires. The arrangement is diagrammatically shown in the accompanying sketch. Momentary contact between a telephone wire, the trolley line, and one of the earthed guard wires is sufficient to complete the earth connection through *a b*. This causes the automatic cut-out provided in the generating station for the protection of the line to act, while the short-circuit indicator will continue to indicate the disturbance until the earthing device in the proximity of the trouble has been reset.

The arrangement has been largely adopted and was subjected to a severe test in Leipzig, where the falling wire was on the one side connected with the apparatus to be exposed to danger and on the other direct with the rails.

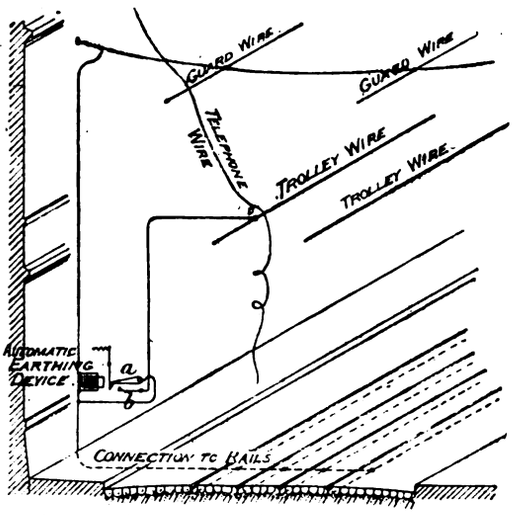

Diagram of Connections for the Ulbricht Earthing Device.

Between the trolley wire and earth a voltmeter was inserted to enable the degree of security afforded the street traffic to be gauged. The automatic earthing device, although of only temporary construction, worked without a hitch. At each fall of the telephone wire across the guards the voltmeter immediately registered zero. The protection afforded was so complete that when a fuse of only eight ohms resistance for a maximum current of one-third of an ampere was inserted in the falling wire, it did not melt. In the last test the falling wire fused the guard wires, which had been previously weakened in many places by partial fusion, but the momentary contact had sufficed to establish a dead earth connection on the trolley wire.

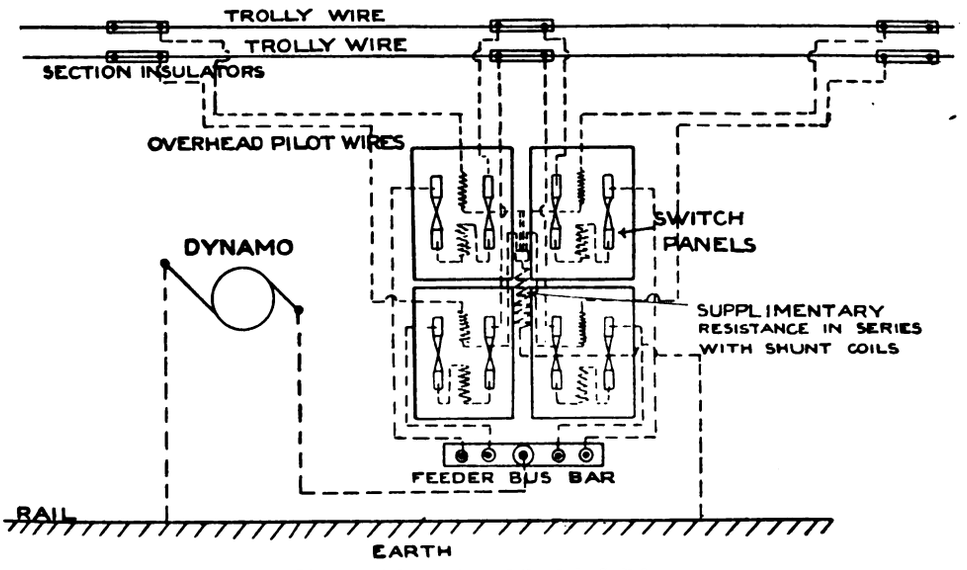

FIG. 4.—Diagram of Connections of the Quin Switch.

An additional advantage claimed for the automatic earthing device is that it enables the guard wires to be of relatively small diameter, since they have to carry but a momentary current, and by suitable arrangement may be

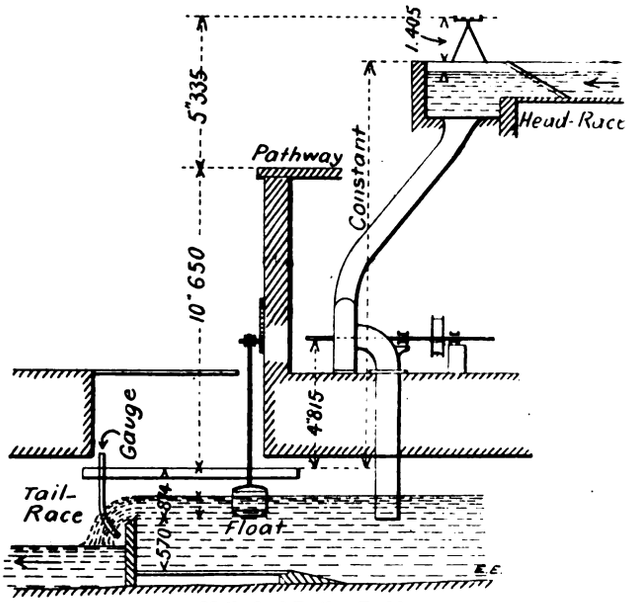
Digitized by Google

made to do their duty even should a large fall of telephone wires cause them to break. Further, the automatic device may be tested daily as to its condition in a similar manner to that in which automatic cut-outs are tested, though in doing this contact between *a* and *b* must naturally be prevented.

A SATISFACTORY TURBINE TEST.

Our attention has been directed to some very satisfactory results which were obtained as the outcome of a test undertaken to determine the efficiency of two newly-erected turbines. The turbines were constructed by Messrs. Hemmer Bros., Limited, of Neidenfels. They are of what is known as the Francis reaction type, provided with the above-mentioned firm's patent turbine wheel, whereby uniform distribution of the water over the same is obtained. The test took place at Messrs. C. Dodero and Co.'s (the purchasers) paper mill at Coazze, near Turin, in Italy, under the direction of two engineers representing the contractors and the purchasers.

The contract was for two turbines, of the "Francis Hemmer" type, designed to pass 77 and 166 gallons of water per second respectively, with an actual fall of 32ft., a further fall of about 18ft. to the lower water-level being



Method of Testing Turbine.

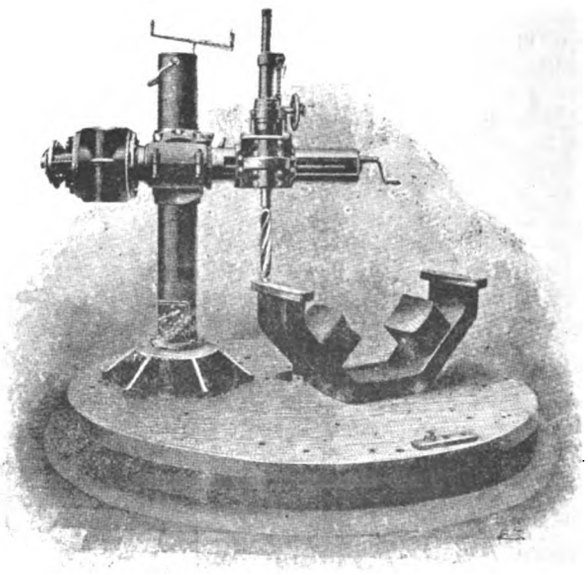
utilised by means of suction pipes, which gives a total fall of about 50ft. It was stipulated that, in view of the rather awkward pipe arrangements and suction, an average efficiency of 75 per cent. should be attained for a quantity of water varying from 100 to 50 per cent., and a maximum efficiency of 78 per cent. for three-fourths of the stipulated quantity of water, the larger turbine to develop 114 b.h.p. at 350 revolutions per minute under these conditions. The upper watercourse is 330 yards long and conducts the turbine water into a reservoir, which is guarded by means of a strainer. The pressure conduit, consisting of a round Monier pipe (cement with an iron skeleton), about 150ft. long, ending in two unions of 31in. and 27in. internal diameter respectively, furnishes the turbine water for both turbines. The turbines have horizontal shafts, which are about 32ft. below the top water-level, whilst the remaining fall, about 18ft., is used by means of suction pipes.

The test under notice was carried out on the large turbine, the turbine water exactly measured, and the apparatus used to ascertain the brake horse-power checked and minutely tested before use. The manner of conducting the test is shown in the accompanying illustration, which, however, it will be seen is not to scale. The results obtained showed 87 per cent. as the highest efficiency, whilst the average efficiency with a flow of water varying from 166 gallons to about 80 gallons per second was 83 per cent. For the half flow of water alone 82 per cent. efficiency was found. The effective horse-power developed with a flow of 173 gallons per second was 118 b.h.p., which represents a far better result than that guaranteed. The efficiency of the turbine with a flow of water of only 55 gallons per second (being one-third of the maximum amount), was 72½ per cent. We believe that the results obtained in this test establish a record for the conditions given, a fact highly creditable to Messrs. Hemmer Bros., Limited, as reflecting upon the good design and workmanship of their turbines.

We are indebted for the above information to the firm's London representatives, Messrs. J. Marx and Co., 133 to 139, Finsbury-pavement, E.C., who, we understand, will be pleased to furnish further details and copies of the charts and schedules taken during the test to interested parties.

ELECTRICALLY-DRIVEN UNIVERSAL PORTABLE DRILLING MACHINE.

This machine is designed with the special object of providing a tool convenient for drilling operations, where the expense of carrying the tool to the work is less than that of carrying the work to the tool. The machine is entirely self-contained, having no connection with any outside apparatus, except the electric leads. It may readily be



Electrically-Driven Drilling Machine.

set up, and can be detached, moved, and started again with a minimum delay. The spindle is direct gear-driven from the motor shaft, thereby ensuring economy of power. The driving gear is of great strength, and the machine is capable of taking heavy cuts considering its size. The machine is so designed that holes may be drilled in any direction—horizontal, vertical, or at any angle—with equal facility. All the adjusting clamps may be loosened at the same time for the necessary adjustments without fear of any part being over-balanced. Holding-down bolts are dispensed with, as it is able to grip any bed-plate or other convenient flat and smooth piece of iron.

As will be seen from the illustrations, this machine consists of a main column fitted with a saddle, which carries a radial arm, on one end of which is mounted the drilling head with its spindle, and on the other end the driving motor. These parts are constructed to give three independent motions of the drill: (1) the saddle and all parts carried by it can be swivelled in a complete circle round the main column in a horizontal plane; (2) the radial arm can be swivelled in a complete circle in a vertical plane; (3) the radial arm, and with it the drill spindle, can be swivelled about its own axis through a complete circle in a plane perpendicular to the arm. Besides these motions the head can be traversed along the radial arm and the saddle can be raised or lowered on the main column. The base of the drill is provided with an electromagnetic clutch arrangement which holds the drill in position when

Digitized by Google

placed on any flat and smooth surface of iron, and with a good contact an adhesion of three tons can be obtained. For specially heavy work it is, however, desirable to supplement the magnetic attachment by dogs to prevent creeping. The current for this magnet is taken from the same source as that used for driving the motor, the circuits being connected in such a way that the act of starting the motor magnetises the holding-down coil, thus preventing the tool shifting through carelessness. The main column is 7ft. high and 12in. in diameter, and the lower part of it contains the motor-starting resistance, which is thus effectively protected from injury. A screw runs the whole length of this column, carrying a crescent-shaped nut which projects into a groove in the saddle, providing in this way a ready means of elevating the saddle, while leaving it entirely free to rotate round the column. The radial arm is 8in. in diameter, and on one end is mounted the drilling head with its spindle and on the other end the driving motor. The whole of the driving gear is contained in this radial arm, so that its position in no way affects the driving. The traversing motion of the drilling head is controlled by a screw in the usual way, and it is firmly clamped in position by an expanding wedge gib. The drill spindle is 3in. in diameter, and is bored at the end for No. 5 Morse taper socket, and is provided with power feed by means of a sleeve driven with pinion and two sets of worms and gears directly off the spindle. By disconnecting the power feed by the clamping nut at the centre of the handwheel, the spindle may be fed by hand.

The motor attached is of the Mather and Platt two-pole enclosed type, capable of developing 2 h.p. at 800 revolutions per minute, and is connected to the switch by a flexible cable, and can be wound as desired for working from a 100 or a 200 volt circuit. The motor shaft is prolonged so as to pass through the spiral gear, driving direct on to the drill spindle. This gear has a ratio of 9 to 1, and with back gears of 3 to 1 provided it is possible to run the spindle either at 90 revolutions per minute or 30 revolutions per minute, with the motor running at full speed. Slower speeds can be obtained by regulating the speed of the motor.

The drill, which is protected by a patent, is suitable for boring holes up to 2½in. diameter.

LEICESTER TRAMWAYS REPORT.

(Concluded from page 196.)

Service.—The frequency of service of the cars would, roughly speaking, vary, when worked out, from about one or two minutes in the centre of the town to eight or ten minutes in the suburbs; in fact, in the busy main thoroughfares in the centre of the town there would be at least one car almost always in sight, and available for passengers at any stopping place. The experience of all the towns and cities we visited went to prove that wherever a cheap, rapid, and continuous service was provided the financial results had been the greatest.

General.—The scheme should in every respect be designed and commenced on such a basis as to admit of its being readily and conveniently extended to meet any possible requirements of the borough or the surrounding districts. We were much impressed by the way in which the various tramways run long distances into the country, thus enabling the poorer classes to reside out of the congested portions of the various cities, and consider that in the future it will be well to extend the tramway system of Leicester into the country, with a view of, to some degree, assisting in the solution of the problem of the housing of the working classes. The lines, power station, car depôts, etc., would be designed and carried out by the borough surveyor, and the permanent-way works and the laying of the rails should be done under his supervision by Corporation workmen. This is the course which has been so successfully adopted at other large towns, including Nottingham, Sheffield, Leeds, and Liverpool. It is important that the borough surveyor should be instructed to expeditiously prepare the detailed surveys of the routes, the parliamentary, general, and working plans, specifications and estimates, for the proposed lines, power station, car-sheds, depôts, equipments, etc., also that the services of an electric traction expert should be engaged to advise and assist, as may be required from time to time, in the capacity of consulting engineer in respect of any matters in connection with the preparation of a scheme, and also to advise upon proposals and tenders submitted by electric traction firms, who should be invited to compete on a specification of our requirements prepared, with his advice, by the borough surveyor.

In the course of our investigations we soon discovered that the only successful aspects of the workings of the various systems of electric traction were chronicled in published reports, and that the particulars relating to failures were only obtainable after making most careful examination and exhaustive enquiry on the spot into the several systems, and by interviews with responsible engineers, managers, and others. Although some mistakes have been made in the construction and equipment of tramways in Great Britain, they have been more numerous on the Continent from the very fact that electric traction largely originated there, and has been longer in operation and much more extensively developed. This long practical experience has taught them what to avoid in their later schemes, and what is most desirable to adopt in future. In all cases, whether in Great Britain or on the Continent, the knowledge and experience gained in carrying out and working the different schemes and systems were very freely placed at our disposal, but, for obvious reasons, we were unable, even if it were desirable, to name the towns and cities in which mistakes and failures have occurred. The requirements in growth of traffic have in some cases been so altogether under-estimated that in less than two years the power stations, etc., have had to be remodelled and the system vastly extended and rearranged. Engines, boilers, and dynamos have become insufficient in capacity, and provision in land space for extensions of generating plant, car-sheds, etc., altogether inadequate in consequence of the great popularity of electric trams, which, after conversion from horse traction, has invariably enormously increased, and in many cases multiplied the traffic two or three times. In some of these cases, buildings have had to be partly demolished and machinery pulled out and replaced at much inconvenience and loss. The generation of traction power at several and unsuitable places, instead of at one central station conveniently located and properly designed for traction purposes only, has also in some places been a source of trouble, involving heavy annual charges on construction, feeder cables, equipment, etc., and consequently greater cost of the power supplied and of the distribution works, and also in working expenses. Among other drawbacks to be avoided are the erection of car-sheds too largely in central places instead of providing district sheds where land is cheaper and access more convenient; the complication and cost of the building and equipment of cars to run in connection with two or more systems—viz., overhead and conduit, or overhead and surface contact, also combined with accumulator cars; commencing to run electric cars on light and worn rails originally laid for horse traction instead of at once reconstructing the lines, and the failure financially and inconvenience resulting from being compelled to adopt the conduit and accumulator systems in some thoroughfares for æsthetic or sentimental reasons only. In this matter, involving as it does a large financial outlay, we have pursued what we conceived to be a wise and economical policy by acquiring all the knowledge and information possible before deciding to recommend you to undertake a huge expenditure in effecting such a revolution in the means of transit, even though the change will bring enormous advantages to the inhabitants of this rapidly growing borough. From the evidence contained in our report, and as the result of our thorough investigations of the advantages and disadvantages of the various systems, we are convinced that a most modern and efficient system of electric traction can be installed and worked by the Corporation, which would be not only an immense boon to the public, but also an undoubted financial success. Having devoted our best energies and very much time to the consideration of this

Digitized by Google

matter, we now beg to submit, with full confidence, the following recommendations.

RECOMMENDATIONS.

That the necessary steps be taken to purchase and work the tramways undertaking by the Corporation.

That the overhead trolley system of electric traction be adopted.

That parliamentary powers be sought:

To reconstruct and equip the existing tramlines.

To construct and equip extensions of the existing lines, and also to construct and equip new lines, all within the municipal borough, as set out and described in the following schedule, and shown on the annexed map, and on the cartoon prepared.

This work to be carried out in such sections, and at such times, as may afterwards be deemed advisable by the committee and the Council.

EXISTING LINES PROPOSED TO BE RECONSTRUCTED.

Belgrave-gate Route.—The line from the clock tower along Belgrave gate and road and Loughborough-road as far as the present terminus at Belgrave ..... 1·78 miles.

London-road Route.—The line from the clock tower, along Gallowtree-gate, Granby-street, and London-road, to the present terminus near Knighton-road ..... 2·02 miles.

Humberstone-gate Route.—The line from the clock tower, along Humberstone gate and road and Uppingham-road, to the present terminus near the Great Northern Station ..... 1·61 miles.

Aylestone Route.—The line from Granby-street, along Horsefair-street, Pocklington's-walk, Welford-road, and Aylestone-road, to the present terminus at Grace-road ..... 1·94 miles.

Church-gate Route.—The line from the clock tower, along Church-gate, Sanvey-gate, North-gate, and Wood-gate, to the present terminus near Fosse-road ..... 1·05 miles.

Total length of existing routes, 8·38 miles.

PROPOSED EXTENSION OF EXISTING LINES.

Belgrave Route.—An extension from the present terminus at Belgrave along Loughborough-road to the municipal borough boundary, near the entrance to the Great Central passenger station at Birstall-hill ..... ·75 mile.

London-road Extension.—An extension from the present terminus near Knighton-road along London-road to the municipal borough boundary, near the entrance to the Oadby racecourse ..... ·57 mile.

Humberstone-gate Route.—An extension from the present terminus near the Great Northern station along the Uppingham-road to the municipal borough boundary at Humberstone-lane end ..... ·48 mile.

Aylestone Route.—An extension from the present terminus at Grace-road, along Aylestone-road, to a point just beyond the Wigston-lane. A single line from Horsefair-street along Bowling Green-street, Belvoir-street, to Welford-place ..... ·72 mile.

Church-gate Route.—An extension from the present terminus near the Fosse-road, along Groby-road, to the municipal borough boundary, near the isolation hospital and new cemetery sites ..... ·47 mile.

Total length of extensions, 2·99 miles.

PROPOSED NEW LINES.

Narborough-road Route.—A new line from the clock tower along High-street, St. Nicholas-street, Applegate-street, over the West Bridge, and along Dun's-lane, Braunstone-gate, and Narborough-road, to a point where the municipal boundary meets the boundary of the parish of Braunstone, about one-third of a mile beyond the Burton branch railway bridge ..... 1·68 miles.

Hinckley-road Route.—A new line from Braunston-gate, along Hinckley-road to a point at the main entrance to the Western Park ..... 1·10 miles.

Fosse-road Route—A new line along Fosse-road from Hinckley-road to Woodgate ..... ·87 mile.

Great Central-street Route.—A new line along Great Central-street from St. Nicholas-street to the existing line in Northgate street ..... ·32 mile.

Melton-road Route.—A new line from the Melton Turn, along Melton-road to the municipal borough boundary at the northern extremity of the Belgrave sewage farm ..... 1·13 miles.

St. Peter's-road, etc., Route.—A new line from London-road, along Saxe Cobourg-street, Sparkenhoe-street, St. Peter's-road, East Park-road, St. Barnabas-road, to the Uppingham-road line, and also a connecting line from St. Peter's-road along Highfield-street to London-road ..... 1·65 miles.

Melbourne-road, etc., Route.—A new line from the corner of St. Peter's-road and St. Stephen's-road, along Melbourne-road and Nedham-street to the Humberstone-road line ..... ·77 mile.

Welford-road Route.—A new line from the junction of the Welford and Aylestone roads, along Welford-road to the municipal borough boundary at the brook beyond Knighton-lane ..... 1·78 miles.

Total length of new lines, 9·30 miles.

That parliamentary powers be sought: To construct and equip a central electric traction power station on the land adjoining the refuse-destructor buildings at the "Lero," Belgrave-gate, and to utilise the 5,500 yards of spare land, now belonging to the Corporation, for that purpose; to purchase from the Leicester Navigation Company for tramway purposes, such as car-sheds, workshops, etc., 4,366 square yards, or thereabout, of land, part of the public wharf adjoining the above-mentioned land, having a frontage of 504ft. to the public wharf canal basin, at 24s. per yard, including an easement over a width of 15ft. of the waterway, which is not charged for at per yard, but is covered by the price for the land. That the continuous direct-current system of generating plant be adopted, and that designs and tenders, when required, be obtained from electric traction firms for boilers, engines, and generators, switchboard, and all other necessary mechanical and electrical appliances and equipment, on a specification of our requirements prepared with the advice of the consulting engineer. That, when required, designs be invited for overhead construction and equipment, feeder cables, etc., upon a specification prepared with the advice of the consulting engineer.

That parliamentary powers be sought also: To construct a car-shed depôt, with repairing sheds, workshops, etc., on part of the back land belonging to the Corporation, adjoining the canal, off the Abbey Park-road, and having an entrance thereto at the canal bridge near Lero, sufficient land being set apart to admit of extensions to provide for making our own cars eventually, if found advisable; to acquire sites for and to construct and equip such district car-sheds and depôts as may be determined upon in the preparation and adoption of a traction scheme; to alter and adapt for electric traction purposes, as far as may be deemed advisable, the buildings to be acquired from the Leicester Tramways Company, and to obtain such other powers as may be required in connection with the proposed tramways undertakings. That, to enable the Tramways Committee to give effect to the foregoing recommendations, or such other recommendations as may be hereafter adopted, the borough surveyor be instructed to make the necessary surveys and sections of the routes, prepare the parliamentary and general and working plans, specifications, and estimates for the proposed tramway lines, power station, car-sheds, depôts, and equipments; also for the adaptation of buildings to be taken over, and to do such other work as may be required. That the borough surveyor be provided with the necessary additional staff assistance. That the services of an expert of considerable experience in electric traction be engaged by the Tramways Committee to advise and assist, as may be required from time to time, in the capacity of consulting engineer in respect of any matters in connection with the preparation of a scheme as broadly outlined in this report, and to advise upon any proposals and tenders submitted by electric traction firms, and also to support a scheme by parliamentary or other evidence.

That parliamentary powers be sought for the carrying out of the above recommendations, and that the committee and the town clerk be instructed to take such steps as are necessary for that purpose as soon as the requisite plans, surveys, and estimates are completed.

THE GENERAL ELECTRIC COMPANY'S DINNER.

The eleventh annual dinner of the General Electric Company, Limited, was held at the Hotel Cecil on Saturday last. The addition during the year of the word "limited" at the end of the name of the company does not in any way apply to the dinner, as, owing to the large increase in the number of those invited, a change had to be made in the place selected for this event. This year, for the first time, it was held in the Hotel Cecil, and the numbers present can be gathered from the fact that the Grand Hall was comfortably filled by the members of the staff of the company and by the visitors invited. One good feature in the programme of the evening was that the long list of toasts which is so intimately associated with other dinners in the Grand Hall of the Hotel Cecil was reduced, in order to make room for the programme of a smoking concert held afterwards. The chair was taken by Mr. Max Byng, who proposed the first toast, that of "The King, Queen, and Royal Family."

Mr. ECKSTEIN, another director of the firm, proposed "The Army, Navy, and Auxiliary Forces." In so doing,

Digitized by Google

he alluded to the war in South Africa and the part which the Electrical Engineers Volunteers had played in the same. The great lesson to be learnt from the war was that the British Empire had risen to the occasion and shown what infinite resources it possessed in times of need, both at home and in its Colonies.

Lieut.-Colonel CROMPTON said that the toast of the Imperial forces was the most appropriate at the present time, as it included not only the navy and the army, but also the militia and the volunteers, which latter departments of the Imperial forces had shown what they could do in the present war. The good work done by the militia in guarding communications had, he thought, not been properly recognised. He was pleased to state that practically all the members of the Electrical Engineers Volunteer Corps who had returned from South Africa had now obtained employment, which was a credit to those electrical engineers who had stopped at home.

Captain LLOYD also replied, and gave an example of the far-reaching influence of the General Electric Company. While the speaker was at Plymouth he had the pleasure of meeting Mr. Hirst and of doing business with the firm. When the Electrical Engineers Corps had got to Pretoria, and were commissioned by Lord Roberts to equip the hospitals with electric light, they found on enquiry that there was in Johannesburg a branch of the General Electric Company. He promptly went down to interview the agent in charge, and took over the entire stock. He believed that the goods were delivered with more dispatch in that case than in any other he knew of.

It fell to the lot of Mr. RAYLING to propose the toast of their absent chief, Mr. G. Byng, who was the founder of the firm, and to whose talent for organisation they owed the progress which they had made. He was pleased to hear that an announcement was to be made to the effect that Mr. Byng hoped to be able to preside over the dinner next year. He coupled with the toast the name of Mrs. G. Byng, who was present.

The CHAIRMAN then read a letter he had received from his brother, which he used as a reply to the toast. In this Mr. G. Byng stated that he was making good progress towards recovery, and that he hoped to be able to resume his place at the head of the firm before long. The letter went on to refer to the great commercial fight which was taking place in the country between English and foreign firms, and to the need which existed for every firm like the General Electric Company straining every nerve to keep their various departments well to the front. If the men on the staff determined to excel individually, he had no fear but that they would be able to repel the foreign competition which threatened so many trades in Great Britain.

Mr. H. HIRST proposed the health of the staff in a humorous speech, in which he referred to some remarks of Mr. Raworth last year on the question of the financing of a large firm like theirs. He was pleased to state that the staff had a large hand in the financing of the company, and that since last year the conversion of the company into a limited liability concern had enabled the members of the staff to take a financial interest in the firm. He added that the ordinary shares of the company were also held to a certain extent by the staff, who were thus actually partners interested in the well-being of the firm. He proceeded to humorously review the relative importance in their own estimation of the various members of the staff. Commencing with the office boy, and going up to the directors, he showed how well in their own estimation each man was able to exaggerate the importance of his own work as compared with that which was done by those above them. There was, however, one common interest in the firm, and this he looked to all the members of the staff to maintain. He announced that in order to increase the strength of the directorate they had just arranged to make Mr. Bevis and Mr. T. Hawkins directors, while Mr. Rayling had joined the Board a few weeks ago.

The toast having been replied to, Mr. M. BYNG, the chairman, proposed "The Visitors," coupled with the names of Prof. John Perry and Mr. R. W. Wallace, K.C. He said that should the first-named gentleman happen to meet the President of the Institution of Electrical Engineers on his return home, he hoped that he would take him a good report of the dinner of the General Electric Company.

Dr. JOHN PERRY, in reply, said that distinctions had been drawn between engineers and men of science, but the organisation and control of a firm like the General Electric Company needed men of science in every respect of the word. He thought that the organisation was one which even our Government offices would do well to copy. He quoted the American author who gave the advice that "you should do unto your neighbour as your neighbour would like to do unto you, and do it first," as the principle which had to be followed when fighting foreign competition. The commercial struggle was now between nation and nation, and it could only result in the survival of the fittest.

Mr. R. W. WALLACE, K.C., who also replied, said there was not even any need to get quotations from America. He was glad to see that a suggestion he had made of increasing the financial interest of the firm by allowing outsiders to acquire shares had been followed during the past year.

Mr. DANE SINCLAIR then proposed the health of "The Chairman," which was drunk enthusiastically, and after a short reply an adjournment was made to an adjoining room for the smoking concert. There an excellent programme of songs, humorous sketches, etc., was given under the direction of Mr. H. S. J. Booth, and the visitors and staff split up into groups for conversation.

It is interesting to note that this firm invites every member of their London staff to the dinner. The guests, among whom were representatives of the leading men in every branch of the profession, in many cases brought their wives, which added considerably to the social character of the occasion. Among the guests we noticed Prof. John Perry (president of the Institution of Electrical Engineers), Lieut.-Colonel Crompton, Captain Lloyd, Mr. J. S. Raworth, Mr. Dane Sinclair, Mr. Roger Wallace, K.C., Mr. Musgrave Heaphy, Mr. and Mrs. E. Manville, Mr. A. H. Walton, etc.

THE MAXIMUM PRICE FOR ELECTRICAL ENERGY.

On Wednesday last Sir Courtenay Boyle received at the Board of Trade a deputation on the question of the proposed decrease in the maximum price for electrical energy which up to now has been inserted in the various new provisional orders which are from time to time issued by the Board of Trade. The Institution of Electrical Engineers were represented officially by Lieutenant-Colonel Crompton and by Mr. W. M. Mordey. A large number of gentlemen representing applicants for provisional orders in this session of Parliament were also present, while the London County Council were represented by their solicitor, Mr. Blaxland.

Sir COURTENAY BOYLE, in opening the meeting, said that the Board of Trade had been urged to reduce the maximum price which was inserted in provisional orders, which was 8d. per unit. The London County Council had suggested it should be reduced to 5d. per unit as a maximum. The Institution of Electrical Engineers had written to the Board on the subject, and he would be pleased to hear what the two representatives of the Institution and the other gentlemen present had to say against the proposed reduction.

Lieut.-Colonel CROMPTON said that he had the honour, with Mr. Mordey, to represent the Institution, and he proposed to confine himself to the broad principles involved. The proposed change chiefly affected small towns and country areas with widely-scattered populations which up to the present had not electrical supply. The actual cost of electrical energy was largely a question of the output of the works at which it was generated. The incidental expenses, when commencing a supply in any district, rendered the cost of generation in the first few years quite as high as in the earlier days of electric lighting. Thus the cost of labour had gone up, and also the cost of supervision, and these increases tended to counterbalance any increased efficiency in the plant. If the maximum in future provisional orders was placed at 6d., it would prevent

Digitized by Google

a number of districts from ever having electric lighting undertakings. He should be pleased, if necessary, to furnish the Board of Trade with complete sets of figures to show that for electric light stations of under a certain output a supply could not be profitably given at any price below 8d. per unit. He thought, therefore, that the Board of Trade should hesitate before making any such change in the maximum price in view of the competition between oil, gas, and acetylene lighting and the electric light. The reduction in the price of electrical energy had always followed commercial lines, and he thought that the present charges were quite independent of the Board of Trade limit.

Mr. W. M. MORDEY quoted the village of Sidcup as an example of small places which could not be supplied under 8d. Estimates for the electric lighting of this place showed that some £15,000 would have to be spent, and that the working expenses when supplying 40,000 units would be £900 per annum. The interest in sinking fund at 6 per cent. would make another charge of £900 per annum, and at 6d. per unit the undertaking would not pay its way.

Sir COURTENAY BOYLE asked whether this was not an argument that provisional orders should not be granted to and worked in such small areas, but that they should be dealt with under a large power distribution scheme, such as came before Parliament last year for the supply of electricity in bulk to small undertakers.

Mr. MORDEY thought that the option should be given to places like Sidcup either to do the work themselves or to take a supply from a power company. There was not, however, any such company having powers over the Sidcup area.

Mr. SIDNEY MORSE said he represented several companies which were promoting provisional orders this year. In looking through a complete list of the scales of charges for all electrical undertakings in the United Kingdom, he found only 1 or 2 per cent. charged at the maximum rate of 8d. The average price obtained per unit was very much below the maximum, and in London the St. James's and Pall Mall Company only obtained on an average some 4½d. per unit sold. If the maximum price were reduced from 8d. to 6d., it would seriously interfere with a system of charging which was very largely adopted. He referred to the Wright maximum-demand system, by which the high price was charged for the first hour or two's use per day of the maximum output demanded, after which a great reduction was made for all further energy taken. For instance, at the Clerkenwell station of the County of London and Brush Provincial Electric Lighting Company the charge was 7d. for the first period and 3d. per unit afterwards; the average price obtained by the company under this system was 4·71d. Mr. Morse then quoted evidence to show that when the regulations were being discussed in 1882, it was recognised that the price must depend on the consumption. He urged that any attempt to fix a price by law would be a failure, and that the competitive conditions were quite sufficient to cause serviceable reductions. He quoted the following figures to illustrate the influence of the consumption on the profit. The St. James's and Pall Mall Company had an income of 10*s.* per lamp fixed, and were able to pay a 14½ per cent. dividend with the average price mentioned above. The Chelsea Company, on the other hand, although obtaining a higher price per unit, only had a revenue of 4*s.* to 5*s.* per lamp fixed, and paid a dividend of 5½ per cent. With regard to the Power Bills, he thought they should not be considered in this matter, in view of the clauses which were inserted in them before they left the House. The companies owning them were so much in the hands of the municipal authorities that they might not be able to do business at all. He thought that the question of the maximum rates might be solved by introducing clauses like those adopted in the Weybridge order last year. In this a scale of charges was introduced by which 7d. per unit was to be paid for the first 91 hours per quarter and 4d. per unit for all above. In another order in which he was interested a similar sliding scale was introduced for power purposes, with a proviso that if the average cost per unit supplied for power purposes exceeded a certain figure, the scale should be revised. In summing-up his case, Mr. Morse emphasised the fact that there was no storage in electric lighting undertakings, and that in consequence some such differential rate such as he had described was required. The late Dr. John Hopkinson had advocated a system of making an annual charge per lamp fixed, together with a small additional charge for energy supplied.

Mr. A. H. DYKES described the conditions which existed at Hindhead, where a company was putting down works. From the houses which had had to be supplied, scattered over a considerable area, and the limited time in each year during which these houses were occupied, 8d per unit would have to be charged to certain consumers to keep the undertaking going. He also added that the inhabitants were quite prepared to pay this charge.

Mr. PERCY SELLON, representing the Electrical Section of the London Chamber of Commerce, endorsed what the previous speakers had said. He presented a letter from the section, which letter had been passed by the council of the whole chamber. It suggested that any reduction in the maximum price would be fatal to the maximum-demand system of charges, and that clauses should be inserted in future provisional orders of the general type used in the Wellingborough order last year. The clause should have the effect of reducing the scale of charges if the average price obtained for light and for power exceeded the predetermined limits.

Sir COURTENAY BOYLE said that no doubt large consumers were able to protect themselves, but that it was the small consumers who needed the protection of the Board.

A GENTLEMAN representing Falkirk, which Scottish town is applying for an order this year, said that they objected to a decrease in the maximum rate of charge because it would affect the borrowing power, or rather the rate of interest at which money could be borrowed. In Scotland they were not allowed to make a profit, but had to supply at the bare cost. The bigger the margin there was, therefore, between the price charged and the maximum the easier could money be raised.

Mr. BLAXLAND, on behalf of the London County Council, put in a list which had been prepared by the Council of the prices charged by the various companies and the municipal authorities in their area. While the Council wished to keep down the charges for electrical energy, they did not wish to press for clauses which would prevent the maximum system of charges being adopted.

Sir COURTENAY BOYLE said he was much obliged to the gentlemen who had come there that day, and he was particularly pleased to find in all the remarks an acknowledgment that the Board of Trade was anxious to do what was best for all concerned. They were particularly desirous of avoiding any new departure which would tend to discourage the development of electrical science, or the extension of electrical distribution. The Board had therefore decided at present not to make any hard-and-fast rule. At the same time they felt that the maximum price of 8d. per unit was too high. Therefore, without giving any definite maximum limit for this year's orders, reductions would be made, and the onus would lie on the promoters of provisional orders for small places to show reason why a maximum of 8d. per unit should be adopted. The Board of Trade approved of the maximum-demand system of charging, and thought it was one which ought to be encouraged. On the whole, he thought that the large consumer was able to take care of himself, and that the maximum price chiefly affected the small consumer. They could rely on each case being considered by itself, but the 8d. maximum would only be given in certain cases.

In answer to one or two questions asked afterwards, it was to be gathered that the usual maximum would be 7d. per unit, with 8d. for very small places, and perhaps 6d. in the case of very large undertakings. In either case the promoters would have to show cause why they should be allowed a 7d. or an 8d. maximum. The conference closed with an expression of thanks to Sir Courtenay Boyle for the kind hearing he had given those present.

Merthyr Tydvil.—The Merthyr Electric Traction Company are prepared to supply current for the lighting of the town hall.

QUESTIONS AND ANSWERS.

If thou hast knowledge, let others light their candle at it.

Under this heading we insert questions and answers of a practical character relating to central-station work, tramway work, or construction work; and for each suitable question offer *one shilling*, and for the best solution of any question we offer *ten shillings*. We also give *five shillings* for every other answer we print. The answers to any question should be sent within 10 days after the question has appeared. We would call the attention of those sending in answers to the fact that the neatness of any sketches (which must be in *ink*) sent in is considered when marking the relative values of these answers. All formulæ should be carefully written to prevent mistakes as to symbols, and all loose sketches should be signed by the author. The matter must be written on one side only of the paper. Questions may be sent at any time.

QUESTIONS.

357. Can any reader recommend a thoroughly reliable feed-water filter which will take out all oil from surface condensed water? The condensed water as it leaves the air-pump has a very milky appearance, the oil being very intimately mixed with it. The oil is a mineral oil drawn up the low-pressure piston rods by the vacuum.—C. S. M.

358. In power transmission work is there any advantage in generating two-phase currents and transforming them up to three-phase for transmission? Also again transforming down and to two-phase current for distribution? Give a diagram of the transformer connections.—J. A.

ANSWERS.

Question No. 351.—In running alternators in parallel it is possible to obtain two kinds of motor current between them, one caused by any irregularity in the turning moment of the engines, and which is shown by a violent swinging of the ammeter needles, and the other due to the strengths of the alternator fields being in the wrong proportion. This results in a current passing between the machines which is quite steady, and has the appearance of an increased load. The writer has run two machines in parallel, one of which would not maintain full voltage on full load when running alone, but in parallel would give its full amperage, the other machine maintaining the voltage on the 'bus bar at full pressure. Can any reader explain this apparent boosting up of the volts, and if it is an armature reaction, how it is the field is not weakened instead of strengthened?

Best Answer to No. 351 (*awarded* 10s.).—In order to explain the effects described in the question, it will be as well first to state the causes of the two types of idle current a little more fully. The current which causes the ammeter needles to swing violently is an intermittent alternating one—*i.e.*, it alternates with a periodicity approximately equal to the periodicity of the alternators, and at the same time its value rises and falls with quite a different (usually slower) periodicity depending on the relative irregularity of the turning moments of the two engines. The latter variation can hardly be called periodic, as the spacing of the different maxima and minima might be most irregular, especially if the engines were of different types and ran at different numbers of revolutions per minute. Fig. 1 shows the approximate result of running

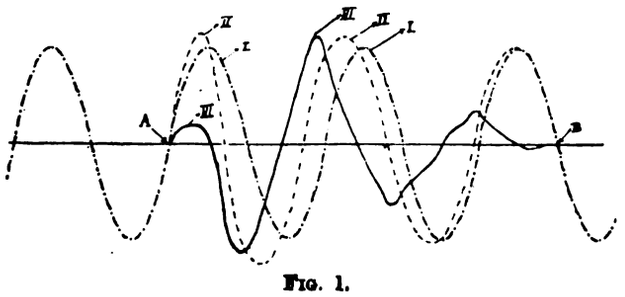

FIG. 1.

two alternators in parallel—one being assumed to run at a perfectly uniform speed and give the voltage curve marked I., whilst the second has an exaggerated unevenness of speed lasting over about 2½ periods at a time and reaching a maximum deviation of about 40deg. of phase from the uniform. (In practice alternators will not run satisfactorily in parallel if this deviation exceeds 5deg. or 4deg. of phase.) Curve III. gives the difference in the ordinates of Curves I. and II. at each point. It will be seen that this difference (which is the voltage tending to pass current round the two alternator armatures in series) starts at zero at A, reaches a maximum amplitude, and then falls again to zero at B during the period of time represented by the curve. In practice, if the engines were of the same type and ran at the same number of revolutions per minute, the time elapsing between A and B would be about equal to the time taken by the alternator to cover $\frac{1}{2 \times \text{number of cranks}}$ of a revolution. If the alternators were running at light or no load, there would be an actual alternating current passing between them at the moments at which a difference voltage (Curve III.) existed; if fully loaded, there would probably only be periodical variations in the relative amounts of current supplied to the external circuit by the two machines. In any case, however, the ammeter between them would vibrate violently.

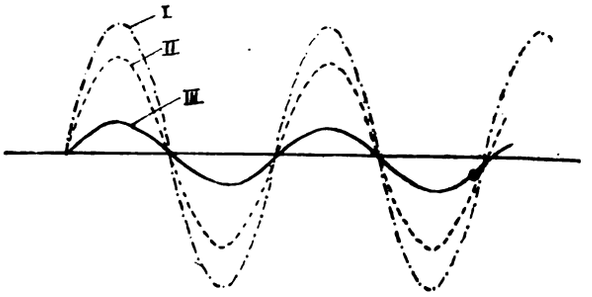

FIG. 2.

Turning next to the effect of under-excitation of one of the machines. This case is represented in Fig. 2, on the assumption that the two alternators are in phase, and have exactly similar turning moments. Curve I. is the voltage curve of alternator No. 1, and Curve II. is that of alternator No. 2, whilst Curve III. is the difference between the two, and is in phase with both. Suppose alternator No. 1 at work and alternator No. 2 put into parallel with it. The immediate result of the voltage represented by Curve III. will be a large current through the two armatures in series. Being practically in phase with the voltage of alternator No. 2 this will act as a strong *motoring* current, and will therefore increase the speed of No. 2 slightly, and shift its voltage slightly ahead in phase of that of No. 1 and of the current in the circuit which depends on the difference between the voltages of 1 and 2. This is equivalent to making the current a maximum at the moment when the armature coils of alternator No. 2, instead of being situated as in Fig. 3—*i.e.*, each side of a coil

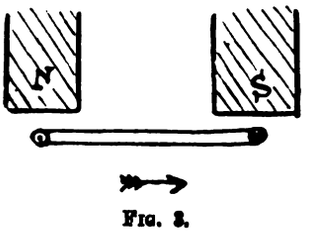

FIG. 3.

centrally under a pole—in which position the magnets are neither strengthened nor weakened by the armature current, are as in Fig. 4, with the result that

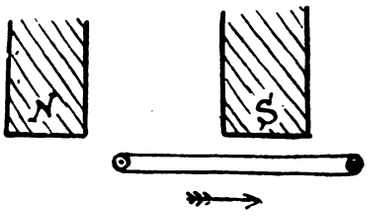

FIG. 4.

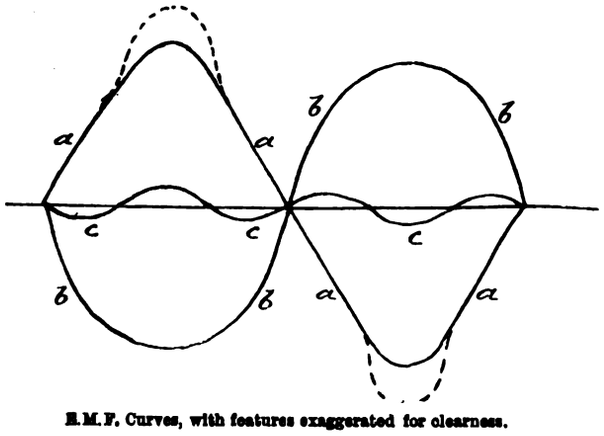
the magnets are distinctly *strengthened*. This can be seen from the direction of currents in the coil O (signifying an up-coming current) and × (a down-going one). This is in accordance with the rule that an alternator armature carrying a leading current, or a synchronous motor arma-

Digitized by Google

ture carrying a current lagging behind the back E.M.F., strengthens its magnets. It is for this same reason that an *over-excited* synchronous motor can be used in place of a condenser for producing leading currents. As soon as the voltage of alternator No. 2 has been increased sufficiently by this armature reaction (due to a definite armature current passing, the amount of which depends on the type of alternator, whether the air-gap is small or large, whether the armature has many or few ampere-turns per mile of periphery, and on the amount of the under-excitation) a balance is reached, and the machines then continue to run steadily. The ammeter between them would read the motoring current, which, as stated in the question, would be indistinguishable from an ordinary load current, except that alternator No. 1 would be found to be supplying considerably more current than is required in the external circuit.

The above explanation also accounts for the case mentioned of an alternator giving a higher voltage when running in parallel than when alone; but, of course, this means of raising the voltage is valueless, as any current passing through the under-excited alternator is a motoring current.—Q.

Answer to No. 351 (*awarded* 5*s.*).—The cause of the rise of voltage in the first alternator when put in parallel with another may, I think, be due to a difference in the wave-form of the two machines. That the voltage falls below normal at full load is, of course, in part due to ohmic loss and in part to armature reaction, the latter preponderating.



E.M.F. Curves, with features exaggerated for clearness.

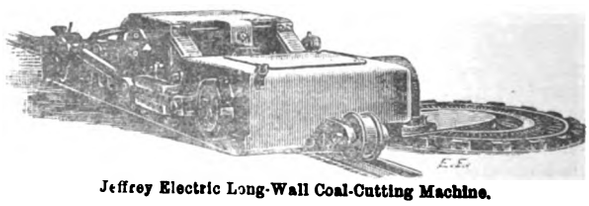
The drop due to armature reaction, moreover, increases with the lag of current behind E.M.F. in a generator. In a motor the case is reversed; armature reaction strengthens the field, increasing the back E.M.F., and this effect is greater with a lagging current. Now, for two alternators in parallel to act as generators at all phases of their cycle it is obvious that the E.M.F. of each must be identical at every instant, or, in other words, their E.M.F. wave-forms must be exactly similar. For if at any instant the voltage of one is never so slightly less than that of the other, the current in it must be reversed, and for that instant it must run as a motor. If, now, the first machine have its E.M.F. wave of some such form as *a a*, and the other have it of the form *b b*, the E.M.F. driving a current in series through the two machines is the resultant, *c c*, of the two curves plotted in opposition, as shown. Where this resultant curve is on the reverse side of the axis relatively to a machine's E.M.F., it shows that machine to be absorbing a motor current supplied by the other over and above that going out to the external circuit.

Leaving out of consideration, for the present, any effect produced in armature reaction, this would have the effect of bringing the ammeter reading for the machine permanently lower than before the other machine was paralleled. There would be no perceptible swinging, as the inertia of the instrument would prevent variations of such frequency being recorded separately. It appears possible that with a machine absorbing current at the beginning and end of a cycle, the field may be thereby so strengthened by the armature reaction of this motor current as to raise the E.M.F. curve in the middle region to a more peaky form, and that this may occur to a sufficiently great extent to bring the E.M.F. and current values up to normal average value for the whole cycle. With regard to this, it is to be remembered that the effective values given by the instruments are the square roots of the mean squares, so that a peaky curve raises the readings rapidly.—ZIPHERN.

Question No. 352.—What advantages are obtained by the adoption of electrical coal-cutting machinery? Describe shortly, with the aid of sketches, what you consider to be the best types of electrical coal-cutters.

Best Answer to No. 352 (*awarded* 10*s.*).—The advantages of cutting coal electrically in mining operations may be briefly summarised as follows: (1) Reduction in number of men actually engaged in coal getting, and consequent reduction in wages bill. One of the best electric coal-cutters, taking two men to work it, will hole as much as from 20 to 30 hewers. (2) Increased amount of coal cut per diem. A satisfactory estimate of the full working capacity of an electric coal-cutter cannot be arrived at, as it is impossible to get the coal away quickly enough to keep pace with the machine. (3) Reduction in cost of upkeep of tools, owing to fitter instruments for the purpose being used. Picks, gads, shovels, etc., are not "lost." (4) Increased comfort to the miners, and therefore easier management of the men. (5) Not so much small coal obtained as by the older method. The cutters make clean cuts around large masses of coal, which are broken into large lumps. (6) Extreme flexibility of system. Cables can be laid along any passage, however low, and provided that a track of light rails can be laid, the cutters can reach portions inaccessible to a man. (7) It is possible to make the roof, floor, and sides of a level more regular than can be effected by hand boring. (8) The rate of driving levels or sinking shafts is two to four times greater than is practicable by hand boring.

Electric coal-cutters have been manufactured capable of working on one of the following principles: (*a*) bar cutters; (*b*) rotary wheel or disc cutters; (*c*) drills. Of these sections the first is the most important at present, being represented by such machines as the Goolden-Atkinson cutter, the Jeffrey coal-cutter, the General Electric Company's cutter, etc. The second class is not so forward, the principal developments being the Snell-Waterhouse cutter used at the Glass Houghton collieries—a rapidly rotating wheel of large diameter undercutting into the coal seam—and the Thomson-Houston "mowing-machine" coal-cutter, which is a modification of the wheel cutter, being a cutter chain turning over a wheel at its front and back ends, and cutting, of course, while passing over the front wheel. In the third class is the Van Depoele electric percussive drill, whose motion is derived from the action of fluctuating currents produced by the interaction of solenoids carrying direct and alternating currents (both obtained from the same direct-current dynamo by means of a special arrangement of brushes). A coal-cutter really consisting of a multiple drilling machine driven by means of a two-phase asynchronous motor, is used in the mines of Pittsburg, Pennsylvania. The advantage of the last system is that the energy is transmitted, without undue waste, a long distance, and, as there are no commutators or collector rings, no sparking can occur. The disadvantage is that fairly high-tension current is used, which is not convenient in a mine.



Jeffrey Electric Long-Wall Coal-Cutting Machine.

The two most useful machines now on the British market appear to be the Goolden-Atkinson cutter (of British manufacture) and the Jeffrey cutter (an American article). Though both bar cutters, their methods of operation are dissimilar. The Goolden bar cuts its way at right angles to the face of the level, being drawn along the level by means of a winch applied to the truck on which it is fixed. The Jeffrey cutter is parallel to the face of the level, and starting at the face cuts its way back to a distance of 5ft. or 7ft. behind the face. The truck is then

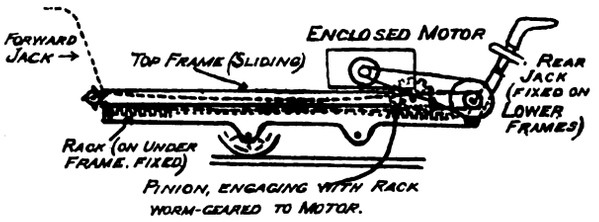
Digitized by Google

moved along to a new position, clamped on the rail, and jacked against the sides and roof of the level, and the process repeated. A detailed drawing cannot, of course, be given of the machine. The sketch, however, shows the salient features. It consists of a movable frame or bed-plate carrying the cutter bar at the front end, the motor near the rear, and the necessary driving, speed-reducing, and reversing gear both for the turning of the cutter and the travel of the cutter bar forwards. This base slides along a fixed frame mounted on truck wheels and carrying a pair of jacks, one at the front and one at the back. It carries also a straight rack, in which a pinion on the sliding frame engages, which pinion is turned by the motor through reducing gear so as to give a low feed forward. The cutter bar, revolving at about 200 revolutions per minute, is driven by an endless steel or bronze chain from driving shaft. The cutter bar is 36in. wide and its travel 7ft. A 15-e.h.p. motor is required, running at 1,000 revolutions per minute, to drive it, and power is usually supplied at 220 volts. The motor is series-wound to give a good starting torque—sufficient to start the cutter against the friction of *débris*.

Referring again to the Goolden bar cutter, this essentially consists of a direct-current enclosed motor whose spindle is horizontal and geared to the cutter bar by a pair of cast-steel double helical wheels running in oil. This motor, gear, and cutter bar are pivoted on a vertical pin, round which the frame carrying these parts is rotated by means of a worm and worm-wheel, the pin being part of an iron truck which travels along the rails of the level. There is another truck on which a winch is mounted, and which can be clamped and jacked rigid in the tunnel, so that by winding the winch the first-mentioned truck, carrying the

cutter bar, can be drawn along. As this bar is about 4ft. long and rotates at 400 to 500 revolutions per minute, it follows that if the whole length of the bar is at work a cut is made 4ft. deep in the wall, of length corresponding to the travel of the cutter track. In order to start the cut, the bar is slewed round until its top touches the face of the level where it is required to cut. It is then rotated, and the cutter truck being kept at the same place, the bar is slewed round until it is at right angles to the face of the level, and is then cutting throughout its whole working length. The winch is then worked and the cut made. The form of bar usually used is as shown. It is taper, and has holes drilled in spirally to receive cutters, this spiral form facilitating the removal of the *débris*. Both machines take about the same power and do the same work in equal times as far as can be judged. There is no real rivalry between them because their purposes are rather different. The Jeffrey cutter is good for driving headings, and for any work where a deep cut is required. As a rule, however, in English mines such deep cuts are not wanted, in addition to which the level must be 7ft. wide to admit the cutter. The Goolden cutter is excellent for long wall work, as it only needs about 4ft. width of level.—J. A. S.

Answer to No. 352 (*awarded* 5*s.*).—It would be difficult to draw any definite conclusion as to the best type of electric coal-cutter, as the type and also the motive power best suited depends in every case upon the conditions of working, the nature of the coal and the price paid for getting by hand, and the nature of the workings in the mine generally, and upon the commercial value of the coal when brought to the surface. Coal-cutting by electricity is now coming more to the front on account of the previous difficulties having been removed by the increased power given to the motors. One form of machine which is now on the market is constructed with two motors, one at each end of the frame, each gearing into the wheel or disc, upon the periphery of which are fitted the cutters, the motors being either of the continuous or polyphase type. The advantage of the latter is the absence of sparking both at starting and running, thus fitting them for working in the majority of mines in the United Kingdom, as very few mines are free from gas at all times; also it requires no starting resistance "as with the continuous-current motors." The starting switches in both cases, "together with starting resistance for continuous-current motors," are contained in a gastight iron box, the handles of the switch passing through a stuffing box. With the polyphase type the motors are started with the cutters off the coal. Then when the motor has attained its speed the cutter disc is allowed to work its way in the coal.



This form of coal-cutter is shown in the illustration, the makers of which are Messrs. John Davis and Son, of Derby, who also supply machines which consists of cutters fitted into an endless chain, the whole frame of which can be jacked up in any position to suit the seam, and is used for shearing in headings, rooms, or entries. The machine is first placed in position and raised to the top of the seam at which the first cut is made, after which it is lowered to a fresh position. Thus complete shearing from top to bottom, about 7ft. deep and 4in. wide, can be done in about 25 minutes. Another type of machine is the bar coal-cutter manufactured by Mavor and Coulson, Glasgow, and it is claimed that less power is required by this than by the disc type on account of the small leverage at the point at which the power is spent. In the machine, as the name implies, there is a steel bar which stands out at right angles to the machine. This bar, along which the cutters are arranged, revolves and cuts its way in the coal to a depth of from 3ft. 6in. to 5ft. 6in.

The advantages of these machines may be set down as follows: (1) great increase in output, about 80 per cent.; (2) a higher price can be realised for the product, in the way of round coal; (3) in the case of bad roofs, the advantage is that the machine travels quicker, thus fresh roof is opened, and packs and props are got up quicker and not so much timber is required; (4) in the case of thin seams where the getting price is high.

Almost in every form of coal-cutter the machine as a whole is hauled forward by means of haulage ropes, which are coiled on a drum, which can be revolved by the motor at a speed determined by the man in charge.

A polyphase installation can be seen at Park Colliery, Garswood, Lancashire.—K.

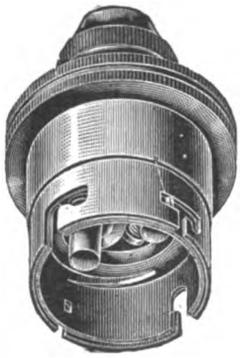
CATALOGUES.

The Electrical Company, Limited, have forwarded to us the 1901 editions of their lampholder and measuring instrument lists. The list of lampholders covers a very great range of design, as in it are included all types that are made in Germany, and also those which have been standardised from time to time by English manufacturers. One feature in the list which we do not remember to have seen before is a lampholder specially designed for damp positions, and which can also be used under water. In this holder a complete porcelain covering is provided, which renders the live metal absolutely secure against moisture. Another feature of the list is the lampholders used for stage-lighting. Three types of these are illustrated, in which the holder is mounted on a porcelain base through which the main conductors can be passed. In this way each holder in the footlight acts as a guide to the conductors, isolating them one from the other. On the last page of the list will be found the adjusted lampholders with standard Edison screw sockets, which are devised with the object of preventing lamps of a higher candle-power than arranged for being inserted. These holders are, of course, only required where the light is given on a flat rate of so much per 16-c.p. lamp per annum. In the list of measuring instruments sent us by the same firm, we find included the various ampere-meters and voltmeters which have for so many years been the standard types of the Electrical Company. Following on to these is a complete series of instruments, in which the induced eddy currents in a light pivoted disc and in a metal

Digitized by Google

screen are so made to interact as to give the readings required. These instruments are wonderfully dead-beat, and the list is devoted to instruments for special purposes for use in workshops and laboratories. It is quite worth while for every electrical engineer to have this list by him when he is working out any new testing apparatus.

We have received from the General Electric Company, Limited, a copy of their March "Progress" sheet, in connection with which special attention is drawn to their new high-voltage wall socket with "lined chamber" fuse; their "quick-break" tumbler switch, with protecting wall of porcelain; and their new "anti-vibration" holder, for use on traction systems and in theatres, etc. With regard to the last-mentioned speciality, it will be seen from the accompanying illustration



that the holder is similar to the firm's usual bayonet-cap type, except that it is provided with an additional interior ring having a small projection engaging in a bayonet catch. The lamp is inserted in the usual way, and is automatically locked by the inner ring. This holder is strongly recommended for car, street, train, ship, and mill lighting, colliery installations, or any position where the lamps are subjected to vibration. Moreover, the anti-vibration holders enable the lamps to be cleaned without fear of their falling out, and are, therefore, eminently adapted for service in footlights and battens of theatres especially. In view of the rapid growth of electric traction in this country this type of lampholder should prove of considerable value.

Messrs. Geipel and Lange have taken up the sole agency in this country for the Ward-Leonard rheostats and circuit breakers, and have recently issued a complete trade list of the same. In looking through this, one is struck by the great diversity of pipes which the firm are now stocking as standard types, and which are applicable to every conceivable requirement in motor control. It is impossible in the space at our disposal to deal with these types individually, and we therefore propose to indicate certain features which are found in almost all of them. One of these features is that the circuit of the motor is never broken on the regulating contacts. Instead of this, a subsidiary contact is provided, at which any slight arcing there may be takes place. This subsidiary contact is also operated in the event of the current in the circuit exceeding the predetermined limit. In a number of these circuit breakers the starting arm is held in the "full-on" position by an electromagnet in the shunt field circuit of the motor. In the event, then, of the supply being discontinued, this lever is released, and springs back into its original position. Of course, in doing so it has not to interrupt any current. The circuit is thus broken by an independent arm in the event of over load, which combination prevents any damage being done to either the motor or starter. The Ward-Leonard rheostats now being supplied by Messrs. Geipel and Lange consist of resistance wires secured on to an iron base by means of enamel. The iron base is made with radiating fins in order to get rid of the heat which is generated in the resistance wires, and in this way the makers are enabled to get into a small space the wires required for regulating the motor or dynamo. We gather, however, that the design is not strained, as the radiating surface provided is about 1in. for every 2½ watts lost in the resistances. The enamel protects the resistance wires from oxidation. Of course, the success of this type of rheostat entirely depends on the enamel, which must allow of the expansion of the resistance wires with heat without cracking. It must also be of such a nature that the heat does not make the cover soft enough to deform. In both these qualities the Ward-Leonard rheostat enamel appears to be most successful. Another feature standardised by the firm is the Ward-Leonard resistance units, which consist of wires of high resistance and of low temperature coefficient, which are wound on to porcelain tubes. The wire is then cemented on to the tubes by means of enamel, which prevents oxidation and also prevents the adjacent layers of the spiral coming in contact. The porcelain tubes are open at the ends, which, of course, increases the radiating properties, as it allows a through draught to pass up the centre of the resistance spiral. These units can be obtained for a great variety of currents and with a corresponding variation in resistance. For instance, with a spiral and a porcelain tube 3½in. long and ⅜in. in diameter, the first unit listed is 700 ohms resistance, and will stand a maximum current of about one-third of an ampere. A range of 12 of these resistances ends up with one of only 15 ohms resistance, and through which 2·17 amperes can be passed without damage. A second list of the same size continues the range down as low as 0·15 ohm, with a maximum current of 21·7 amperes. It will be a great convenience to electrical engineers to be able to buy at a uniform rate resistances of such a durable character, from which any combination required can be quickly made up. The list of rheostats and circuit breakers is completed by a number of special starting gears such as are required for driving printing machinery and other special applications of electric motors.

From the Dermatine Company, Limited, 95, Neate-street, London, S.E., we have received a copy of the Dermatine price-list for 1901, which contains a considerable amount of information about the goods manufactured from the material in question, including belting, driving bands, air-pump valves, joints, washers, hydraulic cup rings, hose, etc. Dermatine, we are told, consists of a combination of gums and chemicals treated specially and vulcanised much in the same way as indiarubber. It is stated to have been tested all over the world for many purposes against indiarubber, and, particularly in hot climates, found greatly superior, especially in regard to its lasting qualities. But the special feature of the catalogue consists, perhaps, in the maps which it includes to show the districts throughout the world where raw rubber is collected.

LEGAL INTELLIGENCE.

WIRING CONTRACTORS' RESPONSIBILITY.

In the City of London Court on Friday last, before the deputy-judge and a jury, an action of much importance and interest to the electrical trade was disposed of, it having been remitted from the High Court. The claim was made by the Electrical and General Engineering Company, 17, Gracechurch-street, E.C., to recover the sum of £111 1s from Mr. Albert J. Aitkens, Fernwood, Camden Wood, Chislehurst, for work and labour done in installing the electric light at his house.

Mr. Turner, counsel for the plaintiffs, said that the defendant had paid £95 of the sum claimed, but now that the action had come into court the defendant not only refused to pay the balance, but had set up a counterclaim, in which he asked to be awarded £100 for defective workmanship of the plaintiffs'. The defendant was the brother-in-law of an architect named Knight, for whom the plaintiffs had done work on several occasions, and in that way he was introduced to the plaintiffs, because he wanted to have the electric light installed into his house at Chislehurst. The order was given, and a specification was supplied for installation in September, 1899. The plaintiffs suggested that the wires should be carried in enamelled steel tubes, as by using them there would be greater protection from injury. An increase in the price of 25 per cent. was made for that. The work was commenced in October, but it was not completed until early in January because of building alterations which were going on in the defendant's house. At last the electric light was duly installed, and when it was finished the plaintiffs in March sent in their account. Then the defendant commenced to make a long list of excuses why he should not pay their bill. He complained that there was a leakage of the current, but that was due to the dampness of the house. The main was put into the cellar, which was very damp, indeed, and, in fact, the house reeked with dampness during the whole of the time that the plaintiffs were fitting up the light. The condition of the switches alone showed that there was a leakage of current through the dampness. The defendant complained that he could not turn out the light in the hall, and that it had to burn night and day. Afterwards, he complained that he could not get the hall light to burn, and that the billiard-room was in darkness. The plaintiffs' men went down and they found a considerable quantity of surface leakage, but it was all caused by the dampness. They found that the tubes had been damaged by the defendant's builders, and in the vestibule they took out a wire which had been injured while some floors were being put down. Fresh pipes were put in, and the work was left in a thoroughly complete state. There was no cause for the defendant's complaints, and they ought not to have been made.

Mr. J. A. Bower, who said he was one of the plaintiffs, stated that all the work sued for had been carried out under his personal supervision. He was not at Chislehurst the whole time that the work was being done, because he had to go into the country on other business. Their contract required that they should instal the light to the approval of the electric lighting supply company at Chislehurst, as well as the fire insurance companies. Both of those bodies had approved of his work, and the light was supplied after the approval so given. In cross-examination, he said he did not know that the electric current had been escaping all over the defendant's house, to put it generally. He was surprised that the defendant could not use the water in the lavatory because of the electric shock which anyone received upon putting their hands into the water. If there was such a shock, it would not be dangerous. The defendant told them about it, and they immediately sent to rectify it. It was not true that the work

Digitized by Google

was done inefficiently, or in an unworkmanlike manner. They had not infringed the rules of the supply company by leaving wires which were uncovered. If the supply company said the installation was at the present time dangerous to their own mains as well as to the lives of the people in the house, it would not be true. The house had been sweating in a marvellous manner, and when he was down there on Monday last the place absolutely tasted of dampness, and the walls were wet. They did not use brazed tubes, but tubes with open joints. The damp could not be excluded from the tubes containing the wires, because it was necessary to leave open spaces. He did not know that they had neglected to put any insulation between the main switchboard and the wall. When he entered into the contract he had no idea the place was so wet. On the previous Monday, when he tested the electric light, he found it was quite satisfactory. The house had had a chance to dry lately, and the lights all over the house were satisfactory, except that the basement was wet. They could have supplied moisture-proof tubing instead of the enamel steel tubing, but the difference in price would have increased the expenses by 50 per cent. If the fire insurance companies had anything to complain of in the defendant's house, it would only have been fair to have given them a chance of remedying any defects, if they existed. The tubing which he used was of the best kind, and of the sort which was generally found in houses. There was a better class of tubing, which had no joints in it and which was lined with insulation, and it would cost three times more than the kind used. The defendant could have had this insulated steel tubing, but that was a fad more than anything else. Their work was delayed to some extent, but that was because the defendant's building operations were interfered with.

Mr. L. Schram was also called to speak to the work being carried out properly. The cause of the leakage was excessive wet and moisture. The test which he made quite recently was satisfactory. There was no ground for suggesting that naked wires were put under the drawing-room floor. The electric light had been in use for 18 months now. The reason he did not use tubing with brazed joints to exclude the moisture was because it was not specified for. He did not know that the rubber round the wires had in some instances burned away in consequence of the electric current escaping. They did not take any exceptional precautions to provide against dampness.

Mr. Frederick J. Bewer was also called, and he said he had had 10 years' experience as an electrician. The work was carried out under his supervision, and wherever it was unsatisfactory it was on account of dampness. The wire which was used was insulated with vulcanised rubber.

Mr. Henry C. Hall, A.I.E.E., arbitrator to the London Chamber of Arbitration, said he acted for the City of London Electric Lighting Company and other large concerns as an expert. He had spent five years in the manufacture of rubber, and he was of opinion that the rubber covering on the wire used by the plaintiffs in the defendant's house was of the highest class used for house purposes. There was no remedy for the leakage which had been complained of. It was impossible to prevent it. If the plaintiffs had contracted to fix up an impossibility, that was no affair of his. The only way to get rid of the condensation was to dry the place, and then it would disappear. The best materials were used in fitting up the electric light at the defendant's house.

For the defence, **Mr. Colam** said the complaint which the defendant made was a very serious one, indeed. The inconvenience to which he had been put was also very great. The defendant had had to pay for a vast amount of electric current which had been wasted in consequence of the very defective way in which the plaintiffs had installed the light into his house. No one would ever be able to tell the extent of the defendant's loss, because the electric current had been escaping all over the house. The defendant had never had given to him the supply that the plaintiffs had contracted to put in. At the present time the defendant had only a partial supply. The supply company would not run the risk of allowing the defendant to leave on the current during the night, and he was compelled to shut it off during the greater part of the day. It was only in the evening that the defendant was allowed to use the light at all, and then only for limited hours. The great charm of electric light was the convenience of it. People did not have it entirely because it was much a more brilliant light, so much as for its convenience in being able to switch it on and off at a moment's notice. The defendant had been deprived of that convenience simply because of the plaintiffs' gross neglect. Furthermore, the defendant was still uninsured because of the possibilities of fire, because the installation of electric light had been carried out so badly that the fire insurance companies thought the risk too great to accept. The defendant now counterclaimed for damages for the plaintiffs' bad workmanship, and he asked the court to give him something to cover his risk of non-insurance. It was very likely that difficulties would still arise, and all in consequence of the careless way in which the plaintiffs had done their work.

The **Jury** here intimated that they only wanted evidence about the plaintiffs having failed to comply with the supply company's requirements and the fire insurance company's stipulations.

Mr. Fricker, of the firm of Fricker, Miller, and Co., said he was a member of the Institution of Electrical Engineers, and adviser to the London, Liverpool, and Globe Insurance Company. He was requested by the insurance company to inspect the defendant's premises on Jan. 30 with a view to insuring them against fire. Their rules had not been complied with, and he could not advise the company to accept the risk. Directly the main switch was on there was a dead earth. That was very serious, and it might be dangerous to life or cause a fire. In his view it was not all due to dampness, as suggested, but because of the imperfect material which the plaintiffs had used. Open-jointed pipes had been laid in plaster work, and that was an improper thing to do. He did not notice that the house was particularly damp, as had been alleged, and, in fact, the cellar seemed rather dry. The insulation had not been properly fixed, and the work was by no means high class. The wire was not the best that could be furnished. Wire enclosed in damp plaster ought to be put in hermetically-sealed conduits.

Mr. F. S. Hanning, an electrical engineer of the supply company, said he inspected the work in question. They had supplied the electric current to the defendant's house, but their requirements had not been complied with by the plaintiff company. There was considerable danger attaching to the way in which the plaintiffs had done their work, and the defendant only had a limited use of the light. They could not tell when a short-circuit might take place. There had been short-circuits.

The **Jury**, in giving their verdict, said they were of opinion that the plaintiffs were not entitled to any more than £95 which had been paid them on their claim, and on the defendant's counterclaim they awarded him £25 damages, and judgment was entered accordingly.

FORTHCOMING EVENTS.

FRIDAY, MARCH 8.

Physical Society.—At 5 p.m., meeting at Burlington House. Papers: "A Theory of Colloidal Solutions," by Dr. F. G. Donnan; Exhibition of Apparatus, by Mr. R. Appleyard; "On the Production of a Bright Line Spectrum by Anomalous Dispersion and its Application the 'Flash Spectrum,'" by Prof. R. W. Wood. Council meeting at 4 p.m.

Royal Institution.—At 9 p.m., discourse on "Vitrified Quartz," by Mr. W. A. Shenstone.

Institution of Civil Engineers.—At 8 p.m., students' meeting. Paper on "Sewage Treatment," by Mr. Chas. Johnston.

British Insulated Wire Company.—At 6.30 for 7 p.m., annual dinner, Adelphi Hotel, Liverpool.

SATURDAY, MARCH 9.

Royal Institution.—At 3 p.m., "Sound and Vibrations," by the Right Hon. Lord Rayleigh (Lecture III.).

Institution of Junior Engineers.—At 3 p.m., visit to the Southall station of the Brentford Gas Company to inspect the carburetted gas plant, etc.

Glasgow and West of Scotland Scientific Society.—At 7.30 p.m., ordinary meeting. Paper on "The Progress of Electricity Supply," by Mr. J. G. Scott.

MONDAY, MARCH 11.

Society of Arts.—At 8 p.m. "Electric Railways," by Major P. Cardew (Lecture I.).

Institution of Electrical Engineers (Newcastle-on-Tyne Section).—Ordinary meeting.

Sanitary Institute.—At 7 p.m., lecture on "Ventilation, Warming, and Lighting," by Prof. T. Roger Smith.

TUESDAY, MARCH 12.

Institution of Civil Engineers.—At 8 p.m., ordinary meeting. Paper on "The Æsthetic Treatment of Bridge Structures," by Mr. Jos. Husband.

Institution of Electrical Engineers (Manchester Section).—At 7.30 p.m., ordinary meeting. "The Adaptation of the Steam-Engine to the Generation of Electrical Energy," by Mr. J. S. Raworth.

Board of Trade.—Adjourned enquiry into the application of the Electric Lighting Companies to increase the standard pressure of supply.

WEDNESDAY, MARCH 13.

Institution of Electrical Engineers (Students' Section).—At 7.30 p.m., extra meeting. Paper: "Distribution of Energy in Coal Mines," by Mr. F. E. Pring.—Glasgow Section: At 8 p.m., ordinary meeting.

Institution of Civil Engineers.—At 2.30 p.m., students' visit to the Millbank-street pumping station of the London Hydraulic Power Company.

Society of Arts.—At 8 p.m., ordinary meeting. "The Proposed Electrical 'Monorail' between Liverpool and Manchester."

Parochial Institute.—Mr. C. N. Russell will read a paper on "Refuse Destructors."

THURSDAY, MARCH 14.

Institution of Electrical Engineers.—At 8 p.m., ordinary meeting. If the discussion on Mr. O'Gorman's paper is concluded the following paper will be read: "Some Notes on Polyphase Sub-station Machinery," by Mr. A. C. Eborall.—Students' Section: Visit to the works of the Incandescent Lamp Company announced for this date will not take place.

FRIDAY, MARCH 15.

Institution of Mechanical Engineers.—At 8 p.m. ordinary meeting. Paper on "Combined Trolley and Conduit Tramway Systems," by Mr. A. N. Connett.

SATURDAY, MARCH 16.

Royal Institution.—At 3 p.m., the Right Hon. Lord Rayleigh on "Sound and Vibrations" (Lecture IV.).

TO CORRESPONDENTS.

All Rights Reserved. Secretaries and Managers of Companies are invited to furnish Notice of Meetings, Issue of New Shares, Installations, Contracts, and any information connected with Electrical Engineering which may be interesting to our readers. Inventors are informed that any account of their inventions submitted to us will receive our best consideration.

All communications intended for the Editor should be addressed C. H. W. Biggs, *139-140, Salisbury Court, Fleet Street London, E C. Anonymous communications will not be noticed.*

TO ADVERTISERS.

Advertisements should be addressed to the Publisher, 139-140 Salisbury Court, Fleet Street, E.C., and should reach him not later than noon of Thursday. **Special Terms** *for a series can be arranged on application.*

SITUATIONS WANTED will be charged at three words for One Penny (prepaid and net), with a minimum charge of Sixpence.

TO SUBSCRIBERS.

"The Electrical Engineer" *can be had by Order, from any Newsagent in Town or Country, and at the various Railway Stations; or it can, if preferred, be supplied direct from the Office on the following terms:*

	3 months.	6 months.	12 month
United Kingdom	3s. 3d.	6s. 6d.	13s. 0d.
Other Places	5s. 6d.	10s. 6d.	21s. 0d.

Cheques, Post Office and Postal Orders for Subscription and Advertisements should be made payable to C. H. W. Biggs, *139-140, Salisbury Court, Fleet Street, London, and be crossed "Union Bank."*

ELECTRIC POWER FOR WEST AFRICA.

Such is the title of an article in the *Financier and Bullionist* of Tuesday last, suggesting a power transmission scheme for the economical working of the gold mines on this coast. That electrical transmission has a great future in Africa there is no doubt, but the promise is only first rate when water power is available. We are not going to criticise too closely the statements and figures of the article, though it will be necessary to indicate that the true conditions of the case are not considered, and the estimates are a little rosy. The writer correctly states that "electric power can now be generated and economically transmitted one hundred miles," and then points out the advantages as regards transport and labour that would arise with a generating station at the coast. A weak point comes in when it is assumed that "the power would be reliable and continuous, breakdowns would practically become things of the past." Aluminium conductors, instead of copper, are suggested, and the distance of transmission fifty miles from the coast. If the conductors were overhead, maintenance would be very difficult for many reasons, not the least of which would be the tendency of the natives to get at the metal. The author evidently intends the cables to be overhead, because he states that the lighter aluminium will require less poles. It is certain that some deaths would occur with a pressure of ten thousand volts and pilfering natives; this might frighten the latter. On the other hand, it might exasperate and greatly affect the political situation. We doubt, indeed, if the politicians would in the present state of affairs permit of overhead transmission, and underground transmission is probably impracticable. A more important point, however, in considering the suggestion is, assuming the success of mines only fifty miles from the coast, whether it would not lead to the early construction of a railway to the scene of operations. If so, would it not be much better to erect a central station on the field and distribute around. At the present moment the contour of the district is not before us, so that the cost of a railway cannot be estimated; we assume its practicability. With a railway—and it might be an electric railway—the transport difficulties would be solved, and it would be easier to guard the conductor of an electric railway than the conductor through a virgin country. The question of labour also would present fewer difficulties, in that the coast would be easy of access. The estimated cost of erecting and equipping a station to supply 1,500 h.p. at the point of consumption, together with working capital to run for a year, is £110,000 + £35,000 = £145,000. The working costs are estimated at £34,250, hence the above allowance of £35,000. Allowing for a working year of 3,500 hours, 1·56d. is the estimated cost "per horse-power hour for energy given off at the mines," and if sold at 3d. per horse-power the profit would be over £31,000 a year. This, of course, would be an excellent scheme if the conditions were altogether favourable, but, as previously indicated, they are somewhat doubtful. A mere transmission

Digitized by Google

plant would not help the transport of machinery or supplies; and if success comes, these must be considered. If "Jungles" turn out another Rand scene of operations, a railway will become a necessity; hence we suggest caution.

CORRESPONDENCE.

"One man's word is no man's word,
Justice needs that both be heard."

THE LONDON COUNTY COUNCIL TRAMWAYS.

SIR,—Your correspondent, "Pro Bono Publico," quotes the first half of a certain paragraph, and in it puts italics which are his. Allow me to quote the second half of the same paragraph, and to use italics which are mine:

"... *it is doubtful if there will really be much saving, for the extended yoke need not be rectangular (as shown in Fig. 7), but can be of the more commonly employed triangular shape (as in Fig. 9), which is an illustration of one of the New York tracks.*"

"Pro Bono Publico" says he quoted the paragraph to show that there are other considerations besides those of ingenious design and elaborate machinery. His meaning is not clear, unless he means that the London County Council conduit has the one advantage of small size. In other words, the advantage would be in the small amount of road excavation necessary for the laying of that conduit, but I had shown the advantage of a system which required *few* repairs.

More than all the excavation saved in the beginning with the London County Council conduit will be made afterwards in repairs. There are 13 years of experience with conduits which prove this. It is not less than amazing that such a question should be raised at this date. Men have not made conduit yokes heavy for any reason more subtle than this: that the lighter forms of yokes proved unworkable.

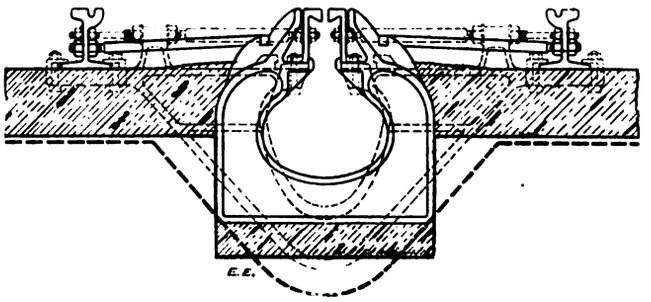
And it is not alone the lightness of the London County Council conduit to which experienced men will object; it is to the bad design throughout. First of all, it is bad engineering to lay the rails independently of the slot-rail yokes. The inadequate stay-bolts in the London County Council track can be of no avail, and of what advantage is it that less excavation be made in the beginning, if afterwards the slot closes up tight on the contact plough, and the passengers have to walk? The slot does close up. At 6,000lb. per square inch the London County Council slot closes an eighth of an inch. It ought to resist 20,000lb.

If engineers form themselves into national cliques so that, for example, a Bulgarian will never use a certain cylinder oil because it is Roumanian, we shall soon have more than enough nationality and too little progress. This is happening, not in the Balkans, but in England, and all over this miserable affair of a conduit. Is it worth her while to fight over such a matter? I mean, is it worth a little corner of her pride to fight against the *via trita* of successful experience?

Someone in the *Electrical Review* of Feb. 22 has been making a skirmish of that kind. He would defend the conduit of the London County Council by asking much begged questions which he himself decimates. But after all he fails to champion that which he damns by the inevitable faintness of his praise. It would be an injustice to the designer of the London County Council conduit to suppose that his high reputation depends upon the worth of that device. And no one need champion him by the defence of other numbers of his works than those which have added undoubted elements to the industrial progress of Great Britain.

At all costs the electric tramways must work without a hitch. A failure in the beginning will do more harm than a thousand excessive excavations which might for some weeks annoy the gentle omnibus driver. But no one proposes such excavations.

An actual discussion of the comparative amounts of excavation has not been entered upon because that question stands far to the side of the *sine qua non* in London traction. However, for the benefit of the few who cannot help seeing a paramount importance in a tertiary consideration—viz, excavation—I give a drawing which shows the facts.



The full lines show the London County Council yokes and conduit. The dotted lines show one of the many conduits which have worked with perfect success. One may compare the excavations and the concrete.—Yours, etc.,

M. B.

P.S.—"Pro Bono Publico" loves chaff. Tell him that I shall try to feel the flattery which he intimates when I note the charming attention symbolised by the use of granite in England. He bids me consider the motto, *Via trita, via tuta.* My Latin, as one says, is not what it used to be. But it can stand the strain of *tritus* and *tutus.* Am I to read, "*The beaten path is the safe path*"? Impossible! "Pro Bono Publico" is but turning humour on himself. Surely the grey matter is on the wrong side of his venerable skull. It is the *via trita* I have recommended; the beaten track, the tried thing; not the new conduit. When in the wet spring of 1893 I sailed for the last time out of the Bay of New York, the sound of the exploding conduits brought tears to my eyes. I would ask "Pro Bono Publico" to leave me this memory of my race, and to bring it not too prominently into the glare of a great public controversy.

THE LATE PROF. G. F. FITZGERALD, F.R.S.

We regret that pressure on our columns prevents us giving a detailed obituary notice of the late scientist, who was president of the Dublin Section of the Institution of Electrical Engineers, but no remarks from us could better express our sense of loss than the following references made at the parent Institution last week. Thus before the commencement of the ordinary business of the meeting, Dr. Perry called on Prof. Ayrton.

Before the commencement of the ordinary business of the meeting of the Institution of Electrical Engineers on Thursday week some sympathetic references were made to the recent death of Prof. G. F. Fitzgerald, late chairman of the Dublin Section of the Institution.

Prof. W. E. AYRTON said he rose to propose no ordinary vote of condolence, for in expressing in conventional form the sincere regret that this Institution felt at the death of the chairman of its Dublin Section, he desired rather to give voice to their deep grief and sorrow at the loss of the dear friend of many and the willing helper of them all. To some of them, perhaps, Fitzgerald was but a name—and why? Because his life's work was that of inspiration—inspiring others. He gave them his ideas; aye, he even explained to them the real meaning of their own. Science to Fitzgerald was what religion is to the highest type of priest—not a thing to be used to increase the status or the wealth of its exponent, but a great good to be poured forth without reference to reward or even to remuneration, for the benefit of man and of the world. Singularly free from human importance, singularly fertile in suggestion on all subjects, was their dead comrade. He knew his worth, but never claimed it. He knew his power; but whenever he used it was for them, for him, for science, to secure intellectual liberty, but never to secure position for Fitzgerald. And yet for him abstruse mathematics had no difficulty, complex physical processes no obscurity. He seemed to be able to follow the interaction of physical molecules more than they could grasp

Digitized by Google

the working of visible machines. Only that day he (Prof. Ayrton) was looking at two letters from Fitzgerald—one which reached him on the very day that Duddell read his paper in that room in December, and the other a few days later. Every line breathed suggestion, encouragement, criticism, modification. These two letters were little treatises of the theory and possibilities of Duddell's device. Single-minded, simple-hearted, he died as he had lived, respected, honoured, beloved.

Major-General WEBBER also paid a high tribute to the memory of Prof. Fitzgerald. He could trace his descent back to the time of the Normans, and there was no doubt that the brain tissue was strengthened and brought down to him through generations of strong and powerful men. Not only was Fitzgerald strong, but he was entitled to be called gentle.

Prof. S. P. THOMPSON wished to add his voice in expressing their condolence at the loss of one who was so dear to them, and so helpful to every worker in science who had the fortune to come across him. In Germany they deplored the fact that there was not more combination in the efforts of scientific men such as was the custom in England. If there was one man who was more helpful than another in that work, it was Fitzgerald. They ought not to forget what a very important part Fitzgerald's ideas played in the discovery of the propagation of electric waves. Fitzgerald had read papers before the British Association, and predicted the properties of these waves on the lines of Maxwell before even the researches of scientists had resulted in the experimental methods of exploring electric waves. One of the suggestions for a coherer for detecting waves was made by Fitzgerald himself. In thousands of ways he helped others to carry out ideas which he himself could not possibly develop for want of time, and so gave them to the scientific world. Even in the work of examining candidates for their degree in physics at the University of London, he was as kindly and helpful and as fertile in ideas as any man could be. There were few in any walk of life that could claim the ability which Fitzgerald had, and there were none who surpassed him in kindly help to others.

The PRESIDENT said that at the inaugural meeting of the Birmingham Local Section the night before he had said what he had to say on this subject. He had attended the funeral of the late Prof. Fitzgerald as representing the Institution.

The following resolution was then passed in silence, each member standing in his place: "That the Institution of Electrical Engineers in full meeting desires to express its profound sorrow at the death of Prof. George Francis Fitzgerald, and to place on record the high appreciation of his brilliant qualities as a man, as an investigator, and as a leader of scientific thought; and to express to Mrs. Fitzgerald and his family its heartfelt sympathy in the calamity which has fallen on them and on science."

ELECTRIC LIGHTING ENQUIRY.

Question of Increased Pressure.

At the Westminster Town Hall on Friday last, Sir Courtenay Boyle, permanent secretary to the Board of Trade, opened an enquiry into the application of the electric lighting undertakers in general that the proviso to Clause 6, Section B, of the regulations made by the Board of Trade on March 4, 1896, might be so altered as to take away the right of consumers to object to an increase of the standard pressure of supply.

The counsel engaged in the enquiry were: Mr. Balfour Browne, K.C., Mr. Roger Wallace, K.C., and Mr. D. Warnington, for the Westminster Electric Supply Corporation; Mr. Moon, for the Chelsea Electric and the Metropolitan Electric Companies; Mr. Roskill and Mr. A. B. Cane, for the City of London Electric Lighting Company; Mr. Littler, K.C., for the Windsor Hotel and the Junior Constitutional Club; Mr. Alfred Lyttleton, K.C., and Mr. Talbot, for the London County Council; Mr. R. C. Glen, for the Paddington Borough Council; and Mr. Danckwerts, K.C., and Mr. A. J. Walter, for the City Corporation. A number of local authorities were represented, Mr. John Bowers, town clerk depute, representing the Glasgow Corporation in support of the application.

The PRESIDENT explained the object of the enquiry to be as stated above.

Mr. BALFOUR BROWNE said he not only appeared for the Westminster Electric Supply Corporation, but also on behalf of several local authorities. He proposed to state the case of the Westminster Corporation first. Under the Electric Lighting Act of 1888 the company applied for a provisional order. The Board of Trade then held an enquiry as to the questions involved, and one of the principles laid down in the report, which had been very often acted upon since, was that competition was in favour of the public, and that the best competition the Board could see its way to sanction was competition between two companies supplying two different kinds of energy—one alternating and one continuous current. An order was granted to the Westminster Company in 1889, and Section 10 provided that energy was to be supplied by means of a system approved by the Board of Trade and subject to such regulations and conditions for securing the safety of the public and ensuring a proper supply of energy that the Board of Trade might from time to time impose. In July, 1890, the company submitted a system to the Board of Trade, which was sanctioned on Sept. 4 the same year. This was a low-pressure continuous-current three-wire system. The same month the Board of Trade published their regulations in accordance with the section to which he had already referred. The most important of these regulations was that with regard to the fixing of the standard pressure of supply by the undertakers, which ran "Such constant pressure shall not be altered, except by permission of the County Council, and upon such terms and conditions as the County Council may impose, and after public notice has been given." Then there was a provision that if the company were not satisfied with the decision of the County Council they might appeal to the Board of Trade, whose decision was to be final. The learned counsel said that, as he understood it, the regulation just referred to was made for the express purpose of guarding the rights of the public. It was a perfectly sufficient protection for the public, but the regulation which afterwards took its place was no protection at all, and allowed one or two consumers to block and interrupt a proper supply of energy to a very large district in London. Regulation 6 provided that the undertakers were to declare the constant pressure at which they proposed to supply energy, which was not to be greater than 115 volts and not less than 45 volts. The seventh regulation provided that the variation of pressure at the consumer's terminals should not exceed 4 per cent. Under these regulations the Westminster Company commenced supplying energy in 1891, and in accordance with Regulation 5 they fixed their standard pressure at 100 volts. By the fourth schedule of the order, Section 1, they were entitled to charge 8d. per unit. The business of the company increased very rapidly. In 1891 they had 763 consumers taking 672,500 units, while to-day they had 5,500 consumers taking 7,000,000 units. Accordingly, they were able to and did reduce the price, until to-day it stood at 6d. per unit for the first 4,000 units, and 4d. for every unit in excess of that figure. This represented an average charge of 4¾d. per unit, which was only 57·4 per cent. of the authorised price. The method of supply to consumers which was chiefly adopted was by means of an agreement terminable on either side by one month's notice. It must not be forgotten that in this district the public were not entirely dependent upon one company, as there was a competitive company to whom they could go if dissatisfied. The Board of Trade had from time to time, said the company's counsel, power to alter and revise their regulations, and in 1895 they exercised this power. One of the chief points to consider was the question of allowing the use of a higher voltage than 100, and in November of that year the Board of Trade held a conference, presided over by Sir Courtenay Boyle. The result was that many of the existing regulations were revised and altered. A question, however, arose as to the definitions of the terms "high pressure" and "low pressure," and when the conference arrived at the consideration of Regulation 6, providing that the undertakers were to declare the constant pressure, the discussion was postponed, the president intimating that it depended upon the true definitions of these terms. Subsequently the Board appointed a committee of experts, consisting of Lord Kelvin, Sir Wm. Preece, and Major Cardew, to consider the question of pressure, and on their recommendation 250 volts was fixed as the highest limit for a low-pressure supply. The following regulation was then made: "No change shall be made in the pressure of the supply to any premises except with the consent of the consumer." It was to this clause that the companies now objected. When the Westminster Company began to supply energy they were advised by exceedingly competent engineers, and they were fully alive to the advantages of a 200-volt pressure, but at that time there was no 200-volt lamp which could be depended upon. The company accordingly adopted the 100-volt pressure. In 1896, however, they were again advised by Prof. Kennedy, and they saw that the time had come to alter the pressure, as being in the interests of the consumers, of the company, and of the local authority. In order that they might increase the pressure, they circularised their consumers, pointing out that they considered the change would be advan-

Digitized by Google

tageous, and that the permission of the County Council to the alteration had been obtained. The result was that 5,500 consumers were to-day taking the 200-volt pressure with the exception of eight. In these circumstances they had, under the present regulations, to go on supplying eight customers scattered over a large area with energy at 100 volts, and this cost the company a great sum of money. As they had the right to charge 8d. per unit they had charged these eight consumers the full price, and even then it was at a loss. Instead of going to the other company, they insisted upon still continuing to have their energy from the Westminster Company, and they also insisted that if the change from 100 to 200 volts was to be made, they should dictate what should be done and what should be paid them. The large bulk of the consumers were satisfied with the 200-volt pressure, and the change had been made entirely at the company's expense, having cost them already £45,000 in the houses of the consumers. What some of the opponents seemed to desire was not that the change should be made on fair arbitration terms, which the company were quite willing to accept, but they wanted to dictate what was to be paid them on account of inconvenience caused by the conversion. And the company resisted.

The PRESIDENT: Have the company offered arbitration terms at their expense?

Mr. BALFOUR BROWNE said he was told no such offer had, in fact, been made. The company, however, had been exceedingly fair in the matter. He was prepared at this instance to offer arbitration terms, the arbitrator being appointed by the Board of Trade or the Local Government Board. The proviso the companies proposed in place of the one now existing provided that "no change shall be made in the standard pressure of supply except upon such terms and conditions as may be agreed upon between the undertakers and the consumer, or, failing agreement, as may be settled by an arbitrator to be appointed by the Board of Trade." The first of the objectors was the Junior Constitutional Club in the Mayfair district, of which Mr. V. D. B. Cooper was the electrical adviser. They consumed 89,980 units in 1900. This was the only objector in the Mayfair district. The next was the Dowager Duchess of Sutherland, of Belgrave-square, her case being that she was afraid of getting a shock with the 200-volt current which would not be given by the 100-volt current. It would be explained later in the proceedings that there was no more danger from shock from a 200-volt circuit than from the 100-volt three-wire system. Mr. Todd, of Eaton-square, and Mr. Norman, of Belgrave-mansions, also objected, but gave no reasons. Then in the Westminster district the Hotel Windor objected. Mr. Cooper, again, was not only the electrical adviser, but he had an interest in the hotel as well. They consumed 68,505 units in 1900. Messrs. Sellon and Cooper, of the Broadway, and Prof. Forbes, of Great George-street, also objected. They consumed 70 units and 17 units respectively. The Westminster Company were now supplying seven million units to 5,500 people, and these eight were the only objectors. The advantages of the change from the 100-volt to the 200-volt pressure were these. In the first place, to all those consumers who had taken the 200-volt current a reduction in price of 8 per cent. had been made. Another advantage of the 200-volt pressure was that of economical distribution, and a great saving in the loss in carrying the energy to the consumers. With the 100-volt supply the loss was 12½ per cent., and the consumers had to pay for it. That loss could be reduced to 5 per cent. by the change-over to 200 volts, which would enable the company to supply energy at a cheaper rate. Again, owing to the increased capacity of the mains, there would be less frequent interruption and pulling up of streets. Besides that, there was the steadier and more efficient supply of energy with the 200-volt current. In the first place, the higher pressure would be an advantage to the company, and in 21 years there would be a saving in capital expenditure of £157,000, which they would have had to spend in additional feeders for the 100-volt supply. But, of course, against that must be put the £45,000 which they had already paid for the conversion of the lamps and fittings. There, however, would be a net saving of £112,000 in that period. One great effect of this was that when, at the end of 42 years from the date of the provisional order, the company came to be bought out, the less spent on capital the less the local authorities would have to pay. The loss of 5 per cent. in distributing the current would not go up again to 12½ per cent. until the company was nearly at the end of their tether.

The PRESIDENT asked why the figures had been calculated on a 21 years' basis.

Mr. BALFOUR BROWNE said that at the end of that time the company would have exhausted the capacity of the existing mains. It was thought by some people that by having a greater pressure they would be forced to use more energy in their lamps, but that was not the case. They had examined the accounts of the consumers both under the 100 and 200 volt supply, but no appreciable difference could be ascertained. Under these circumstances what was to be said against the change? Everywhere it was being carried out—St. Pancras, among other places. Bradford was the first town to adopt the 200-volt current with entire satisfaction to the consumers, while in Glasgow the majority of the consumers were being supplied at the increased pressure. Why, asked the learned counsel, should a few consumers have the power to prevent the companies doing this? He appealed to the Board of Trade to say whether it was fair. These eight consumers did not really object to the increased pressure; they were holding out so as to get all they could out of the company because the company would not come to Mr. Cooper's terms. It was a matter of public interest, and he would ask the president to say that the first regulation made in 1890, leaving it for the County Council to decide whether or not the change should be permitted, was a more reasonable one than the last made. The 1890 regulation left the public to be protected by the county councils, and, if necessary, by the Board of Trade, while the latter regulation left the companies at the mercy of the public. In the event of arbitration, he was perfectly willing that the question of the costs should be left in the hands of the arbitrator.

A discussion here followed as to the mode of procedure to be adopted during the enquiry, and it was eventually decided to deal with the general questions affecting the companies as a whole; any special points to be dealt with separately.

Mr. LITTLER, on behalf of some of the objectors, raised the point that, as the Board of Trade had given a vested right to the consumers to have current supplied at a pressure of 100 volts, that right could not now be taken away by the alteration of a regulation which was made with the consent of the company themselves. It was a condition precedent to the regulations being changed, and could not be altered except with the consent of the person directly interested. He must say he had the greatest respect for the Board of Trade, but——

The PRESIDENT: I am very glad to hear you say that, Mr. Littler, in view of some of the letters we have had from your clients. I do not think you would approve of some of the letters we have received from them.

Mr. LITTLER said he was not responsible for the action of his clients.

Mr. DANCKWERTS, for the City Corporation, who are opposing the application, pointed out that the power which the Board of Trade had was to make regulations "for ensuring a proper and sufficient supply of energy." To take away from private people the vested rights which they had, the Board had no power to do. What the companies were seeking to do was not to have an alteration in a regulation, but to take away the condition upon which the Board of Trade altered the regulations. The County Council and the Borough Councils of Lambeth and Paddington were supporting this objection.

Mr. BALFOUR BROWNE, in reply, said a proviso was either a regulation or it was not. If it were not, then the Board of Trade had no power to make it, and it was not binding; if it were, on the other hand, they had power to alter it.

The PRESIDENT ruled that for the purposes of these proceedings the Board of Trade had power to alter the proviso.

Mr. DANCKWERTS then raised the point that the question had been finally decided in 1896, and could not therefore be reviewed. In this case there was an appeal to the Board of Trade, and one of the conditions on which the change of pressure was permitted was the proviso now objected to.

Mr. A. J. WALTER also argued on the same lines on behalf of the City Corporation. If this point were decided in favour of the Corporation, they would retire from the enquiry.

The PRESIDENT said it was true the Board of Trade had given a decision on appeal, but he thought it was so probable that his advice to the Board of Trade would be that they could alter the proviso, and so do away with that particular appeal, that it was very desirable that the City should be represented throughout the enquiry.

Mr. WALLACE, who appeared with Mr. Balfour Browne, then proceeded to call evidence in support of his case.

Prof. A. B. W. KENNEDY, engineer-in-chief to the Westminster Supply Corporation, stated that in 1890 the system employed by the company was the three-wire system, the pressure used being 100 volts. It was in 1895 that it became possible to get lamps which would work at 200 volts, and it was then that he advocated the change in pressure to the Board of directors. He had made several tests with the 200-volt lamp, and he found that it compared quite favourably with the 100-volt lamp. With regard to the suggestion that there was danger from shock with a 200-volt current, which was absent in the 100-volt current, it was a mistaken impression. In the case of lamps at 200 volts used on a three-wire system, the Board of Trade had arranged that the middle wire should be definitely put to earth, so that in any consumer's house there was only a 200-volt pressure for anybody to get a shock from, as was also the case in a three-wire system at 100 volts. In very large premises, where both sides of the 200-volt two-wire system were taken in the wires were kept quite separate, and it was impossible to get a shock unless one went to certain protected places. A 400-volt shock was not par-

Digitized by Google

ticularly harmful. He knew of no other alleged danger from the increased voltage. The risk of fire, in his opinion, was not more than with a 100-volt current. On the other hand, there were many advantages to be gained by the increased voltage. In 1896 he knew that the company's distribution losses were about 12½ per cent., and he calculated that with the change of pressure to 200 volts they could go on with the same mains for approximately 21 years before the losses came up to 12½ per cent. again. They would be at once reduced to 4½ or 5 per cent. In 1896 they were spending £7,500 per annum on new feeders, and accordingly he put the saving in feeders alone at £7,500 per annum for 21 years in the case of the Westminster Company. In general, there would be a very considerable capital saving, and he took it that if a company saved capital it was also an advantage to the statutory purchaser when the company's term was up. In the case of the Westminster Company, the consumers benefitted by the advantages gained in that the price of the current was reduced. The company had spent about £38,000 or £40,000 in the consumers' premises in providing new lamps and overhauling wiring and fittings, besides what they had spent in the power station. They had given them new lamps for old, and a reduction of 8 per cent. on the current charges. Taking it generally, the wiring in the consumers' houses had been improved. All over the country the increased pressure had been or was being adopted. There was no supply which had been laid on since 1897 on which lamps of 200 volts pressure or more had not been used. Owing to the opposition of the eight consumers on the wires of the Westminster Company, the shareholders of the company were suffering a distinct loss. Everything was ready to give them a supply at 200 volts pressure if they would only follow the example of the other consumers. The company would have completely changed over the pressure to 200 volts last year but for this opposition. In the event of only one or two consumers holding out great difficulties arose. It was necessary either to lay separate mains or put a rotary transformer at the terminals of the consumer who wished for the 100-volt current. This latter course was a very undesirable thing for a small private consumer, but comparatively simple in the case of a very large consumer. What the Westminster Company had done was to set apart certain of their mains for those consumers who would have the 100-volt supply. It was true that whenever the company made a saving it had shown a tendency to lower the price of the energy, so that the average price now charged those consumers who took the 200-volt supply was 4¾d.

Under cross-examination, Prof. Kennedy repeated that the change in pressure made absolutely no difference to the consumers so far as the light obtained for a given quantity of energy was concerned. The whole cost of the change was borne by the company. On paper the increased pressure would quadruple the capacity of the mains, but not in reality. He could not agree that a 200-volt lamp gave 33 per cent. less light than a 100-volt lamp for the same energy, nor was it the fact that the candle-power hours were infinitely less in a 200-volt lamp. An 8-c.p. 200-volt lamp could be set to run for 1,000 hours as specified by him, or else it would not be accepted, and if it consumed from 3½ to 4¼ watts per candle he considered it satisfactory. He knew of no disadvantages attaching to the 200-volt supply. Since it was possible to get a 200-volt lamp he had carried out the change for a large number of municipalities—Edinburgh and Oldham, amongst others. In these cases the fittings of all consumers were overhauled and replaced where necessary. In some cases it was true that the insulation used for the lower voltage had proved insufficient for a 200-volt supply. This should have been seen to, and also, he should think, a careful examination of the mains laid for 100 volts was necessary before the change was made.

The PRESIDENT asked whether there was not more risk of corrosion in insulating materials in a consumer's premises with the 200-volt current than with the lower voltage—whether with the 200-volt pressure there was not more risk of the wearing away of the insulating materials.

Prof. KENNEDY thought not. If the wiring had been put in for 100 volts and the insulation were really efficient, then the increase of voltage made no material difference. In answer to further questions put by Mr. Danckwerts, the witness agreed that it was as important to the supplier of energy as to the consumer that the fittings on the consumers' premises should be overhauled. The lampholders were just as safe with 200 volts as with 100. In answer to the question what advantage did the consumer get from the higher voltage, Prof. Kennedy said that, *per se*, he did not think the consumer got a direct advantage, but in the case where the consumer had been changed over from one voltage to another, he did get an advantage because the whole of his installation had to be overhauled and he was presented with new fittings and lamps. In the case of the Westminster Company he also got a reduction in price.

The PRESIDENT: Suppose the consumer deprives himself of having the 200-volt lamp, and continues on with the 100-volt lamp, what advantage does he gain?

Prof. KENNEDY did not think he got any advantage at all. With the 200-volt current the main advantages he got were new fittings and the reduction in price.

Mr. LITTLER here said he had already intimated his desire to come to some sort of settlement with the Westminster Company, although he could not compromise his clients by saying that they were in any way to blame. He had been discussing the question with his learned friend, Mr. Balfour Browne, and he thought it would be best if he postponed his cross-examination of Prof. Kennedy in the hope that some sort of settlement might be arrived at.

The PRESIDENT consented.

The WITNESS was then further cross-examined by Mr. Talbot for the London County Council, and Mr. Glen for the Paddington Borough Council. Prof. Kennedy, in answer to questions, said that if the Westminster Company had been able to reap the full benefit of the change to the 200-volt pressure, they would not have had to lay any more feeders for 21 years. The consumption of electric energy by a 200-volt lamp was no more than by a 100-volt lamp. He was aware that there was a difference of opinion on this matter. A single 5-c.p. lamp could be used with a 200-volt current, but he could not say as regarded a 3-c.p. lamp. It was the custom with these smaller candle-power lamps to run a number of them in series, in which case lamps of 100 volts could be used, or even less. This was largely done on the Westminster circuits. There was no difficulty in obtaining good and efficient lamps of 8 c.p. for the 200-volt circuits.

In answer to Mr. Roskill, for the City of London Electric Lighting Company, Prof. Kennedy could not say that the light given by a 200-volt lamp was superior to that of the lower-voltage lamp. There was no appreciable difference between the two.

Mr. JAMES HEALD, chairman of the Electricity Committee of the Lancaster Corporation, in reply to Mr. Wallace, said that the standard pressure of current in that town was 100 volts, but they now wished to increase the voltage to 200. The number of consumers was about 800, and these were spread over a fairly large area. He quite agreed with Prof. Kennedy as to the advantages of the 200-volt current over the lower voltage.

Mr. W. A. CHAMEN, electrical engineer to the Glasgow Corporation, was the next witness. Examined by Mr. Wallace, he stated that the area taking the Corporation's supply was about 28 square miles. The system adopted was the three-wire system with 250-volt lamps on the consumers' premises. The horse-power of the generating station in Waterloo-street was 3,300. In 1893 the voltage they commenced with was 100 volts on the three-wire system, making 200 volts altogether. Since then two other generating stations had been put down, and the Corporation had spent altogether over £800,000 on the undertaking. The voltage that was allowed by the regulations at the time the provisional order was granted was 115 volts. In January, 1897, however, the Corporation gave an intimation to the consumers that the standard pressure would in future be 250 volts, permission having been obtained from the Board of Trade to the change. Since then the Corporation had taken over a very large number of the consumers to the 250-volt pressure, and had not yet finished operations in this direction. Only four cases of difficulty had as yet been met with, one of which was absolute refusal to take the increased voltage. The others were cases of extortion. They did not expect any further trouble except from about a dozen consumers. These objectors would either have to be supplied by separate mains, or the pressure would have to be reduced at the consumers' terminals by means of motor-generators. The latter was a most unsatisfactory arrangement as the transformer required daily attention, and this was not a thing that could be put up with. In one particular case of opposition it had cost the Corporation £150. The transformer was attended to every day by the butler of the house, but the Corporation had to send a man once every week to examine it. Up to the present they had spent about £23,000 on the change, in alteration to fittings on the consumers' premises and in new lamps.

In answer to further questions, witness said he decidedly thought it was a fair matter to be left to an arbitrator to decide what money should be paid to the consumer, but he was sure in the majority of cases arbitration would not be necessary. The total consumers on the Corporation's main were 3,500, of which 2,150 were being supplied at a pressure of 250 volts, and the remainder, numbering 1,350, were taking the 115-volt current. However, 460 of these were already prepared for the change, leaving 890 still to be dealt with. As to the advantages of the higher voltage, he quite agreed with what had been said by the previous witnesses. There was no trouble or worry to the consumer in consequence, and as to the pulling up of the street, etc., the higher voltage saved this to a considerable extent.

Under cross-examination, witness admitted that in the case of Glasgow they were able to change the voltage practically without leave, as the Corporation was the local authority. They asked their own permission, in fact. They had a similar proviso in their order as in the case of the Westminster Electric Supply Corporation. The average cost of the change of pressure

Digitized by Google

was about £20 a consumer. Last year about 15 per cent. of the energy could not be accounted for. This year the loss in the mains was only 5 per cent. Asked whether when the light was bad in those places where the change had not been made, witness said that where the 250-volt current was used nothing of this sort was experienced. It was impossible to maintain a constant pressure with 100 volts, but easy with 200 volts. One reason for this was that the loss in the 100-volt mains was so much greater than with the higher pressure. A very distinct advantage accrued both to the supplier and the consumer by the use of the increased voltage. The lamps used at Glasgow were of the Robertson, Edison and Swan, and Stern makes. They lasted just as long as the 100-volt lamps with the exception of one particular make. The consumption was about four watts per candle in both cases. In reply to Mr. Roskill, witness agreed that the saving in price and the more uniform supply summed up the advantages of the 250-volt pressure.

At this stage the enquiry was adjourned till yesterday.

This conference was resumed yesterday, when further important evidence was taken, which we propose to give a *résumé* of in our next issue. At the opening of the conference two important announcements were made. The first of these was from Sir Courtenay Boyle to the effect that the Board of Trade had decided, after taking advice, that it had power to alter the regulation of 1896, which required the consent of the consumer to be obtained before making a change to a higher voltage. The other announcement was that no agreement had resulted from the negotiations between the Westminster Electric Supply Company and the eight consumers who were resisting the proposed change.

APPOINTMENTS VACANT.

Assistant Electrical Engineer, Ilford Urban District Council, lighting and tramways department, £120 per annum, March 11.

Engine Driver, Ilford Urban District Council, experience of Willans engines, £2 per week, March 11. Details in our advertisement columns.

Stokers (two), Ilford Urban District Council, 26s. per week, March 11. Details in our advertisement columns.

Assistant Driver, Ilford Urban District Council, 30s. per week, March 11. Details in our advertisement columns.

Switchboard Attendants (two), Ilford Urban District Council, 25s. per week, March 11. Details in our advertisement columns.

Arc Trimmers (two), Ilford Urban District Council, 30s. per week, March 11. Details in our advertisement columns.

Meter Fixer and Inspector, Ilford Urban District Council, 9d. per hour, March 11. Details in our advertisement columns.

Working Foreman, National Electric Supply Company, Preston; must be used to paper-insulated and Callender cables. Details in our advertisement columns.

NEW COMPANIES.

The following companies have been registered since our last issue:

H. Ingram, Limited.—Capital, £2,000. Object: to acquire the business carried on by H. Ingram at 72A, Sankey-street, Warrington, as H. Ingram and Co., and to carry on the business of electricians, electrical engineers, mechanicians, manufacturers of and dealers in electrical plant, etc.

Wolseley Tool and Motorcar Company, Limited.—Capital, £40,000. Object: to carry on the business of omnibus, motorcar, cycle, and vehicle manufacturers, electricians, etc.

Universal Lighting Syndicate, Limited.—Capital, £2,000. Object: to carry on business as ironfounders, engineers, tool manufacturers, die sinkers, wood workers, electricians, etc.

European McGuire Manufacturing Company, Limited.—Capital, £20,000. Object: to acquire under an agreement with F. C. Buxton certain patents relating to inventions for electric motor trucks, sweepers, fenders, stores, life guards, elastic brake hangers, brake handles; and to carry on business as engineers, electricians, electrical equipment manufacturers, electric traction and lighting supply manufacturers; and to act in England for the McGuire Manufacturing Company (Chicago), U.S.A., or any other agency business.

Barcelona.—A circular has been issued by the Municipality stating that they are desirous of changing the public gas-lighting arrangements of the city and suburbs, and adopting the "latest and most perfected styles in the light and its manufacture"; they accordingly invite tenders for the realisation of this end, to be accompanied by plans and projects, to be sent in not later than March 31, 1901. All tenders to be marked "Tender for Gas Supply." The basis of contract can be had on application to the Municipality.

LIGHT RAILWAYS.

The Light Railway Commissioners (Mr. Fitz-Gerald and Colonel Boughey) have held an enquiry at Pwllheli with reference to the application by a syndicate to construct a light railway from Pwllheli to Port Nevin and Port Dinlleyn. In closing the enquiry the president said that, as far as they were concerned, they would grant the order.

The Commissioners have also held an enquiry into the application of the Worcester Tramways Company, Limited, for powers to construct light railways along the Malvern-road to Asylum-lane, Powick, to Astwood Cemetery and Shrub Hill Station, and from the Bull Ring, St. John's, to Henwick Station. The order will be granted.

The Commissioners have held an enquiry at the North Stafford Hotel, Stoke, respecting the proposed extension by the Potteries Electric Traction Company, and will grant the order.

The Commissioners have held an enquiry into the application of the Essington and Ashmore Light Railways Company for the authorisation of an amendment and extension of the Essington and Ashmore Light Railways Order, 1900. The Earl of Jersey said they had to decide whether they would be justified in turning the private agreement into a public railway. They did not think they would be. Mr. Disturnal had abandoned railway No. 1, and proceeded with an alternative proposal, by which, he said, the two collieries and the population of Short Heath district would be served, and to this proposal there was no objection.

The Commissioners have held an enquiry into the application by the Halesowen District Council for an order authorising them to construct light railways within their district, at the close of which they intimated that they would report upon the application at a future date.

The Commissioners have decided to grant the application, made in May last, for a light railway order, in respect to the proposed extension of the Southwold Railway to Kessingland.

The name of the Mid-Anglian light railway project has been altered by permission to the Bury and Diss Light Railway.

The Oswestry Town Council propose to make an additional grant of £2,000 to the Tanat Valley Light Railway Company, £1,000 of which sum was to be in ordinary shares, so as to secure the appointment of a representative director under the order, and the remaining £1,000 as loan.

At a recent meeting of the Electric Lighting and Dinas Dinlle Light Railway Committee it was resolved to arrange for the drawing up of the objection to the granting of the order, also that Mr. Peterson be informed that the resolution passed by the Council supporting his application has been rescinded, and that the Gwyrfai District Council be so informed.

Application has been made to the Commissioners for an order authorising the construction of a light railway from Lyndhurst to the London and South-Western Railway Company's sidings at Lyndhurst-road Station. The proposed light railway will cross the main road in the parish of Colbury, and the Main Roads Committee have the proposals of the promoters under consideration, with a view of securing the due protection of the interests of the county.

The Bridges and Roads Committee of the Merthyr District Council recently reported to that body that they had received a copy of the award of Mr. W. R. Sheldon upon the arbitration between the Council and the British Electric Traction Company in reference to matters connected with the construction of the new electric railway. The London agents of the Council had suggested an appeal, but it was decided that no further action be taken in the matter. The question of costs will be determined by the Board of Trade.

A deputation from the promoters of the proposed light railway from Basingstoke through Kingsclere to the Highclere Station of the Didcot, Newbury, and Southampton Railway, recently waited on the Newbury Corporation to explain its objects. It was stated on behalf of the projectors that they would aim to get into Newbury as quickly as possible, but did not think it could be managed any other way than *vid* Highclere.

At the last meeting of the Quorn Urban District Council it was stated with reference to the Loughborough and District Light Railway that none of the Council's terms had been inserted in the draft order, and that Messrs. Clifford and Perkins had been instructed to lay the Council's objections before the Board of Trade.

The Carnarvon County Council have confirmed the decision of the Light Railways Committee to grant a loan of £7,500 for the purpose of the light railway from Pwllheli to Nevin, subject to the provisions of the Light Railways Act, and to the Cambrian Railway Company giving a binding and sufficient guarantee for the regular and efficient working of the line and the payment of the interest.

There is considerable opposition at Stockton Heath to the Warrington and Northwich light railway scheme.

The Runcorn Rural District Council are opposing the Warrington and Northwich Light Railway.

At a special meeting of the shareholders of the Isle of Axholme Light Railway Company on March 2 it was resolved

Digitized by Google

to sell the Isle of Axholme Light Railway to the North-Eastern Railway Company upon terms to be agreed upon. It was stated that the directors were willing to accept £8,000 per mile.

The Montgomery County Council have agreed to make a further advance of £1,250, making a total of £3,750, to the Tanat Valley Railway Company.

The Wiltshire County Council will lodge a protest with the Board of Trade against the issue of an abandonment order with respect to that portion of the Amesbury and Military Camp light railway proposed to be carried beyond Amesbury, on the ground that the proposed railway would be of great value to the County Council for the transport of road materials.

At the meeting of the Armagh County Council on the 13th inst., it will be proposed that the Council petition against the Kingscourt, Keady, and Armagh Railway scheme.

On Thursday Sir Courtenay Boyle, K.C.B., had before him, for approval at the Board of Trade, the Tickhill Light Railway Order, under which it is proposed to construct a line of railway in the West Riding, about 12 miles in length, from Tickhill to Haxey, where it will connect with sidings of the Great Northern Railway and also with other sidings of the Great Eastern and Great Northern joint line. Sir C. Boyle thought that the Great Northern must have a wire clause to guard against falling wires to apply only to the use of electricity for traction.

The Worthing Town Council have decided to apply to the Light Railway Commissioners for a provisional order authorising the construction of light railways in the town.

The preliminaries in connection with the letting of the contract for the construction of the Wick and Lybster Light Railway have now been arranged. The works have been let to Mr. William Kennedy, contractor, Partick, and operations will be commenced without delay.

The Portmadoc Urban District Council are opposing the South Snowdon and Beddgelert Light Railway Bill.

The Commissioners have submitted to the Board of Trade for confirmation an order made by them amending the Isle of Thanet Light Railways.

COMPANIES' MEETINGS AND REPORTS.

CHARING CROSS, EUSTON, AND HAMPSTEAD RAILWAY.

At a special general meeting on Monday, Mr. W. E Jones in the chair. Bills (1) for conferring further powers upon the Company and authorising agreements with the Brompton and Piccadilly-circus and the Central London Railway Companies; (2) to empower the Company to extend their authorised railways to Highgate and Victoria and for authorising agreements with the Midland, the Central London, the Baker street and Waterloo, the Brighton, and the Victoria and Pimlico Railway Companies, and the South-Eastern and Chatham Railway Companies' Managing Committee; and (3) for incorporating and conferring powers on the Finchley and Hendon Tramways Company were approved.

W. T. HENLEY'S TELEGRAPH WORKS.

The directors' report for the year 1900 states that of the additional capital authorised by the shareholders in August, the directors have issued £25,000 preference shares at par, and £25 000 ordinary shares at 100 per cent. premium, the latter enabling the reserve account to be increased by £25,000. These shares were all issued to the shareholders or their nominees. During the past year a net profit has been made of £62,723 18s. 6d. After payment of debenture interest and income tax, and making ample allowance for depreciation of buildings, plant, machinery, etc, there remains £56,411. 17s. 10d., making, with £18 853 7s 4d. brought forward from last year, a total of £75,265. 5s. 2d. available for distribution. The directors have transferred £1,000 to the debenture redemption sinking fund, and £11,000 to the reserve account (in addition to the £25,000 above mentioned), and they recommend the payment of the following dividends—viz.: on the preference shares at the rate of 4½ per cent. per annum (less income tax); and on the ordinary shares at the rate of 20 per cent. per annum (less income tax), including the interim dividend of 4 per cent. paid on Sept. last. These payments will, together, amount to £50,554. 9s. 2d., leaving £24,710. 16s. to be carried forward. The Earl of Galloway and Sir Henry M. Stanley, G.C.B., retire by rotation in accordance with the provisions of the articles of association, and being eligible offer themselves for re-election. The auditors, Messrs. Ball, Baker, Deed, Cornish, and Co., retire, and being eligible offer themselves for re-election.

NORTHALLERTON ELECTRIC LIGHT AND POWER.

At the annual shareholders' meeting on the 6th inst. (Mr. C. E. L. Ringrose presiding) the directors presented a balance-sheet which showed an adverse balance of £473. 17s. 5d. During the year the current taken by private consumers had very greatly increased, and had been so great as to necessitate a large extension of the works and alterations and additions to the plant. It was estimated that the consumption for private lighting and motors for the next quarter would be over 10,000 units. Unfortunately, the contract with the Urban District Council had proved a heavy loss to the Company, and the directors felt it their duty to give notice to the Council to terminate it in May next. The report and balance sheet were adopted.

CARLISLE TRAMWAYS

The report of the directors of the Carlisle Electric Tramways Company states that owing to the Corporation of Carlisle pressing for the construction of certain additional lengths of lines authorised, but which were not contracted for or intended to be laid, the completion of the tramways and equipment was considerably delayed. The directors are, however, glad to state that they induced the Manchester Traction Company, Limited, to construct these additional lengths, which has now been done, and without any increase on the original contract price. The tramways depôt, etc., were not finally taken over by the Company until Nov. 1, 1900. Meanwhile such lines as were finished were opened for traffic on June 30 last and the remaining lines at later dates, and worked by the Company under an arrangement to pay 40 per cent. of the traffic receipts to the Manchester Traction Company, Limited as shown in the accounts, in consideration of which, under the terms of the contract, the Manchester Traction Company, Limited, paid the 4 per cent. interest on the debenture stock subscribed and paid up, and the 5 per cent. interest upon the ordinary share capital to the date of the taking over the tramways by the Company. The revenue account for the half-year and one day shows a surplus of £1 523. 13s. 8d., and the balance of the profit and loss account, after writing off one-third of preliminary expenses, is £1,669. 4s. 10d., which your directors recommend should be dealt with as follows: to carry to a fund to meet depreciation, £500; to pay dividend for the half-year ended Dec. 31, 1900, at the rate of 3 per cent. per annum, making a total return of 4 per cent. for the year £900; to carry forward £269 4s 10d.—total, £1 669. 4s. 10d. The car miles run in the period have been 116 853 and the number of passengers carried 1,103,941 The results above shown must be regarded as preliminary to the regular working of the tramways, and is considered satisfactory, many initial difficulties having presented themselves and been overcome. The short lengths of the routes render it absolutely necessary to run very frequent services, and as the number of cars contracted to be supplied is found inadequate for the lengthened system, arrangements have been made for the provision of three new cars to be delivered in ample time for the spring and summer traffic. The directors who retire are Mr. R. B. Barningham and Mr. T. D. Lingard, who being eligible, offer themselves for re-election. Messrs. Walter J. Kershaw and Co. the auditors, also retire, and are eligible for re-election.

The revenue account is made up from June 30 to Dec. 31, 1900 (half a year and one day). It shows that the receipts were as follows (omitting shillings and pence): traffic £4,606; advertising, £114; sundry, £17; bank interest, £5—total, £4,742. Expenditure — electrical energy purchased, £884; running expenses, £1,341; maintenance and repairs, £20; administration and general expenses, £482; debenture stock interest, £491; surplus, £1,523.

The traffic receipts per car mile amounted to 9·46d.; total receipts, 9·74d.; total expenses (57·52 per cent. of receipts), 5·60d.

CHELSEA ELECTRICITY SUPPLY.

Directors: J. Irving Courtenay (chairman); Nugent Daniell; G. N. Marten; Major-General Webber, C.B. (retired R.E.). Chief engineer: Percy Still. Secretary: S. J. Cluer.

Report of the directors (with abstract of accounts) for the year ended Dec. 31. 1900:

In October. 1900. an allotment of 14,000 ordinary shares, at a price of £6 per share, was made *pro rata* to the shareholders, and at Dec. 31 allotments of 9,805 shares had been taken up. The balance of premium received in 1900, after deducting cost of issue and certain exceptional expenses, has been carried, as on previous occasions, to the reserve fund. The total of the reserve fund now stands at £56 622 13s. 5d. In order to conform to the Companies' Act, 1900, some alterations in the articles of association of the Company are necessary, and with this object resolutions will be submitted for approval at an extraordinary general meeting which will be held immediately after the ordinary general meeting. In consequence of the high price of coal, there has been a considerable increase in the cost beyond the provision made in 1899 to meet the expected extra outlay. An appreciable diminution in the revenue per unit sold has also been caused by the reduction in the price of the unit to consumers on the 200-volt supply, which it was deemed advisable to make in the latter part of 1899. This reduction has, however, been gradual, as it depended on the change by consumers to the higher pressure; it has resulted in bringing increased custom and inducing a somewhat freer use of the current. The number of lamps connected on Dec. 31, 1900, was 145,277, an addition of £16,410 during the year. The sum of £3,000 has been added to the renewals and depreciation fund out of the net revenue. After deducting this amount and after payment of interest on debenture stock (£6,750), there remains a balance of £11,370. 17s. The directors recommend that this balance shall be applied as under; interim dividend of 6 per cent. per annum on the preference shares for the half-year to June 30, 1900 (paid July 1, 1900). £900; interim dividend of 5 per cent. per annum on the old ordinary shares for the half-year to June 30, 1900 (paid July 1, 1900), £4,250; dividend of 6 per cent. per annum on the preference shares for the half-year to Dec 31, 1900, £900; dividend of 6 per cent. per annum on the old ordinary shares for

Digitized by Google

the half-year to Dec. 31, 1900, making a total dividend of 5½ per cent. for the year, £5,100; dividend of 5½ per cent. per annum on the 9,805 new ordinary shares from the due dates of the instalments to Dec. 31, 1900, £99; amount carried forward to next account, £121. 17s. The retiring directors, Mr. Nugent Daniell and Mr. George N. Marten, are eligible for re election. The auditors, Messrs. Cooper Bros. and Co., offer themselves for re-election.

The annual meeting of the shareholders was held at the Chelsea Town Hall on Wednesday, Mr. J. L. Courtenay presiding.

The **Chairman**, in moving the adoption of the report said three causes had operated in lowering the dividend by ½ per cent.—namely, the increase in the price of coal, the diminution in the amount of revenue per unit sold resulting from the reduction in price to consumers who took the supply at 200 volts (a decrease amounting to ½d. per unit on the whole supply, or close upon £3,000), and the unusually light weather in the first and last quarters of the year 1900, which the directors estimated had diminished the revenue by much more than £1,000. The Company's plant had given very little trouble, and had been maintained in a high state of efficiency. Several important extensions of the mains had been carried out, and the Company was in a position to supply electricity at short notice to premises situated in any part of the area of supply. They would have to invest a substantial sum before the end of the year in acquiring certain properties, which it was estimated would give them sufficient space for all buildings necessary for the supply of current to the whole of Chelsea. In conclusion, the Chairman said he thought the Company had done a very great deal towards educating the residents in that important West-end district on the advantages derived from the use of the electric light for domestic purposes, and from this point of view the directors looked forward with every confidence to the future success of the Company.

Major General Webber, C.B., seconded the motion, which was approved.

NEWCASTLE ELECTRIC SUPPLY.

The annual meeting of this Company was held at the offices of the Company.

Mr. T. G. Gibson (chairman) presided, and in moving the adoption of the report and accounts said that out of capital account they had expended during the year on Pandon Dene £15,997. That represented a considerable expense in the building of further plant, and they had also had to increase the condensing plant. The sum included also a cooling tower, which had been found necessary in order to minimise the steam arising from the condensing plant. This cooling tower was now in operation and giving good results. They had added to the Pandon Dene plant two continuous current 500 kw. machines. The greatly increasing demand for power in the town could not be supplied from the alternating plant that they started with. They had laid during the past year five miles of mains, and they had now about 31 miles of mains in the town. The capacity of their plant was equal to supplying 90,000 8 c.p. lamps, and they were supplying at the present time 75,000 8 c.p. lamps, divided over about 1,160 customers. The power station at Wallsend had cost them £74 696. That had been taken over pursuant to a resolution approved at the September meeting of the Company. They had there a very large station, which would enable them to supply the wants of the Wallsend and Walker Union Gas Company's district, and gave them power also to supply their own extended wants at Gosforth, Willington Quay, and all about there—districts which they got power to supply by Act of Parliament last year. With a view to the further extension of works, and having regard to the powers which they obtained in the Act of Parliament last session, the directors had thought it wise and prudent to secure a site at Carville, by the side of the River Tyne. That site comprised 11 acres, and it was proposed to erect further works upon it. The site cost them £22,000, but they had not paid for it in cash, the vendor taking shares at £1 premium. The Company would require further capital to develop the works at Carville, and that would be raised partly by the issue of further shares, and by calling up money that had not yet been paid for shares that had been issued. That would carry them on for some time, but they thought it desirable that they should borrow some money, and the directors proposed to issue debentures at not more than 4 per cent., to the amount of half of the paid-up capital of the Company at any one time.

Dr. J. T. Mers seconded the motion, and the dividends recommended were declared.

METROPOLITAN ELECTRIC SUPPLY.

Report of directors (with abstract of accounts) for year ended Dec. 31, 1900:

The capital expenditure, which at the end of 1899 amounted to £1,244,254. 1s 6d, has now reached a total of £1,417.805. 8s. 11d., being an increase during the year of £173,551. 7s. 5d. The principal items of expenditure were for the works at Willesden, and for the extension of the low-tension system. During the past year the capital has been increased by the issue of £125,000, being the balance of the 3½ per cent. mortgage debenture stock; and also by the issue of 15,000 ordinary shares of £10 each to the shareholders at par, being the balance of the Company's authorised share capital. The gross revenue for the year amounted to £209,420. 6s. 1d., as compared with £179,190. 1s. 10d. in 1899, being an increase of £30 230. 4s. 3d. The cost of generation, which in 1899 was £90 419. 7s. 1d., amounted in 1900 to £106,009. 4s. 9d., or an increase of £15,589 17s. 8d. To meet the rapidly increasing demands for current, a fourth steam generator of 1,500 kw. capacity is in course of erection at the Willesden works, and a fifth machine of similar size has been ordered, and will be erected in the course of the summer. During the year negotiations took place with the St. Marylebone Vestry for the sale to them of the Company's West London (Marylebone) undertaking. A provisional agreement, subject to the approval of the Vestry and the shareholders respectively, was entered into on terms which, in the opinion of the Board, were fair and reasonable. The agreement was approved by the Vestry on Aug. 3, but at a subsequent meeting held on Oct 16 the Vestry decided that the resolution approving the agreement should not be confirmed. The balance at the credit of the revenue account, before providing for depreciation, is £78,500. 10s. 5d. The directors have set aside £14,000 as an addition to the depreciation and reserve fund, which now amounts to £78 422. 5s. 10d., carrying to the credit of the net revenue account the sum of £64,500. 10s. 5d. which, with the balance brought forward from last account and other receipts, makes a total of £71,840. 18s. 9d. After deducting debenture and share interest and other charges, there remains a balance of £27,841. 1s. 3d. An interim dividend of 6s. per share on the ordinary share capital was paid on Aug. 11, 1900, amounting to £25,500, and the directors recommend that a further dividend of 6s. per share on such shares be now paid, making a total distribution of 12s. per share for the year, being at the rate of 6 per cent., together with the proportionate payment of 9d. per share on the new shares. This will absorb a further sum of £26,016. 6s. 9d.,

Digitized by Google

and leave a balance of £1,824. 14s. 6d. to be carried forward to the next account. The directors consider that this result is satisfactory, having regard to the high price of coal generally, especially during the last three months of the year. The number of 8-c.p. lamps supplied by the Company increased during the year from 500,000 to 570,000. The present number of lamps connected is 578,000, and the applications show no signs of decrease. In accordance with the articles of association, the following directors – viz., the Hon. J. B. Lubbock, Sir James Pender, Bart., and J. Carr Saunders, Esq.—retire from the Board, and are eligible and offer themselves for re election. The auditors, Messrs. Deloitte, Dever, Griffiths, and Co., also retire, and are eligible and offer themselves for re-election.

The ordinary meeting of the proprietors of this Company took place on Tuesday at Winchester House.

Mr. W. H. Cripps said the number of lamps added during the year was 70,000. This large rate of increase was a very gratifying feature when considering their future, and was far in excess of the estimate they formed when they first considered the advisability of erecting the works at Willesden. The Board therefore felt that the shareholders would agree that the Company was fully justified in the step they took when the Willesden works were decided on, for this large yearly increase could never have been properly met in any other manner. As it was, with ample space at their disposal it was comparatively easy for them to cope with any demands that might be made on them, and already two new machines had been ordered, and would be in readiness for next winter's supply. This would bring up the total capacity of the plant to 12 500 h.p., equal to the supply of nearly 500,000 lamps connected. Referring to the negotiations carried on last year with the St. Marylebone Vestry for the sale to them of the West London portion of their undertaking, he said their successors, the Borough Council, had not reopened negotiations, but decided to proceed with the application to Parliament for a right to give a competing supply. That Bill would come before Parliament this session. The directors having done their best to work amicably with the local authority, and having offered to sell the undertaking to the vestry on what, he was sure, would be considered the most reasonable terms, were determined to offer the most strenuous opposition to the Bill. Entirely apart from whether municipalities, backed by the rates, should compete with private traders, it could never have been contemplated in the original Electric Supply Acts that the local authorities should become trade rivals to the companies. Parliament had given the local authorities extensive powers of supervision over the Company, powers which could be only fairly used by an entirely disinterested authority. These powers, combined with those obtained under an agreement, were freely used by the Borough Council. To be given over, bound hand and foot, to a jealous trade rival clothed with such powers as the Borough Council possessed was not competition, but rather unjust confiscation. He never could believe that a parliamentary committee would sanction such a scheme, inflicting as it would a blow on free and independent trading, the life and soul of commercial enterprise in this country. The directors were glad to be able to state that by far the greater portion of the Company's mid-London area had now been changed to a low-pressure continuous-current supply, and the economy obtained from the results of that change had abundantly justified them in the policy which they had been pursuing for the last few years. Portions of the Company's St. Marylebone and Paddington district had been similarly dealt with, except that the supply remained alternating. The directors were engaged in treating the southern half of St. Marylebone in the same manner as they had treated the mid-London area—viz., by changing the present high-tension supply to the continuous-current one; and the laying of the mains for the purpose was already in progress. He feared they would not be able to complete much before the beginning of next year. He moved the adoption of the report.

Sir James Pender seconded, and the motion was unanimously agreed to.

W. T. HENLEY'S TELEGRAPH WORKS.

The ordinary general meeting of the shareholders of this Company was held on the 6th inst. at the Cannon-street Hotel, Mr. Sydney Gedge presiding.

The Chairman, in moving the adoption of the report, congratulated them on its very satisfactory nature, and stated that, comparing the accounts this year with those of last year, an improvement was shown in every particular. The dividend of 15 per cent. last year required £16,500, and this year the 20 cent. they proposed would require £25,467; while among the preference shareholders the amount divided would be £3,712, as compared with £2,086. He then compared the position of the Company in the past five years, and pointed out that the progress made had been steady, the rate of dividends having been 10 per cent., 12 per cent., 14 per cent., 15 per cent., and 20 per cent. They could not have presented these agreeable results had it not been for the unremitting attention of Mr. Sutton (managing director), Mr. Hatton, and the staff.

The Earl of Galloway seconded the motion, which was carried unanimously; and resolutions were afterwards passed, declaring the dividends mentioned and reappointing the Earl of Galloway and Sir Henry M. Stanley as directors.

BROMPTON AND KENSINGTON ELECTRICITY SUPPLY.

Directors: Henry Ramié Beeton (chairman); William Reginald Davies; Robert Arthur Germaine; William Francis Leese; William Page. Manager: Henry W. Bowden. Secretary: Thos. J. Owens.

Abstract of directors' report and accounts for the year ended Dec. 31, 1900:

The revenue account shows a credit balance of £21,324. 3s. 7d., which, with the balance of £229. 4s. brought forward, and £282. 13s. 5d. balance of interest received makes a total of £21,836. 1s. After deducting £2,250 for interest on debenture stock paid and accrued, £2,100 for interim dividend paid on the 7 per cent. cumulative preference shares, and £2,457. 12s. 6d. for interim dividend at the rate of 5 per cent. per annum for the half-year to June 30, 1900 on the ordinary shares, the directors recommend that the sum remaining—viz., £15,028. 8s. 6d.—be dealt with as follows: to credit of depreciation account, £6,000; in reduction of renewals suspense account, £3,000; to payment of the remainder of dividend to Dec. 31, 1900, on the 7 per cent. cumulative preference shares, £2,100; to payment of a dividend on the ordinary shares for the half-year to Dec. 31, 1900, at 7 per cent. per annum, making 6 per cent. for the year, £3,440. 13s. 6d.; and that the balance of £487. 15s. be carried forward to the next account. The increase in the number of lamps connected during 1900 was

Digitized by Google

equivalent to 13,675 35-watt (8-c.p.) lamps. In accordance with the special resolution passed Jan. 10, 1901, the nominal capital of the Company is now £300 000, divided into 20,000 preference shares of £5 each and 40,000 ordinary shares of £5 each. The directors now propose to issue 8,000 preference shares and 339 ordinary shares, bringing the ordinary and preference capital up to £100,000 each, and to redeem the existing debenture stock. The renewal of antiquated plant has been completed during the year at a further cost of £2,992. 16s. 10d., and after appropriating £3,000 from the income of the year, the renewals suspense account stands at £14,194. 16s. 10d. Mr. W. R. Davies and Mr. W. F. Leese retire from the Board by rotation, and being eligible, offer themselves for re election. Messrs. Miall, Wilkins, Randall, and Co., the auditors of the Company, offer themselves for re-election.

At the ordinary general meeting of the proprietors held at Winchester House, Old Broad-street, E.C., **Mr. H. R. Beeton** (chairman) said that but for the increase in the price of fuel the works cost would be the lowest they had yet achieved. During the past year they had completed the renovation of their station by disposing of the last instalment of the antiquated plant. To accomplish this they had had to write off the capital account from first to last nearly £27,000, but they had now practically a brand new engine-house equipped with the most modern type of plant, the fruit of which they were reaping, and would continue to reap, in economy of production for many years to come. By substituting vertical for horizontal plant they had added so much to the floor space of the engine-room as to postpone the necessity for building a new station for a long time to come. They had laid the foundations of lasting and growing prosperity, so that the directors would be very disappointed if in their next report they were unable to recommend an increased distribution of profit. From the circular sent out it would be seen that the directors contemplated an issue of further capital whereby their ordinary and preference capital would be raised to £100,000 each. The object of that issue was not merely to provide for the immediate capital requirements, but to redeem the debenture stock. He moved the adoption of the report and accounts, and that the dividends recommended therein be approved.

Mr. Wm. Page seconded.

On the question of coal, the **Chairman** said they had about two months' stock under their present contract, and there was nothing fixed beyond that, so that they could avail themselves of the present price.

The motion was then put and carried unanimously. Mr. W. R. Davies and Mr. W. F. Leese were re-elected directors, and a vote of thanks to the chairman concluded the proceedings.

CHARING CROSS AND STRAND ELECTRICITY SUPPLY.

Directors: William Francis Fladgate, Esq., Craig's-court, S.W. (chairman); G. H. Brougham Glasier, Esq., St. James's-street, S.W. (vice-chairman); Stefano Gatti, Esq. (A. and S. Gatti), Strand, W.C. (managing director); John M. Gatti, Esq. (A. and S. Gatti), Strand, W.C.; Richard Chadwick, Esq., St. Martin's-lane, W.C. Secretary: Edwd. Wilmot Seale, Esq. Engineer-in-chief: W. H. Patchell, M.I.C.E., etc.

The report of the directors (with abstract of accounts) for the year ended Dec. 31, 1900, states that the directors are glad to be able to put before the shareholders a satisfactory report of the working of the Company. The building extensions at the Lambeth station have been completed, and the entire site is occupied by the generating station, which is now fully equipped. The sub-station buildings at Short's-gardens have also been completed and partially equipped. One thousand five hundred kilowatts in motor-generators and 400 kw. in batteries have been installed. The plant and machinery at these stations and at the Maiden-lane station have been maintained in a high state of efficiency. The increase in the Corporation's business has necessitated the erection of a further sub-station to supplement the existing stations in use for the West-end areas, and a site has been acquired in St. Martin's-lane, in the rear part of which a sub-station is being erected, while in the front offices are being built to accommodate the staff necessary to carry on the general business of the Corporation. An Act empowering the Corporation to acquire land and erect generating stations at Marsh Gate-lane, Bow, was passed in the session of 1900. The Act also empowered the Corporation, upon terms to be approved by the Board of Trade, to supply electric energy in bulk to certain local authorities in the East-end. The site acquired under this Act consists of 7½ acres of freehold land, on part of which the generating station is being erected for the City order. Sites for sub-stations have been secured at Fenchurch-street and Ludgate-hill. Building operations are in progress on these sites, and negotiations are proceeding for other necessary sites. Motor-generators and batteries are being installed at Ludgate-hill sub-station, and supply is already given from that station to part of the City area. The growth of the Corporation's business in all its areas has been satisfactory. The equivalent of 39,431 additional 8-c.p lamps (36,004 in the western areas, 3,427 in the City area) have been connected to the mains of the Corporation, making a total of 222,120 lamps now connected, while negotiations are proceeding in the several areas for a supply to nearly 50,000 additional 8-c.p. lamps, of which a large proportion are in the City area. There have been 22 miles added to the mains in the West-end area, and 27 miles in the City area, making the total mains laid 174 miles. The units sold during the year 1900 show an increase of 995,132 over those sold during 1899 The increase of gross revenue from sales of current in 1900 over 1899 was £15 962, as compared with an increase of £10,715 in 1899 over 1898—*i.e.*, an increase of nearly 50 per cent. The directors have reason to congratulate the shareholders on the satisfactory results of the year's trading, which would have been even more satisfactory but for the price of coal (entailing an increased expenditure of nearly 30 per cent. over the price paid in 1899); the serious loss of income due to the fire at Maiden-lane Station in March last, and the further consequent heavy distribution losses pending the reinstatement of damaged plant and machinery. The fire loss on capital account is being written off share premium account. In accordance with the arrangements authorised at the extraordinary meeting of the Company held on May 17, 1900, the sum of £73,670. 16s. 10d. has been lent to the Charing Cross and City Electric Company on account of £200,000 authorised. The net earnings, as shown in the revenue account, have amounted to £29,517. 1s. 3d. A sum of £2,182. 2s. 9d. has been paid in respect of interest on debentures and temporary loans up to Dec. 31, 1900, and £10,625 was distributed as interim dividend at the rate of 8½ per cent. per annum for the half-year ended June 30, 1900. There remains a sum of £16,709. 18s. 6d., which, added to the undivided profit of £4,541. 13s. 10d. from the preceding year's account, and £1,161. 4s. 7d. received for interest on advances, makes £22,412. 16s. 11d., which the directors propose to deal with as follows: to provide for dividend on 4½ per cent. preference shares, £7,052. 1s.; to pay a dividend at the rate of £9½ per cent. for the half-year ended Dec. 31, 1900, on the ordinary shares (making with the interim dividend paid in August, 1900, £9 per cent. for the whole year), £11,875; and to carry forward £3,485. 15s. 11d. Mr. W. F. Fladgate and Mr. R. Chadwick are the directors who retire by rotation, and being eligible, offer themselves for re-election. The auditors, Messrs. O. R. Johnson and Son, also retire, and offer themselves for re-election.

At the annual meeting of this Company held at St. Martin's Town Hall, Mr. J. M. Gaster, who presided spoke of the position of the Company as satisfactory in every way. During last year they had added nearly 14,000 lamps in St. Martin's district, 15,100 in the Strand district, and 7,000 in Holborn. A new demand for electricity was arising for motor and heating purposes; last year the Company had doubled their supply under that head. The gross revenue was also in a satisfactory state, the increase being £15 962. That being the case, he could understand shareholders enquiring how it was that the Board proposed to pay only the same dividend as last year, and that in order to do even that they had to fall back on some of the carry forward of the previous year. There were two causes for this—the increased price of coal and the expensive mode of working during several months as the result of the fire last March at their Maiden-lane station. The Corporation was now supplying electric light in 166 streets in its western area and 55 streets in the City.

Mr. G. H. B. Glasier seconded the motion, which was adopted.

CONTRACTS FOR ELECTRICAL SUPPLIES.

CONTRACTS OPEN.

Stockton.—Tenders will be advertised shortly for one 300-kw. engine.

Sutton Coldfield.—The Corporation invite tenders for house wiring. Tenders by March 11. Details in our advertisement columns.

Shereditch.—The Council invite tenders for their annual contracts. Tenders by March 12. Details in our advertisement columns.

Sunderland.—The Corporation invite tenders for indiarubber-covered cables, etc. Tenders by March 29. Details in our advertisement columns.

Wallasey.—The Urban District Council invite tenders for the supply and delivery of electrically-worked tramcars. Tenders by March 14. Details in our advertisement columns.

Ploesti (Roumania).—The Municipality invite tenders for the laying down and working of electric tramways for 30 years. The provisional deposit is £2,000. Tenders by April 3.

Colwyn Bay.—The Urban District Council invite tenders for the supply of one 120-kw. steam dynamo and switchboard extensions. Tenders by March 22. Details in our advertisement columns.

Buxton.—The Urban District Council invite tenders for a 250 kw. steam dynamo and a Belliss engine coupled to two 43-kw. dynamos. Tenders by March 12. Details in our advertisement columns.

Shipley.—The Urban District Council invite tenders for the supply of house terminal boxes and switch gear, motors, wiring installations, &c. Tenders by March 19. Details in our advertisement columns.

Cheltenham.—Tenders are invited for the electric lighting of St. John's Church, Cheltenham. Specifications, etc., can be had from Mr. Weaver, Carlton-place, Hewlett-street, Cheltenham. Tenders by March 25.

Southampton.—The Corporation invite tenders for insulated electric cables, frames, and covers, including excavation and reinstating of roadways. Tenders by March 11. Details in our advertisement columns.

Warrington.—Tenders are invited for electrical light installation for the new police buildings. Specification, etc., can be obtained from the architects, Messrs. Cackett and Burns Dick, 24, Grainger-street West, Newcastle on-Tyne.

Darwen.—The Corporation invite tenders for the supply and delivery of feeder cables pillars, and overhead electrical equipment in connection with the electric tramways. Tenders by March 25. Details in our advertisement columns.

Manchester.—The Tramway Committee invite tenders for the supply of permanent-way materials, tools, and plant. Particulars may be obtained from Mr. J. M. McElroy, general manager, Tramways Department, Town Hall, Manchester. Tenders by March 9.

Aberdeen.—The Electric Lighting Committee invite tenders for supply of fuel economiser and additional Babcock and Wilcox boilers. Specification, etc., may be obtained from Mr. J. Alex. Bell, city electrical engineer, Cotton-street, Aberdeen. Tenders by March 15

Cardiff.—The Corporation invite tenders for steam-pipes, exhaust pipes, injection and overflow pipes, feed pipes, drain pipes, engine-house flooring, and switchboard gallery and central service gangway. Tenders by March 18. Details in our advertisement columns.

Dagenham (Essex).—The West Ham Town Council invite tenders for the erection of a dynamo house at their small-pox hospital, Dagenham Essex. Specification, etc., may be obtained at the Borough Engineer's Office, Town Hall, West Ham. Tenders by March 12

Wolverhampton.—The Tramways Committee invite tenders for the complete overhead equipment of about five miles of tramway route, and the supplying and laying of feeders, conduits, and switch pillars for the same. Tenders by March 22. Details in our advertisement columns.

Vercelli (Italy).—The Municipality will shortly advertise for tenders for an electric installation for public and private lighting. The former will consist of 76 arc lamps of 800 c.p. and eight amperes each, and the latter of 1,700 16-c.p. lamps. Work must be commenced within six months.

Digitized by Google

Burnley.—The Tramways Committee invite tenders for the supply of the necessary materials for the overhead equipment in connection with the trunk line. Specification, etc., may be obtained from Mr. R. Birkett, borough electrical engineer, Aqueduct-street, Burnley. Tenders by March 23.

Hammersmith.—The Borough Council invite tenders for supply of electrical stores for 12 months ending March 31, 1902. Specification, etc., may be seen and any further information obtained of Mr. G. Gilbert Bell, resident engineer at the electricity works, 57, Fulham Palace-road, Hammersmith. Tenders by 13th inst.

Wimbledon.—The Urban District Council invite tenders for cables, joint-boxes and jointing material, transformers, meters and demand indicators, lubricating oils, and Welsh steam coal, for the year ending March 31, 1902. Specification, etc , may be obtained on application at the Electric Lighting Works, Durnsford-road, Wimbledon. Tenders by March 15.

Bristol.—The Electrical Committee invite tenders for the erection of the superstructure of the Avonbank electricity works, Feeder-road, Bristol. The work comprises a large amount of steelwork, as well as brickwork and concrete work. Specification, etc., can be obtained at the office of Henry Williams, Esq., architect, 24, Clare-street, Bristol. Tenders by March 12.

Warrington.—The Corporation invite tenders for (Section 1) supply, delivery, and laying of steel rails, paving, etc., forming permanent way; (2) supply, delivery, and erection of steel poles, brackets, trolley wire, insulators, etc., forming a complete overhead equipment; (3) electric tramcars. Specifications, etc.. can be obtained at the offices of Messrs. Preece and Cardew, 13, Queen Anne's-gate, Westminster, S.W. Tenders by March 27.

Bray (Ireland).—The Urban District Council invite tenders for the supply and erection of: (Section A) boiler-house plant—one Lancashire boiler and accessories; (Section B) engine-house plant—(1) one 150-kw. high-speed steam alternator, and (2) one 25-kw. rope-driven alternator and accessories, for the municipal electricity works. Specification, etc., may be obtained by manufacturers at the offices of Mr. Robert Hammond, M.I.C.E., the consulting engineer to the Council, 64, Victoria-street, Westminster, London, S.W. Tenders by March 14.

Newport (Mon.)—The Corporation invite tenders for the supply and erection of: (Section 4) constructional steelwork, bunkers, etc.; (5) steel flue; (6) coal and ash conveyor; (8) overhead travelling crane; (9) steam-boilers; (10) mechanical stokers; (11) fuel economiser; (12) water-storage tanks; (13) compound condensing vertical engines; (14) electric generators; (15) condensing plant with cooling towers; (16) feed pumps. Specifications, etc., may be obtained from Mr. H. F. Parshall, 8, Princes-street, Bank, London, E.C. Tenders by March 25.

London, W.C.—The British Electric Traction Company, Limited, on behalf of the Gravesend and Northfleet Electric Tramways Company, invite tenders for the construction of new tramways in Gravesend and Northfleet, and the reconstruction of the existing tramways in Gravesend; for the supply and construction of the necessary electrical equipment for working the overhead system. Copies of the specifications and schedules can be obtained on payment of £10, returnable upon receipt of a bona fide tender, from the secretary, Mr. Charles Dade, Donington House, Norfolk street, Strand, London, W.C. Tenders by 25th inst.

RESULTS OF TENDERS

Bradford.—Messrs. D. Bruce Peebles and Co. have secured the contract for two 200-kw. tramway generators for the Corporation.

Cregdon.—Messrs. Callender have obtained the contract to supply cables and undertake works of mainlaying, etc., during the current year.

Mortlake.—The Barnes Urban District Council have accepted the tender of Messrs. Johnson and Fitzer, St. John's-road, Richmond, at £89. 6s., for wiring their electricity works at Mortlake.

Halifax.—The Tramways Committee have accepted the tender of the Brush Electrical Engineering Company, Limited, for the supply of 12 tramcar bodies at the price of £238 5s. each, and for the supply of 36 trucks for tramcars at £55 each.

Islington.—The Borough Council have accepted the following tenders for the supply of electrical stores: Sloan Electrical Company, 15, Fore street, Avenue, E.C., and Mackey's Electric Lamp Company, Limited, Tulip-place, New Church-street, Bermondsey.

Worthing.—The Electric Lighting Committee have received tenders for the fitting up of premises with the electric light from Messrs. Bostel Bros., Brighton; Messrs. Page and Miles, Limited, Brighton; and Messrs. Whittaker Bros., Limited, Dudley.

Ballinasloe (Ireland).—The tender of the Ampère Electrical Company, Mill Abbey street, Dublin, at £1,205, has been accepted for supplying and erecting the necessary plant and fittings for an electric light installation in the new hospital block of the district lunatic asylum, Ballinasloe.

Aberdeen.—The Tramways Committee have accepted the offer of the British Insulated Wire Company, Limited, amounting to £1,601. 2s. 7d., to furnish the electrical equipment of the tramway to the bathing station. The Gas and Electric Lighting Committee have accepted the tender of Messrs. Alley, M'Lellan, and Co., Glasgow, for condensers for the new Dee Village electric lighting station, at £1,697.

Huelva.—The tender of Don Julio Saranana, at 7,400 pesetas per year, has been accepted for the lighting concession of the town for 20 years. In connection with these Spanish contracts, it is interesting to note that the successful tenderer, who will transfer his concession to the Electro Ayamontina Company, was the only tenderer, and that he obtained the same at 100 pesetas per annum less than the official estimate.

Wolverhampton.—Tenders have been received for the construction works for the new electrical tramways and the erection of the buildings. They include the supply of about 1,500 tons of steel rails for 7½ miles of the track. The tender of Mr. H. Holloway, of Wolverhampton, at £50,000, for making the line from the boundary on the Bilston side through Wolverhampton to Tettenhall, has been accepted. The time fixed for this work is 11 months.

London School Board.—The School Board have received the following tenders for wiring, etc., for electric lighting Offord-road School:

G. Weston and Co.	£379	0	0
Drake and Gorham	365	5	0
Peto and Radford, Limited	331	0	0
Comyn Ching and Co.*	324	0	0

* Recommended for acceptance.

Hendon.—The following tenders are recommended for acceptance in connection with the electric lighting:

Section A.—Holdsworth and Sons	£3,838	0	0
Section B.—Mather and Platt, Limited	5,876	0	0
Section D.—J. Spencer and Co.	330	0	0
Section E.—B. Thomas	1,221	16	0
Section F.—Electrical Power Storage Company, Limited	2,103	7	6
Section G.—Western Electric Company	12,318	11	9
Section H.—British Thomson-Houston Company, Limited	347	15	0
Section I.—Puck and Hickman	255	4	9

Section C not yet tendered for.

Southwark.—The Electric Lighting Committee have received the following tenders for the second extension of electric lighting station:

Section A.—400-kw. steam generator with foundations, steam connections, etc., and a spare armature for same.

C. A. Parsons and Co.	£3,520	0	0
Bergtheil and Young	£3,827, £3,897, £3 987, 4 627	0	0
British Schuckert Company, Limited	£4,000. £4,303, 5,882	0	0
British Westinghouse Company, Limited,	£4,064, £4,220, £4,254, £4,268, 4,884	0	0
Willans and Robinson, Limited,	£4,070, £4,409. £4 579, £4 878, 5,142	0	0
Siemens Bros. and Co.	£4 226 *£4,310, £4,313, 4,995	0	0
Mather and Platt, Limited	£4,180, £4 24), 4 300	0	0
Smith, McMillan, and Co.	£4 379, 4 969	15	0
Electric Construction Company	£4,390 4,769	0	0
Ashton, Frost, and Co., Limited	4,328	0	0
S. Z. de Ferranti, Limited	£4,610. 15s., £4,717. 15s., 5,190	15	0
General Electric Company	4,813	10	0
Johnson and Phillips	4 350	0	0
Crompton and Co., Limited	£5,034, 5,017	0	0
Brush Electric Engineering Company, Limited	5,270	0	0
Bow, McLachlan, and Co., Limited	£5,500, 5,582	0	0

Section B.—For the provision of a further pair of water-tube boilers with steam connections, mechanical stokers, and extensions to coal-conveyor gear.

Babcock and Wilcox, Limited	†3 230	0	0
D. Smith, McMillan, and Co.	3 300	0	0
Stirling Boiler Company	3,460	0	0
Hornsby and Sons, Limited	3 709	0	0
J. Thompson	3 900	0	0

* Recommended for acceptance. † Recommended for acceptance, subject to the price of their chain grate stokers and Vicars's stokers being included in the schedule annexed to their contract, and the Council reserving the right to determine which stoker is to be installed within three months from the execution of the contract. Switches, ammeters, and instruments required for regulating the East-street feeder are to be fitted to the switchboard panels in the station by the General Electric Company, at a cost of £117. 10s.

BUSINESS NOTES

TRACTION.

Carlisle.—Steps are being taken to safeguard the public as far as possible from the risks attending the falling of electric wires.

Ayr.—Mr. Frederick Coutts, of Dundee, has been appointed manager of the electric tramways at a salary of £200 per annum.

West Cumberland Tramways.—On Monday the West Cumberland Electric Tramways Bill was read a first time in the House of Commons.

Barnes.—A ratepayers' meeting has unanimously approved the action of the District Council in opposing the London United Tramways Bill.

Power Bills.—The Brighouse Town Council and the Mexborough Urban District Council intend to petition against the two Yorkshire Electric Power Bills.

Merthyr Tydvil.—At the meeting of the Bridges and Roads Committee on Monday, it was stated that the electric traction company's authorised lines were nearly completed.

Darlington.—At a meeting of the General Purposes Committee on Wednesday it was resolved to recommend the Corporation to conclude the purchase of the tramway company's undertaking for £7,590.

Digitized by Google

North Shields.—It was fully expected that the new electric tramways would have been in operation on Saturday, but for some reason the cars were not running, and much disappointment was expressed.

Warrington.—On the recommendation of Mr. Preece, the consulting electrical engineer, estimates of the cost of additional plant in view of the early introduction of electric tramways are being prepared.

Leamington.—All that is now needed before the work of laying the new line for the electric trams for Warwick and Leamington can be commenced is the formal parliamentary ratification of the provisional order.

Stourbridge.—At a special meeting of the Urban District Council on Tuesday it was stated that the Railway Committee had now agreed to allow the tramway company to use span wires and ornamental poles to carry them.

Bilston.—The District Council have given their consent to the transfer of the old Wolverhampton Tramway Company's undertaking in Bilston to the Wolverhampton District Electric Tramway, Limited, at the price of £9,582.

Gateshead.—The system to be adopted on the tramways for the protection of the public against falling wires is to consist of earthed guard wires over the trolley wire at such points where the trolley wire is crossed by telegraph or telephone wires.

Chester.—With reference to our note in last week's issue, we now learn that at a special meeting of the Town Council last week it was decided to abandon the proposed extensions of the tramways to Hoole and Liverpool-road, and to Stonebridge, Saltney.

Ipswich.—The Corporation have notified the tramways company that they have obtained the approval of the Board of Trade to their purchasing the company's undertaking. An extraordinary meeting of the company has resolved to sell to the Corporation by agreement.

Swansea.—The official notice of approval of the tramways extension shows that the maximum charges are to be 1d. per mile, and the Corporation have power to borrow up to £100,000, and are given leave to lease the undertaking to the tramway company on terms already arranged.

Leicester.—Mr. E. George Mawbey, M.I.C.E., the borough engineer, is particularly interested in the proposed tramways, having, in conjunction with the Tramways Sub-Committee, prepared the scheme. As reported in last week's issue, Mr. E. Manville has been appointed consulting engineer.

Pembroke (Ireland).—The Urban District Council have received a deputation from the railway company in reference to the proposed Scalp and Enniskerry tramway. It is contended that the statutory requirements have not been complied with, and the matter is postponed to enable the Council to obtain advice on the point.

Shoreham.—Representatives of the Brighton and District Tramway Company have had an interview with the Urban District Council's Works Committee relative to running their cars by electricity instead of by horses, and respresentatives of all interested authorities are to be invited to meet and talk the matter over.

Gosport.—A ratepayers' meeting has unanimously agreed to the proposal of the District Council to apply the rates under their control to the payment of the expenses attending the opposition to the Bill now being promoted by the Portsmouth Street Tramways Company to construct further tramways in the urban district of Gosport and Alverstoke.

Croydon.—The County Council have decided that on the conversion of the tramways to electric traction the cars shall stop only at certain fixed points along the route. A start was made on Wednesday with the work of erecting the poles for the overhead system, the contract for which is in the hands of the British Thomson-Houston Company.

Scarborough.—With regard to the offer of the tramways company to hand over their Bill to the Corporation on payment by the latter of £1,600 (expenses in connection therewith), the Streets and Buildings Committee have decided not to close with this offer, but to continue to oppose the Bill of the company pending any arrangement which might be come to.

Crewe.—At a meeting of the Town Council on Wednesday the chairman of the Tramways Committee stated that the Light Railways Commissioners had refused to give the Council an order for the construction of electric tramways within the borough. The scheme although blocked would only be delayed, and he thought it would be carried out in a few years' time.

Burnley.—The price to be paid by the Corporation for the undertaking of the Burnley and District Tramway Company has been fixed at £53,000. The Corporation took possession on March 1, and are now carrying on the system. Already it has been decided to abolish the existing steam trams, and to spend £120,000 forthwith in equipping the line for electric traction.

Sunderland. — The overhead equipment of the new electric tramways on the Southwick, Tatham street, and Hylton-road routes was inspected on Tuesday on behalf of the Board of Trade by Mr. A. P. Trotter. He expressed himself satisfied, and then proceeded to the electric power station in Dunning-street, which he inspected and approved. Major Druitt, R.E., inspected the permanent way of the new routes the following day.

Manchester.—The General Purposes Committee have resolved that a statement be inserted in the petition of the Corporation against the Lancashire and Yorkshire Railway Bill that the angle of the proposed new road at its junction with St. Mary's-road would be unsuitable for the electric tramways, and suggesting that the company should make such alterations as might meet the views of the Corporation and the safety and convenience of the public.

Motor Union.—At the annual meeting of the Automobile Club it was decided to form a motor union, open to all motorists, ladies or gentlemen, without reference to social position, by which all automobilists shall be embodied under one banner for the purpose of furthering the motor movement. Members of the union will have the privilege of claiming from the union financial and legal assistance in respect of proceedings or actions-at-law, either civil or criminal, in connection with their motor vehicles.

Proposed Railway under the Solent.—In the case of the South-Western and Isle of Wight Junction Railway Bill, under which powers are sought to connect the Isle of Wight with the mainland by a railway under the Solent, the Examiners of Petitions for Private Bills have decided that the Standing Orders of the House of Lords have not been complied with, inasmuch as no proof has been given in connection with that part of the Bill empowering the London and South-Western Company to subscribe to the undertaking.

Dundee.—Work upon the eastern tramway route is now practically completed. As all opposition to the Constitution-road scheme has been withdrawn, it is expected that the Municipality will be vested with authority to construct the proposed tramway in that part of the town. A start with the work will be made about the end of April. Plans are also being prepared for the conversion of the system in Victoria-road. The Board of Trade inspection of the electric overhead equipment of the East End tramway system was announced for Wednesday last.

Proposed Russian Electric Railway.—The Berlin correspondent of the *Standard* states that an English company proposes to build an electric circular railway, with several branch lines and a central station, in St. Petersburg. It promises to provide the Russian capital with a service of trains running every two minutes. In the city the line would run overhead on iron pillars, and in the suburbs on an embankment. It would be about 60 miles in length, and would cross the Neva and canals on 11 bridges. It is reported that the Russian Government has appointed a committee to examine the project.

Cardiff.—At the adjourned meeting of the General Purposes Committee on Monday it was resolved that the Tramways Committee be requested to discuss with the tramways company the suggestions contained in the letter of Mr. John Glenn, the essential parts of which are: that the existing lines be measured up by the engineer of the company with the borough engineer; that the value of the lines as the result of the measurement be agreed; that the company reconstruct the lines for electric traction by Jan. 1, 1902; and that the work done for this purpose be carried out by the company at the cost of the Corporation.

Aberdeen.—On the report of the electrical engineer in reference to the equipment of the bathing-station route of the tramways, the Tramways Committee have recommended the grouping of the telephone and telegraph wires at as few points as possible, and the erection of efficient guard wires. At a meeting of the Tramways Committee on Saturday, it was stated that instead of there being a deficiency of £1,100 on the horse tramcar service for the last 35 weeks as previously reported, there was, in fact, a surplus of between £300 and £400, and, in consequence, the present service will be continued. The mistake was due to a miscalculation of the mileage.

Liverpool.—The subject of the proposed Manchester and Liverpool electric express railway was before the council of the Chamber of Commerce on Monday. The Chamber had previously resolved to petition in favour of the new railway. Considerable diversity of opinion seems to exist in Liverpool as to the desirability of the scheme. The Parliamentary Committee have recommended the City Council to petition against the Bill authorising the construction of the proposed railway, and on Wednesday the Council adopted the recommendation on the ground that the railway would be a source of danger on account of the excessive speed proposed—viz., 110 miles an hour.

Dudley.—The Tramway and Electric Lighting Committee are recommending the retention, so long as he is professionally engaged in the district of Mr. R. Wilson as chief engineer at the electric generating station at a salary of £500, on condition that he engages and pays two assistants, one to Mr. Marsh, the present engineer. At a meeting of the Town Council on Tuesday considerable discussion took place respecting the new tramway regulations, by which cars to and from Cradley Heath were not allowed to run through the town, an alteration which, it was contended, had given great dissatisfaction to the travelling public. It was stated that the tramway officials proposed to lay a new scheme with regard to the matter before the committee.

Barrow.—Up to the present the Corporation and the British Electric Traction Company have been unable to come to terms in regard to the purchase of the steam tramways. The Board of Trade are granting the company licenses for short periods, and as the permanent way is being repaired, a full service of cars is still maintained. The Corporation have intimated to the company that with regard to an extended tenure and the conversion of the present lines to electric traction, they are prepared to receive in writing and discuss the length of term, value of present lines, cost of conversion, electric current, improvements in lines and rolling-stock, etc. The Independent Labour Party have appointed a committee to urge the Corporation to municipalise the tramways.

Digitized by Google

Traction Equipment.—We are informed that Messrs. Robert W. Blackwell and Co., Limited, have lately secured the following contracts: Bradford Corporation, overhead electrical equipment of the Idle and Thackley, Clayton and Queensbury, and Farsley sections of the tramways; Southampton Corporation, overhead electrical equipment of the Canute-road, Dock Station to Avenue, and St. Mary-street sections of the tramways; Brighton Corporation, supply of their traction switchboard and for the overhead electrical equipment of their tramways system; Southport Corporation, supply of all the poles and brackets required for the extensions of the tramways; Manchester Corporation, the material required for the overhead equipment of their new car-shed, and for tower wagons, reel wagons, and all the necessary tools required by the tramways department for carrying out extensions of their line.

Hampstead.—With a view to securing the withdrawal of the opposition of the Borough Council to the Hampstead, Euston, and Charing Cross Railway Bill, the promoters offer to give way in every important particular to which those interested in the preservation of the Heath have objected. They promise not to erect a station on the summit of the Heath, or at North-end, and not to tunnel under any portion of the Heath if the Borough Council will undertake not to oppose the Bill for the construction of the extension of the line from Holly-hill, Hampstead, to Golder's green, Hendon. The Borough Council has appointed a committee to meet a deputation representing the promoters and discuss the details with a view to a settlement being arrived at. The General Purposes Committee of the Borough Council have agreed to confer with the London County Council's Highways Committee on the proposal for the construction of a new tramway line from the Marble Arch along Edgware-road to the county boundary at Cricklewood.

London County Council Tramways.—The parts of the London County Council (Tramways and Street Widenings) Bills which have been struck out in consequence of the opposition of road authorities related to tramways in Stoke Newington and Hackney; Hampstead-road, Marylebone, and Tottenham Court-road; Cambridge-circus and the parish of St. George-the Martyr, Holborn; from Cheyne-walk to Blackfriars Bridge along the Victoria embankment; Chelsea and Hanover-square; Vauxhall and Grosvenor-road, and the parish of St. John's, Westminster, and Vauxhall Bridge, Putney, and Battersea Bridge; Hammersmith and Fulham, King-street, Hammersmith, and the Broadway, from Uxbridge-road to Netherwood-road, from Netherwood-road to Shepherd's Bush-road, etc. Consents to the Battersea parts of the Bill were given, as also were those to the parts affecting Lambeth, Southwark, Bermondsey, Wandsworth, Camberwell, and Newington. Tramway No. 6, it is understood, will run along the boundary line between Finsbury and Holborn, and that while Finsbury consents Holborn in part refuses consent. A special report will in this case be submitted to the Standing Orders Committee.

Leeds.—The Tramways Committee have approved of the electrical engineer's recommendation in favour of the furnishing of every electric car with an earth switch, which will practically divert the electricity from a fallen wire or wires to the rails; and also of his proposed arrangement of telephone boxes, and the suggested connection of the underground telephone system with the fire brigade station. At the same meeting a discussion took place relative to the present management of the tramways. The Chairman admitted that the system he had favoured two years ago of having two managers had absolutely broken down, and that he was now in favour of the proposal advocated by the Liberal party in the Council at that time. The chief point in the discussion was whether a general manager could be appointed with full control over the entire staff. No decision was arrived at. The Tramways Committee recommend that the salary of the tramway electrical engineer be increased by £200, and that of the superintendent of street-lighting by £25. An effort is being made to have the Beeston-hill electric tramcars running at the beginning of next week. The equipment of the line is almost complete, and workmen are now devoting their attention to the Elland-road section.

London's Underground Railways.—A Select Committee of the House of Lords is to be appointed to join with a committee of the House of Commons to consider and report whether the lines of route for the proposed underground railways in and near London are best calculated to afford facilities for present and probable future traffic, and, if not, what modifications of those lines of route are desirable; what special provisions, if any, should be made for the protection of owners, lessees, and occupiers of property adjacent to underground railways from possible damage and annoyance, what special terms and conditions as to construction and working should be imposed on the promoters; and whether any of the schemes should be sanctioned in the present session. In the House of Commons last Friday the President of the Board of Trade, in answer to Mr. Compton Rickett, stated that an expert committee was sitting to enquire into the subject of vibration on the Central London Railway, and until it had reported he was not in a position to express any opinion. Among a number of Bills which received second readings in the House of Lords on Tuesday were those of the Central London, City and Brixton, and the City and South London Railway Companies. Yesterday the Chairman of Ways and Means in the Commons, in accordance with a message from the Lords, moved a resolution corresponding with that passed in the Lords as to the appointment of a joint committee of both Houses to consider the question of underground railways in London. Notice of opposition has been given in the House of Lords by the trustees of the Cavalry Club against the Charing Cross, Hammersmith and District Electric Railway Bill; by the Westminster Corporation against the King's-road Railway Bill; and by the Westminster Corporation against the Piccadilly and City Railway Bill.

LIGHTING AND GENERAL.

Hastings.—The Town Council have resolved to purchase electric light plant at a cost of £9,500.

Wath.—The Urban District Council will not at present oppose the South Yorkshire Electric Power Bill.

Durham.—The County Council will probably petition in favour of the Cleveland and Durham Electric Power Bill.

Share Market.—A steady business was done during the week in electric shares, although prices did not alter much.

Lynton.—The agreement between the Council and the electric light company for lighting the town hall has been sealed.

Eastbourne.—We understand that Mr. Bennett is being consulted with regard to the proposed municipal telephones.

British Insulated Wire Co.—The annual staff dinner of this Company takes place to-day at the Adelphi Hotel, Liverpool.

Neyland.—The Urban District Council are making enquiries into the cost of obtaining an electric lighting provisional order.

Calverley.—The District Council have obtained a report by the committee appointed to obtain information with respect to proposed electrical supply.

Not Made in America.—Messrs. Escher, Wyss, and Co., of Zurich, have just received from Niagara an order for six electric turbines, each of 5,500 h.p.

Todmorden.—The Town Council have decided to oppose the Bills of the Electric Power (Yorkshire) Company and of the South Yorkshire Electric Power Company.

Manchester.—Mr. S. D. Pearce (now chief engineer at Shepherd's Bush generating station) has been appointed deputy chief electrical engineer, at a salary of £500 per annum.

Cable Depot.—Messrs. Johnson and Phillips, Electric Cable Works, Old Charlton, have opened a West-end depôt for their cables at 37, King-street, Covent Garden, W.C.

City of London Electric Co.—The directors announce a dividend of 6s. per share on the preference shares for the six months ended Dec. 31, £11,350 being carried forward.

York.—The Local Government Board have sanctioned the borrowing of the sum of £20 000 by the Corporation for electric lighting purposes, the time allowed for repayment being 25 years.

Morley.—Sanction has been received to the reborrowing of £21,247 for electric lighting works. Application is to be made for sanction to borrow £7,050 to carry out electric cable extensions.

Ilford.—Mr. Arthur Shaw and the accountant are about to visit Brighton with a view to making themselves acquainted with the system of keeping the electricity accounts as in use at that town.

Coventry.—The Council have confirmed the resolution previously noted by us to borrow £23,200 as follows: electric works extensions, £14 891; distribution £3 300; expenditure already incurred, £5,009.

Middlesbrough.—The Town Council on Wednesday decided to apply for sanction to borrow £21,000 for additional generating plant and extensions to the Park-road, Linthorpe, and Newport districts.

Penzance.—The Town Council have adopted the engineer's report on electric lighting, and will discuss the same at a future meeting. It is probable that the scheme will be handed over to a company.

Hull Telephones.—The Hull Guardian Society at their annual meeting last week passed a resolution urging the City Council to immediately apply to the Postmaster-General for a license for municipal telephones.

Bridlington.—The Electric Lighting Committee having considered the Bridlington Electric Lighting Order, 1900, are now asking certain syndicates upon what terms they would be prepared to carry out the order.

London Gazette.—The day fixed for public examination *re* the Gutta Percha Corporation, Limited, Throgmorton House, Copthall-avenue, E.C., is March 11 (at 11 a.m) at Bankruptcy-buildings, Carey-street, Lincoln's-inn, W.C.

Arbroath.—The Arbroath Town Council have resolved to apply to the Secretary for Scotland for a provisional order conferring powers upon the Council to borrow a sum not exceeding £40,000 for the purpose of electric lighting.

St. Pancras.—The Borough Council have adopted an extensive scheme of arc lighting prepared by Mr. Baynes, chief electrical engineer, for various parts of the borough. The necessary feeders are to be laid down at an estimated cost of £69,112.

Southwark.—Application is to be made to the London County Council for a loan of £15,000 for electric lighting extensions, repayable in 42 years, the first instalment being made payable at the end of the third year from the date of the loan.

West Hartlepool.—The Town Council intend to oppose the Bill of the Cleveland and Durham Electric Power Bill, the promoters having declined to insert a clause which had been approved at the joint meeting of Corporation representatives at Stockton.

Worcester.—We note that Mr. C. J. Sutherland resumed his duties on Jan. 1 last, and that the City Council at their last meeting apppointed Mr. Hoadley (who carried out Mr. Sutherland's

Digitized by Google

duties during his absence) as chief assistant at a salary of £250 per annum.

Beckenham.—The National Telephone Company are asking the Urban District Council for permission to lay a cable through the Croydon road recreation ground, as they have been refused seven important wayleaves. The matter is before the Works Committee and the surveyor for report.

Aron Electricity Meter Co.—We are informed that, owing to disputes as to the management of this Company, Dr. Julius Juttke has resigned his seat on the Board as well as his position as managing director of Aron Electricity Meter, Limited, after having been connected with the Aron Meter for the last 11 years.

Tredegar.—At the last meeting of the Bedwelty District Council at Pengam it was decided that an expert from Cardiff be engaged to report upon the cost of an electric light scheme for the whole of the Rhymney Valley area of the Council's district. It is suggested that the generating machinery be placed at Pengam.

City of London.—The Court of Common Council have received formal notice from the Charing Cross and Strand Electricity Supply Corporation of their intention to open all the principal streets in the eastern part of the City for the purpose of laying cables. The notice has been referred to the Streets Committee.

Barrow.—The Corporation intend to apply for sanction to borrow £12,000 for electric lighting in connection with the new town of Vickerstown on Walney Island, Barrow, which is being built by Messrs. Vickers, Sons, and Maxim and where over 1,000 houses are being erected for the workmen employed at the shipyard.

Wimbledon.—At the last meeting of the Urban District Council it was stated that Mr. Barnes Spencer had yielded to the Electric Lighting Committee's wish that he should remain with the Council. His salary is to be raised by £100 a year as from April 1 for a period of two years, at the end of which time the matter will be reconsidered.

Newport.—It is reported that there has been a mistake in the estimate of expense in putting up and equipping the new power station to the amount of something like £70,000. The estimate at first was about £130,000; now it is about £200,000. The foundations alone will involve a much greater expenditure than was at first thought.

Gravesend.—Application is shortly to be made for sanction to a loan to cover the cost of the proposed installation of the electric light system, including a supply of energy to the tramway company and others, with the addition of a dust destructor. The committee are about to view proposed sites for the works in company with Mr. Trentham.

Eastbourne Telephones.—The borough accountant is preparing a map showing the premises of those who have agreed to become subscribers to the municipal exchange, and the Town Council have notified the National Telephone Company that they are prepared to negotiate with them for the acquisition of the company's Eastbourne undertaking.

Stock Exchange.—The Stock Exchange Committee have ordered the undermentioned securities to be quoted in the official list: Cape Electric Tramways £400 000 shares of £1 each, fully paid, Nos. 1 to 400 000; Electric Lighting and Traction Company of Australia 20 000 6 per cent. cumulative preference shares of £5 each fully paid, Nos. 1 to 20,000.

Newport (Fife).—At the last meeting of the Town Council a discussion arose on a motion that the Council consider the advisableness of applying for a provisional order for electric lighting. It appears that the community of Newport are strongly of opinion that the quality of the gas is so bad that they would rather have electric light. The question was remitted to a committee.

Worksop.—An interview with the solicitors to the promoters of the Notts and Derbyshire Electric Power Company's Bill having proved futile, so far as securing the insertion of a clause to safeguard the interests of the Council is concerned, the latter have decided to oppose the Bill in Parliament. The Council are now spending £15,000 on electric lighting works within their district.

Southport.—At the meeting of the Chamber of Commerce last Friday a letter was read from the town clerk, stating that the Corporation were considering the desirability of establishing a municipal telephone exchange, and until a decision had been come to on that matter they could not consider any application from the Telephone Company for permission to lay down any underground wires.

Sales of Plant.—The Electric Lighting Committee of the Hull Corporation are about to sell four Willans Siemens direct coupled steam dynamos, together with spare armatures and other parts, switchboards, and accessories; and the Dudley Electrical Committee have for sale generators, belt-tightening gear, Westinghouse engine, wrought-iron stack, etc. Full particulars appear in our advertisement columns.

West Bromwich.—The Mayor has consented to open the works at Black Lake as soon as everything is ready for the generation of electricity. Several demands for power having been made, the Electric Lighting Committee have decided to carry a main down Swan-lane and Phœnix-street; a distributing main will also be laid along the latter street. It is also recommended that the Farley clock tower be lighted by electricity.

Monmouth.—The report of the Drainage Committee, adopted on Monday, stated that Messrs. Siemens Bros. had accepted the conditions offered by the Council, the Council agreeing to pay them £4,753. 4s. 5d. in settlement of the electric machinery, etc., supplied, including the extra dynamo now on order—£757. 4s. 5d. to be paid now, the balance, £3.996, with interest, to be paid by quarterly instalments extending over five years.

Twickenham.—The Council have consented, under the usual conditions, to an application from the General Post Office, in connection with the proposed new Post Office telephone service, to lay distributing pipes from time to time in order to reach the premises of the subscribers, and asking that the Council would give their general permission for the laying of such distributing pipes under the footways and streets within the district.

Dudley.—It is proposed that the scheme for the free wiring of the premises of intending users of the electric light be abandoned on account of the opposition of the Local Government Board. The price for current recommended is 5d. per unit throughout or 6d. per unit for two hours per day (the hours to be determined by the Corporation or their engineer from time to time) and 1½d. per unit for the remaining 22 hours, no rental to be charged for meters.

High-Voltage Switch.—The Electrical Trades Supply, Limited, of Birmingham, have forwarded to us one of their circular sheets, illustrating the high-voltage tumbler switch manufactured by them. The chief advantages claimed for this switch are a long break between the lever and contacts, wide space between the terminals, and improved leverage, while it is asserted that no leakage is possible. These high-voltage switches are made in three sizes, of 5, 10, and 20 amperes respectively.

Aberdeen.—The Council on the 4th inst. decided to borrow a further sum of £81 000 with the view of meeting the additional expenditure on machinery, buildings, etc., in connection with the electric light undertaking. It was remitted to a special committee to report as to the propriety of the Corporation obtaining a license from the Postmaster-General to provide a system of public telephonic communication for the city and district adjoining under the powers conferred by the Telegraph Act, 1899.

Pacific Cable.—Reuter wires that a resolution authorising Canada's share of five-eighteenths of £2,000,000—the cost of the Pacific cable—was adopted in the Dominion House of Commons on the 5th inst. Mr. Mulock, the Postmaster-General, said that as to the concession granted by New South Wales it was too late now for Canada to recede, as the contract was signed and the cable under construction. He denied the report that any pooling arrangement existed with the Eastern Extension.

Heathman's New Factories.—We have been asked by Mr. Heathman to mention that he will be pleased to show anyone over Messrs. Heathman and Co.'s new works at Rectory-road, Parson's Green, when in his direction. The various workrooms have been designed specially for the services they are to render. We note that the company's west central stock and showrooms, 37, Hadell-street, Covent Garden, and the Islington depôt at 7, Pentonville-road, will still be retained for the convenience of customers.

Bath.—The resignation of Mr. G. F. Metzger, the city electrical engineer, who has been appointed engineer to the Manchester Corporation, has now been accepted. Fifty applications were received for the post, and of these the committee selected three to appear before them—Messrs. Teague (Paisley), Sayer (Hampstead), and Pullen (Ealing). At a special meeting of the Electric Light Committee on Tuesday it was decided to recommend the appointment of Mr. Teague, at a salary of £350 per annum.

Accrington.—On Monday afternoon last, the Accrington Corporation new electricity works were formally opened by Councillor Jas. Cunliffe, chairman of the Electricity Committee. The Mayor (Mr. D. L. Sprake) subsequently spoke in highly appreciative terms of the work done by Councillor Cunliffe for the benefit of the ratepayers in connection with the undertaking. We hope to give illustrations and full particulars in an early issue. The electrical engineer's report for January states that there were 61 consumers connected with the mains. The average units generated had been 2 270, the average units delivered to the town 1,884 per week. The average fuel used per week was 7·5 tons, or 7·45lb. per unit generated. The appointment of Mr. Harold Gray as borough engineer, to take effect from Jan. 1, has been confirmed. The electrical engineer and surveyor are conferring with a view for temporarily heating the assembly-room in the town hall by electricity.

Leith.—A sub-committee has been appointed to consider the terms and conditions on which electricity was supplied to consumers, and also the practicability of free wiring and of hiring out motors. The provision of further generating plant at the power station, and a reduction in the charges for both light and power, will shortly be considered by the Council. The accounts of the electricity department show that the capital expenditure to date has been £44 014. 4s. 10d. Of that sum £35,000 has been borrowed for 30 years at 2¾ per cent., and £9,000 for five years at 3¼ per cent. It had been a hard year for the scheme owing to the high price of coal, of which 2,945 tons were consumed, costing £1 795. 8s. 11d., an average of about 12s. 2¼d. per ton. If coal could have been bought at 6s. 8d. a ton the price of the previous year, the revenue would have shown a surplus of £435 4s. 9d., instead of a deficit of £378. 10s. 10d. The income was: from private lighting £3,041; from motive power, £1 247; from public lighting £2 160; miscellaneous receipts £15—total, £6 385. The cost of generation and distribution was £4 743, leaving a profit of £1 641. This added to the credit balance brought forward, gave a total of £2,370 to meet payment of interest, £1,602, and repayment of capital, £1,298. On the whole, the accounts were very satisfactory. Attention was drawn to the fact that the amount of electricity sold compared with the amount generated showed a deficiency of 54,564 units, about 10 per cent. of the total production.

Digitized by Google

North Shields.—The electric light supplied by the Tynemouth Corporation has been tested on several occasions during the past week, and has proved in every way satisfactory. A number of large arc lamps in the principal thoroughfares have been tried and found to give an excellent light. A number of places of business, the North Shields police station, and the Presbyterian church in Northumberland-square have also been lighted with the new illuminant, and the results produced have come up to the most sanguine anticipations.

Burnley.—The deputation appointed by the meeting of consumers of electricity waited upon the Corporation Electricity Sub-Committee on Thursday last week with respect to the method of charging for electricity supplied for lighting purposes. The deputation requested the sub-committee to institute a uniform system of charging, and that the price per unit be 3½d. The sub committee, after fully considering the present system, decided to abolish the maximum-demand principle of charging, and to charge 4d. per unit for all electricity supplied for lighting purposes.

Glasgow Technical College Scientific Society.—The eighth annual dinner of this society was held in the Bath Hotel on Saturday night, Mr. D. Home Morton, M.I.C.E. and M.I.M.E., occupying the chair. There was a large attendance. Mr. Andrew Stewart, A.I.E.E., who had officiated as honorary secretary to the society for the past three years, and had lately departed from Glasgow to fill the important position of manager and engineer to the Durham Power Distributing Company, Limited, was presented with an illuminated address and various other tokens of esteem.

Hendon.—At the last meeting of the Urban District Council a letter was received from Mr. G. D. Perks intimating that the approximate price at which his company could furnish current for electric lighting would be 3d. per Board of Trade unit. A communication was received from the borough of Hampstead intimating that the price for electricity in bulk would not be less than 5d. per Board of Trade unit. The Council decided to abandon the idea of taking a supply of electricity in bulk from an outside source and to proceed with the execution of their own electric lighting order.

Stockton.—At a meeting of the Town Council on Tuesday the electric works manager submitted an estimate, amounting to £21,000, for additional machinery required and the necessary cables in connection with the proposed extensions of the electric lighting system in the town. The manager was instructed to prepare plans and estimates of the future requirements for electric lighting, and it was decided to advertise in the meantime for tenders for a 300-kw. engine. The Rural District Council have decided to formally petition against the Cleveland and Durham Electric Power Bill, but it appears that the feeling is in favour of the Bill, provided that the Council's interests are properly protected.

Exeter.—Plans for the new electricity works at the Basin have been approved, and tenders for building and equipping the station are to be invited. The Council will consider any alternative complete proposals on the alternating system of equal efficiency, under guarantee, for the construction and equipment of the electric station, such proposals to be accompanied by estimates. Additional plans and specifications are to be prepared for dynamos, etc., for supplying electric current on the direct system for motor purposes, with a view of inviting tenders for the supply of such power in conjunction with the construction and equipment of the new station. The salaries of various members of the engineering staff have been increased.

Rochdale.—At a meeting of the Gas and Electricity Committee last week a resolution was received from the Rochdale Merchants' and Tradesmen's Association urging that it would be to the general benefit to have one uniform charge for electricity. The committee, however, could not see their way to any alteration in the present system of charges until the present method has had a full three months' trial. A discussion arose as to the decision of the joint conference on the utilisation of refuse for the generation of electricity. The committee resolved to be in readiness to supply electric power for the tramways when it is called for, and to recommend the Council to give orders for necessary additional plant to generate the power so required.

Salford.—The severe weather of the past month has caused some delay with regard to the outdoor work at the new electrical station at Strawberry-road, but (according to the *Salford Chronicle*) satisfactory progress is being made. The walls of the fine generating station are completed, and half the roof principals have been erected. Eight of the large Lancashire boilers are already in position, and a ninth will be delivered this week end. The erection of the two fine stone and brick chimney stacks is proceeding apace. These are to be 200ft. high, and the one nearest the roadway has already attained the height of 185ft. Plant and machinery are daily being delivered, and great efforts are being put forth to be prepared to supply the great demand for the electric current when any of the tramway routes are ready for it.

Presentation.—On the occasion of Mr. Cross, the present works engineer of the electricity department, leaving Aberdeen to fill the position of borough electrical engineer for Rotherham, he was entertained in the Bon Accord Hotel, Market street, by the staff of the department and presented with a case of drawing instruments, a collection of books on electrical and allied sciences, and a photograph of the present staff as a token of their esteem and good wishes. The city electrical engineer (Mr. J. Alexander Bell) presided, and referred to the excellence of the work carried through by Mr. Cross during the 2½ years he had been connected with the department. He said Mr. Cross was the first Aberdeen assistant who had been appointed a chief electrical engineer, which showed that Aberdeen was growing in standing and importance in electrical distribution in comparison with other towns.

Shipley.—At the last meeting of the District Council a statement was referred to which had appeared in the *Bradford Observer* to the effect that the Shipley District Council in their Bill were applying for powers to supply electricity to other districts. This was stated to be a misrepresentation. The Council were not making any such application, therefore it could not be necessary for the Shipley Bill to be opposed on that ground. It was also stated that it might be necessary for Bradford, as they were making an application for Baildon to be included in their area, to free Baildon from the necessity to take its gas from the Shipley Council. Provision was made in the Shipley Bill under which Bradford, for Heaton, or Baildon, for itself, might at any time, by giving six months' notice, obtain the right to supply its own district. It could not be contended that the powers of the Shipley Council should be voluntarily surrendered, or that Bradford or Baildon would attempt to compel Shipley to part with legitimately-acquired rights without proper consideration.

Croydon.—The borough electrical engineer's report, which was adopted at the last meeting of the Town Council, stated that the extra high-pressure main to Upper Norwood, laid in the autumn of 1898, specified to work at a pressure of 5,000 volts, and to stand a test pressure of 10,000 volts, notwithstanding its having successfully withstood this test at the works, does not now, as laid, meet the requirements of the specification, the failure not being due to deterioration, but to the fact that such a long length of cable requires larger margins of insulation to withstand the current produced by the machines than the makers have given it. The borough electrical engineer further reported that he had been in communication with the contractors with regard to the cable not meeting the requirements of the specification, and that the contractors had now expressed their willingness to lay a new cable, in accordance with the specification, from the central station to Upper Norwood, *viâ* Thornton Heath, free of cost, the Corporation to pay for the excavation only, the old cable being left in the ground, the property of the Corporation. The committee recommended that this offer of the contractors be accepted, and that the corporate seal be affixed to a contract embodying this arrangement.

Edwards Air-Pump Syndicate, Limited.—The third annual report of the directors, with revenue account and balance-sheet at Dec. 31, 1900, has just been issued. The royalties booked during the 12 months show an increase of over 32 per cent. on the previous year. The revenue for 1899 amounted to £3,219, while that for 1900 is £4,266. We quote from the report as follows: "In addition to the important contracts formerly booked for the London County Council, the Mersey Dock and Harbour Board, and the Corporations of Glasgow, Manchester, Liverpool, Salford, Bradford, Portsmouth, Halifax, Swansea, Newport (Mon.), etc., the Edwards pump was specified during the past year for the following installations: the Midland Electric Corporation for Power Distribution, Limited, the Metropolitan Electric Supply Company, Limited, South London Electricity Supply Corporation, Limited, Merthyr Tydfil Electric Traction Company, Limited, Melbourne Electric Lighting Company, and Calcutta Tramways Company; Leeds, Bristol, Burton-on-Trent, Torquay, Aberdeen, Wrexham, Accrington, Barrow-in-Furness, Derby, Southport, Warrington, Wolstanton, and Alloa Corporations; Wimbledon and Dartford Urban District Councils; Shoreditch, Hackney, Plumstead, and Wandsworth Borough Councils. More than 1,000 pumps are now at work or in course of construction."

Walker.—At a meeting of the District Council on Tuesday the Surveyor reported to the Electric Lighting Committee that electric mains were being laid from the Walker and Wallsend Gas Company's generating station at Wallsend along the riverside railway into Walker, and preparations were being made for the erection of a sub-station between the railway and Fisher-street, but no plan had been deposited for the Council's approval. The gas company were running the overhead cables from their station at Wallsend through Messrs. W. Richardson's boiler works in Walker, and were continuing them through the shipyard. It was recommended that counsel's opinion be taken. A resolution was proposed to reconsider the question of the destructor, as the estimates were higher than anticipated, and the usefulness of the destructor had been curtailed. It was stated that at the beginning it was estimated that the cost of the destructor, erecting an electric station, and providing plant would be £30,000. Already they had spent £13,000 for the destructor and £16,000 for the mains, leaving only £1,000 for the station. The Chairman said the destructor would save £500 a year to the ratepayers, and the sanitary conditions would be greatly improved. The entire expenditure would come out of the pockets of the electric supply company under an agreement already come to. The motion was lost by a large majority.

Basingstoke.—Mr. Reginald P. Wilson, electrical engineer, of 66, Victoria-street, S.W., has submitted to the Town Council a report on the proposal to introduce a scheme of electric lighting for the borough. The following estimates are appended to the report: Capital expenditure—engine-room and boiler-house, engine and boiler foundations, chimney, £4,750; boilers and mechanical stokers, feed pumps, pipe work, etc., £2,500; two 100 kw. and one 50-kw. sets, switchboard, balancers, traveller, etc., £4,050; cables, including all roadway work, arc lamps posts, switch pillars, meters, and house connections, say, £4,650; legal and engineering charges, etc, £1,250—total expenditure at end of third year, £17,200; probable cost of destructors, £750. Financial results: Revenue—private lighting (84,000 units at 5d.), £1,750; public lighting (including repairs, interest, etc.) (10,652 units at 2¾d.), £120; power supply (104,000 units at 2d.), £866;

Digitized by Google

pumping water (218,400 units at ¾d.), £682; pumping sewage (155,520 units at ¾d.), £486; meter rents, £75—total units, 572,545; total receipts, £3 979. Expenditure—total works cost (198,625 units at 1·5d.), £1,237; total works cost (373,920 units at 0·6d.), £935; interest and sinking fund at 6½ per cent. on £17,200, £1,120—£3,292; balance being profit, £687—total, £3,979. The interest and sinking fund on the sewage and water pumps are not included in this figure because they will be borne by the committees responsible for sewage and water works respectively.

Bury St. Edmunds.—On Thursday week the Mayor and Mayoress (Mr. and Mrs. Shillitoe), accompanied by Mr. A. H. Roe (borough electrical engineer), and Mr. C. Oliver (former chairman of the Electric Supply Committee), assisted in the inauguration of the public lighting. The Mayoress switched on the current. There was no speechmaking. There are eight arc lamps, of the open, double-carbon, change-over type, and are capable of burning for 32 hours without re-carboning, serving to light 24 ends of streets or turnings of streets. The current for the arcs is taken from the private lighting mains, and the lamps are controlled by means of time switches. The arc lamps will burn from sunset until 11 o'clock, at which hour the incandescent lamps, fixed about half-way up the pillars, will be switched on, and will continue to burn for the remainder of the night. Each arc lamp is equal to about 2,000 c.p., thus giving a total of 16,000 c.p. Measuring from the centre of the globe, the height at which they are suspended is 22ft. from the ground. The small incandescent lamps are 12ft. Mr. A. H. Roe, the borough electrical engineer, is responsible for the design of the installation, and the work has been entirely carried through by the staff at Bury St. Edmunds electricity works. The three-core steel-armoured cable has been supplied by Messrs. Callendar and Co.; the pillars by Messrs. Macfarlane and Co., of Glasgow; the lamps by Messrs. Crompton and Co., of Chelmsford.

WORCESTER ELECTRIC LIGHTING ACCOUNTS.

The accounts of the electricity department of the Worcester Corporation for the year ended Dec. 31, 1900, have just been published, from which we give an extract of the revenue account, general balance-sheet, and statement of electricity generated, sold, etc. An abstract of the report of Mr. C. J. Sutherland, city electrical engineer, to the Electricity Committee on the work of the department during the year is also appended:

Dr.	Revenue Account.	£	s.	d.
Coals		2,677	12	1
Oil, waste, and engine-room stores		217	11	3
Wages at generating station		1,037	0	7

Statement of Electricity Generated, Sold, etc.

Quantity generated in Board of Trade units		842,132
Quantity sold { Public lamps 106,049 / Private consumers by meter.. 519,690 }		625,739
Quantity used in works		8,605
Total quantity accounted for		634,344
Quantity not accounted for		207,788
Total maximum supply demanded (kilowatts)		510

Number of public lamps: 57 arc lamps of 500 watts each, three incandescent lamps of 600 watts each, 13 of 60 watts each.

Mr. Sutherland's Report.

I have the honour to submit to you the following report on the results of the sixth year of working of the electricity department. I have followed the usual precedent, and included the result of previous years in order that they may be compared with those obtained in 1900. I think it is a matter for congratulation that the financial result shows a small profit, in spite of the large increase in the cost of coal. It will be noticed that the coal bill has increased by a sum of £1,051. 8s., and this is almost entirely due to the high price, and not, as might be supposed, to a largely increased consumption. As a matter of fact, the consumption for 1899 was 2,068 tons, and for 1900 was 2,157 tons. If this is reduced to pounds of coal per steam unit it will be seen that though the cost of coal per unit has increased from ·707d. to 1·027d., the weight of coal used has only increased from 11·19lb. per steam unit to 11·27lb. per steam unit. This small increase is accounted for by the fact that we were using a different class of coal during 1900. The item of oil, waste, etc., shows a small increase of ·015d., chiefly owing to the additional quantity of oil required by the Ferranti plant. The cost per unit of salaries and wages at works has again fallen, and has shown a steady diminution since the commencement of the supply, and the figure at which it now stands—viz., ·397d.—will be found very low in comparison with the majority of other undertakings. There is a rise of ·029d. per unit in repairs and maintenance to buildings and plant, etc., due to several repairs which had to be undertaken during the past year, and also to the fact that as the engines age they naturally require more repairs than when they are practically new. It will be noticed that the cost of repairs and maintenance of mains, etc., has fallen by ·024d., the reason being that in 1899 the repairs were heavier than usual owing to the breakdown of several transformers. The total works costs show an increase of ·323d., and as coal alone is responsible for ·320d. of this amount, I think the result may be considered satisfactory. Every other cost per unit including salaries, etc., has decreased until insurance is arrived at. This shows a small increase of ·004d., owing to the committee having decided to insure the works more fully against fire and the alternators against self ignition. Our payments to the Free Wiring Company have increased during the past year, but this is due to a larger number of units having been sold to free-wired customers, and is merely a receipt which is passed on to the company. The cost of lamps is, however, included, and though this has risen, it must be borne in mind that it is not a cost in the usual sense of the word, but is merely a discount formerly allowed for prompt payment, and is therefore no more a cost than a cash discount would be. As more units were sold during the first six months of 1900 (the period during which the lamps were allowed) it follows that the cost necessarily increased. Now that the giving of "free lamps" has been abandoned, the item will disappear from the accounts. The total costs have increased ·211d. per unit, and when it is remembered that coal increased ·320d. and lamps ·016d., it will be seen that if it had not been for the higher price of coal a substantial reduction in costs would have been shown and a profit of several hundred pounds would have been made. The units supplied to public lamps are returned as less than in 1899, but this decrease is more apparent than real. It is not possible to measure these units, and they have to be calculated from the hours the lamps are lighted. This year I have adopted a standard for calculation which I consider more accurate than the former method, and the result is that the units appear less; this new method also accounts for a larger percentage of units remaining "unaccounted for." The units sold to private consumers for the year 1900 increased 17·62 per cent., a satisfactory result, but slightly below the previous year, when the increase was 20·73 per cent. The waterworks used 24·22 per cent. more current for their motors, the total units being higher than any previous year. The mean price per unit obtained has risen from 3·638d. to 3·708d., owing to the increase in the price of current, which came into force in the last quarter of the year. It is worthy of note that the average price obtained for private lighting only is 4·48d. per unit, which proves the advantage of the maximum demand system of charging to the consumers, for as a whole they pay rather less than 4½d. per unit for current. The number of new customers connected during 1900 was 69, against 51 in 1899. This is a very good result, especially as the increase in prices mentioned above, which was rendered necessary by the high cost of coal, preventing many customers from coming on. With regard to the water power, I am pleased to say that this was much better than during the previous year, the result being

Digitized by Google

that practically half our units were generated by water power—the actual figures are 50·87 per cent. by steam and 49 13 per cent. by water. There were only two floods of long duration, and the wet summer caused the water to hold out better than usual during August, September, and October. One result of the increased water power was that we were able to run both motors at the waterworks more frequently, and consequently the units used for pumping were much higher than usual, as mentioned above. The contract formerly existing between the Free Wiring Company and the Corporation was terminated last June, up to which time they had obtained 44 customers altogether. From June until the end of the year nine customers had availed themselves of the Corporation free wiring scheme, and there seems every probability of its becoming more popular as the advantages are more fully realised by the citizens. The Ferranti plant has run well during the winter load, and is proving very economical in steam—in fact, it is largely due to the use of this plant that our coal consumption increased so little in spite of the increase in units generated. When we have a good head of water the turbines are made to do all the load possible, and the surplus is done by the Ferranti plant, which is a much more economical arrangement than when we were obliged to run several Brush engines. There was an unfortunate breakdown of the Ferranti engine in November, and for some eight weeks it could only be run on the high-pressure side, which caused a large increase in the coal used during these weeks, amounting to some 50 tons. The valve gear on the engine has been remodelled and now runs very smoothly, and is less complicated than the old arrangement; and a new governor has recently been fitted, which is very satisfactory up to the present. It will be remembered that the Ferranti Company agreed during last year to alter the plant from 300 kw. to 400 kw. in lieu of penalties for delay, and though it will do the increased load it is not at present quite satisfactory when running with loads above 325 kw., and the company are giving the matter their attention. We are still in the same position as last year regarding reserve plant, and if the Ferranti set breaks down during the winter it will be a very serious matter, more especially if the accident should happen during a flood, when the water power is not available. The scheme for the new generating station in the town is now under way, but it is doubtful if if the plant will be available for use before the spring of next year.

UNITS GENERATED BY STEAM AND WATER POWER WITH PERCENTAGES FOR 1900

Month.	Total units.	Steam.	Water.	Steam, per cent.	Water, per cent.

Note.—July, September, and October only 36in. wheel for a few hours per day; Oct. 17 to Nov. 3, No. 5 turbine under repair. Floods: (1) Jan. 1 to 10; (2) Feb. 16 to March 14; (3) Dec. 28 to 31.

PROVISIONAL PATENTS, 1901.

FEBRUARY 25.

3964. **Improvements in electric igniters for internal-combustion engines and the like.** Anthony George New, The Voltage, Woking.

3965. **Improvements in automatic and safety subsidiary devices for controlling electrically-propelled vehicles and the like.** Anthony George New, The Voltage, Woking.

3967. **Improvements in dynamo-electric generators and electric motors.** Albert Dickinson and Thomas Preece, Armley Electric Works, Edinburgh-avenue, Armley, Leeds.

3972. **Improvements in machines or mechanism employed in the manufacture of pipes or tubes or for covering telegraph and telephone cables and wires with lead or other metallic substances for electric purposes.** Ernest Alexander Claremont and John Stratton, 4, St. Ann's-square, Manchester. (Complete specification.)

3982. **Improvements in electrical accumulators.** Henry William Cobb, 49, Crowther-road, South Norwood, London.

4005. **Improvements in or relating to electrical ship log apparatus.** Thomas Ferdinand Walker and Thomas Sydney Walker, 55, Chancery lane, London.

4008. **Improvements in controlling apparatus for electric lifts.** Herbert John Haddan, 18, Buckingham-street, Strand, London. (August Stigler, Italy.)

4007. **Improvements in telephonic apparatus for central stations.** Charles Denton Abel, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Siemens und Halske Aktien-Gesellschaft, Germany.) (Complete specification.)

FEBRUARY 26.

4050. **Improvements in electrical switches.** Ludlow Patton Perkins and Henry Humphreys, 40, Victoria-buildings, Manchester.

4068. **A safety device for overhead systems of street electric transmission of power.** Cecil John Reginald Le Meeurier, 19, Perrymead-street, Fulham, London.

4098. **Improvements in railway electric signalling apparatus.** Washington Hume, 52, Chancery-lane, London. (Complete specification.)

4114 **Improvements in or applicable to the trolley system of electrical traction.** Sidney Harper Heywood, 70, Deansgate, Manchester.

4122 **Improvements in make-and-break switches or interrupters for electric circuits.** Georges Eugène Gaiffe and Gaston André Gabriel Contremoulins, 11, Southampton-buildings, Chancery-lane, London.

4123. **Improvements in and relating to slack-cable safety gears for electrically-operated lifts, elevators, and the like.** Charles William Hildred and Henry Cecil Walker, 60, Queen Victoria street, London.

4149. **Improvements in electrically-operated switches.** John Henry Spangler, 18, Buckingham street, Strand, London. (Complete specification.)

FEBRUARY 27.

4215. **Improvements relating to electric switches.** Henry Harris Lake, 45, Southampton-buildings, Chancery-lane, London. (The Telephonfabrik Aktiengesellschaft, vorm. J. Berlinger, Germany.)

4243. **Improvements in electrical circuit breaking and making devices.** J. W. Beauchamp, 6, Lord-street, Liverpool.

FEBRUARY 28.

4259. **The preparation and use of calcium compounds for the electro-depositions of metals other than calcium.** James Kelly, 27, Branston-street, Birmingham.

4290. **Improvements in mica insulation for electric apparatus.** The British Thomson-Houston Company, Limited, Bush-lane House, Cannon-street, London. (Charles F. Peterson, United States.) (Complete specification.)

4305. **An improved tidal meter for generating and transmitting electrical energy.** Richard William Derbyshire 73, St. Stephen's road, Upton Park, London.

4330. **Improvements in the connections or contacts of incandescent electric lamps for lighting and heating.** Herbert John Dowsing, 115, Cannon-street, London.

MARCH 1.

4337. **A new or improved stopping-place indicator for electric cars and electric railways.** James Bates MacKenzie, 2, Market-street, Bradford.

4366. **Improvements in safety devices for the trolley poles of electric cars.** Charles Revill Bellamy, William John Turner, and Daniel Richard Wallwork Hardman, 34, Castle-street, Liverpool.

4382. **An improved method of breaking the electric circuit in the overhead wires of electric tramways, railways, and the like, and apparatus therefor.** Cecil Charles Hewett, 185, Fleet-street, London.

4388. **Improvements in devices for producing, by the electric volatilisation of metal wires, flashes for use in photography.** Jules Courtier, 70, Chancery-lane, London. (Complete specification.)

4401. **An electric heater for liquids.** Thomas Kerrison Bellis 15, Bury street, St. Mary-axe, London.

4422. **Improvements in electric primary batteries.** Charles Albert Hussey and Stephen Greely Clarke, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Complete specification.)

4429. **Improvements in or relating to electric storage batteries or accumulators.** Frédéric Marie Chaplet, 111, Hatton-garden, London.

MARCH 2.

4467. **An improved magnetic brake for motors for electric lifts and other purposes.** John Bush and Matthew Thomas Medway, 90, Lausanne-road, Peckham, London.

4469. **Improvements in electrolytic cells and in electrodes therefor.** August Alfred Vogelsang, 139, Queen Victoria-street, London. (Complete specification.)

4494. **Improved process for making electrodes for accumulators.** William Phillips Thompson, 322, High Holborn, London. (Akkumulatoren und Electricitäts-Werke Aktien-gesellschaft, vorm. W. A. Boese und Co., Germany.) (Complete specification.)

4501. **Improvements in electric switches.** George Wallace Coxson, 11, Burlington-chambers, New-street, Birmingham.

4508. **Improvement in accumulator plates.** Henry John Horatio Pickard and James Samuel Evans, 55, Chancery-lane, London. (Complete specification.)

Digitized by Google

4509. Improved composition of paste for filling the cells of reticulated accumulator plates. Henry John Horatio Pickard and James Samuel Evans, 55, Chancery-lane, London. (Complete specification.)

4519. Improved construction of rail for electric and other railways or tramways. Charles Frederick Hengst, 166, Fleet street, London.

COMPLETE SPECIFICATIONS ACCEPTED.

To be published on March 23.

1899.

25591. Apparatus for wireless telegraphy. Guarini. (Date applied for under International Convention, May 27, 1899.)

1900.

3949. Electrical speed indicator. Collinge and Collard.

3998. Voltmeters. Wise. (Aktien-Gesellschaft Electricitätswerke, vorm. O. L. Kummer und Co.)

4461. Electric cables or conductors. Glover.

4630. Electric accumulators. Müller.

5860. Electrical apparatus for hoisting or other intermittent work. Scott.

6301. Means for electrically igniting miners' safety lamps. Best.

7657. Cord grips for electric lampholders, ceiling roses, and the like. Burbey.

7792. Electrically-operated brakes for centrifugal drying machines or hydro-extractors. Longsdon and Dale.

7997. Electric gear for cranes. Kammerer.

8347. Trolley head employed in connection with electrically-propelled cars or vehicles. Taylor and Hudson.

11097. Electrical accumulators or secondary batteries and manufacture of same. Woodward.

15225. Electric arc lamps. Bremer.

17487. Telegraphones. Paramore.

19674. Electric railways working on the surface-contact system. Lake. (Brown.)

20778. Electric arc lamps. Heany.

20779. Electric arc lamps. Heany.

22585. Flexible supporting structures for electric lamps. Brewster.

23582. Electric block signalling and supplying electric current to trains in connection therewith. Cruvellier.

23892. Magneto-electric device for igniting explosive mixtures. Sturm.

1901.

776. Electrically-operated ploughs. Meissner.

1966. Positive rods for secondary electric batteries. Rore, Halifax, and Antrobus.

2117. Mechanism for actuating electrical igniters for internal-combustion engines. Abel. (Gasmotorem Fabrik Deutz.)

NOTES.

American Institute of Electrical Engineers.—The January number of the *Transactions* of this institute contains some interesting papers read before the members last year. At the end of the volume are given two discussions under the headings of "Townsend on Transformers" and "Sheldon on Electrolytic Corrosion" respectively.

Submarine Torpedo Boats.—The naval estimates which were presented to the House of Commons this week make provision for the construction of five submarine torpedo boats. Some of these were said to be already in course of construction, and to be of the "Holland" type. This class of boat is propelled when under water by electricity from accumulators, which are charged from oil-engines. These latter also serve to propel the boat when at the surface. From accounts which are to hand of other types of submarine vessels, the Admiralty are experimenting with the best type.

State Electrical Laboratory in New York.—The New York State Senate will shortly consider a Bill for the establishment of a laboratory of electric engineering in connection with Union College in Schenectady. It proposes an appropriation of over £30,000 for the erection and equipment of the laboratory and between £5,000 and £6,000 a year for its maintenance. In consideration of this appropriation the State is to have the title to the land and 25 four-year free scholarships annually in electric engineering at the college. The selection of Union College is determined by the fact that the works of the General Electric Company are situated at Schenectady, and from them greater facilities are to be obtained.

American Telephones.—In a lecture on telephones recently before the New York Electrical Society, Mr. Kempster B. Miller pointed out that a board of 6,000 subscribers had hitherto been the limit of any telephone undertaking in America. Within three or four months, however, this will not be the case, for by that time the New York Telephone Company hope to have completely installed at their Cortlandt-street exchange a board of 9,400 subscribers, which will be one of the largest in the world. It is confidently asserted in the States that within five years or so the total number of telephones in the old city of New York will aggregate 100,000. In the year 1900 no less than 14,210 new stations were established in the district of Manhattan and the Bronx, which is practically the old city of New York.

Sydney Electric Trams.—In connection with the further conversion of the tramways in Sydney, N.S.W., to electric traction, we gather that some little difficulty arose recently in Elizabeth-street, owing to the disturbance of the telephone wires. It was the intention of the Postal Department, according to the *New South Wales Railway Budget*, to lay trunk wires in the telephone tunnels, and to remove the existing wires in Elizabeth-street in order to allow of the tramway overhead wires being erected. There was considerable delay, however, in putting the telephone wires underground, and until this was done it was decided not to run the electric trams on the new route, although the wiring had been practically completed. By this time probably the contemplated change in the telephones has been carried out, and the conversion of the next section of tramways may shortly be expected.

Society of Model Engineers.—The second visit in connection with the Liverpool branch of this society took place on Saturday, Feb. 23, when, by permission of the general manager, Mr. S. B. Cottrell, a party of members and friends inspected the Overhead Railway Company's power station at Bramley Moore Dock. The second annual general meeting was held on March 6, when the officers and committee for the ensuing session were elected as follows: chairman, Mr. T. S. Dawson; vice-chairman, Mr. S. H. Croker; treasurer, Mr. E. Thorp; hon. secretary, Mr. F. T. Stewart; committee, Messrs. Rimmer, Jackson, Kirby, Bootle, and Hastings. It was then decided to reduce the subscription to 5s. per annum, with an entrance fee of 1s. for new members, and that, if possible, a more central place of meeting be procured. Further particulars may be obtained on application to the hon. secretary, Mr. F. T. Stewart, 14, Adelaide-road, Kensington, Liverpool.

Overhead Tramway Conductors.—We gave in last week's issue descriptions of two means of preventing danger to the public when other trolley wires are broken, or when a falling telegraph or telephone wire makes connection with the trolley wire. In the last event, complete immunity from danger is furnished by either device. We notice, however, that the Dundee Tramway Department have adopted an alternative, which, we think, is not to be recommended, in view of the apparatus which we described in our last week's issue. Instead of relying on automatic earthing of the trolley wire when a telephone conductor falls across it, they propose in Dundee to provide on each tramcar a bamboo cane with an insulated cable, with the two ends of the cable bared. The conductor of a car then, in the event of a wire having fallen, proceeds to hook the upper end of this insulating wire on to the trolley wire to make connection with the lower end of the insulating wire and the earth. This would, of course, blow either the sectional fuses or the main cut-outs in the station, but we think that the arrangements suggested by Mr. R. Ulbricht, of Dresden, would give much more satisfactory results.

Electric Marine Railway.—An electrically-operated marine railway, probably the first in the world of its kind, was opened recently at Liverpool, Nova Scotia. On this occasion a vessel was hauled up a distance of 500ft. and lowered down again, all the apparatus and gear working satisfactorily. Some interesting facts about the railway are given in the *Canadian Engineer*, from which it appears that the equipment consists of a 30-h.p. induction motor, the motor shaft being geared to a heavy worm shaft and wheel. The worm-wheel shaft carries a pinion wheel, which gears into another large wheel, on the shaft of which is placed a large heavy sprocket wheel; over this sprocket wheel the heavy 2in. chain meshes into heavy sprocket teeth. This chain hauls the vessel up on a cradle over a track projecting out into the River Mersey to a distance of 500ft., on a grade of ½in. to the foot. The track and cradle are built of heavy pine timber. Whereas it formerly took from four to five hours to haul up a vessel, the motive power used being horses, the same work is now performed in 20 minutes. From the description, a slipway would be a more accurate description of the undertaking than a marine railway.

Competition.—We notice in the first issue of the *Electrical Review* of America for the current month an editorial article headed "The Factory and the Foreigner." In this article comment is made on the ease with which anyone from abroad is allowed to go through electrical manufacturing works in the States. The argument of the editor of our contemporary is this: that in view of the heavy competition which will arise between America, England, and the Continent, the permission to view works should not be granted so readily. The idea seems to be that the trade secrets of the American manufacturer are

Digitized by Google

so valuable that he should close his doors, and keep all the information he has to himself. We should be the last to urge that this should not be done if it in any way pleases the American electrical engineers, but we are not at all sure that the closing of the works would have the result which the editor seems to think of giving manufacturers in the United States an advantage over their rivals. It is a curious fact that, as a rule, the manufacturing firm who makes the most parade of its trade secrets has fewer secrets worth guarding than the firm who allows free access to its works, always taking care to glean from those who go round their impressions of what they see. It is not in the manufactories that we fear competition on this side, but the industry requires more freedom from State interference.

Niagara Falls Switchboard.—Mr. A. B. Weeks describes in the *Electrical Review* of New York the switch gear now at work at the Niagara Falls Power Company's station. We gather from his description that this switchboard is the outcome of the experience of the station, which has now existed for many years. For handling the large currents which are generated, and also for dealing with the high-voltage circuits, many novel devices have been introduced. For instance, all switches throughout the station are operated by compressed air from small levers which can easily be worked by hand. Another point in which experience has been gained at the station is that circuit breakers for 5,000-h.p. circuits are much more reliable than fuses. An emergency switch is also provided for each of the large machines, having for its object the interruption of the field circuit in the event of a persistent short-circuit occurring on the lines supplied by the alternator in question. An ordinary short-circuit which tends to clear itself will not operate this switch, which requires a certain amount of time to act. In the earlier days the exciting current was supplied by rotary converters, which take their current from the alternating-current 'bus bars. Thus, when a severe short-circuit occurred, the 'bus bar voltage would drop and cause the rotary converter to fall out of step and interrupt the supply. As now independent exciting machines are provided for the excitation, the emergency switches have to be installed to give safeguard against such short-circuits.

Electro-Capillary Action.—The *Scientific American* for March contains an extract from the *Bulletin* of the Academy of Cracow, in which Constantin Zahrzewski describes a series of experiments which he has recently made upon the E.M.F. produced by capillary action. In these experiments it seems he used an apparatus consisting of two large glass vessels united by a capillary tube of glass, silvered on the interior. The vessels were half filled with water, and each vessel contained a metal electrode placed in the water at a short distance from the opening of the tube. The movement of the water through the capillary tube was produced by compressing the air in one of the vessels. The experimenter found that the movement of water through the tube gave rise to an electric current, the direction of this current depending upon that of the water. It was found that the E.M.F. depended upon the difference of pressure at the ends of the tube, and also upon the distance of the electrodes from the opening; when the electrode contained in the vessel toward which the current flows is removed farther from the end of the tube, the effect is diminished. The thickness of the layer of silvering seems also to have an effect upon the E.M.F., this being diminished as the thickness of the layer is increased. We should like to know what were the electrodes used in the experiments, and to be assured that the E.M.F. existed in spite of the fact that silver electrodes were employed as well as a silver lining for the capillary tubes.

Electrical Patents.—In looking through the list of patents issued during 1900, it is interesting to note how many of these are issued to the various electrical firms respectively. Thus we learn that last year the British Thomson-Houston Company obtained no less than 101 new patents. It does not follow, however, that these 101 inventions were made during the year by the staff of the British Thomson-Houston Company, as a very large number of them were communicated to the firm by the General Electric Company of America, and the patents are held in this country by the British Thomson-Houston Company as agents. The next highest number of patents granted stand to the name Messrs. Siemens Bros. and Co., who have protected 19 new inventions during the year. These, of course, represent actual improvements made by the members of the staff of the company, as the German firm of Siemens and Halske have also applied for and received 18 new patents. We notice with interest that Mr. C. B. Steinmetz is still actively working on electrical subjects, and that during the past year he obtained 14 patents in this country. Of course, with the patent law as it at present stands, it does not by any means follow that the whole of the above are valid. Amongst the American applications, for instance, we notice that a large number are for details of construction, which can hardly be classed as inventions. It has still to be seen how far these patents for details can really be claimed as inventions under the English patent law.

Electric Lighting Notices. — Elsewhere in this issue will be found an account of a case brought by the Marylebone Borough Council against the Metropolitan Electric Supply Company, Limited, which was heard before the magistrate last week. Eight summonses in all were issued, the ground of complaint being that the company had not adhered to the plans for laying mains which had been submitted to the Council. In six of these instances the company pleaded that they were guilty of having deviated the mains from the position in which they were shown on the plans as submitted. It was urged, however, on behalf of the company that in no case was the public at all interfered with in consequence of the deviation. The only offence which the counsel for the defence admitted was that the engineer had laid five electric mains more than had been shown in one of the notices in question. We have not seen the full report of the case, but it seems to us that the magistrate took a most exaggerated view of the technical offence which had been committed. As the law now stands, a company has no right to break up the streets in order to lay mains without giving notice of one month and depositing plans with the council concerned. It is quite impossible for the company to tell exactly whether it can find room for the mains which have to be laid, as we do not believe that any local authority has a complete plan of the pipes and mains in its streets. In consequence of this, we are not at all surprised to find that deviations of a radical character have often to be made. If this be so, it is manifestly absurd to fine the company £56 for a technical offence which they were practically powerless to prevent.

Tramway Track Pavements.—The vexed question of maintaining the street surface adjacent to a tramway rail always presents itself in any town in which trams are worked. In the first instance it is usual to make the street surface slightly higher than the tramway rails, and then complaints are made that damage is done to the wheels of other vehicles using the streets because of the projecting edge of the pavement, which is frequently of granite setts.

Digitized by Google

In course of time this complaint ceases, and with the wear of the granite setts the rails begin to project above the pavement line. As the wheels of the cars then run along the rails before mounting, a groove is worn out in the pavement, which accentuates the difference. The ideal system is, of course, to do away entirely with the tramway rails, using automobiles, but the full conditions for such a service have not yet been solved. We notice that in certain towns in the States new work has been laid down in which the rails are of the ordinary "T" form with a heavy head, but with no groove. The pavement blocks next to the inside of the rail are then bevelled off so as to leave space for the flanges of the tramway wheels. Although special blocks are provided along the inside edges of the tramrails which are keyed in under the head of the rails, we think that there must be considerably more obstruction to the ordinary traffic than with the girder rail more frequently used in this country. Another point which has been experimented on in America is the use of vitrified blocks for paving the space between the rails. These it is said are giving great success, but we have no information as to the extent of the ordinary traffic in the streets in which such blocks are used.

The Nobel "Peace Prize."—Scientists will be interested to know that the Board of Education has now received through the Foreign Office a copy of the provisional special regulations for the award of the Nobel "Peace Prize." Dr. Alfred Bernhard Nobel, the inventor of dynamite, it may be remembered, left in 1896 a large sum of money for the most important discoveries in physics, chemistry, physiology, or medicine, for the most remarkable literary work of an idealist tendency, and for the greatest service rendered to peace. It is in regard to the award for the latter service that the special regulations have been received. The committee responsible for the regulations have decided that institutions and societies, as well as individuals, shall be eligible for the "Peace Prize," proposals for which must be sent to the Comité Nobel Norvégien, Victoria-terrasse, 3, Christiania, Norway, so as to reach the committee not later than April 1 next. Among the persons entitled to nominate competitors for prizes are the following: (1) members of the Norwegian Nobel Committee; (2) members of the legislative assemblies and Governments of the various States of the world; (3) members of the Commission du Bureau International Permanent de la Paix; (4) members and associates of the Institut de Droit International; and (5) university professors of law, of political science, of history, and philosophy. An abstract in English of the statutes of the Nobel Foundation and of the Nobel prizes (other than the "Peace Prize") can now be obtained on application to the secretary of the Board of Education, Whitehall. An appendix containing the regulations for the "Peace Prize" will be issued as soon as possible as an appendix to the abstract.

Berliner Telephone Patent.—We have now before us the full text of the judgment which was given in the United States Circuit Court on Feb. 27 of this year, in which the judge decided that the Berliner telephone patent was invalid. This patent, which was owned by the American Bell Telephone Company, was dated Nov. 17, 1891. The curious fact, however, was that the application for the patent was made by E. Berliner on June 4, 1877, rather more than 14 years before. In the original application it was stated that "these simple instruments will reproduce any musical sound uttered in the neighbourhood of one of them; but for the reproduction of special sound, such as speech, they are not adapted." The inventor also stated that he accomplished his objects by means of a make and break in the circuit, and the judge held that the drawings submitted with the application showed that it was intended to transmit sound by the erroneous method of interrupting the contact of the electrodes and breaking the circuit. He accordingly held that there was conclusive evidence that Berliner had not invented, and did not intend to apply for a patent for, a constant-contact speech transmitter. The rest of the judgment is well worth a perusal, as being an example of the working of the American patent law. During the interval which elapsed between the application for and the granting of the letters patent great progress was made in the art of telephoning. The Bell Company, who have obtained the control of the application, hoped to get a new lease of their monopoly by incorporating into the patent inventions which have since been made. The judge's decision, which has taken him 15 months to arrive at, is looked upon in the States as a great victory for the independent telephone companies. We understand that an appeal against the judge's finding is still possible.

American Patent Law.—A recent judgment in the United States on an appeal from a decision of the Commissioner of Patents relating to certain details of an electrical measuring instrument is particularly interesting, as showing one point of resemblance between the American and our own patent law. We gather from a note in the *Electrical World* that two of the claims were on mechanical operations, consisting in drawing a section of a metal over a mandrel, and subjecting it to pressure until a desired configuration is acquired, and then turning down the lateral edges. The decision of the Court, as it appears in the *Official Gazette* of the United States Patent Office, was that "this is a simple and well-known operation which contains no element of patentable novelty." Respecting two other claims at issue, the judgment runs: "The appellant has discovered that by taking a spool of sheet metal with a coil properly wound around it, and adjusting it in a certain manner on pivot pins, and adjusting the needle in a certain manner through the instrumentallty of the pivot which supports it, he can accomplish a desired purpose." The Court held that "this process or method, while it may require the use of delicate mechanism for its actual development and manifestation and to effect the desired adjustment, seems to be a mental operation entirely independent of such mechanism; that the process is first in the logical order of things, and the mechanism only a sequence." Several authorities bearing on the point were relied upon by the Court. It had been laid down, for instance, first, that processes involving a chemical or other elemental action, if new and useful, are patentable; second, that a process which amounts to no more than mere invention of the machine is not patentable; third, that a process or method of mechanical nature not absolutely dependent on a machine, although perhaps best illustrated by the mechanism, may, if new and useful, be the subject of a patent, even though it involve no chemical or other elemental action. In the States the decision of the Court in the case in question is looked upon not only as sound in law, but as establishing a precedent of the highest value to inventors.

Electrical Dredger.—In certain parts of California there are large deposits of gravel which contain an exceedingly small percentage of gold, which under the ordinary conditions it would not pay to work. These deposits are now being gone through by means of dredgers on which the motive power is electricity. The largest of these is at Sailor Bar, on the American River, about six miles from Folsom. The power for the work is taken from the Sacramento Electric, Gas, and Railway Company, which

Digitized by Google

has its power plant not far from the place where the dredgers are working. The object for which the electrical power station was laid down, however, was to transmit power 22 miles into Sacramento, for which purpose the three-phase transmission at 11,000 volts is employed. To supply energy to these dredgers three 325-kw. oil-cooled transformers are used, which transform this voltage down to 500 volts on the dredgers, which work with chain buckets. A 150-h.p. three-phase variable-speed motor is used to drive the chain of buckets. These discharge the dirt into a revolving screen, which takes out the larger stones and lets the rest fall into a sluice box, where it is carried down by a stream of water over riffles, which catch the gold much in the ordinary way as is done in placer mining. A 75-h.p. motor supplies the water to wash the dirt through the screens, and a 150-h.p. motor is required to provide a large volume of water for the sluice boxes. On the dredger there is also a 20-h.p. motor for elevating and lowering the end of the bucket chain. It is curious to note that these dredgers are often worked in a pond excavated by themselves at a considerable elevation above the water-level of the river. The dirt is then, after being washed for gold, discharged behind the dredger, and so fills up the rear of the pond, while the working edge is continually being advanced as the dirt is removed. In order to keep up the water-level of the pond, a 40-h.p. three-phase motor is used to run a centrifugal pump forcing water up from the river. This plant, as illustrated in the *Electrical World*, was supplied by the General Electric Company of America, but we understand that the Westinghouse Company have also equipped a dredger which is working near Oroville. By means of these electrical appliances the cost of labour is so kept down, that it is said to be worth while working any ground which will yield 5 dwt. of gold for every cubic yard washed. This opens up a large field for these electrically-equipped dredgers, provided that the power supplied can be had at a reasonable rate.

Progress in Bradford. — Unfortunately, it is not often that an electrical engineer can look to the representatives of the gas industry for accurate information as to the progress of electrical undertakings, or for accurate comparisons between the advantages of electric light and gas lighting for street purposes. We are pleased to note, therefore, that the paper recently read by Mr. Charles Wood, F.C.S., at the annual meeting of the Manchester District Institution of Gas Engineers, is a marked exception in that it deals most fairly with all controversial matter, and gives most useful information of the progress of electric light and power distribution in Bradford. Mr. Wood at first deals with the use of incandescent gas for street-lighting. There are in Bradford no less than 10,346 incandescent burners in the streets, which, according to Mr. Wood, are giving most satisfactory results. Until 15 months ago both the gas and electricity undertakings at Bradford were controlled by one committee, and he considered that advantage had certainly been given to the electricity department. That was so because electricity was supplied practically at cost price, and the department was paid for most of the street-lighting which it did. The gas department, on the other hand, was made to contribute large sums annually towards the expense of other Corporation departments, besides providing 98 per cent. of the public lighting of the city. Mr. Wood then proceeded to deal with the increase in the sale of electricity, noting that last year more than 93 per cent. of the electrical energy sold was supplied to motors, and this year he expected that more energy would be sold for driving motors than for lighting purposes. In the above comparison the energy used for tramway purposes is not taken into consideration. Dealing with the question of electrolysis of gas-mains, Mr. Wood stated that in Bradford there had been several miles of electric tramway in operation for 2½ years, but so far as he had been able to detect with certainty, there was no damage done to the pipes by electrolysis. There had been one gas-pipe destroyed by being directly connected to a faulty cable, but otherwise there had been no trouble. He thought that the distance between the gas-pipes under the pavement and the rails of the tramways had something to do with the immunity from electrolytic damage. Without a doubt, the stringent Board of Trade regulations have often more to do with the result, and we think that Mr. Wood's fear that in the future considerable damage may be found is not likely to be realised if, as he states, there have been no clear indications of damage in the 2½ years of working.

The Proposed Manchester Tube. — Up to the present the scheme for providing a quicker and better form of communication between the different parts of the city of Manchester by means of an electric underground railway, has not advanced far beyond the stage of preliminary discussion and financial calculation. A statement as to the course proposed to be pursued, however, has been made, giving some particulars of the venture, from which it appears that the circular system will be introduced. It is pointed out in the local Press that such a circle, if it embraced only the area contained within an imaginary line drawn round the principal railway stations, would be rather circumscribed, but an outer circle would serve to connect such distant places as Longsight and Trafford Park. This outer circle, indeed, would supply the want caused by the alleged inability of the Tramways Committee to establish a system of through routes, or to inaugurate, for the present at any rate, an outer circle of tramways. To the north of Manchester there is a very populous district, and it is suggested that the outer circle, if decided upon, should embrace such places as Pendleton, Broughton, Cheetham, Harpurhey, Newton Heath, Openshaw, Longsight, and Alexandra Park. So far, at least, as the inner circle is concerned no great engineering difficulties, it is expected, would be met with. The red sandstone would allow the tunnel to be lined with concrete in the ordinary way, instead of with the steel casing which is necessitated by the London clay. A double tube, as in the case of the Central London Railway, is in contemplation, so that traffic could be managed in either direction without the possibility of collision. A second scheme is for the construction of a tube connecting London-road, Exchange, and Central Stations, with intermediate stopping places. This line would be 2⅝ miles long, and its cost is estimated at two millions. In view of the fact that the Corporation have just taken over the tramways in the city, it is generally anticipated that considerable opposition would be offered by them to any scheme which would interfere with the success of the system. Congestion of the streets in large towns and cities is admittedly a great evil, and the only practical means by which this may be relieved is by the introduction of underground communication. It is, therefore, in the interest of the city that such a scheme as suggested above should be matured, and in the event of any opposition on the part of the Corporation being successful it will be another case of the municipal authority quashing private enterprise, the introduction of which would be directly for the benefit of the inhabitants.

New South Wales Tramways.—The New South Wales Railway and Tramways Commissioners are setting a good example to government departments in other parts of the world. We have just received their report for the

Digitized by Google

quarter ended Dec. 31, 1900, including the statistics for the whole year. Dealing with tramways, the position at the end of 1899 is compared with the present state of things. Thus, at the end of December, 1899, the number of miles open was 69½, against 78¼ miles on Dec. 31, 1900; revenue £97,372, against £134,835; expenditure £83,411, against £115,269; tram miles run 956,458, against 1,650,028; earnings per tram mile 2s. 0½d., against 1s. 7½d.; expenditure per tram mile 1s. 9d., against 1s. 4¾d.; percentage expenditure to earnings 85·66, against 85·49; and number of passengers carried 15,355,078, against 23,193,639. The increased mileage includes the three following routes, which were opened for traffic during the past year: Kensington race-course to the rifle range; Military-road to the Spit, middle harbour; and Kensington line to Randwick race-course—representing a total length of just over two miles. It is interesting to note what wages and salaries the Government pay to their tramway employés. In the engineer's department a draughtsman receives £3 a week, while engineers are paid 12s. a day, electrical mechanics 9s., dynamo attendants 9s., armature winders 12s., labourers and firemen 8s., cleaners 3s., fitters and turners 10s., trimmers 7s. 6d., greasers 3s. 6d., electric light trimmers 5s., watchmen 6s. a day, apprentices £30 per annum, and linesmen 50s. a week. These are, as a rule, the payments made on appointment, and are subject to rises. We notice in a recent issue of the Sydney *Daily Telegraph* a very comprehensive article by Mr. W. M. Fehon, the traffic expert amongst the Commissioners, entitled "Railway Federation," in which he sketches out a form of federation, based upon a seven years' average, under which the railway capital accounts could be consolidated. Editorially commenting on this, the *Daily Telegraph* points out that at present the position of the railways under the constitution is a very unsatisfactory one. "If the federation of the railways," the editor concludes, "added but a few shillings an acres to the value of our lands south, north, and west, as it certainly would do, the Government of this State would be enriched by many millions." We might add that if the policy of State ownership of tramways now obtaining in New South Wales becomes the policy of the Federated Commonwealth, an asset would be created the growing importance of which it is impossible to overestimate.

Electrical Transmission from Coal-Mines.—Mr. H. W. Hart, dealing with this question in the March number of the *Electrical World*, takes the case of the Albemarle Mine, near Bland, New Mexico, where some three years ago the Cochiti Gold Mining Company erected a large cyanide mill, installing at the same time a large Corliss engine for driving the crushers, rolls, etc. Then the question of fuel arose, as wood cost something like £1 per cord, and owing to the exceedingly rough nature of the surrounding country the supply was very limited. At Madrid, some 32 miles away, there were large coal deposits belonging to the Santa Fé Railroad. As bituminous coal of an excellent quality and almost unlimited quantity could be obtained at a nominal price, it was decided—a careful examination having proved that there was no available water power—to instal a modern steam plant at Madrid and transmit power electrically to the Albermarle mine at Bland. Current was turned on for the first time on April 13 last year. With the old steam plant, using cord wood as fuel, the total cost of supplying power for hoisting and milling 200 tons of ore per 24 hours was about £45 per day. The cost of doing the work with electrical energy is just over £10 per day for treating 300 tons of ore. Whereas formerly the coal company at Madrid had to ship water in tank cars a distance of 40 miles for feed purposes. On the introduction of the power plant for the transmission of electrical energy, feed water was obtained from the Galisteo River, some 14,000ft. away, through a 4in. pipe. A motor-driven deep-well pump, with the pump barrel 200ft. below the surface, delivers water to a small receiving tank, from which the force pumps deliver it through the 4in. pipe line to two steel storage tanks, having a capacity of 100,000 gallons. The power-house equipment, when complete, will consist of two General Electric three-phase, revolving-field type, 605-volt, 60-cycle generators, direct-connected to 32ft. by 48ft. Allis-Corliss engines, running at 90 revolutions per minute. There are also three step-up transformers of 200 kw. each of the vertical air-blast type, wound to transform a voltage of 605 to 20,000, and having a full-load efficiency of 97 per cent. The boiler equipment consists of two batteries, each consisting of three 175-h.p. return tubular boilers, built to stand a working pressure of 125lb. The coal is drawn from the coal-bins through spouts at convenient points in front of each of these boilers. The pole line of transmission is designed to eventually carry two circuits of wire, the three wires of each circuit being placed at the points of an equilateral triangle, the distance between wires being 24in. A telephone circuit of hard-drawn copper is placed 5ft. below the power circuits. The power circuits are transposed every half mile, the telephone every five poles. A satisfactory point is that no difficulty is experienced from inductance on the telephone circuit. During the course of construction many difficulties were met with owing to the character of the country, and on one particular section the heavy pine timber made it necessary to clear a right of way for several miles, some 6,000 trees being cut out. Poles for the entire line had to be hauled on wagons from a point near the Albemarle mill. A supply box is placed at each telephone station, and in it are kept all materials required for repairing that particular section of the line. Glass insulators of the Provo type, manufactured by the Hemingray Company, were used, mounted on special locust pins, which were boiled in paraffin. The energy loss in the line when delivering 600 kw. to the mine is 8·5 per cent. The equipment at the receiving end of the line consists of three 180-kw. transformers, reducing the potential from 18,500 volts to 605. The transformers are of the vertical air-blast type. A distributing board of blue Vermont marble is equipped with primary and secondary switches for each motor circuit, and the necessary instruments. The motors at this end of the line are one 150 h.p. for compressor; one 100 h.p. for hoist; two 150 h.p. for mill; one 20 h.p. for sawmill; two 20 h.p. for Peletin tanks; one 10 h.p. for solution pumps; one 10 h.p. for machine shop; one 1 h.p. for transformer blower; 10 h.p. for lights—making a total of 621 h.p. At the generating end the motors are: one 20 h.p. for motor-generator set; one 10 h.p. for coal conveyor; one 10 h.p. for ash conveyor; one 10 h.p. for coal crusher; one 1 h.p. for transformer blower. At the pump-house, 14,000ft. from the power-house, there are two 10-h.p. 450 revolutions per minute motors geared to triplex feed pumps for forcing water up to power-house, and one 10-h.p. motor belted to an artesian deep-well pump. This makes a total of 702 h.p. in induction motors. The demand on the power plant is practically for continuous service, but on Sunday mornings the plant is shut down in order to take up wear and make any necessary adjustments. The engine, however, at times, has run 21 days without interruption. The entire electrical equipment was supplied by the General Electric Company, and the author was responsible for the design and construction of the plant.

THE TRAFFORD PARK POWER WORKS.

The first electrical station to be worked in England with the special object of supplying power in bulk to large manufacturers is that of the Trafford Power and Light Supply, Limited. The works of this company are not yet so far completed as to give the economy in generation which will ultimately be obtained; they are, however, supplying already a number of important works at prices which are below those charged anywhere else in the United Kingdom. We also believe that the prices will compare favourably with the charges made in many power distribution systems abroad in which the energy is obtained from water. In any scheme for the distribution of electrical energy in quantities it is essential, in the first place, that the prices charged shall be such as to induce long-hour consumers to take a supply. If this is done, it is found that new factories are attracted into the districts which can be supplied, as is witnessed by the large growth of new industries round the Niagara Falls power works.

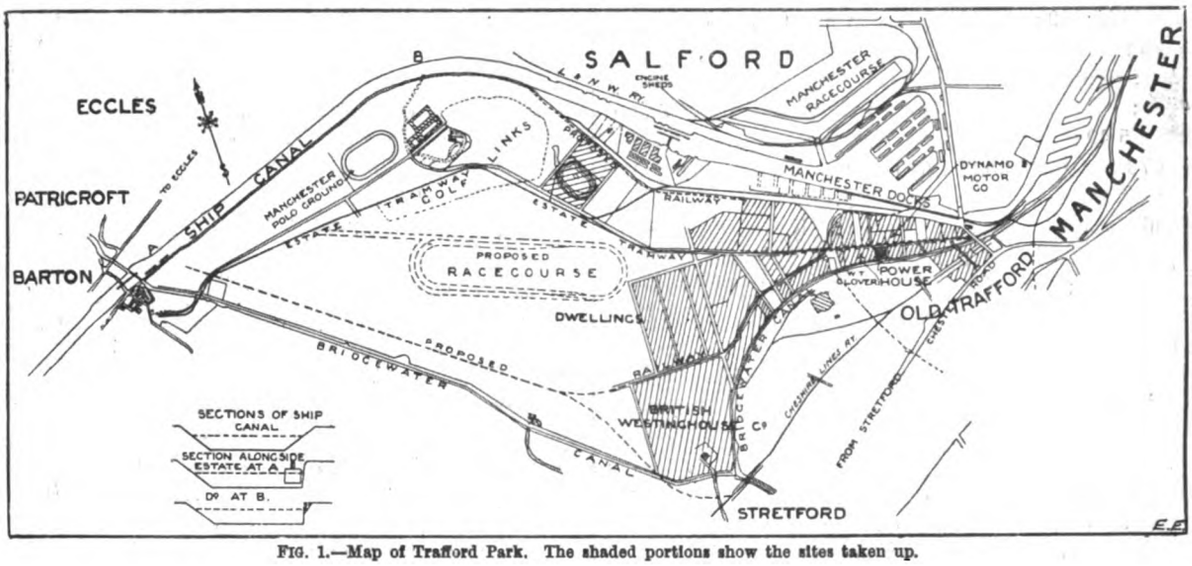

FIG. 1.—Map of Trafford Park. The shaded portions show the sites taken up.

Trafford Park, which has a history going back for many centuries as the estate of the Trafford family, was acquired for industrial purposes some few years ago by the Trafford Park Estate, Limited. The map (Fig. 1) which we give herewith shows how conveniently situated the estate is for the establishment of large manufactories. This will be evident by the exceedingly numerous plots which have already been taken up on the estate, the factories on many of which are already running. Amongst these are the

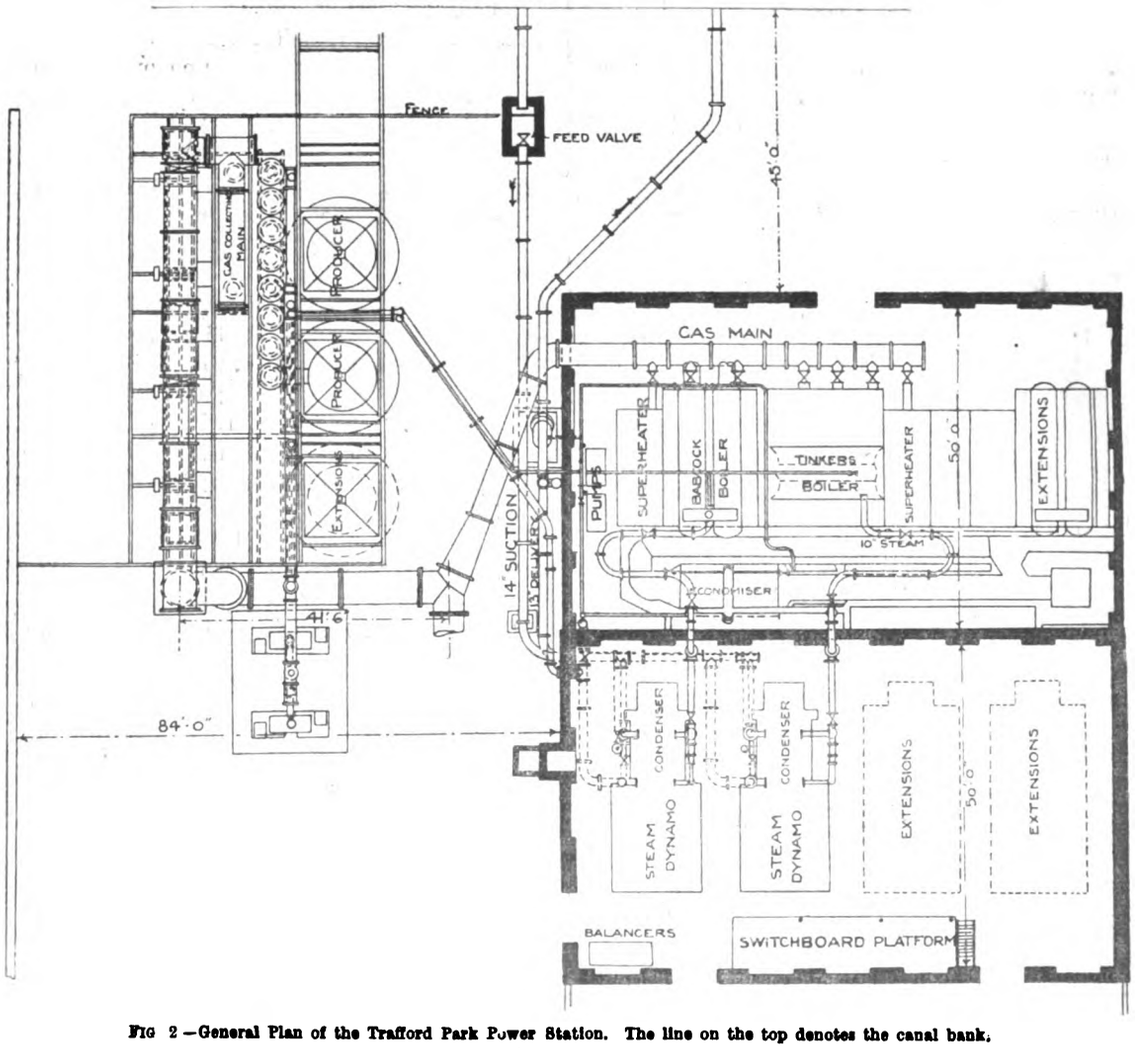

FIG 2.—General Plan of the Trafford Park Power Station. The line on the top denotes the canal bank.

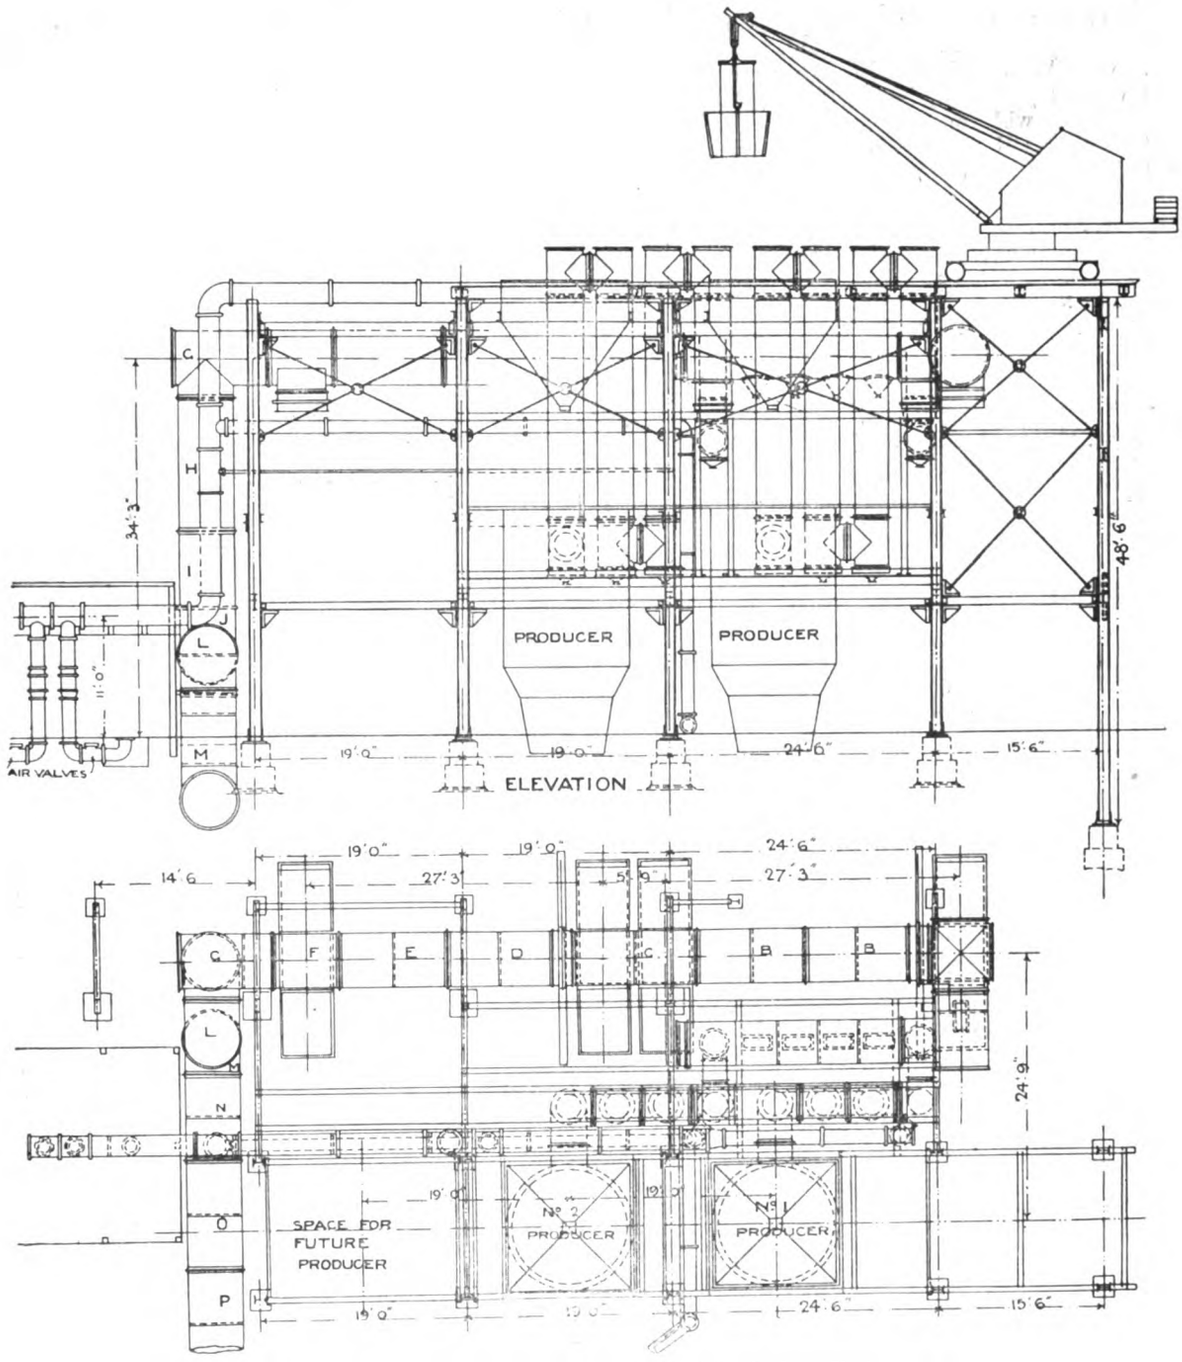
Digitized by Google

extensive new works of Messrs. W. T. Glover and Co., Limited, for the manufacture of electrical cables and accessories connected with the laying of the same. Again, the Lancashire Dynamo and Motor Company, whose name is appearing frequently in the list of accepted tenders for public contracts, have a well-equipped factory in working order on the estate. Another electrical firm just about to build are Messrs. Royce and Co., of Manchester, while the British Westinghouse Company have secured a very large block on the estate. The roof principals of the latter company's factory are now being erected. We mention these names as an example of the way in which the electrical industries have approved of the facilities offered on the estate, but it is more than probable that the power company will obtain its largest consumers, and also its longest-hour consumers, amongst the many other industries in connection with which warehouses or factories are erected or in course of construction. Amongst these the grain elevators and stores figure largely. It will be seen from the map that the Manchester Ship Canal forms the boundary on two sides of the estate, while the other two boundaries are made by the Bridgwater Canal. The Manchester Ship Canal is 50ft. wider than its normal width where it adjoins the estate, and ships can be moored and discharged at any point along this canal. The Bridgwater Canal also provides a cheap means of transporting coal, iron, and other materials on to the estate on the south-east and south-west sides, and also for the removal of manufactured goods. Ample railway connections are provided in addition to the water transport facilities. We believe that the conception of the power scheme was due to Messrs. W. T. Glover and Co., who organised a limited liability company for its equipment. Before embarking upon this enterprise the company retained the services of Messrs. Lacey, Clirehugh, and Sillar and Mr. L. B. Atkinson, and these gentlemen have jointly advised the company on the various questions which have arisen from time to time during the progress of the works. We are indebted to them for the information we are able to give below. We also gather from Mr. Clirehugh that the scope of the power distribution company is not restricted to the estate itself, as it is able to supply in bulk to no less than three local authorities whose districts adjoin the estate. The power distribution company have offered these authorities exceedingly low terms for the supply of power in bulk, which terms are, we understand, some 20 per cent. lower than those of the South Lancashire Power Company—in fact, if the load in the local authorities' system gives about a 14 per cent. load factor, the charge works out under the proposed scale to 1·87d. per Board of Trade unit. We understand that the negotiations



FIGS. 3 AND 4.—Plan and Elevation of the Mond Gas Producer Plant.

Digitized by Google

for the supply of two out of three of these local authorities are so far advanced that contracts are likely to be signed shortly.

The Power Works.

In the design of these power works, Messrs. Lacey, Clirehugh, and Sillar have introduced a new combination of a steam plant with a gas-producer, which has not hitherto been tried in electrical power works. Of course, for many years boilers have been used in ironworks which have been fired by blast-furnace gases, but we believe, that the Trafford Park undertaking is the first case in which a gas-producer plant has been laid down with the special object of providing a gaseous fuel for boilers. This gas-producer is of the Mond type, and we understand that Dr. Mond has taken considerable interest in the undertaking. We are debarred from giving the full particulars of this gas plant, but the general arrangements and advantages will appeal to our readers. In the first place, it is proposed not only to distribute electric energy from the Trafford power works, but also to distribute the Mond gas for heating purposes. This will increase the output of the gas plant and enable larger quantities of that valuable by-product—sulphate of ammonia—to be obtained. We need hardly say that with a gas-producer of this kind the cost of extracting the by-products goes down exceedingly rapidly with an increase in the size of the plant.

As far, however, as generation of electrical energy is concerned, there are many advantages from gas-firing the boilers. The first and most important is that of cost. With the coal, or rather the slack, which will be used at the works, either when firing direct under the boiler or for the generation of power gas in the gas-producer, the first cost under normal conditions averages about 7s. per ton. It costs on an average about 1s. 6d. per ton to handle the coal on its way to the furnace and to remove the ashes afterwards, which brings the cost up to 8s. 6d. per ton. It is found by actual experience that one ton of sulphate of ammonia can be recovered from every 23 tons of coal which are burnt in the gas-producer. With sulphate of

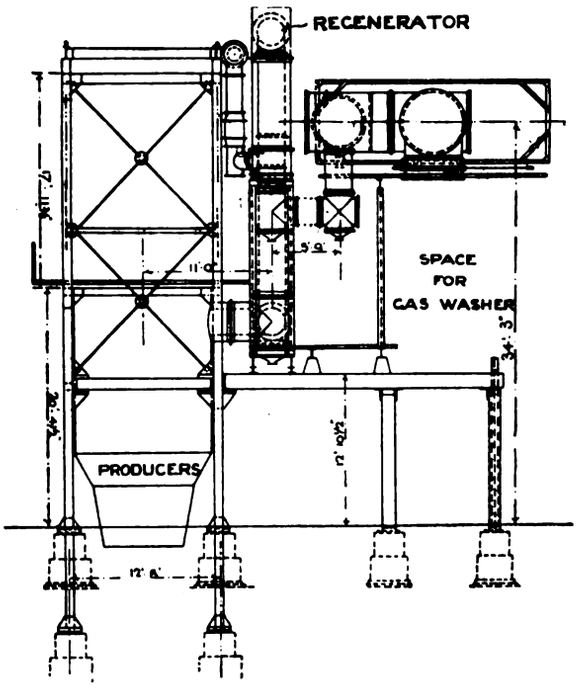


Fig. 5.—End Elevation of the Gas Producer.

ammonia just over £11 per ton, this means that the residuals obtained from every ton of coal are worth about 10s., or 3s. more than the original cost of the coal if the labour items are not increased. As regards the handling of the coal, it will be seen from the accompanying drawings that the cost of labour in connec-

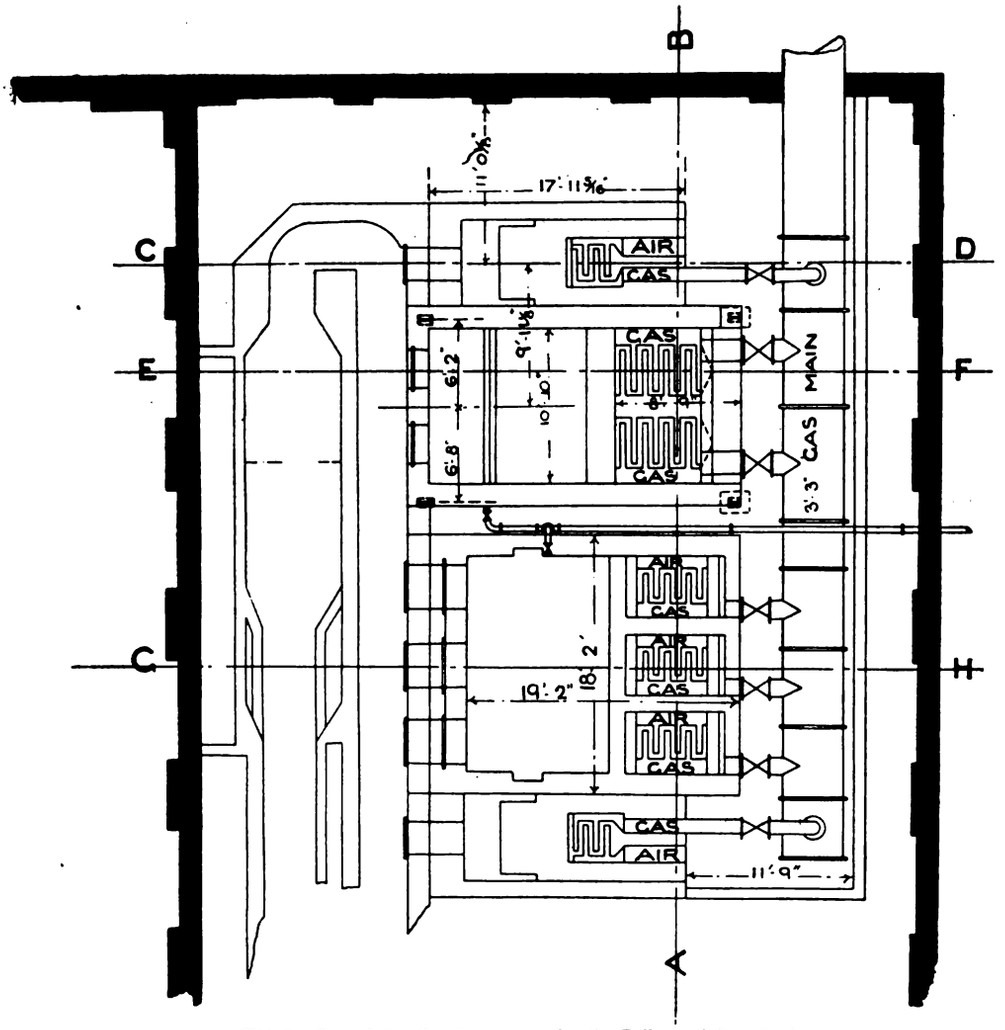

Fig. 6.—Plan of the Gas Furnaces under the Boiler and Superheaters.

Digitized by Google

tion with the gas-producer is exceedingly small. In the Trafford Park district this slack coal is bought in boxes, which are brought alongside the works in barges. These boxes are actually filled under the screens at the coal pits, and hence the colliery owners will supply the slack coal in boxes at a cheaper rate than in bulk in consequence of the greater ease in handling. A general plan of the power works is shown in Fig. 2, while an elevation and plan of the two first gas-producers are shown in Fig. 4. The crane seen in Fig. 3 runs over the producers, and when turned round can lift these boxes charged with coal direct from barges in the Bridgwater Canal. When the boxes have been brought by the crane immediately over to hoppers of the producers, the bottoms of the boxes are released, and the coal falls into the hoppers over the producers. These large hoppers act as bunkers, and the coal is dropped down into the gas-producers as required. The coal falls by gravity on to the firebars of the producer, and a mixture of air and steam is passed through the incandescent mass. It may be mentioned here that the steam for that purpose is obtained from the exhaust of the engines. As will be seen later on, there are practically two steam-engines on one shaft driving each of the large dynamos. As it is improbable that at first the whole of the steam from one set will be required for the producers, the exhaust piping is so arranged that the one engine of the set can be worked condensing while the other

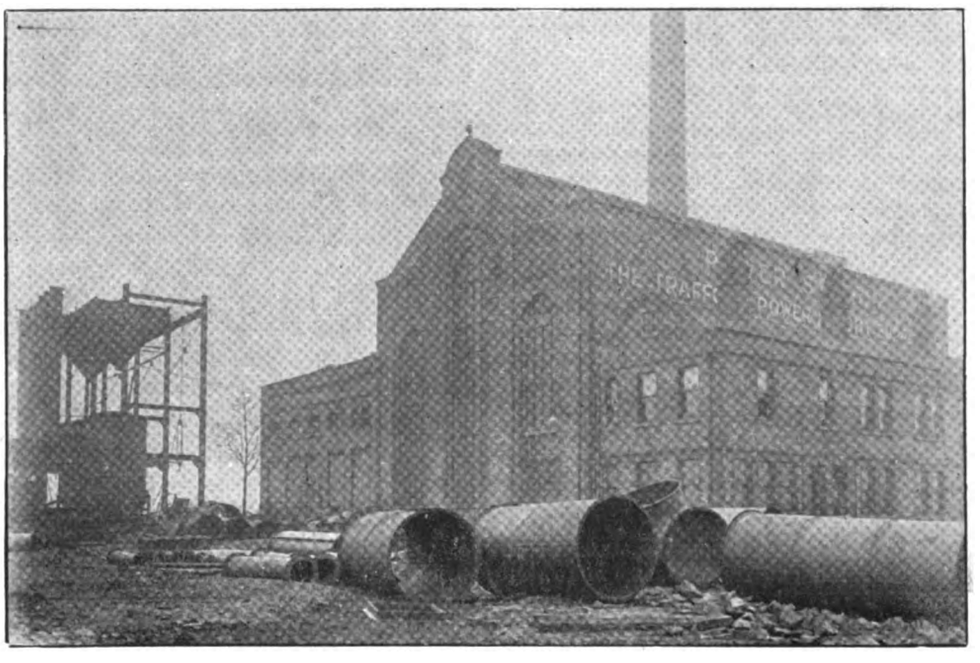

FIG. 8.—General View of the Trafford Park Power Station.

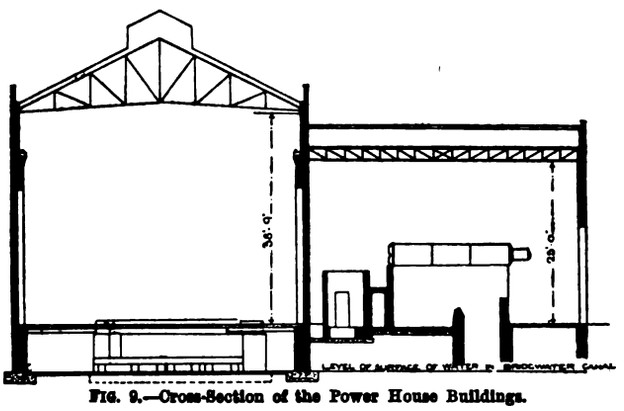

FIG. 9.—Cross-Section of the Power House Buildings.

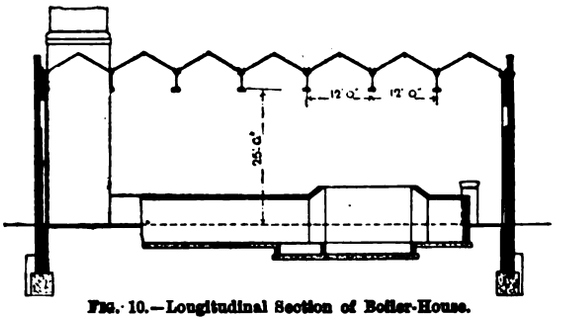

FIG. 10.—Longitudinal Section of Boiler-House.

Digitized by Google

engine is passing its exhaust through the producers. By this means an independent boiler to supply steam for the producer, as has usually to be employed, is saved, while at the same time the engines are worked condensing whenever possible. Another view of this producer is shown in Fig. 5. The gas as it leaves the producer is passed through the large regenerator pipes seen in the drawing. From these it goes to the gas-washers, which will be placed in the space indicated in Fig. 5, and after having had the ammonium sulphate abstracted the gas passes into the supply pipe which will feed the boilers, and will also supply the system of pipes conveying the gas to various parts of the estate. In Fig. 6 is shown the arrangement for burning this gas under the boilers. This illustration should be looked at in conjunction with the elevation given in Fig. 7. It will be seen from these two together that the gas is burned in a firebrick chamber, which is directly under the ordinary firebars of the boiler which are used for burning coal. These coal furnaces are actually in use at the present time, and all the change that has to be made to change over to gas firing is to remove the firebars and to uncover the arch above the gas furnace. This arch is made of firebrick with a number of interstices through which the incandescent products of combustion pass up through to the boiler. The lower part of the combustion chamber, which is shown in Fig. 6, and in sectional elevation in Fig. 7, consists of two chambers divided by a zig-zag partition of firebrick. The air is admitted on one side of the chamber, while the gas is admitted at the other. The air and gas pass along the spaces left between the firebrick partition, and then rising over it mingle the one with the other. We understand that the combustion takes place just over the firebrick partition, while the arrangements are such that there is no danger of explosion taking place at the point of admission, as the air and gas are not mixed until they have risen to a certain height in the furnace. The crown arch of firebrick becomes exceedingly hot, and thus ensures complete combustion of the gaseous mixture passing through it. It will be seen that at the side of each of the sets of boilers, one of which consists of three furnaces and the other of two, there is a small independent furnace. These two smaller furnaces are to be used for heating up the Schmidt superheaters, two of which are being provided. This independent firing of the superheater will enable the degree of superheat to be accurately adjusted. It is proposed to work with 300deg. F. of superheat on the steam at the superheater, which will give at least 250deg. at the stop valve of the engine. These superheaters are being supplied by the firm of Messrs. Schmidt and Co., of Cassel, and the firm have guaranteed that if the engines under ordinary conditions take 17lb. of steam per indicated horse-power without the superheat, that the consumption shall not be more than 10lb. per indicated horse-power when the superheat mentioned above is obtained.

The general design of the buildings of the power-house can be seen in Fig. 8, while Figs. 9 and 10 give sectional elevations of the same. It will be seen from Fig. 10 that the roof of the boiler-house has its ridges at right angles to the main ridge of the engine-house. The large pipes seen in the foreground in Fig. 8 are parts of the main pipes for the gas between the producer and the boiler. The erection to the left of the main buildings is for the producer plant, which at the time the photograph was taken was still in course of construction. Only the hoppers and producers were in place, and a considerable amount of work had still to be done in the erection of these generators and of the running rails for the crane.

Boilers.

The boilers at present installed are of two kinds. Thus, at either end of the boiler-house there are two Babcock-Wilcox boilers, as shown in Fig. 2. The two boilers to the right of the boiler-house, which is marked extensions on the illustration, are actually in place. In the middle of the boiler-house there is a new type of boiler made by Messrs. Tinkers, Limited, to which we hope to refer at greater length in a future issue. It is a tubular boiler with several novel points in its construction. The feed water for these boilers is taken from the Bridgwater Canal, and is forced into the boilers by three-throw feed pumps; two of these pumps are now installed, and they are driven by electric motors by means of a double-reduction gear with rawhide pinions. The motors, gear, and pumps were supplied by Messrs. Royce, Limited, of Manchester, and they work wonderfully quietly; in fact, the gears were so silent when we inspected the plant that they could hardly be heard. The motor armatures are double wound, and are connected up to a series-parallel controller which has no less than 14 different steps. In this way the speed of the pump and the quantity of water delivered regularly to the boilers can be varied over a very large range, while good economy is still obtained in the motor.

The steam-pipe arrangements can be seen from Fig. 7 in elevation, and in plan they are shown in Fig. 2. It is proposed in the ordinary way to work each of the large engines independently from one of the sets of boilers. The gas supplied to the furnace of that boiler can then be regulated easily according to the load on the engine; also the risk of a total interruption to the supply is reduced

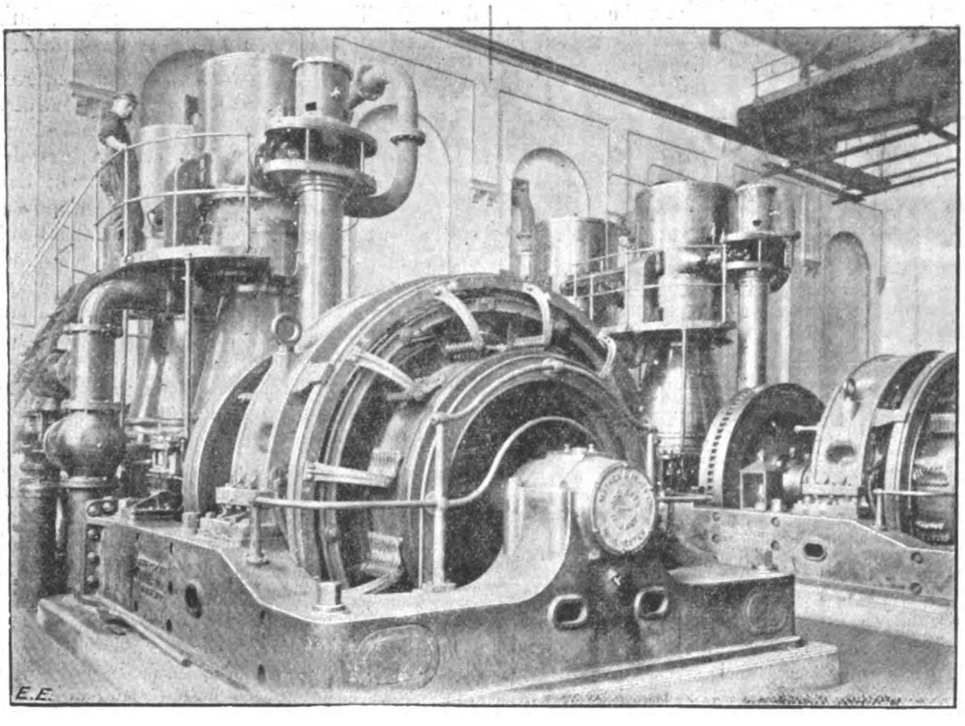

Fig. 11.—General View of the 660-kw. Steam Sets—Raworth Engines and Mather and Platt Dynamos.

Digitized by Google

very much by working thus independent units of plant from independent sets of boilers without cross-connecting the steam-pipes. There is, however, an interconnection between the two sets of steam-pipes provided, as will be seen in the illustrations, so that steam can be passed from one to the other if the need for so doing should arise.

THE STEAM DYNAMOS.

These consist of Mather and Platt multipolar direct-current dynamos direct coupled to Raworth engines. The dynamos are compound wound, but can be worked as shunt machines later on if need be. It is found, however, at present that there is considerable advantage in running them as compound machines, in view of the large fluctuations in load which take place when the large consumers of power switch on and off. These fluctuations will, of course, become proportionately less as the number of consumers increases, and it is proposed to run machines shunt-wound when working in parallel. The output of these dynamos is 1,200 amperes at any voltage from 500 to 550 at a speed of 200 revolutions per minute. Each dynamo is of the 12-pole type, the yoke ring and magnet cores being of cast steel. Arrangements are made so that the lower half of the ring can be lowered into the foundations, enabling any magnet winding to be taken off or to be easily inspected if necessary. The armature is of the slotted type, the bars being laid in insulating troughs, and entirely embedded in the iron of the core, which is the usual practice in generators of this type, and efficiently protects the windings from damage. Special attention has been paid to the question of efficient ventilation both of the armature and commutator, and the machine can consequently carry the full load for long periods with but a small rise in temperature. The commutator is of large diameter and width, and of a design and construction up to the highest standard of modern practice. The current is collected by carbon brushes mounted in special holders, which admit of the contact pressure being adjusted as may be required, and each holder is fitted with hold-off attachment. These machines can be seen both in Fig. 11, which gives nearly an end view of one of the sets, and also in Fig. 12, which shows the whole of the engine-room, with the switch gallery and the boosters. The engines are best seen in Fig. 11. These are of the Raworth-Universal type, and, as mentioned above, consist practically of two independent engines, each of 500 h.p., mounted on the same shaft.

(To be continued.)

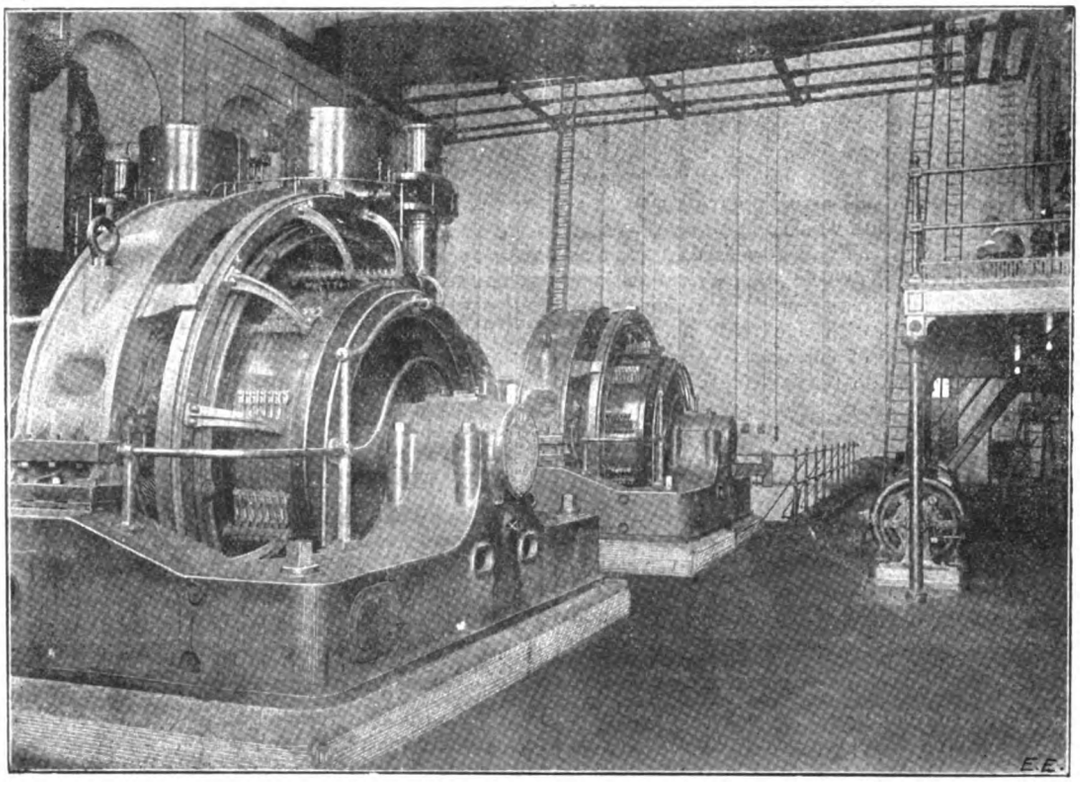

FIG. 12.—View of the Engine-Room, showing Dynamos, Switch Gallery, and Balancers.

PRACTICAL NOTES ON ELECTRIC MAINS.

BY A MAINS ENGINEER.

(Continued from page 188.)

The use of a brick chamber for the transformer, and two smaller brick boxes—one to contain the primary and the other the secondary switch-fuse gear—makes a capital job. The chamber for the transformer can be built large enough to contain a 50-kw., but for the start can be partly filled with bricks, and a much smaller transformer used. A space in front of the transformer 1ft. 6in. clear will give plenty of room for the jointer to stand in; and as the top of the chamber can be made to lift entirely off, the greatest depth that will be required will be the height of the largest transformer plus, say, 6in. clearance between the under-side of the pit cover and the transformer top. The primary and secondary mains can pass right through their respective switch-fuse boxes, tappings to feed the transformer being taken off through combined switches and fuses. These switch fuses should be so designed that they can only be removed by hand, singly, as it is well never to trust to high-tension switches that cannot be seen. Combined switches and fuses are not to be recommended entirely, as a high-tension fuse blowing in one's hand is not to be desired; but under the above circumstances, especially if there is not much room, it would seem that they are about the only things to use. The iron boxes containing them would necessarily be filled with thick oil or made with watertight covers, according to the class of insulation on the cables used. Another point in the favour of a brick chamber is that radiation of heat from the transformer takes place more readily.

For high-tension distributing boxes the above-mentioned switch fuses are sometimes used. In this case also it is well to build a shallow brick box to contain the switch-fuse box, instead of covering it with soil; water gets away better and it is easier to get at. On a low-tension network, where fuses are not used, a brick box of 9in. work and with a floor space of about 25 square feet and 6ft. or so in depth, can be built to contain a distributing pillar, such as is used on the Manchester network. One would wish, however, to fuse a low-tension network; this could be done at the feeding points very well, small sections of the network being fused. Fuses would not be so necessary if the system of main-laying was the solid system with single conductors, for reasons before stated.

Digitized by Google

When the design for a sub-station (underground) is got out, the cable system must be thought of. If conduits are used, they can be laid right into the station. If armoured cables are used, pipes can be built into the walls; the troughings for solid-laid systems should not be brought through the walls, but should terminate outside, the cables passing into the station through earthenware ducts of suitable form. All low-tension cables, from whichever side approaching, should enter at one end of the sub-station and high-tension cables at the other. The crossing of cables is much better done outside the station in the ground.

Turning our attention to gear used in the sub-station, perhaps transformers come first; and perhaps the most important point to consider after having obtained a good transformer is its ventilation. The writer came to this conclusion some years ago, with the result that the patterns used by one very large firm for street-box transformer cases were all altered to provide for ventilation. Probably the only firm which has seen the importance of ventilation in the transformer itself (leaving out the containing box) is the Berry Transformer Company, and they so design their transformers as to obtain a good current of air through the windings. In the writer's opinion, good ventilation would go far to prevent increasing iron losses. To this end, where transformers in watertight cases are used in underground sub-stations, their lids need not be entirely closed down; but in brickwork street boxes the lids must be closed, and effectually. It is therefore necessary in this latter case to dry the transformer thoroughly before putting it on the mains. It is always best to dry all transformers wherever they are to be used. The drying of a transformer can be easily accomplished by connecting its high-tension terminals across a circuit where the pressure is equal to the pressure which would be given by its low-tension winding, were the transformer connected as designed, the low-tension terminals being then short circuited. The high-tension or primary circuit should have an incandescent lamp placed in series with one lead—such a lamp as will allow the same amount of current to pass which the primary winding was designed to take. The transformer so connected will get up a good heat in two days or so, and can be left connected as long as convenient—not less than a week. The cover must be off while drying. Another way of drying a transformer, but more risky, is to connect it to the mains and close it down in its case after having introduced a pot containing calcium chloride; this will take up all the water. The writer once obtained from a 6-kw. transformer 2½oz. of water in this way; the weight of the water was obtained by weighing the chloride both before and after use.

As to the heat set up in unventilated transformers, the high temperature of 168deg. F. has been measured on the outside of the iron circuit, and as the copper circuit was completely enclosed it must have been much hotter. This transformer had been on the mains for about two weeks, but had not been fully loaded. The load on transformers in sub-stations should be measured from time to time by means of a recording ammeter, left connected for a night at a time. The Reason demand indicator has been tried for this purpose, but does not seem to answer very well, as it takes some time to record, while top load is reached and passed very quickly. Some transformers of which the writer has had experience while in use on mains, and which have given excellent results, are the Brush, the Berry Transformer Company's, and transformers made by Messrs. Johnson and Phillips and Messrs. Crompton and Co.

Transformers for use on cable networks are better without switches and fuses of their own. If placed in a sub station, the switching and fusing is best done at a transformer circuit board, and need be single-pole only. The cables (high-pressure) by which the transformers are connected to the switchboard should be single-conductor, rubber-insulated, and lead-covered. The lead covering can then be earthed, and the cable, where it enters the transformer case, will need no protection in the form of insulating bushes. Transformer cases must always be earthed, and every transformer should have an earth shield inserted, when built, between the high and low tension windings. If this is not done, the insulation between the high and low tension windings may at some time break down, thus putting high pressure into the low-pressure mains. In cases of this sort, the insulation between windings and case sometimes holds good. The writer has come across two cases of this sort during the last five years, but as the low-tension network was protected by several Cardew earthing appliances no harm was done. Switchboards are best constructed with marble bases, as marble can be more easily kept clean than slate. If slate is used as a base, it should be enamelled. It is a good plan to enamel high-tension boards red and low-tension black. As high-tension switchboards have to be cleaned very often, a base that can be easily cleaned must be used. It will be found that if enamelled slate is used, the enamel will with repeated washings of methylated spirit be entirely removed in a short time. Both methylated spirit and benzoline are excellent things for cleaning switch gear; but if the board is built on marble, and the marble becomes stained, the stains can be removed better with dilute sulphuric acid, quickly brushed on and quickly sponged off. If the dilute acid is allowed to remain on for any length of time, the marble will be pitted.

Having chosen the material for the base, the switch gear which is to be mounted on it should be of very ample proportions and strong in construction. Terminals should be large, and such as will ensure good contact. Laminated contacts give the best results. The fuses on high-tension boards should, if there is room enough, be kept distinct from the switches. On single-phase concentric cables, it will be sufficient if one pole—the inner or high-potential—is switched and fused if the outer conductor is earthed, as is usually the case; the outers of all cables (high-tension) can be connected together on common 'bus bars. For the low-

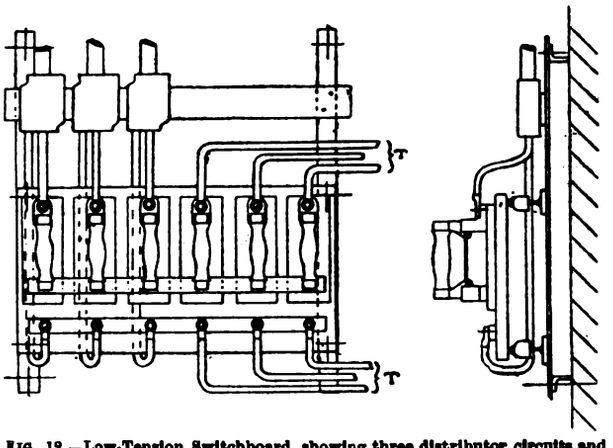

FIG. 12.—Low-Tension Switchboard, showing three distributor circuits and low-tension connections for three transformers, marked T.

tension distribution boards, the switches and fuses can be conveniently combined, as in this case still more room is required for the switch gear, as there are usually far more low-tension cables than high-tension in a sub-station. If the distributing system is two-wire, then one-wire, only the inner, if concentric cables, need be switched and fused, the other wire being clamped direct to a common 'bus bar by means of a stud (iron), fixed in the 'bus bar, and a brass nut; the cable end being sweated solid into a thimble, which is placed on the stud. Iron or steel studs give more strength than brass studs; but brass nuts must be used, as if iron or steel were used they would rust to the studs. In the case of a three-wire distribution, the neutral wire could go on to the common 'bus bar, and the two outer wires be switched. Switchboards can be conveniently mounted on insulating bolts, as shown in Fig. 12, the base of the bolt being first secured to the iron battens before mentioned.

Transformer switches can be combined on one base with the distributing switches—*i.e.*, the high-tension side on the high-tension board, and, similarly, the low-tension on the low-tension board. Cable-dividing boxes, for use with concentric fibre or paper insulated cables, should be fixed above their respective switchboards, the single-conductor rubber-covered dividing cables being brought out through glands in the bottoms of the boxes, and clamped by means of sweated thimbles direct on to the switchboard terminals. As the boxes will have to be filled with compound, care must be taken to see that the cable glands are well packed before the box is filled, as if the smallest aperture is left, the compound will leak out with the warmth of the sub-station, disfiguring the switchboard below. In an above-ground

Digitized by Google

station the cable boxes would be below the switchboards. If oil is used for filling cable boxes, it will gradually find its way along the copper of the cables, and if the boxes are above the switchboards, the switch terminals will always be very dirty with oil; sometimes the oil dries on and prevents the switch from acting. All cables entering boxes before going on to their switchboards must be clamped to the sub-station walls, or to the iron battens on the walls, so as to prevent the cables from slipping, owing to their spring, and thus causing their connectors inside the boxes to come in contact with the sides. Spare switches and fuses should always be kept ready for use in all sub-stations, also spanners and any other tools necessary for disconnections. At least one pair of rubber gloves should be kept in each station The sub-station should always be kept neat and trim—all the high-tension apparatus at one end, and the low at the other. All the ironwork should be earthed. A Cardew earthing appliance should be fixed in each sub-station, one pole being connected to the earthed ironwork, and the other pole to one of the low-tension network 'bus bars.

Probably some of the best-arranged sub-stations for single-phase distribution are to be found at Cheltenham. The older ones were built of concrete, faced on the inside with ordinary rough bricks; but the later ones have been constructed entirely of brickwork, the inner facing being white glazed bricks. The first mentioned have had their walls covered on the inside with two or three coats of Blundell, Spence, and Co.'s petrifying paint, with the result that they also have clean, white, and glossy walls. (When this paint is used, it must be applied in small quantities only, and well rubbed into the brickwork; if it is put on

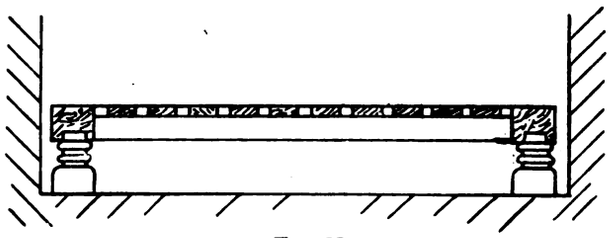

FIG. 13.

with a full brush it will run, making a very unsightly job indeed.) In these sub-stations the floor at the high-tension end is an insulated floor, constructed as shown in Fig. 13. The wood grating, which can easily be taken to pieces for cleaning, is supported on brown stoneware insulators, and thus is always kept dry. It is constructed of good pitch-pine, and rubber mats are kept lying on it. An insulated floor is a good thing when the high-tension operations are conducted by a man who knows what he is about, but perhaps is apt to give a false sense of security to others. Such a floor would be no good, for instance, if one were using a high-tension switch with one hand while resting the other hand on an earthed transformer case.

Fig. 12 shows the general arrangement of switchboard connections, and method of fixing the boards, in use at Cheltenham for three 30-kw. transformers and three distributing mains (low-tension). The arrangement on the high-tension side is exactly similar, except that a better class of connecting cable is used, and generally more attention is paid to insulation. The outers of the high-tension cables are coupled together inside the cable-dividing boxes instead of on the switchboard. Each high-tension dividing box is designed for three cables. The connecting cable for the outer pole of the transformer (primary winding) is brought out through a gland designed for it, and the connecting cable for the inner pole is taken through a switch fuse off the high-tension feeder switchboard.

It will be found the best practice for the mains engineer to design the whole of his switchboards and cable boxes, as these things cannot be bought in suitable form from the makers of such gear.

(To be continued.)

Harrogate.—The Local Government Board have sanctioned the borrowing by the Town Council of £10,000 for electric lighting purposes.

ELECTRIC RAILWAYS.

BY MAJOR P. CARDEW.

The first of the series of three Cantor lectures on "Electric Railways" to be delivered by Major Philip Cardew, was given on Monday last at the Society of Arts. Being the introductory lecture, the greater portion of the hour was taken up by a *résumé* of the history of electric traction, and a rough survey of the state of electric traction as applied to railways at the present time. Major Cardew commented on the fact that the art of locomotion had been practically stationary from the time of the Romans up to the beginning of last century. The Roman art of road-making had been exceedingly little improved upon during the interval, and it was not until the introduction of the steam locomotive that improved means of locomotion were at all realised. He thought that even as there had been a vast increase in the speed and ease of travelling due to the introduction of the steam locomotive, so there would be a corresponding increase due to the introduction of electric railways. In the same way as the steam locomotive had out-distanced all its rivals in economy and speed up to the present, so he thought electric railways would out-distance steam. The advantage could only be gained by the introduction of electricity, in consequence of the great ease with which electric energy could be transmitted. Dealing with the history of the subject, Major Cardew pointed out that up to the time of Faraday electric railways were commercially impossible, as the only source of electricity was the voltaic cell. Even with the introduction of dynamos and motors, the ideas which resulted from working with voltaic cells still tended to hamper progress. There was the error that so many held, that no more than 50 per cent. efficiency could be obtained from a motor, because the maximum output from a battery was obtained when the internal resistance was equal to the external. At the same time, the maximum output could be obtained from a motor when the counter E.M.F. was half the applied E.M.F. In this instance, of course, the full-load efficiency could only be 50 per cent., but no motor would stand a load on that basis. A mistake had been the confusion between the maximum output and maximum efficiency. The first electric railway was laid down in the Berlin exhibition in 1879, and was afterwards exhibited at Paris in 1881. This ran with an insulated third rail, the track acting as a return. The Portrush electric railway was the next to be constructed, and that was working at the present time. It used 300 volts on a raised third rail, but this had to be replaced by overhead construction some few years back in consequence of an accident to a cyclist. In 1884 the Blackpool conduit tramway was put down in a position most trying for conduit work, as in times of storm the sand from the seashore was blown on to the road and filled up the conduit. Conduit lines, however, were now being worked successfully at Washington, New York, and other places, and were shortly to be introduced in London. In 1889 a new system of conduits was tried at Northfleet in which the cars were worked in series. It was a most ingenious system, but the objections to series working were too great to render the undertaking commercially successful. In 1893 the Liverpool Overhead Railway showed what could be done with electric traction on heavier lines on a superstructure raised above the ordinary traffic levels. The success of this line was largely due to Mr. T. Parker, who boldly undertook to carry out the scheme, and attained the success which his efforts deserved. In 1891 the overhead trolley system, which had been first developed in the States, was first introduced into this country at Leeds. The result of the earthed return was interference with the telephone circuits, in consequence of which a joint committee was appointed, which instructed the Board of Trade to draw up rules to regulate such tramway undertakings. After a conference on these rules, at which all interested were represented, they were put into force, and he thought they had proved sufficient to prevent any injury to underground pipes. The South London Electric Railway was the first tube line to be constructed, and was the forerunner of many enterprises of a similar kind now working or in course of con-

Digitized by Google

struction. The use of three-phase currents for electric railways had been largely developed on the Continent, and Major Cardew showed on the screen a number of views taken on railways in Switzerland worked with polyphase currents. The great advantages of electricity over steam were hardly to be expected on long journeys, such as the journey to Scotland, which should be undertaken at night in sleeping-cars, as without a considerable increase in the maximum speed there would be little saving of time. Without a doubt the speed could be increased to 100 miles per hour, and it was practically certain that in special cases speeds of 120 miles per hour could be maintained. But the question was always whether the traffic on such lines could be made to pay for the construction, as special tracks would have to be provided. He thought, however, that electric railways had a special field in connecting up towns, say, 100 miles apart. The advantages gained would be a more frequent service, increased regularity in service, and reduction in the time taken on the journey. The economy with the use of electricity would result from having light trains running at frequent intervals.

Major Cardew then proceeded to quote from Mr. W. Langdon's paper at the Institution of Electrical Engineers on the advantages of electric locomotives, and stated that he thought Mr. Langdon underestimated these advantages as far as repairs of rolling-stock and locomotives were concerned. There was no doubt that with this frequent service there would be increased receipts, but the capital expenditure required for the change was considerable, and it was not easy to estimate what the actual effect of the change would be. Firstly, the power would cost less because it would be generated in bulk and not in detail, as in the case of locomotives. Next, the daily run of a given motor or locomotive would be largely increased. He found that the average run now was about 54 miles per day with a steam locomotive, whereas 300 miles per day were often obtained even on a system of electric tramways. The third advantage was that the motive power was not restricted, as in a locomotive, but could be increased in order to gain higher speeds up steep grades. The wear of the rails was reduced, and the loss of adhesion, which resulted in the waste of energy in slip, could be considerably lessened by distributing the motors throughout the train so that a greater proportion of the total weight might come on the driving wheels. Another advantage would be that an absolute block system could be obtained by causing one train automatically to cut off the supply of current to the section behind it. Coming more to the apparatus to be used, he thought that for the design of motors his audience could not do better than read the Cantor lectures on electric motors delivered last year by Prof. Carus-Wilson. He proceeded to give a brief *résumé* of the working of a series-wound motor to show that, although it took the largest current when starting, it was then working at a condition of least economy. Major Cardew contended that some means of independently exciting the field magnet of a motor would be adopted, in order to cut down the great waste of energy and resistance when starting. He described the Ward-Leonard system, which had this object in view, but hinted that some other system would shortly be brought before the public which would reduce the actual power taken from the line when starting to one-third of its present value, and would also enable a larger proportion of power to be returned to the line when stopping the train. The series-parallel controller had for its object the reduction of starting losses, and Major Cardew estimated that, while with a single motor in getting up full speed an average efficiency of only 45 per cent. was obtained, a 56 per cent. efficiency could be obtained by using two motors in series in the early steps of the trolley. If four motors were used, commencing with all in series and going by steps to all in parallel, this efficiency could be increased to over 60 per cent., but he was not sure that the extra complication was worth the slight saving. Reverting to the separately-excited motors, he thought that considerable economies could be obtained by their use when starting.

(To be continued.)

THE BRITISH INSULATED WIRE COMPANY'S STAFF DINNER.

That this well-established annual has lost none of its popularity was amply demonstrated on Friday evening last, when about 170 guests congregated at the Adelphi Hotel, Liverpool, to partake of the above company's hospitality. The event incidentally gave one the opportunity to renew many old acquaintances; the visitors' contingent—made up, as usual, of units from all parts of the country—being particularly strong. Exceeding good cheer was the characteristic feature of the proceedings, which were ably piloted through by Mr. W. Marriner Brigg. An excellent dinner having been served to an orchestral accompaniment, the CHAIRMAN proposed "The King" in a few well-chosen words, which called forth a hearty response.

The next toast was that of "The Electrical Industry," proposed by the Hon. A. STANLEY, M.P., whose combined eloquence and wit struck a high note and convulsed his hearers with laughter. He did not know anything about electricity, but up to six o'clock that morning the Irish members in the House were talking of law and order, and if Irish members could talk of law and order, he was convinced he could talk about electrical matters. This he proceeded to do, mentioning that in 1896 there were £61,000,000 invested in electrical concerns in this country, while in 1900 this amount had increased to £124,000,000—a fact which, he thought, spoke sufficiently well for the progress of electricity. But if these figures were not in themselves sufficiently convincing, he need only add that the rate of interest on the invested millions had never fallen below 5½ per cent. With regard to the recent accident in Liverpool, it pointed to the necessity of giving electrical engineers a free hand in providing against such occurrences. Mr. Stanley went on to make some amusing references to wireless telegraphy, and the talk of establishing connections with Venus and other planets of that order, but for want of space and other reasons—mainly other—we must refrain from dealing at length with this portion of his speech. Suffice it to say that a sort of guarantee for the success of any future experiments in this direction which may be conducted on this side of the Atlantic was suggested in the reputed interest taken in the matter by Mr. S. Z. de Ferranti, with whose name the toast was coupled.

In replying, Mr. S. Z. DE FERRANTI proved himself quite equal to the challenge, and related an amusing anecdote which had been called to mind by the remarks of the previous speaker. But here, again, pressure on our columns prevents us from entering into detail. Mr. Ferranti expressed the pleasure it gave him to address so many old friends. As regarded the future development of the electrical industry, he thought this depended very largely on the efforts of the young men around him. The development of the past had been very great, but the future offered enormous possibilities in comparison, and the country was undoubtedly going ahead. Fortunately, electrical work was now looked upon in a more friendly light than had been the case some time ago, and greater facilities were being given for the distribution of electrical energy over wide areas. He also referred to the probable developments of electric traction on main-line railways.

The next toast was "The Visitors," proposed by Alderman T. SNAPE and responded to by Mr. W. M. MORDEY.

Mr. J. S. RAWORTH proposed "The British Insulated Wire Company," to which Mr. J. B. ATHERTON made an able response. Referring to American and German competition, Mr. Atherton said that, given fair play, they could look into the future with confidence.

In proposing "The Directors of the British Insulated Wire Company, Limited," Mr. G. H. NISBETT drew a humorous sketch of the mean policy adopted by some boards of directors, with the object of showing how enlightened were the methods of his own Board in comparison, and how alive they were to the interests of their shareholders.

This practically terminated a most successful evening, or, perhaps, it would be more correct to say our mental

Digitized by Google

notes as to what occurred after this stage of the proceedings are somewhat confused. An excellent programme of vocal music followed upon the orchestral performance. On the following morning a large number of the visitors took advantage of the opportunity afforded them to visit the company's works at Prescot, where the enormous amount of work on hand indicated more eloquently than the words of the previous evening the growing prosperity of the company's undertaking.

ELECTRIC LIGHTING ENQUIRY.

Question of Increased Pressure.

At the opening of the proceedings on Thursday, the 7th inst., Sir Courtenay Boyle announced that the Board of Trade had decided against the contention of the counsel representing the City of London Corporation. The Board of Trade had the power to alter the rules and regulations, and therefore had the power to alter a proviso in the set of regulations issued in 1896.

Mr. R. W. WALLACE informed Sir Courtenay Boyle that although the Westminster Company had had a consultation with the representatives of those consumers who would not change over to the 200-volt supply, they had been unable to come to any agreement in the matter.

The case for the Chelsea Electric Supply Company was then opened by Mr. MOON, who explained that up to the present the company had had no trouble through the clause in question. They were supplying 1,500 consumers at 200 volts, and 500 consumers at 100 volts. They had had no objectors at present, as all the changes over to the higher voltage had been done voluntarily.

Mr. P. STILL said he was the chief engineer of the Chelsea Electric Supply Company, whose system was a continuous-current one. At first they had given a three-wire supply at 100 volts, but they used high tension to transmit the power between the main station and the sub-stations. The change over to the higher voltage would not affect the feeders, but would give a very considerable economy in the capital outlay for the distributors from the sub-stations. With the gradual changing over, the cost of supply to a few consumers at 100 volts would increase much in the same way as the number decreased. In order to induce their consumers to take the higher voltage, they had offered to supply at a cheaper rate. Thus the 100-volt consumers were charged 6d. per unit, while the 200-volt supply was given on the maximum demand system, with a charge of 6d. for the first 1½ hours' supply and 3d. per unit afterwards. The average price obtained from these consumers was 5d. per unit, and it had resulted already in the reduction of £3,000 per annum in the accounts. The 6d. per unit was not enough for the 100-volt supply, and they had given notice that they would charge 7d. per unit from July 1 next.

Sir COURTENAY BOYLE said he should like to hear an argument later on as to this course being in accordance with the terms of the order, that they were not to give undue preference to any consumer.

In answer to Mr. Moon, Mr. STILL went on to state that he estimated that the extra penny per unit represented the extra cost of supplying 100 volts to a few consumers. The consumers had a benefit from the change because the wires installed in their houses would be able to carry twice as many lamps at the higher voltage, or if the number of lamps were kept the same the voltage drop on their mains was very much less. He thought that in 1896 200-volt lamps were not so good as the 100-volt, but now he considered that both as regarded light and efficiency there was nothing to choose between the two. As regarded the company, he thought that they would save from £3,000 to £4,000 per annum in consequence of the change.

Cross-examined by Mr. Littler, Mr. STILL said that the practical advantages to the consumer consisted in the reduction in price, and also in the increased regulation of voltage in consequence of less drop in the house mains. He did not consider it was a practical suggestion to put motor-transformers in the consumers' houses, or to run two sets of mains in order to supply at the 200 volts. He gave an estimate of £500 as the cost of a 45-kw. rotary converter, but did not consider it feasible to put down such motor-transformers to supply even a street of 100-volt consumers. The increase of cost to supply these consumers was not in the production, but in the delivery of the current. Under further cross-examination on the question of the voltage drop, he considered that it was not an uncommon thing to have a four-volt drop in the consumers' wires when all the lamps were on, and this would be reduced to a 1 per cent. drop with 200 volts. With respect to the life of the lamp, he was not surprised to hear that the electrical engineer of the Great Northern Railway specified a 2,000-hour life for a 100-volt lamp and only a 1,000-hour life for the 200-volt lamp. He had tested 200-volt lamps which lasted more than 1,500 hours, but in any case, with either voltage supplied, he did not consider it at all advisable to run them for more than 1,000 hours. His company had not obtained the London County Council's consent, because they had not changed their standard voltage. Any change over that had taken place had been done voluntarily by the consumers to get the reduced price. They had had no complaints as to the alleged extra cost of the lamps or as to the decreased light. He did not consider that the fire risk was any more, but admitted that certain changes had to be made in the fuses, wall plugs, switches, and lampholders. The cost of these changes was not much.

Re-examined by Mr. Moon, Mr. STILL explained that a rotary converter to supply one street would result in a great waste of energy. The losses were almost as great when running light as when working under load, and the all-day loss would be exceedingly high. Even assuming it were feasible it would not apply to the case in point, as their 100-volt consumers were not collected in one street, but were dotted over the district.

Mr. SYDNEY BAYNES, the electrical engineer to the St. Pancras Council, gave some history of the introduction by himself of the higher-voltage lamps at Bradford. In St. Pancras they had a certain amount of difficulty in inducing consumers to take the higher-voltage supply. One consumer who had been induced had to be threatened that the supply would be discontinued before he gave way. The St. Pancras order was dated 1883, but he was not aware that the regulations of 1896 did not apply. They had received the regulations from the Board of Trade with the statement that they would be enforced from a certain date, and he assumed that they applied to St. Pancras.

Cross-examined, Mr. Baynes had to admit that he had no right to threaten to cut off a consumer as had been done. The consumer in question had asked for an assurance that the 200-volt supply would not cost him more, but he could not bind the Vestry on such a matter. Now that the change had been made, he had had no complaint from the consumer that the cost was more. There would certainly be less variation of pressure with higher voltage supply. The 200-volt lamp might cost a little more, and it would last quite as long as it was necessary. He did not think that any lamp should be used more than 700 hours. The difficulty with the St. Pancras voltages had been that the wrong voltage lamps had been used.

Cross-examined on behalf of the London County Council, the question of the threat to cut off was again taken up, the counsel putting it that the threat was directly contrary to law, and that it showed the spirit in which local authorities used the powers conferred upon them. In reply to Mr. Balfour Browne, he said he was aware that the Edison-Swan Company would supply both 100 and 200 volt lamps at the same price. Neither should be used more than 700 hours. Although the Board of Trade regulations of 1896 did not apply to St. Pancras, the Vestry had acted upon them as if they did.

Mr. MOON here pointed out that in the case of the Metropolitan Electric Supply Company they wished to raise their voltage from 50 to 100. The company, he said, started with a high pressure, and were bound to transform, therefore, at the consumers' terminals. The regulations gave the consumers the right to have either 50 or 100 volts pressure, and at the present time the company were bound to supply at both.

The PRESIDENT said that was a special case, and must be dealt with after the general issues had been disposed of.

Mr. CANE announced that although the City of London Electric Lighting Company still continued to support the application, he did not propose to call any witnesses or to address the court on the subject.

Mr. MASSEY then said he appeared on behalf of the Crown, and in the event of any alterations being made in the regulations he would ask the president to see that the Crown was protected. The Crown was a consumer in a large number of places, and at Buckingham Palace current was supplied at both 100 and 200 volts pressure. Personally, he did not object to the change.

The PRESIDENT: Then what have you to say here?

Mr. MASSEY said that when it came to the question of the overhauling of the old wiring for 2,000 or 3,000 lamps in the State rooms of the palace, at present supplied at 100 volts pressure, it was found that the cost of conversion would be £1,500. Rather than bear that expense, the company continued to supply at 100 volts when the pressure was increased to 200. But although this was for their own benefit, they charged the Crown more than they charged the consumers taking the 200-volt supply. The Crown could not compel them to change to 200 volts, but it appeared the company could go on supplying at 100 volts if they so desired. In this particular case he had it in black and white that, rather than pay the £1,500 for replacing the old wiring for the 200-volt supply, the company preferred to go on supplying at 100 volts. He submitted that any alterations the Board of Trade might make in the regulations would merely be for the temporary relief of the undertakers, because sooner or later

Digitized by Google

their mains would be sure to overload again. Then they would either have to break the law by not maintaining the standard pressure, or perhaps take on the five-wire system. As showing the position some electric lighting companies took up, Mr. Massey quoted the case of a hospital which required 3,600 lamps. The company refused to supply them with current because they could not balance their circuits within 10 per cent., which was practically impossible with such a large supply.

The PRESIDENT: The question is, How does this damnify the Crown?

Mr. MASSEY said because they would have to have another change when the mains became overloaded in the future as they had been in the past. In the case of a large building, you were faced with this difficulty: that you must bring into the premises more than one pair of terminals. If the five-wire system were introduced, as at Manchester, you would have to bring in more than two pairs of terminals, and he maintained that it was possible to get a shock of 400 volts although the middle wire might be earthed. Of course, transformers might be introduced, but why should the consumer pay for the transformers to save a little copper in the company's mains? The suggestion he had to make was that the following words should be added at the end of the proviso in question if amended: "Provided always that none of the cost of conversion shall be borne by the consumer."

The PRESIDENT: Have you authority to make this proposal?

Mr. MASSEY said he was instructed to put forward this representation on behalf of the Crown. He agreed by all means that an arbitrator should settle what the cost of the conversion should be, and also the compensation to be paid to the consumer for disturbance and inconvenience.

Lieut.-Colonel CROMPTON was then called and examined by Mr. Moon. He said he had been connected with the electrical enterprise from the beginning. He had had the question of the change of pressure before him for some time; in fact, he was one of the originators of the scheme. The same controversy over the change of pressure from 50 to 100 volts arose in 1882 and 1883, and much the same rusty arguments were brought forward then as now. It was said that the efficiency of the 100-volt lamp was not as good as the 50-volt lamp, that the light was not as good, etc., but it was clearly proved that the objectors were quite wrong. He had heard to-day that the 100-volt lamp was all that could be desired. He was connected with the Kensington and Knightsbridge Company, who commenced to supply at 100 volts. They chose that pressure because it was the pressure for which they could get the best lamps at that time. He had been continuously testing 200-volt lamps up to last week, with the result that he found that a certain number of makes had as good an efficiency as the 100-volt lamp. Certain makers, however, had never succeeded in making the 200-volt lamp with as good an efficiency as the lower-voltage lamp.

Mr. MOON: It was suggested that the longer carbon filaments in the 200-volt lamp are a disadvantage. Is that the case?

WITNESS: Theoretically it makes an improvement in the lamp; practically it makes the mechanical use of the lamp rather more difficult. Continuing, witness knew of no disadvantages of the change to 200 volts pressure, but there were many advantages. It was undoubtedly the case that a serious difficulty to the suppliers was that of finding space in the streets for their mains, and if they were compelled to go on supplying at 100 volts to certain consumers considerably more space would be required. The advantages, however, were by no means one-sided. For instance, with the higher pressure there was only half the variation in the mains, and consequently a better light was obtained. In proof of the superiority of the 200-volt supply, witness stated that all new enterprises were adopting that standard pressure.

Cross-examined by Mr. Littler as to the maximum limit of pressure which could safely and satisfactorily be employed, Colonel Crompton thought that at the present time the Glasgow pressure of 250 volts was the limit. In the case of the Windsor Hotel, he did not know what effect the change would have, but the consumer could not be damnified unless his house had been badly wired and fitted in the first instance.

Mr. LITTLER: If I give my consent to the change, ought I suffer any loss?

Colonel CROMPTON: I should say you ought to have 10 per cent. on the work you are forced to do.

Mr. LITTLER: Thank you; that is more than I ever expected you to say.

In answer to further questions, WITNESS denied that it was the fact within his knowledge that the 200-volt lamp cost 33 per cent. more for current than the 100-volt lamp. It was said that the consumption of current might be more in the 8-c.p. lamps and smaller ones. The efficiency of the 16-c.p. lamp had never been questioned, but there was some doubt about the 8-c.p. lamp. He did not agree with this, however. The facts had proved that the thinner filaments in the 200-volt lamps were not a disadvantage, nor was it true that there was a greater fluctuation of the light than in the 100-volt lamps.

Mr. LITTLER: Is there a lamp filament thin, strong, and long enough to give a satisfactory 200-volt light?—Yes.

Continuing, it was not the fact that a 200-volt lamp lasted a shorter time than the 100-volt lamp. The 16-c.p. 100-volt lamp would have a useful light for 800 hours, and the 200-volt lamp compared quite favourably with it.

Under cross-examination by Mr. Walter, Colonel Crompton repeated that the main advantage to the consumer was that he got a steadier pressure with the 200-volt supply. As the variation in pressure was controlled by the percentage of loss in the mains, the variation was about half that of the lower pressure, and consequently a steadier light was given. Pressed as to whether such a small variation as 2 per cent. would affect the light, witness said it made a substantial difference. Of course, if the mains became overloaded in the future, there would have to be another change, but he could not conceive that this would happen. Another advantage to the consumer was that the pressure in his own premises was more constant. As regarded the company, the saving to them would not be great. It would be in the nature of about 1/10d. per unit. This was the figure given by Prof. Kennedy on the last occasion. Witness had checked it, and found it to be correct. On the question of insulation, there was a difference between the 200-volt insulation and the 100-volt, but this was very slight. In some cases he had known it had not been necessary to change the fittings for the 200-volt pressure. The change of fittings was rendered necessary mainly on account of bad insulation. The efficiency of the 100-volt lamps varied considerably according to the maker, and no one suffered so much from the flood of cheap lamps of this voltage that had been put upon the market than the consumer. The longer filament in the 200-volt lamp would not cause the destruction of the lamp more quickly than the shorter filament used in the 100-volt lamp. Witness admitted that the destruction of the lamps was due to the mechanical disintegration of the filament.

Mr. WALTER: That being so, does it not follow that a 200-volt lamp which has a longer filament will wear out sooner than the 100-volt lamp?

WITNESS could not agree. The proof of the matter was that the one lamp lasted as long as the other. He was not aware that there was a diversity of opinion on this point. In carrying out tests he did not confine himself to two or three lamps; he took several at random from a number sent in for testing purposes. The price of the 200-volt lamp was the same as that of the lower-voltage lamp.

In reply to Mr. Lyttleton, witness admitted that it was by superior skill and industry that the 200-volt lamps were made efficient. He did not, however, think that that was a reason for charging a higher price than for the other lamps.

Cross-examined by Mr. Glen, witness said that, as a rule, the companies would not supply electricity to consumers until they had inspected the fittings. The 200-volt lamps had been in use for a number of years now, and he had heard no complaints from consumers as to their cost and durability except in the case of cheap lamps. He admitted that it would be unfair to make the companies pay for replacing wires and fittings which in the first place were bad.

This concluded the evidence in support of the applicants' case on the general issues, and the Court adjourned till the 12th inst.

The following memorandum as to consumption of current by 200-volt lamps was put in by Prof. Kennedy on this day:

In order to find out whether or not the allegation that 200-volt lamps were much less efficient than 100-volt lamps, the Westminster Electric Supply Corporation made a very careful comparison in the following manner (these figures have already been placed before the Board of Trade): The consumption of a number of consumers whose pressure had remained the same during the corresponding quarters in two consecutive years was compared with the consumption of those whose pressure had been changed in the interval. The quarters taken were the Lady Day quarters of 1898 and 1899, and the whole of the consumers on the company's mains were included except those where local conditions rendered fair comparison impossible. The total units sold in the first quarter of 1898 were 1,540,266, and the units retained for comparison were 1,111,347—over 70 per cent. of the whole. These units were used by 2,505 consumers, 2,031 of whom had remained at the same pressure in both quarters, while the remaining 474 had the pressure changed between March 31, 1898, and Jan. 1, 1899. Of those supplied at the same pressure during both quarters the consumption increased from 927,533 units in 1898 to 955,829 units in 1899, an increase of 3 per cent. of those supplied at 100 volts in 1898, and 200 volts in 1899; the consumption increased from 184,314 units in 1898 to 192,137 units in 1899, an increase of 4 per cent. It will be seen that this increase is practically the same as where the pressure had not been changed, which appears to me entirely to dispose of the suggestion that the new lamps use more current than the old ones. I draw special attention to the very large scale on

Digitized by Google

which this comparison has been made, and to the fact that it really represents practical working, and not laboratory experimenting on the lamps. I think the conditions were such as to eliminate practically all accidental variations in special cases. Sir Courtenay Boyle had asked that later figures should be produced which bear on the same point. Time does not allow of the comparison of nearly 12,000 quarterly accounts which would have to be made in order to get figures of the same kind as those given above. The change of pressure has, however, been in progress since the beginning of 1897, and, therefore, if 200-volt lamps are less efficient on our circuit than 100-volt lamps, there should have been a progressive increase in the consumption per lamp each year. We find, however, that in the year 1897 the number of units used per lamp per annum on our circuits was 16·1; in the year 1898, when 43 per cent. of our customers were changed over to 200 volts, it was 16·2; in the year 1899, with 75 per cent. changed over, it was 16·6; but in the year 1900, with 97 per cent. changed over, it had again fallen to 16·3. These differences, both up and down, appear to me to be quite within the limits of variation which may be expected, and there is nothing to show that either the rise or the fall is due to the changing over from 100 to 200 volts. It seems fair to say that in the last four years the consumption of current per lamp has remained practically constant. As the lamps are now practically all of 200 volts, while in 1897 very few were supplied at that pressure, it appears to me to show conclusively that as regards the lamps used on the Westminster Company's circuit the watts used per candle-power must have been practically the same at both voltages. It may be added that during the same four years the revenue per lamp per annum has fallen from 7·44s. to 7·08s., 6·68s., and finally to 6·45s. This, of course, shows that even if there had been a very considerable increase of current used per lamp per annum, and a heavier cost from renewals (neither of which we believe), the reduced price paid by the consumer per unit must have more than counterbalanced them. The corresponding average prices obtained per unit during the same years are 5·54d., 5·25d., 4·83d., and 4·75d. In 1897 the rate of charge was slightly higher than now, but since Jan. 1, 1898, it has been the same, the only difference being that the reduction of 8 per cent. on account of 200 volts was not made in 1898, while it was made in 1899 and 1900. Consumers also derive an additional benefit by a reduction in meter rent, owing to the smaller sized meters for 200 volts; this amounts on an average to ·1d. per unit. The following figures also tend to show that 200-volt lamps are certainly not less efficient on the Westminster circuit than are 100-volt lamps. The figures refer only to the Mayfair and Belgravia parts of our district. The other district, Westminster, has been so much affected of late years by the large number of lamps in Government offices connected to our circuit, and also by the supply to the Army and Navy Stores, that any comparison is impossible. The two districts named contain, however, over 75 per cent. of the total number of lamps installed, and the maximum load in amperes, divided by the number of lamps connected, has gradually fallen from ·1036 in 1895 to ·1017, ·0998, ·0991, and ·0977 in successive years, while in 1900 it was only ·0964. As the proportion of lamps alight at the time of maximum load is pretty constant, the maximum load would have certainly increased in proportion to the number of lamps installed had the efficiency of 200-volt lamps been less than that of 100-volt lamps. Although I consider that the figures given above are conclusive as to the points essentially affecting the consumer, they cannot, in the nature of things, deal with exact measurement of candle-power. I therefore put in the results of experiments which I made about two years since on 8-c.p. and 16-c.p. lamps of 200 volts by four different makers, on which I based my evidence on this matter.

ALEX. B. W. KENNEDY.

TUESDAY, MARCH 12.

On the enquiry being resumed, Mr. DANCKWERTS, K.C., opened the case for the city of London. He first suggested that the question of the power of the Board of Trade to revise the clause should be submitted to some lawyer of eminence, whose decision would be accepted by all parties. The legal arguments could then be made before the gentleman selected. He proceeded to argue that the proviso requiring the consent of the consumers before changing over to 200 volts had been inserted in the 1896 regulations, because previous to that the undertakers were bound to supply at some pressure between 115 and 45 volts. He looked upon the regulation to that effect as an agreement between the company and the consumer, which could not be changed without the consent of the consumer, and he held it was for this reason that the proviso now objected to by the companies had been inserted in the 1896 regulations. He looked upon the question as being one in which the companies got all the advantage of the change, and even then the advantages as regards the increased capacity of the present mains would be only temporary. After a considerably longer statement of his case,

Sir COURTENAY BOYLE put forward the following suggestions as to a proposed clause which the Board of Trade might be prepared to accept as carrying out some of the suggestions which Mr. Danckwerts had made. Sir Courtenay Boyle, who said he was not announcing any decision of the Board of Trade, then read the following clauses, which would replace the consent clause in the 1896 regulations:

"Provided that no change shall be made in the pressure of the supply to any premises which are or were supplied with energy by the undertakers except with the consent of the consumer, but where the consumer withholds his cousent after the undertakers have offered to pay the reasonable cost of, or incidental to, the change, the undertakers may appeal to the Board of Trade, and that Board may, if they think fit, dispense with the consent of the consumer on such conditions as the Board impose."

"The Board of Trade may, if they think fit, in any case refer to the arbitration of a single arbitrator appointed by them the question of the conditions to be imposed under this provision."

"The arbitration shall be subject to the provisions of the Arbitration Act of 1889, as if the arbitration were pursuant to a submission, and should also be subject to the like provisions as an arbitration in pursuance of a special Act under Part I. of the Arbitrations, etc., Act, 1874."

The various counsel present agreed that if some such clauses could be adopted as agreeable to all parties it would save time in the continuation of the enquiry, and after a certain amount of argument the enquiry was adjourned until the 14th. Sir Courtenay Boyle suggested that any amendments to the clause given above should be forwarded to the Board of Trade before the next meeting.

THURSDAY, MARCH 14.

At the opening of the enquiry the Hon. L. LYTTELTON, K.C., said that, as representing the London County Council, he had considered the clauses proposed by Sir Courtenay Boyle, and had an amendment to propose. Arguing on the grounds that the change over to the higher voltage should be made at no cost to the consumer, and that the undertakers were the sole gainers on the change, he thought all controversial points should be settled at the expense of the undertakers. His first suggestion was that any dispute on the question of the change over should be taken before the Board of Trade, and considered that 19 out of 20 cases should be settled in that way. In the event of one of the parties not agreeing, the Board of Trade should appoint an arbitrator to settle the indemnity to be made to the consumer by the undertaker. The cost of the reference to the Board of Trade and of the arbitration should be borne by the undertaker, unless the arbitrator said that the consumer had been vexatiously withholding his consent. In the proposed amendment as read out the undertakers were to be made responsible for both the direct and indirect expense to the consumer in carrying out the change.

Mr. A. H. WALTER agreed to the suggested amendment on behalf of the Corporation of London. As the undertaker alone was benefited, he ought to bear all the reasonable cost arising out of the same.

Mr. WARMINGTON, on behalf of the Westminster Supply Corporation, said that the proposed amendment would mean that a large number of small cases would have to be argued either before the Board of Trade or before an arbitrator. Under the terms of the amendment the Board of Trade would only hear the case if both the parties were agreed in submitting it to them, and a consumer who withheld his consent to the change would not be likely to sign a reference. He did not agree with the proposal as regards costs.

Mr. E. MOON followed on the same line, arguing that the consumer, having his costs practically assured to him, would resist the change over even more than at present. He thought that the idea of an indemnity in consequence of the change over was an erroneous one, and that the consumer's consent was only required in the 1896 regulations because the high-voltage lamps were then in an experimental stage. If the costs of arbitration were to be as suggested, it might pay the company better to continue supplying the refractory consumers with the low voltage, charging them the maximum rates under their Acts, which they had a right in law to do.

Sir COURTENAY BOYLE then intimated that he had had sufficient argument before him to enable him to advise the Board of Trade on the matter, but he could not promise the counsel for the London County Council and the Corporation of London that he would accept the wording of their amendment. He must, therefore, leave it to these counsel and to others appearing as objectors as to whether they would call their evidence on the controversial questions. This evidence must be called at this stage if at all.

After an adjournment to consider the question, the objectors decided to bring out their evidence, which was being heard when we left the enquiry at mid-day.

TO CORRESPONDENTS.

All Rights Reserved. Secretaries and Managers of Companies are invited to furnish Notice of Meetings, Issue of New Shares, Installations, Contracts, and any information connected with Electrical Engineering which may be interesting to our readers. Inventors are informed that any account of their inventions submitted to us will receive our best consideration.

All communications intended for the Editor should be addressed C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street London, E.C. Anonymous communications will not be noticed.*

TO ADVERTISERS.

Advertisements should be addressed to the Publisher, 139-140 Salisbury Court, Fleet Street, E.C., and should reach him not later than noon of Thursday. **Special Terms** *for a series can be arranged on application.*

SITUATIONS WANTED will be charged at three words for One Penny (prepaid and net), with a minimum charge of Sixpence.

TO SUBSCRIBERS.

"THE ELECTRICAL ENGINEER" *can be had by Order, from any Newsagent in Town or Country, and at the various Railway Stations; or it can, if preferred, be supplied direct from the Office on the following terms:*

	3 months.	6 months.	12 month
United Kingdom	3s. 3d.	— 6s. 6d.	— 13s. 0d.
Other Places	5s. 6d.	— 10s. 6d.	— 21s. 0d.

(Post Free, Payable in Advance.)

Cheques, Post Office and Postal Orders for Subscription and Advertisements should be made payable to C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, and be crossed "Union Bank."*

Now Ready, Vol. XXV., bound in blue cloth, gold lettered price 5s. 6d.

CONTRACTORS AND CONTRACTING.

We have no intention of discussing the Brighton matter, which is referred to in the correspondence given elsewhere, but to call attention to another phase of contracting which needs a remedy. Upon the face of it, the system is admirable of having work done by a contractor selected under open competition. The abstract and the concrete, however, do not always run on all fours. Perfection assumes a competent engineer, an equally competent contractor, and a sensible employer. The system breaks down in practice when these things are not obtainable. Generally the grumbling lies between the engineer and contractor, the employer's interests being safeguarded by the engineer. In some cases the employer tries to run alone, and probably comes to grief. The point to which we call attention belongs to those brought about in the latter contingency. We may, without going far wrong, assume an average of twenty tenders sent in for every large installation. The sending in of a tender means considerable expense to every contracting firm. In the first place, a payment is demanded for the specification, returnable if a *bonâ fide* tender is duly sent. The greater expense comes in because of clerical and drawing office work, the taking out of quantities, the checking of figures, and so on. Under no circumstances does the contractor recoup this outlay directly unless he obtains the contract. It needs little knowledge of commercial economy to see that the expenses thus incurred become part and parcel of the wages bill of the factory. One of the factors determining the ultimate cost of work is the wages bill, hence employers should not unnecessarily add to the works wages sheet. We do not see any remedy for the abolition of tenders, hence the cost of this part of contracting is a necessity. The same does not hold in the following case. A number of employers—indeed, an increasing number—insist upon a banknote of greater or less value—say, generally fifty pounds—being enclosed with a tender, returnable when the tender, so to speak, is *proved* to be a *bonâ fide* tender. It is said, though not in so many words, that contractors must not be permitted to remedy a mistake, and that if a clerk in his addition fails to "carry one," and so makes the total ten, a hundred, or ten thousand pounds less or more, the mistake is not to be remedied; and if it so happen the error decreases the total, the work must be done for the incorrect total, or the contractor be mulcted to the tune of fifty pounds. An error is an error, and should be remedied without fuss. There is no valid reason for fining a man fifty pounds because of a clerical error. Further, this deposit of fifty pounds is not of much account when only a single case is considered; but one firm may have twenty tenders out, and that means the lock-up of a thousand pounds for perhaps three months, or, rather, it is the lock-up of that amount for ever. That for one firm; but there is a multiplicity of firms, and it is easy to see how from twenty to fifty thousand pounds may be always locked up under the circumstances

Digitized by Google

described. We simply take an average number of firms with an average number of tenders out, and show the result. We are not unaware that in many foreign contracts large deposits have to be made, but these are of a different character, for a different purpose. Contractors are human, their clerical staff is liable to err, and assuming tenders honestly made there is no reason for a penalty. Assume an error making the total too high, the tender is out of the running, and the contractor loses the work, the penalty thus being large and naturally enforced. If the total amount is too low by error, perhaps when corrected it merely lets in another contractor, giving a little trouble, but in the majority of cases leaving the erring tender in the same position as it would have been if correct at first. There is still the case where the corrected error still leaves the total under that of the next highest tender, and here the employer has to pay more than he expected; but surely such cases ought to be determined on their merits. This latter case may involve very considerable trouble. A municipality may have borrowed upon the original, not the corrected estimate, and so may have borrowed too little, and have all the trouble of obtaining further borrowing powers—*i.e.*, if the amount is large—but even in this case there seems no vital impediment to an equitable arrangement regarding the trouble and expense.

FORTHCOMING EVENTS.

FRIDAY, MARCH 15.

Institution of Mechanical Engineers.—At 8 p.m. ordinary meeting. Paper on "Combined Trolley and Conduit Tramway Systems," by Mr. A. N. Connett.

SATURDAY, MARCH 16.

Royal Institution.—At 3 p.m., the Right Hon. Lord Rayleigh on "Sound and Vibrations" (Lecture IV.).

Institution of Junior Engineers.—At 6.30 p.m., Westminster Palace Hotel, anniversary dinner.

MONDAY, MARCH 18.

Society of Arts.—At 8 p.m., "Electric Railways," by Major P. Cardew (Lecture II.).

TUESDAY, MARCH 19.

Institution of Junior Engineers.—At 8 p.m., "Works Management," by Mr. A. H. Barker (Lecture IV.).

North-East Coast Institution of Engineers and Shipbuilders.—Meeting at Newcastle-on-Tyne.

Institution of Civil Engineers.—At 8 p.m., ordinary meeting. Paper to be further discussed: "The Æsthetic Treatment of Bridge Structures," by Mr. Jos. Husband.

WEDNESDAY, MARCH 20.

Institution of Electrical Engineers (Students' Section).—At 7.30 p.m., ordinary meeting. Paper on "Indoor Electric Light Fittings at the Paris Exhibition," by Mr. G. E. Turnbull.

FRIDAY, MARCH 22.

Institution of Junior Engineers.—At 8 p.m., engineering question night.

Royal Institution.—At 9 p.m., discourse on "Some Recent Work on Diffusion," by Dr. Horace T. Brown, LL.D., etc.

Physical Society.—At 5 p.m., ordinary meeting. Papers: "On the Expansion of Silica," by Prof. Callendar; and "The Spectroscopic Apparatus at University College," by Dr. E. C. C. Baly. Council meeting at 4.30 p.m.

Institution of Civil Engineers.—At 8 p.m., students' meeting. Paper: "The Hunslet Railway and Bridge over the River Aire," by Mr. O. L. MacDermott.

SATURDAY, MARCH 23.

Royal Institution.—At 3 p.m., Lord Rayleigh on "Sound and Vibrations" (Lecture V.).

Glasgow and West of Scotland Scientific Society.—At 7.30 p.m., ordinary meeting. Paper: "Glasgow's Water Supply," by Mr. James B. Wyllie.

CORRESPONDENCE.

"One man's word is no man's word,
Justice needs that both be heard."

THE QUIN TROLLEY WIRE PROTECTION DEVICES.

SIR,—In your issue of the 8th inst. you describe Mr. Quin's ingenious automatic cut-out, designed for this purpose.

But, from the diagram of connections, it would appear that the device is only applicable where current is fed into the trolley line from a single feeder—*i.e.*, to those (short) trolley lines which can be fed from a single station and by means of a single feeder. For those lines which are fed by several feeders, and at several points, it would appear that the device is inapplicable—at any rate in the form described—for it is fairly obvious that the current necessary to operate an E.M.F. coil can as easily get to the coil from the further side of the break (by means of the feeders which feed sections further from the station), as from the near side of the break.

Perhaps you can explain, Sir, how Mr. Quin overcomes this difficulty, for to me it seems rather a serious one.—Yours, etc.,

PUZZLED.

Birmingham, March 11, 1901.

[The difficulty which our correspondent has in understanding Mr. Quin's device is due to the fact that he does not realise the arrangement of feeding the trolley wires by means of sections. Each section of the trolley wire is fed from one point only; the division between one section and the next is made at sectional insulators, which occur, as a rule, at about a quarter of a mile intervals. The fuses in the sectional pillars, which, as a rule, feed four lengths of trolley wires, two in each direction, are replaced in Mr. Quin's system by automatic cut-outs operated in the way described in our last issue.—ED. *E. E.*]

SIR,—I would feel greatly obliged to you if you would make clear one point in connection with this system, which would appear, from the brief account of it given in your last issue, to be a very serious objection, indeed, to the universal adoption of the scheme. The shunt coils of the automatic switches in the street pillars are excited off the trolley wire by the 500-volt supply from the generating station, and these coils, to quote from your last issue, "when energised, hold on the switch levers, which otherwise fly off and break circuit." From this it would appear that if the 500-volt supply was interrupted all the automatic switches on the system would open, making it necessary, before the traffic could be resumed, for a man to go round and close them again, and, further, this would have to be done every morning before the cars could start.—Yours, etc.,

A. JOHNSTON.

[Mr. Johnston is correct in his surmise that the whole of the automatic switches would go off if the supply were discontinued. It would only be necessary, however, for the conductors of the leading cars to put up the automatic switches again as they come to each switch pillar. A note in the article describing this system mentioned the fact that these switches have to be put on each morning by the conductors of the first cars that go out. The extra safety given by the device more than compensates for this slight additional labour.—ED. *E. E.*]

BRIGHTON CABLE TENDERS.

SIR,—Enclosed are copies of correspondence on this subject, which may be of interest to your readers. I think the letters fully explain the position in which the controversy stands at present.—Yours, etc.,

A. H. HOWARD, Secretary.

Cable Makers' Association, Westminster, S.W.,
March, 1901.

[COPY.]

Town Hall, Brighton, Feb. 27, 1902.

Dear Sir,—Your letter of the 8th inst., the receipt of which I acknowledged on the 9th inst., has been submitted to the Lighting Committee of the Corporation, and in reply thereto I am instructed to inform you that you are

Digitized by Google

in error in stating that several of the recent tenders sent in for cables for the Corporation of Brighton were substantially lower in amount than the tender of the Union Cable Company, which was accepted; that when consideration had been given to the effect of the alterations made in the conditions by the persons and companies whose tenders were apparently the lowest, it was found by the committee that they were, in fact, not so, and that the Union Company's tender was undoubtedly the most advantageous to the Corporation.

I am further directed to inform you that the Lighting Committee of the Corporation are willing at any time to consider any suggestions made by the association or any of its members for the alteration of the conditions attached to the specifications for the supply of cables for the Corporation, but they cannot consent to any alteration in the conditions, when once issued, being made by persons tendering, inasmuch as alterations so made would render a fair comparison of the tenders received exceedingly difficult and, perhaps, impossible.—Yours faithfully,

(Signed) F. J. TILLSTONE, Town Clerk.

A. H. Howard, Esq., Hon. Sec., Cable Makers' Association, Westminster, S.W.

[COPY.]

Cable Makers' Association, 2, Queen Anne's-gate, Westminster, S.W., March, 1901.

Francis J. Tillstone, Esq., Town Clerk, Town Hall, Brighton.

Re Cable Tender.

Dear Sir,—Your letter of Feb. 27 has been considered by the Cable Makers' Association, and I am requested to point out that the facts of the case do not support your contention that the foreign tender accepted was undoubtedly the most advantageous to the Corporation. This is shown by the prices of the various firms, as stated below:

	Cables.	Carriage on empties.	Total.
Johnson and Phillips	£13,335 0 0	£30 0 0	£13 365 0 0
W. T. Glover and Co.....	13,731 13 4	89 9 2	13 821 2 6
B.I.W. Co. (by rail)	13 859 0 0	95 0 0	13,954 0 0
B.I.W. Co. (by sea).....	13 859 0 0	75 0 0	13 934 0 0
Foreign tender accepted, including carriage			13,952 0 0

The carriage on the empty drums given in the second column is obtained from the weight of the drums necessary and the railway company's charges to each manufacturer's works, so that even taking into account this cost of carriage (which is assumed to be included in the foreign tender), there is a difference in price in favour of the lowest British firm of £587.

The only other point which might be taken as increasing the cost of the British tenders is the stipulation that if the drums are not returned, carriage paid, within three months from date of delivery, two-thirds only of the original price charged would be allowed. As presumably the extensions of the circuit are carefully planned out, and the order of laying cables arranged, three months' time should be ample for emptying and returning drums, and the probable cost of keeping some few drums beyond the three months would be very small. But even if every drum were kept more than the stipulated time, the one-third of the cost paid to the manufacturer would still leave Messrs. Johnson and Phillips's tender considerably below the accepted one. The total number of drums required would be 130. These would be of various sizes and prices, but the average price would certainly not be more than £3 per drum, or a total cost of £390. Assuming that none of these drums are returned within three months, the Corporation would have to pay £130 as a maximum charge. This would still leave Johnson and Phillips's tender £457 below that of the Union Cable Company.

Referring to your statement that the Corporation is willing to consider any suggestions for the alteration of the conditions, but cannot consent to any alteration in the conditions when once issued: it is obviously impossible for anyone to suggest alterations to a specification which they have not seen; and your proposition is untenable, unless it is taken to mean that all tenderers must accept the conditions, however onerous they may be, and then ask as a favour that those objected to may be modified. I would point out that this is not a sound business proceeding, and any responsible firm would object to agreeing to conditions which they could not carry out.

The conditions of the Cable Makers' Association were published in October last. Copies have been sent to all consulting engineers and station engineers; among others, to your consulting engineer at Brighton. They were, moreover, published largely in the technical Press. Therefore, so far as is possible, the suggestions which you say your Corporation is willing to consider were made to your consulting engineer, and through him, of course, to you.

As you are aware, the Cable Makers' Association, in dealing with mains for town lighting, has endeavoured to standardise the general conditions of contracts, but does not consider the question of price, so that in no sense could it be looked upon as a ring for obtaining excessive profits.—Yours faithfully,

A. H. HOWARD, Secretary.

ELECTRICALLY-DRIVEN UNIVERSAL PORTABLE DRILLING MACHINE.

With respect to the illustrated description of this machine which appeared in our last week's issue, we now learn that the tool in question was entirely designed and manufactured by Messrs. Mather and Platt, of Manchester, and that the details of it have been patented by that firm. The arrangements of the various parts of the tool, including the driving motor and the electromagnet for securing the tool on to the face-plate, leave nothing to be desired, and will make the drilling machine of very great service on large castings, such as the frames of alternators and large multipolar direct-current dynamos.

A METHOD OF COMPENSATING VOLTMETERS FOR THE VOLTAGE DROP IN LONG FEEDERS.*

BY MICHAEL B. FIELD, A.M.I.C.E.

A problem which often confronts the central-station engineer is the measurement at the power-house itself of the voltage obtaining at distant parts of his network which supplies current for, say, lighting and power purposes. In fact, it is very often of far greater importance that the engineer in charge should know accurately the value of the voltage existing at the distributing network, or, better, the lamp terminals or motor terminals, as the case may be, than that obtaining at the central-station 'bus bars themselves. In cases where the distributing network lies at some considerable distance from the power-house, and is fed with current by means of "feeders," the drop of voltage in the latter may vary from zero, when the network is very lightly loaded, to 10 or 12 per cent., when the network is heavily loaded. Under such circumstances the engineer requires, of course, so to regulate his generators that the voltage at the network or lamp or motor terminals remains constant; in other words, he must raise the 'bus-bar voltage in the power-house above the normal by an amount equal to the drop in the feeders. In such cases a very usual course to adopt is to mount on the switchboard in the central-station voltmeters which are connected to points of the network by means of "pilot" wires, and thus indicate the true voltage existing at those points. The engineer in charge can then readily regulate his generators so that, under varying conditions of load, the voltage indicated by these voltmeters is maintained constant.

In the year 1882 Dr. Hopkinson patented an arrangement for effecting the same purpose without resorting to the employment of pilot wires. His method consisted of compounding the shunt windings of electromagnetic voltmeters with a few turns of thick wire, through which the main feeder current, or a proportionate part thereof, flowed. In this way a voltmeter connected to the near end of a pair

* Paper read at a meeting of the Glasgow Local Section of the Institution of Electrical Engineers, Feb. 13, 1901.

Digitized by Google

of feeders might be compensated for the drop along the feeders, and would thus indicate the voltage existing at the far ends, and obviate the necessity of employing pilot wires. There is, of course, no great disadvantage in employing pilot wires for the purpose named beyond the cost of the same, which will amount to at least £90 per mile per twin wire. If it be possible to save this sum, which, especially in the case of long-distance transmissions or networks covering extensive areas, will amount to a very considerable sum, by merely adding a suitable arrangement of resistances at the switchboards, it will, of course, be advantageous to do so. Moreover, by obviating the pilot wire, we obviate the trouble often connected therewith; and while speaking on this point I would call attention to the fact that it is by no means uncommon for pilot wires to give trouble. What the reason usually is I do not know. Whether it is that while laying them they are considered as an adjunct of no vital importance, and, therefore, the necessary care is not devoted to their instalment, or whether it be for other reasons, is not a matter for discussion here. Compounding coils of the above description are, of course, quite inapplicable to voltmeters constructed on the D'Arsonval principle—*e.g.*, Weston voltmeters—and in consequence of the almost universal preference shown by central-station engineers for instruments of this class for continuous-current work, the writer some little while ago devised a method whereby any voltmeter whatever may be compensated for the feeder drop of either a two, three, or multiple wire system without necessitating constructional modifications of any kind, and, beyond that, can be arranged to indicate the average voltage obtaining at any group of distant feeding points.

The method is capable of very general application, but three instances of its use are of special interest to central-station engineers, and it is the object of this short paper, firstly, to describe briefly these three applications, and, secondly, to investigate analytically the accuracy of the same. The three cases for consideration are: (*a*) the measurement on the same instrument not only of the actual voltage existing at various feeding points of a two-wire network, but also the average of the voltage at all the feeding points, or the average voltage at any desired group of feeding points of the network; (*b*) the measurement of the individual feeding-point voltages and the average voltage at any group of feeding points of a network on the three, five, or other multiple wire systems; (*c*) the measurement by means of a low-tension electrostatic multi-cellular voltmeter of the voltage at the far end of a long single or multiphase power transmission line working at extra high tension, and possibly possessing a comparatively large self-induction.

Let us imagine a large distributing network supplying current for lighting and power purposes over a considerable area. It is evident that a voltmeter in the power-house so arranged that it indicated directly the average of the voltage all over the network would provide the engineer in charge with much more valuable information than one arranged only to indicate the actual voltage at some particular point of the network, for it is clear that the engineer should strive to maintain the average voltage at the normal value. Now, although it is not easy to obain the true average of all points of the network, this may be approximated to by measuring the average voltage existing at all the feeding points; this information would, as a rule, be a sufficient guide to enable the central-station engineer to maintain the average voltage over the network itself at its normal value. It might further be advantageous for the engineer to be able to measure the average voltage existing at some one group or other of feeding points—*e.g.*, during one portion of the day he might perhaps wish to pay most attention to keeping the average voltage throughout the commercial portion of the town constant, and at another time it would be of more importance to maintain the average voltage throughout the residential portion of the town constant. He might further wish to know at any instant what was the actual voltage at the end of some one long feeder supplying an outlying district, more especially if this feeder contained a booster, so that the voltage was capable of independent regulation; all of these conditions become possible by the method about to be described.

Case A.—The additional switchboard apparatus necessary for this case—for, say, a continuous-current system—consists of a low-reading Weston voltmeter with a suitably graduated scale—*e.g.*, an ordinary 600-volt Weston with the series resistance removed would serve perfectly—a multiple-contact voltmeter switch, a set of voltmeter resistances which would be mounted in an out-of-the-way place at the back of the switchboard, and, further, a series resistance for insertion in each feeder circuit. These latter resistances would be similar to those usually supplied with Weston ammeters, and would be such that the drop across them

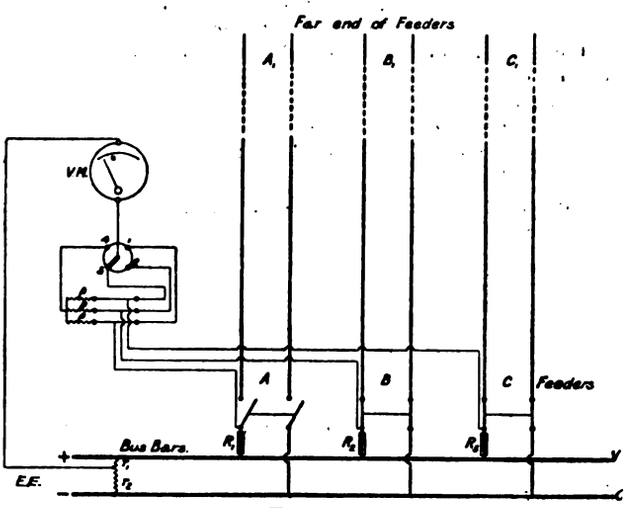

FIG. 1.

with the maximum current would be of the order of two-tenth volt, or less where exceptionally heavy feeder currents are dealt with. The multiple-contact switch would be arranged for as many "positions" as groups of feeding points required. Suppose, for example, three feeding circuits, A, B, C, left the station, a four-way voltmeter switch might be advantageously employed. With the switch successively in the first three positions the voltmeter would indicate the feeding-point voltage of the network at A_1, B_1, C_1 respectively, while with the switch in the fourth position the voltmeter would indicate the average voltage at the feeding points A_1, B_1, C_1. Two distinct arrangements are shown in Figs. 1 and 2. Fig. 1 shows the simpler of the two, but involves the disadvantage that the average voltage of A_1, B_1, C_1 can only be

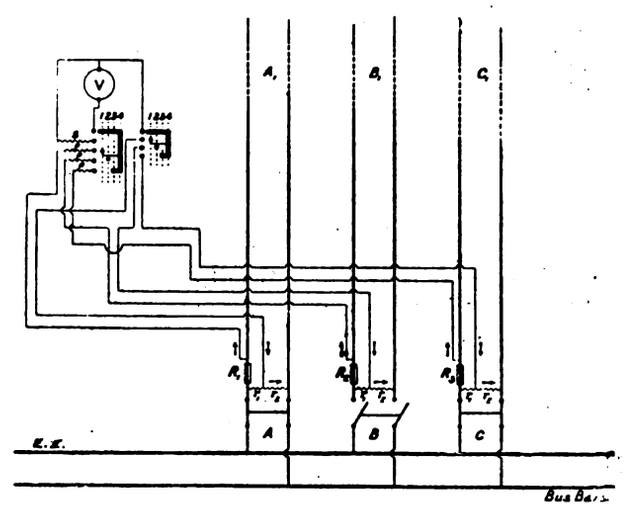

FIG. 2.

obtained if all three feeding circuits are switched in. It is, moreover, only possible to determine the individual values A_1, B_1, and C_1 if the corresponding feeders be switched in. In Fig. 2, on the other hand, a modification is shown whereby the individual voltages A_1, B_1, C_1, and the average of A_1, B_1, C_1, are given correctly by the voltmeter with the switch in the corresponding positions, whether some of the feeder circuits be switched in or not. This involves extra complication in the multiple-contact

Digitized by Google

switch, in which case it may conveniently be constructed on the same lines as a miniature tramcar controller. In Fig. 2 the contact cylinder has, for the sake of clearness, been developed on a plane. R_1, R_2, R_3 are the inserted series resistances in the feeder circuits; shunt resistances (divided into r_1 and r_2) are connected in Fig. 2 across each pair of feeders, in Fig. 1 across the 'bus bars. The letter ρ represents that the particular connecting wires so distinguished must have sufficient resistance to prevent any appreciable interchange of current between the various feeder circuits when the switch is in the fourth position. V.M. is the voltmeter, and s a shunt which is connected across the terminals of the voltmeter when the switch is in the fourth position in order to keep the calibration of the voltmeter correct.

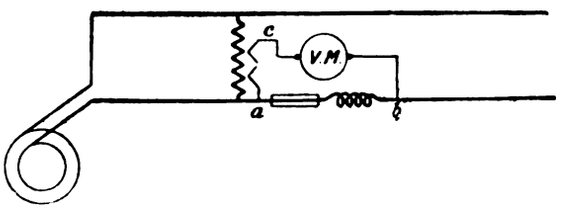

FIG. 3.

Briefly explained, the principle involved is as follows: If r_1 be $\left(\frac{1}{n}\right)$th part of r_1+r_2, the drop of pressure down r_1 will be $\left(\frac{1}{n}\right)$th part of the 'bus-bar volts. Again, if R_1 be $\left(\frac{1}{n-1}\right)$th part of the whole feeder (go and return) resistance, the drop along R_1 will be $\left(\frac{1}{n}\right)$th of the total drop. The voltmeter, then, if connected to one feeder, measures $\left(\frac{1}{n}\right)$th part of the 'bus-bar voltage less $\left(\frac{1}{n}\right)$th part of the drop—*i.e.*, $\left(\frac{1}{n}\right)$th part of the voltage existing at the far end of the feeder. If a number of feeders be simultaneously connected to the same voltmeter, this latter will indicate the average of all the individual voltages. The connecting wires must, however, as already stated, have sufficient resistance (ρ) to avoid any appreciable interchange of current between the different feeder circuits. The action of the shunt, s, which is necessary with the arrangement shown in Fig. 2, but not with that shown in Fig. 1, will be found fully explained in the analytical treatment of the subject.

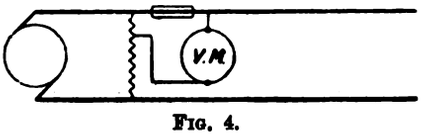

FIG. 4.

It may here be mentioned that the writer, on subsequent investigation, found that particular cases of his method had been anticipated by Mershon in America, and by Crompton and Ashley, and later by Heap, in England. Mershon's patents relate exclusively to alternating currents, since he bases them fundamentally on the use of either current or potential transformers, or both. Fig. 3 shows one of Mershon's arrangement, though many equivalent arrangements are illustrated in his patent specifications. Mershon's object is to compensate the voltmeter not only for the ohmic but also for the inductive drop of the line, and his arrangement is only used in connection with single lines—*i.e.*, it corresponds to case (*a*), where the number of feeder circuits is unity. As is evident from Fig. 3, the shunt resistance $r_1 + r_2$ of Fig. 1 is replaced by a potential transformer whose ratio is $n : 1$. Further, a resistance and a self-induction are inserted in the line whose values are $\left(\frac{1}{n-1}\right)$th times those of the line resistance and self-induction respectively. Referring to Fig. 3, we see, then, that the drop from a to b will be $\left(\frac{1}{n}\right)$th of the whole drop and in phase with it, whereas the secondary voltage of the transformer is $\left(\frac{1}{n}\right)$th of the generator voltage, and if the terminals be correctly chosen in phase with it. Thus the voltage bc, or that measured by the instrument, is $\left(\frac{1}{n}\right)$th of that existing at the end of the line. The anticipations of Crompton and Ashley, and, later, by Heap, are merely case (*a*), where the number of feeder circuits is unity—*i.e.*, they compensate the voltmeter for the drop of voltage in a single pair of feeders by using shunt and series resistances as explained. The diagram of connections for this simple case is shown in Fig. 4, and needs no further comments.

(To be continued.)

CATALOGUES.

We have received from W. T. Henley's Telegraph Works Company, Limited, a copy of their new price-list of electric light cables and wires, insulated with vulcanised and unvulcanised indiarubber, etc. From the tables given, the carrying capacities and other electrical data relating to the different sizes and types of cables manufactured by the firm may be ascertained at a glance, while the prices and data relating to the insulation, etc., of the different cables are also given in tabular form. Single vulcanised indiarubber wires and cables of different classes, having minimum insulation resistances per mile of from 300 to 5,000 megohms, are dealt with in the first portion of the list. Then follow twin vulcanised indiarubber wires and cables, having insulation resistances of from 300 to 2,500 megohms per mile, while the third section deals with concentric vulcanised indiarubber wires and cables. Finally, we have a miscellaneous section in which, as the heading indicates, miscellaneous types of cables are dealt with, besides flexible cords, fitting wires, bell wires, jointing materials, wires insulated with guttapercha, twin paper-insulated wires, etc. The admirable arrangement of the list with a view to facilitate reference will be appreciated.

From the British Thomson-Houston Company, Limited, we have to acknowledge the receipt of four admirably-executed pamphlets. Of these, No. 88 is a revised edition of a previous pamphlet issued by the British Thomson-Houston Company, dealing with inclined-coil measuring instruments. A number of particulars are given relating to switchboard ammeters and voltmeters constructed on the principle in question. Portable ammeters and voltmeters are further dealt with, besides a compact form of indicating wattmeter for incandescent lamp testing, already described in these columns. We also notice a neat form of scale doubling multiplier for use with portable meters. This multiplier has been designed to enable measurements higher than the usual scale limit to be made. Pamphlets Nos. 86 and 89 also supersede previous issues. The former describes the firm's recording wattmeters designed for different systems of supply. Diagrams of the connections for the different systems are given, which add to the usefulness of the pamphlet. Pamphlet No. 89 deals with slow and moderate-speed belt-driven generators, describing the principal features of standard machines. An illustration is also given of a small iron-clad bipolar generator, in which the field frame completely surrounds the armature, thus affording protection to the armature and field spools from mechanical injury. This special type of generator is claimed to be eminently adapted for small isolated plants in virtue of its compactness. Pamphlet No. 51, the last of the four, describes in detail with illustrations the firm's G.E.-58 type of traction motor, which is suitable for both narrow and standard gauges, and possesses all the salient features of the British Thomson-Houston Company's other well-known types of traction motors. The motor with a four-turn armature is rated at 37 b.h.p., and with a six-turn armature at 27 b.h.p. In the design of this motor it may be mentioned that special attention has been given to the bearings, which are made equal to those of standard-gauge motors, in view of the fact that the renewal of linings is frequently the principal item of maintenance cost of a motor it is explained.

Messrs. Hayward Bros. and Eckstein, Limited, have issued a two-leaved illustrated pamphlet describing, amongst other specialities, their newly-invented floor-light for use in electricity works. In this floor-light the iron frame is kept entirely below the surface of the glasses, which latter are set as close together as possible. The narrow spaces or joints between

Digitized by Google

the lenses are run in with a specially-prepared non-conducting composition, which completes the insulated surface. An insulated platform is thus obtained, while the lighting of the area below is at the same time provided for. It should be mentioned that the lenses are of the studded pattern, whereby good foothold is ensured and the danger which, we presume, might otherwise arise from the collection of moisture on the surface minimised. We understand that floor-lights of this type have been supplied to the electricity works at Glasgow, Brighton, Wallsend-on-Tyne, etc.

Messrs. Johnson and Phillips have just issued a new trade list of their vulcanised indiarubber cables and wires. We gather from this that special arrangements are made at the works for testing all cables before being sent out of the factory. The test is made after the cable has been immersed in water for at least 24 hours. The rooms are fitted with transformers capable of working up to 20,000 volts, and, as a rule, high-tension cables are tested at much higher pressures than they are required to work at. Another feature of the firm is their excellent system of registration in the different departments, by which any fault may be traced to its origin.

Messrs. Bergthell and Young have forwarded us their No. II. list of the "Bandy" type of generators and motors. The general specification of the motors shows that they are of high class. For instance, the machine will not be affected in any degree by an overload of 25 per cent. for one hour, or an overload of 50 per cent. for periods of 15 minutes, while the temperature is guaranteed not to exceed 72deg. F. irrespective of the length of run which may be required. The magnet poles are parts of the frame, and between them and the armature is interposed an independent pole-ring carrying pole extensions made up of laminated iron. Owing to the form of these, sparkless running of the motor is obtained, and local currents in the pole-faces are reduced. The commutator is made up of hard-drawn copper, which, on account of its construction, interlocks each commutator bar with the two adjacent bars. In this type of machine such a thing as a "high bar," due to heat or centrifugal force, is unknown. Mica insulation is used between the bars, while the commutator is securely fixed at both ends in mica rings. The standard volts of both motors and dynamos are 120, 240, and 500 volts.

LIGHT RAILWAYS.

The Warrington General Purposes Committee have asked Major Cardew to advise them on the engineering provisions contained in the draft agreement submitted by the promoters of the Warrington and Northwich light railway.

In consequence of an impression that the Nuneaton light railway scheme had been abandoned, the promoters' solicitor (Mr. Warwick Webb) has informed a correspondent of the *Coventry Standard* that one or two points of detail remain under consideration by his clients and the Board of Trade. As soon as these are settled the order will be confirmed by the Board of Trade, and the promoters will then be in a position to proceed with the scheme.

A somewhat important point was raised before Sir Courtenay Boyle this week on a light railway order in Salop. Mr. Munns, for the promoters, said they were a statutory company, and desired to have Section 8 of the New Companies' Act inserted in their order, so that they might have the power of paying commission on underwriting shares the same as a limited liability company, which was illegal under a statutory company. Sir Courtenay Boyle said, without deciding the point, he could not advise the Board of Trade to give a light railway company an advantage over all other existing light railways, but the promoters could go to Parliament to have the law amended if they thought proper.

At a recent special meeting of the Isle of Axholme Light Railway Company a resolution was adopted agreeing to sell the railway to the North-Eastern Railway at a price to be agreed upon.

The Board of Trade have recently confirmed the orders authorising the deviation of a light railway authorised by the West Hartlepool Light Railways Order, 1897, and for other purposes; the construction of light railways in the county of Lancaster, from Ormskirk to Southport; the construction of a light railway in the county of Essex, between Kelvedon and River Blackwater; and the construction of light railways in the borough of Morley and the urban districts of Drighlington, Gildersome, and East and West Ardsley, in the West Riding of the county of York.

An order has been made by the Light Railway Commissioners, and submitted to the Board of Trade for confirmation, authorising the construction of the Blackpool and Garstang light railway.

At a meeting of the General Purposes Committee of the Bolton Corporation, held on Monday last, the Bolton, Turton, and Darwen light railway order was submitted, and protective clauses ordered to be obtained in regard to the gas and water mains.

PHYSICAL SOCIETY.

At the ordinary meeting held on March 8, 1901, Dr. R. T. Glazebrook, foreign secretary, in the chair, a paper on "**A Theory of Colloidal Solutions**" was read by **Dr. F. G. Donnan.**

Mr. Appleyard exhibited three pieces of apparatus. The first was a slide-wire bridge for measuring conductivities of wires. The slide wire, instead of forming two arms of the bridge, forms only one, and the length used is proportional to the conductivity to be measured. If the arm which contains the standard wire used is altered, it becomes necessary to alter the divisions of the scale on the slide wire. This is done by a mechanical arrangement. The second piece of apparatus was a mechanical gauge for measuring the diameters of spheres. The sphere to be measured is placed between a metal face plate and a pieces of glass at the end of the short arm of a pivoted lever. The end of the long arm of the lever moves over a graduated scale, which is calibrated to show directly the diameter of the sphere. The third piece of apparatus was a galvanometer fitted up for lamp and scale work. The illumination was produced by a four-volt ¼-c.p. lamp, and it was shown that very good results could be obtained from this by using a large condensing lens.

Prof. Threlfall said he had usually used a straight piece of the lamp filament itself instead of using the lamp in conjunction with a cross wire.

A paper by Prof. R. W. Wood on "The Production of a Bright Line Spectrum by Anomalous Dispersion and its Application to Flash Spectrum," was postponed until the next meeting at Burlington House, when the subject will be experimentally illustrated by Mr. Watson.

The society then adjourned until March 22, when the meeting will be held in the chemical laboratories of University College, London.

NEW COMPANIES.

The following new companies have been registered since our last issue:

Cooke's Patent Tramway System, Limited.—Capital, £5,000. Object: to adopt an agreement made by this company (by P. Ehrenfeldt, Feb. 21, 1901) with H. J. Cooke and P. Ehrenfeldt, for the acquisition of certain patents granted to them, to develop and turn to account the same, and to construct and maintain rail and tram roads; as electricians, builders, and contractors; producers of gas and electricity etc.

Steel Chain Company.—Capital, £25,000. Object: to acquire certain patents on the terms of an agreement with J. M. Davis and A. G. Strathern, and to carry on the business of weldless and other chain and cable manufacturers, mechanical, marine, electric, general engineers, etc.

British Electrical Manufacturing Company, Limited.—Capital £10,000. Object: to adopt an agreement made by this company with D. R. Broadbent for the acquisition of the business of electrical engineers, etc, as carried on by J. D. F. Andrews at Fulham, to develop the same, and to carry on business as electricians, producers and suppliers of electricity, manufacturers of cables, lamps, accumulators, etc.

APPOINTMENTS VACANT.

Chief Mechanic, Southend Corporation Electricity Works; £2 per week, March 21. Details in our advertisement columns.

Electrical Engineer, Nelson Corporation, £200 per annum, March 25. Details in our advertisement columns.

Clerk of Works, Heywood Corporation, £2 per week, March 18. Details in our advertisement columns.

Fitter-Driver, Maynooth, Ireland, accustomed to high-speed engines, dynamos, and accumulators.

Switchboard Attendant, Carlisle Corporation, March 25. Details in our advertisement columns.

Electric Boats.—A system of canals under Government ownership is proposed to be established in New York State, on which electrically-driven barges and boats will be introduced. Each vessel would be about 150ft. long by 25ft. wide, with a draught of 10ft. The estimated cost of the scheme as it is at present framed stands at between 10 and 11 millions sterling. Electric power would also be employed to pull the boats into and out of the locks, operate the gates and valves, and to furnish light, consisting of four arc lights on each lock proper and one on each approach.

Digitized by Google

QUESTIONS AND ANSWERS.

If thou hast knowledge, let others light their candle at it.

Under this heading we insert questions and answers of a practical character relating to central-station work, tramway work, or construction work; and for each suitable question offer *one shilling*, and for the best solution of any question we offer *ten shillings*. We also give *five shillings* for every other answer we print. The answers to any question should be sent within 10 days after the question has appeared. We would call the attention of those sending in answers to the fact that the neatness of any sketches (which must be in *ink*) sent in is considered when marking the relative values of these answers. All formulæ should be carefully written to prevent mistakes as to symbols, and all loose sketches should be signed by the author. The matter must be written on one side only of the paper. Questions may be sent at any time.

QUESTIONS.

359. Describe a combined balancer booster, and state fully the part it acts in connection with electric lighting. Show connections.—P. N.

[N.B.—This question comes from South Africa, and we will be glad to receive clear and concise answers to it.—ED. *E. E.*]

360. What are the advantages or disadvantages of putting a flexible coupling between the engine and generator of a direct-coupled alternator? State the effect, good or bad, which the introduction of a flexible coupling will have on parallel running.—S. L.

ANSWERS.

Question No. 353.—In designing a shunt regulating resistance for a large dynamo, how should the resistance be proportioned between the different contacts of the regulating switch in order that each movement of the latter shall give, say, one volt variation throughout its entire range?

Answer to No. 353 (*awarded* 7*s.* 6*d.*).—In practice it is usual to divide the resistance into equal steps, as this simplifies the calculation and allows resistances of standard amounts to be made up in quantities without consideration of the particular machines with which they are to be used. The results obtained with such resistances are usually quite satisfactory, for with small ranges of voltage variation, say not over 20 per cent., and with the magnet iron worked at ordinary saturation, equal resistance steps give very nearly equal voltage steps. This results from the fact that, as the terminal voltage gets lower and the magnets less saturated, the necessary alteration in shunt current per volt becomes less, and an equal step resistance has just this effect of gradually reducing the change in shunt current per step as more and more resistance is inserted.

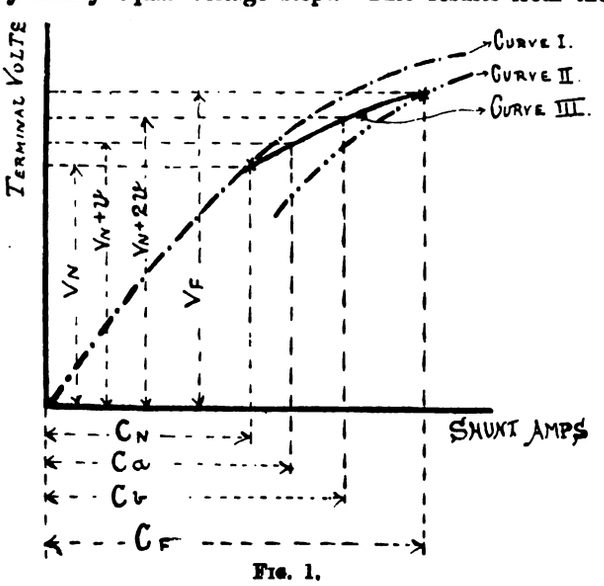

FIG. 1.

A quite exact equality is, of course, seldom obtained in this way, and when such is required it becomes necessary to consider the resistance in connection with the design of the dynamo to which it belongs. To begin with, a saturation curve of the machine must be obtained either by calculation (as explained in any text-book) or, preferably, by actual test. This curve, connecting terminal volts at constant speed and shunt current, will be required (*a*) with no current in the armature, and (*b*) with full-load current in the armature—supposing that the regulating resistance is intended to give equal voltage steps, starting from no load at the lower voltage and gradually increasing the volts as the load increases, until the higher voltage limit is reached with full-load current. If the equal voltage steps are required with a given constant current in the armature, it will, however, only be necessary to obtain the curve for that particular current.

The former case is the more usual, and so will be considered. Having plotted the no-load and full-load curves (Curves I. and II. in Fig. 1), a third curve (Curve III.) should be drawn from the maximum voltage point, V_F, on the full-load curve to the minimum voltage point, V_N, on the no-load curve, and lying approximately midway between the two curves at intermediate points, as shown. This last curve represents the actual shunt current corresponding to every voltage throughout the range, with the correct current in the armature.

Let r = the resistance of the shunt winding itself when cold;

v = the required voltage variation per step;

C_N, C_a, C_b, . . . C_F = the shunt currents, read off Curve III., corresponding to the voltages V_N, V_N+v, V_N+2v, . . . V_F;

$V_F - V_N$ being the required voltage range.

Then $\frac{V_F - V_N}{v}$ = number of steps required.

The total amount of regulating resistance = $\frac{V_N}{C_N} - r$; the amount of regulating resistance left in, with one step cut out = $\frac{V_N+v}{C_a} - r$; the amount of regulating resistance left in, with two steps cut out = $\frac{V_N+2v}{C_b} - r$, and so on for the remaining steps, from which the required value of each step is at once obtainable. The more saturated the magnets of the dynamo are, the more will the "resistance per step" increase, the values at the "all-in" end being always smaller than those at the "all-out" end.

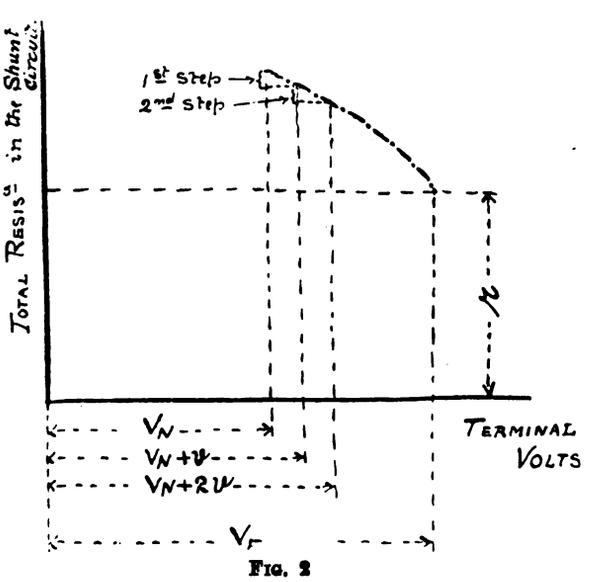

FIG. 2.

When a large number of steps has to be dealt with, the above somewhat tedious process may be simplified by calculating out only the two extreme points and one or two intermediate ones, and connecting the whole by means of a curve, as shown in Fig. 2. The values of the remaining steps can then be quickly read off the curve.—Q

Answer to No. 353 (*awarded* 7*s.* 6*d.*).—The design of a shunt regulating resistance to give equal increments of voltage per contact is governed by the induction curve for the machine, and the point on that curve at which the machine normally works. Let *o a* be this curve, values of

Digitized by Google

the shunt current being plotted as abscissæ, and values of the open-circuit voltage as ordinates, the speed of the machine being constant and normal. If in actually running the machine to obtain the values the speed should vary, being n' instead of n when any pair of readings;

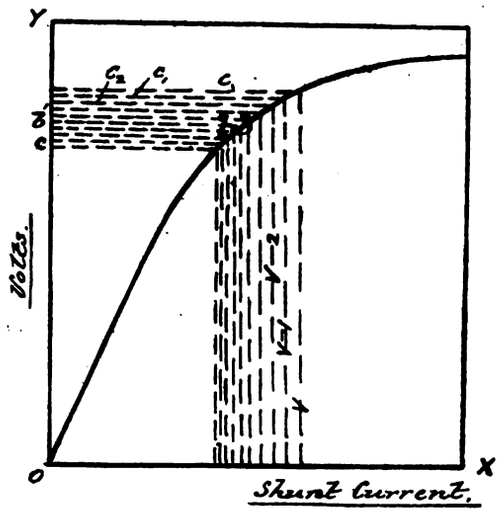

FIG. 1.—Induction Curve.

V' and C_s', are taken. the true values for the curve may be obtained from the equations:

$$V = \frac{n}{n'} V', \text{ and } C_s = \frac{n}{n'} C_s'.$$

The variations are produced in this trial, of course, by an adjustable resistance, and read by an ammeter in series with the shunt, the voltmeter being across the terminals (Fig. 2). Let, now, b be the point of normal working, and

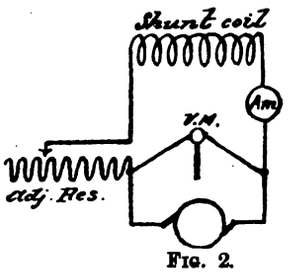

FIG. 2.

firstly let us assume the armature E.M.F. is to be altered by one-volt steps. In other words, the open-circuit voltage has these increments. From b' distances corresponding to one volt are taken above and below, as shown. From these are drawn lines cutting the curve in points, from which are dropped ordinates which give the values of the shunt current for the different voltages. At the lowest of these values the whole resistance must be in; at the highest the actual shunt windings only, we may suppose, would be in, having the resistance R_s.

At voltage—

V – 1 total field resistance is $\frac{V-1}{C_1} = R_1$ } $R_2 - R_1$ across contacts;

V – 2 " " " $\frac{V-2}{C_2} = R_2$ } $R_3 - R_2$ across contacts;

V – 3 " " " $\frac{V-3}{C_3} = R_3$ } etc.

In general, however, the increased voltage is required at the terminals with a constant or increasing current, more usually the latter. In this case the characteristic curve of the machine is required, the excitation being such that on open circuit the voltage is the minimum to which the regulating resistance can cut down. Let $a\ a'$ (Fig. 3) be this curve, set out from open circuit as far as the maximum current with which the regulation is to act. Since the terminal voltage is to rise proportionally with the current (in so far as it may be accomplished with one-volt steps), let the voltage rise at the maximum current be v. If b-b' be set off as shown in the diagram, representing v to the volt scale, the intercepts between $a\ b'$ and the curve represent the increase of internal voltage to be made up by alteration of the excitation. The line $a\ b$ is therefore divided into v equal parts, and vertical lines are drawn through the points giving us the internal voltage addition for each step of the resistance—viz.,

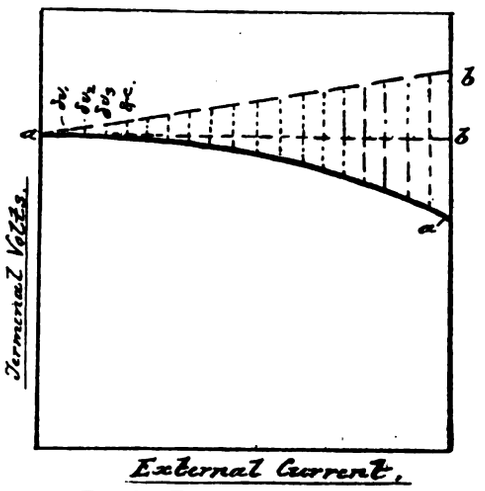

FIG. 3 —External Characteristic.

δv_1, δv_2, δv_3, etc. Turning to the induction curve (Fig. 1), we have $o\ c$ equal to $o\ a$, and from c the lengths corresponding to δv_1, δv_2, δv_3, etc., are each set off from c upwards. Projecting horizontally to cut the curve, and then vertically down, the exciting current for each voltage is obtained. The total resistances of the shunt circuit are then given by

$$R_0 = \frac{V}{c_0}$$
$$R_1 = \frac{V+\delta v_1}{c_1} \Big\} R_0 - R_1 \text{ between first two contacts;}$$
$$R_2 = \frac{V+\delta v_2}{c_2} \Big\} R_1 - R_2 \text{ " second " ;}$$
$$R_3 = \frac{V+\delta v_3}{c_3} \Big\} R_2 - R_3 \text{ " third " ;}$$
etc.

where V denotes the minimum voltage represented by $o\ a$ or $o\ c$.

The above investigation of the matter is exact, and presents no great difficulty. It can be simplified somewhat if a straight line characteristic is assumed—*i.e.*, if the armature drop is taken as directly proportional to the current. Thus, if the drop at maximum load is v' volts at the terminals, and it be required to have a rise, as before, of v volts there, the range of the regulating resistance must be $v + v'$ volts, and at any fraction $\frac{1}{n}$th of the maximum current, it must give $\frac{v+v'}{n}$ volts rise internally. The further operations are then exactly as in the open-circuit case first considered. It may be noted that the circuit should have the calculated resistances when warm.—ZIPHERN.

Answer to No. 353 (awarded 5s.).—To calculate a shunt regulating resistance to give one volt drop per step throughout its range, it is necessary to know the saturation curve of the dynamo. Given this, the method of procedure is the same in all cases, and an example will be the clearest way of showing how it is done. The dynamo considered was built to give 500 amperes at 110 volts for lighting purposes when running at 450 revolutions per minute, and was also capable of charging accumulators at 145 volts without increase of speed. The resistance of the shunt was 15 ohms when hot. The curve shown (Fig. 1) was taken by driving at a constant speed, separately excited, and measuring the exciting current and the voltage generated. To give the figures for the resistance in every step would occupy too much space, but we give a few at the beginning, at the middle, and at the end, and the rest are shown in the curve (Fig. 2).

In the following table the first column gives the volts

Digitized by Google

generated; the second, the shunt current which produces that voltage, scaled on the saturation curve; the third, the

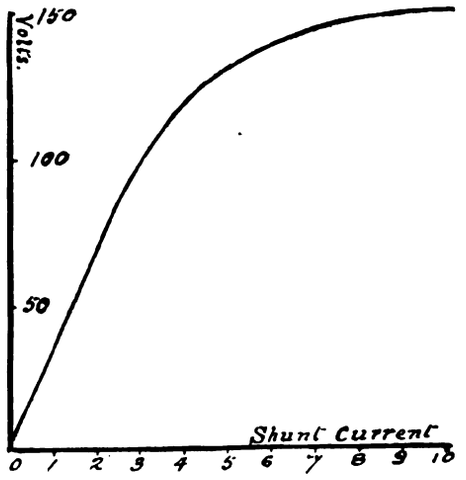

FIG. 1.

total resistance; the fourth, the amount of regulating resistance in circuit; and the fifth, the resistances between

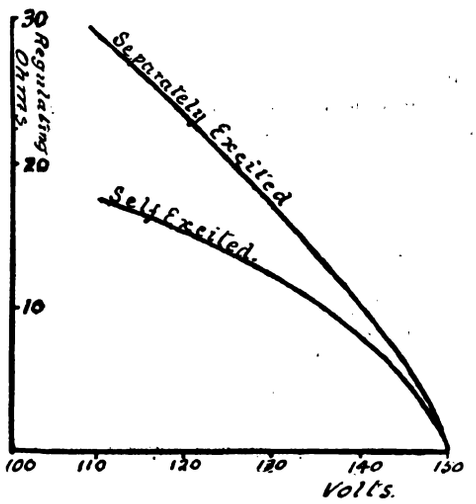

FIG. 2.

two adjacent stops, the stops being numbered from the *all-out* position:

Volts	C in shunt	Total resistance.	Regulating resistance.	Resistance between points.
150	10	$\frac{150}{10}$ =15 ohms	0 ohms	—
149	9·4	$\frac{149}{9\,4}$ =15·85 ohms	·85 ohms	1 & 2 — ·85 ohms
148	8·8	$\frac{148}{8\,8}$ =16·8 ohms	1·8 ohms	2 & 3 — ·95 ohms
147	8·2	$\frac{147}{8·2}$ =17·9 ohms	2·9 ohms	3 & 4 — 1·1 ohms
146	7·7	$\frac{146}{7\,7}$ =18·96 ohms	3·96 ohms	4 & 5 — 1·06 ohms
145	7·25	$\frac{145}{7\,25}$ =20·0 ohms	5·0 ohms	5 & 6 — 1·04 ohms
130	4·75	$\frac{130}{4\,75}$ =27·3 ohms	12·3 ohms	—
129	4 675	$\frac{129}{4\,675}$ =27·7 ohms	12·7 ohms	21 & 22 — ·4 ohms
128	4·6	$\frac{128}{4·6}$ =28·1 ohms	13·1 ohms	22 & 23 — ·4 ohms
127	4·5	$\frac{127}{4·5}$ =28·4 ohms	13·4 ohms	23 & 24 — ·3 ohms
112	3·5	$\frac{112}{3·5}$ =32 ohms	17 ohms	—
111	3·437	$\frac{111}{3\,4375}$ =32·3 ohms	17·3 ohms	39 & 40 — ·3 ohms
110	3·375	$\frac{110}{3·3375}$ =32·6 ohms	17·6 ohms	40 & 41 — ·3 ohms

It will be noticed that the resistances in each step are getting very small at the lower voltages, and the machine is approaching a state of instability. If the machine be separately excited, the quotient in column 3 is always 150, and the resistance required is much larger, the total being $\frac{150}{3·3375}$ = 44·5 ohms, and the regulating resistance being 29·5 ohms. A second curve in Fig. 2 shows the regulating resistance for various voltages with separate excitation.—J. W.

LEGAL INTELLIGENCE.

CALLENDER'S CABLE AND CONSTRUCTION COMPANY v. KILLARNEY ELECTRIC LIGHT COMPANY AND GOODMAN.

On Tuesday the Master of the Rolls heard an action brought by debenture holders of the Killarney Electric Light Company to raise the amount of their debentures. The defendant company was incorporated under a provisional order in 1891, by which the undertakers were bound to continue the supply of electricity, and if they failed to so supply electricity they were liable to a penalty of 40s. for each day. Although the assets of the company were extremely valuable, and would ultimately realise a considerable sum, yet, owing to the manner in which the company had been worked for some years, the machinery had become defective, and the result was that a portion of the town of Killarney was left in darkness in consequence of the breakdown of the machinery. The plaintiffs entered into an arrangement to repair the machines, and at the present time the machinery was going, the town being kept fully supplied with light. The defendant company had a contract with the Killarney Urban District Council for the electric lighting of the town, which would expire next day (Wednesday), and tenders had been invited for a supply of light for the ensuing two years, the gas company being also invited to tender. The defendant company would not tender without the consent of the Court. In order to carry out such a contract a question arose as to whether it could be done without appointing the receiver as manager pending the action.

Mr. O'Brien, K.C., on behalf of the plaintiffs, also asked that the debenture-holders should be at liberty to advance money to keep the place going, and that such advances should be made salvage payments.

Mr. Teeling (instructed by Mr. J. N. Murphy) appeared on behalf of Mr. Leahy, of Tralee, a shareholder and debenture-holder, and asked that the application should be adjourned. He submitted that the plaintiffs had no authority to appear for the debenture-holders, and that the directors of the defendant company had no knowledge of the present application.

Mr. O'Brien said the plaintiffs represented over £4,000 debentures.

Mr. Teeling said that under the circumstances he could not object to the tender for lighting the town being sent in, but he thought the other parts of the application should stand over.

The Master of the Rolls said he hardly understood how this company had got into such a position, because on the figures in the affidavits it ought certainly, at least, to be able to pay its way. It would be a matter of public regret that an electric lighting company should cease to exist in a place like Killarney, where there were not only streets to be lighted, but also large hotels. He had no jurisdiction or power to interfere further than was necessary to preserve the property which was charged with the plaintiffs' mortgage. His Lordship saw no reason to appoint a manager, and as to the contract for lighting the town he thought steps ought to be taken to send in a tender for the purpose. He would make an order to that effect, and also allow the payment of the rent and the hire of the machine to be made salvage claims. The other matters must stand over.

HAMILTON v. GENERAL ENGINEERING COMPANY, LIMITED.

A motion came before Mr. Justice Joyce last week for the appointment of a receiver and manager. This was a debenture-holders' action, and the application was made on the ground of urgency.

Mr. Manning, for the mover, said a meeting of the directors had been held, at which plaintiff was present, and at which it was decided to at once call a meeting of the shareholders of the Company for the purpose of considering the desirability of winding-up owing to the want of working capital.

Mr. Peterson, for the Company, said that he was instructed to consent to the appointment asked, which his Lordship made accordingly.

GUTTA PERCHA CORPORATION.

An enquiry was held in the Court of Bankruptcy on Monday into the failure of the Gutta Percha Corporation, Limited, against which a winding-up order was made in February, 1900. The accounts showed liabilities £20,305, and assets £5,195, absorbed by the claims of debenture holders. The deficiency as regards contributories is returned at £177,067.

Mr. Hubert Waldron said that he had acted as solicitor to the corporation, which acquired patents relating to an invention for producing guttapercha from the leaves and twigs of guttapercha trees. The patents were acquired from the Isonandra Syndicate,

Digitized by Google

of Paris, for £63,000. by Mr. Stanier, a nominee acting for witness, and on the next day resold to Mr. H. Parson Smith, another nominee acting for witness, for £150 000. An agreement was made providing for the incorporation of the present company with a capital of £200 000. The Globe Venture Syndicate agreed to provide £1,000 for the expenses of issuing the prospectus in consideration of subsequently receiving the amount back with a bonus of £1,500 in cash and £8,000 in cash or shares. They also found two directors—Sir Edward Thornton and Sir J. Luther Vaughan—for which a further £2,000 shares were to be allotted to them or their nominees. The prospectus contained favourable reports by Lord Kelvin, Prof. Ramsay, and Dr. John Hopkinson upon samples produced under the patent produced. After the issue of the prospectus the working capital was reduced to £10,000 by a modifying agreement with the vendor. He understood that the proposed profit of £86,500, the difference between the £63 500 to be paid by Mr. Stanier and the £150,000 to be paid by the company, would belong to Mr. G. Shenton. Witness had advanced some £4,500 to Mr. Shenton and had received shares as security, but no cash; the shares were now unsaleable. In February, 1898, the company bought from Prof. Ramsay his patents for a similar invention for £1,000 in cash and £10 000 in shares. In September, 1898, the company spent over £4,600 in erecting premises and machinery at Belvedere, but its products found no sale.

Sir Edward Thornton, P.C., stated that he was chairman of the corporation, and admitted that with a working capital of £50 000 the company might have succeeded, but there were other causes for the failure besides want of capital. He thought the directors were entitled to use the working capital of a company for any purpose of that company, and that under certain circumstances vendors might be paid out of it. He had received nothing whatever from the company, and was, in fact, a loser to the extent of £4,000.

Sir J. Luther Vaughan, K.C.B., said he became a director at the instance of the Globe Venture Syndicate. The reduction of the working capital from £50,000 to £10,000 was done under advice of their chemical experts. He had paid £200 for debentures in the corporation, and had never received a penny from it.

The enquiry was adjourned to Monday next.

MARYLEBONE BOROUGH COUNCIL v. METROPOLITAN ELECTRIC SUPPLY COMPANY.

On Saturday the above-named company answered to eight summonses issued at the instance of the Marylebone Borough Council, for having committed eight breaches of the West London Lighting Order of 1889, by laying down in the district more mains than had been sanctioned and approved by the Council—viz., 44 mains instead of 29. Mr. Muir, on behalf of the company, pleaded "Guilty" to six of the summonses. It was explained that in May last the company were desirous of laying a number of low-tension mains for the transmission of energy from a distant station. The Vestry agreed to the plans, but in November it was discovered that the plans were being violated in several respects; the breaches were made wider than they should be, the mains, instead of being laid under the footway, were carried into the carriageway, and in some cases more mains were being laid than had been sanctioned, and were being laid, not one on top of the other, as agreed upon, but side by side. The Council refused to sanction any deviation from the plan originally submitted. It was argued that the public interest had not suffered; the laying of five extra mains had been done by the engineer under a mistaken idea of the rights of the company, in order to supply without delay a demand for a continuous current of electricity to the premises of two of their customers.

Mr. Curtis Bennett said that he was of opinion that the plan submitted by the company was most misleading, and that nothing would have been heard of the extra mains but for the discovery made by the Council. The case was a bad one. He fined the defendants the full penalty of £10, with £5. 5s. costs, on one summons, and £5, with £3. 3s. costs, on each of the remaining five, £56 altogether. The other two summonses were withdrawn.

We comment upon the case elsewhere.

TORQUAY TELEPHONES.

At Torquay County Court on Saturday, S. J. Trethewy, builder, claimed £14 of the National Telephone Company as damages for breach of contract. In January last year Trethewy applied to the company to connect his premises with their system. The instruments were fitted up, but he was not connected with the exchange. In January last Trethewy was sued for £15 for rent of the telephone, and without obtaining advice he paid the amount into court. It was not until three weeks later that plaintiff's premises were connected with the telephone.

Mr. Alney showed the regulations of the company provided for payment in advance. The connections would have been made as soon as Trethewy paid the rent, for which several applications were made.

His Honour did not think plaintiff had any case as regarded the main point. He entered into a contract which stipulated that the rent should be paid in advance. For some reason he did not pay, and the company was under no obligation to connect his premises. But when sued in January he paid the rent, and was entitled to be connected. For some reason, however, he was not connected for several weeks, and he was entitled to damages for this period. Judgment would be given for plaintiff for £2. 2s. and costs.

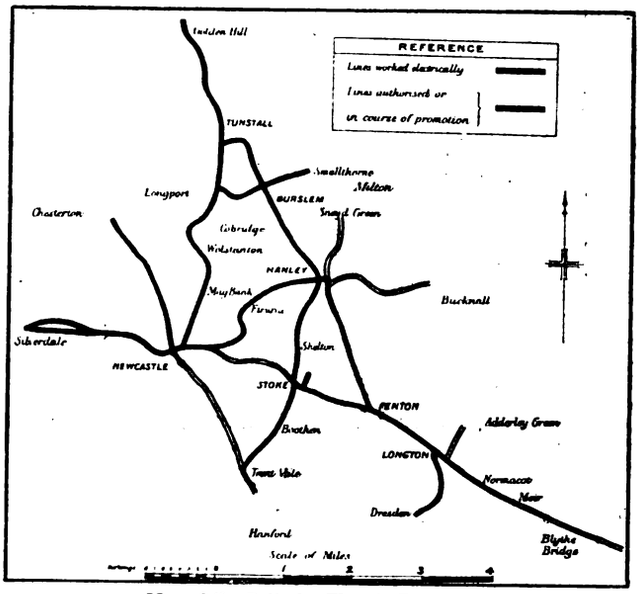
COMPANIES' MEETINGS AND REPORTS.

POTTERIES ELECTRIC TRACTION.

Directors: Emile Garcke (chairman); C. S Drummond; J. V. Kitchener; Stephen Mear; Major Pilkington; J. S. Raworth; S. Sellon. Secretary: B. Kingsford.

Report of the directors (with abstract of accounts) for the year ending Dec. 31, 1900:

The gross profits for the year amount to £64,151. 4s. 7d. After deducting all expenses chargeable to revenue, including all repairs and maintenance and interest on debentures, there remains a net profit of £13 839. 6s. 2d. To this has to be added the amount of £866. 9s. 7d. brought forward from previous account, making an available balance of £14,705. 15s. 9d., which the directors propose should be applied as follows—viz: to provide for dividend for the year on the cumulative preference shares, £10,000; to pay a dividend on the ordinary shares of the Company of 2 per cent. for the year, £4,000; to transfer to the credit of the depreciation fund, £500; to carry forward to next account, £205 15s. 9d. Owing to the strikes of potters and bricklayers throughout the months of April and May the traffic receipts suffered considerably, and the work on the new generating station was seriously delayed, and for some time prevented the opening of the Chesterton and Silverdale lines. It should also be noted that during a large part of the year only a part of the total system has been in operation. During the past year the directors have issued £125 000 4½ per cent. debenture stock, part of a total issue of £200,000. This issue has been guaranteed as regards principal, interest, and premium by the British Electric Company, and the expenses of the issue were paid by that company in consideration of this Company giving them an option to subscribe for the remaing £75,000 debenture stock at par before April 27, 1901. The total capital expenditure at Dec. 31, 1900, was £363 621. 3s. 5d., in addition to £186,311, the cost of the debentures and shares held by this Company in the North Staffordshire Tramways Company, Limited.



Map of the Potteries Electric Tramways.

At the date of the map accompanying the last report about 12½ miles of tramways and light railways had been opened for traffic. Since then the following sections have been opened: Hanley to Etruria, 1 mile 1 furlong; Tunstall and Longport, 6 furlongs; Burslem to Goldenhill, 2 miles 8 furlongs; Etruria and Newcastle, 1 mile 7 furlongs; Wolstanton to Newcastle, 1 mile 1 furlong; Longton to Dresden, 1 mile 2 furlongs; Longton to Normacot, 1 mile 2 furlongs; Newcastle to Chesterton, 2 miles 4 furlongs; Newcastle to Silverdale, 3 miles. The whole of the tramways and light railways of this Company and of the North Staffordshire Tramways Company are now working by electricity, with the exception of the terminal section at Blythebridge, the construction of which is now in hand. In view of the extensions which have been applied for and of other developments of the business, the directors recommend that power be taken to increase the nominal capital of the Company by the creation of 10,000 ordinary shares and 10,000 5 per cent. cumulative preference shares of £10 each, and the necessary resolution which the shareholders will be asked to consider, and, if deemed advisable, to pass, will be found on the first page of the notice convening the meeting. The directors have applied to the Light Railway Commissioners for an order to extend the lines of the Company along the routes indicated on the accompanying plan. The local enquiry in respect of this application was held on Feb. 21 last, and the Commissioners decided to recommend the Board of Trade to grant the order. The directors have taken steps to introduce a service for the conveyance of goods and parcels by electric cars over the Company's entire system, supplemented by horse and hand vehicles, for the purpose

Digitized by Google

of local distribution throughout the Potteries district, and they hope that this service will be in operation before the summer. The directors have decided to establish an experimental service of steam omnibuses in order to provide traffic facilities for the outlying villages, and two of these conveyances will shortly be run between Burslem and Milton, a distance of about three miles. If the experiment gives satisfactory results, the directors propose to extend the system in other outlying parts of the Potteries district. The directors are in negotiation with some of the local authorities for the transfer to this Company of their electric lighting orders. The directors propose to take the opportunity of the general meeting to ask the shareholders to alter the articles of association in accordance with the requirements of the Companies' Act, 1900, and the resolution to this effect is contained in the notice convening the extraordinary general meeting. The directors retiring this year are Mr. C. S. Drummond and Mr. J. V. Kitchener, who are eligible for re-election. Messrs. Bourner, Bullock, and Co., the auditors, also retire, and offer themselves for re-election.

BALANCE-SHEET.

OXFORD ELECTRIC.

The annual report for the year ended Dec. 31 last states that the revenue account shows a profit (including £73. 10s. brought forward from last year) of £5,125. 3s. 8d. After providing £1,965. 10s. 11d. for debenture and other interest, and writing off £254. 0s. 11d. on account of hire-purchase installations, the available net profit is £2,905. 11s. 10d., which the directors propose to appropriate as follows: in payment of a dividend at the rate of 5 per cent. per annum on the share capital, £2,500, and in adding £250 to the reserve and the renewal of plant account, which will then amount to £2,000, leaving £155. 11s. 10d. to be carried forward to next year's account. Since the last report, 3,722 8 c.p. lamps or their equivalent have been connected to the mains. This increase compares favourably with the average progress in previous years. The exceptional cost of coal and the increase in the price of materials generally have acted unfavourably on the cost of production. Notwithstanding the reduction in the price of electricity from 7d. to 6d. per Board of Trade unit, which took effect from Dec. 25, 1899, the revenue from the sale of the current shows an increase of £338. 4s. 2d. over that of the preceding year. The number of units sold had been 13 per cent. more than in 1899, and in view of the number of lamps recently installed and the applications from new customers, there is every reason to anticipate that the rate of increase during the current year will exceed that of 1900. The capacity of the sub-station at North-parade has been doubled to meet the increased demand in the north of Oxford, and the distribution mains of the Company have been extended in Farndon, Woodstock, Banbury, St. Margaret's, and Cowley roads. The plant has been maintained in thoroughly efficient order. To provide for the cost of new plant to meet the growing demands, and other capital expenditure which may be expected during the present year, the directors propose issuing 2,500 shares at par. The retiring directors are Sir Henry C. Mance and Mr. Alderman Robert Buckell, who are eligible for re-election. The auditor, Mr. W. S. Carver, offers himself for re-election.

WOLVERHAMPTON TRAMWAY.

At the annual meeting of this Company, held at the London offices on Monday, the **Chairman** (Mr. E. Garcke) stated that for the lines purchased by the Corporation of Wolverhampton they had received £22,500. The remaining lines had been handed over to the British Electric Traction Company under an agreement for £10,020, so that they might work them with their other systems and relieve the Company of the loss of working the fragmentary portions of the lines. These two matters having been completed, there was no further need for the existence of the Company. He might mention that it was believed by the directors that the receipts would represent £5. 10s. per share.

An extraordinary meeting was then held for the purpose of the winding-up of the Company and the appointment of a liquidator, when resolutions to this effect were adopted.

CONTRACTS FOR ELECTRICAL SUPPLIES.

CONTRACTS OPEN

Zagazig (Egypt).—The Local Commission will receive tenders for the electric lighting of the town up to April 15.

Piatra Neamtz (Roumania).—The Municipality invite tenders for the electric lighting of the town for 30 years. Tenders by April 25.

Sunderland.—The Corporation invite tenders for indiarubber-covered cables, etc. Tenders by March 29. Details in our advertisement columns.

Ploesti (Roumania).—The Municipality invite tenders for the laying down and working of electric tramways for 30 years. The provisional deposit is £2,000. Tenders by April 3.

Kirkcaldy.—The Corporation invite tenders for engines and dynamos, storage battery, and overhead travelling crane. Tenders by April 15. Details in our advertisement columns.

Hornsey.—The Urban District Council invite tenders for the supply and erection of various plant for electricity works. Full details in our advertisement columns. Tenders by April 11.

Colwyn Bay.—The Urban District Council invite tenders for the supply of one 120-kw. steam dynamo and switchboard extensions. Tenders by March 22. Details in our advertisement columns.

Leith.—The Town Council invite tenders for the supply, delivery, and erection of a 350-kw. steam dynamo, suitable for either private or traction supply. Details in our advertisement columns.

Shipley.—The Urban District Council invite tenders for the supply of house terminal boxes and switch gear, motors, wiring installations, &c. Tenders by March 19. Details in our advertisement columns.

Cheltenham.—Tenders are invited for the electric lighting of St. John's Church, Cheltenham. Specifications, etc., can be had from Mr. Weaver, Carlton-place, Hewlett-street, Cheltenham. Tenders by March 25.

Greenock.—Tenders are invited for electric wiring and fitting up the free library, Wallace-square. Specification, etc., may be obtained from Mr. W. M. Nelson, burgh electrical engineer, Hunter-place. Tenders by March 18.

Fulham.—The Borough Council invite tenders for wiring the Central Library, 592, Fulham-road, S.W. Specifications, etc., may be seen on application to the librarian, Mr. F. T. Barrett, at the Central Library. Tenders by March 20.

Darwen.—The Corporation invite tenders for the supply and delivery of feeder cables, pillars, and overhead electrical equipment in connection with the electric tramways. Tenders by March 25. Details in our advertisement columns.

Digitized by Google

Cardiff.—The Corporation invite tenders for steam-pipes, exhaust pipes, injection and overflow pipes, feed pipes, drain pipes, engine-house flooring, and switchboard gallery and central service gangway. Tenders by March 18. Details in our advertisement columns.

Dundee.—The Town Council invite tenders for the supply and delivery of about 1,540 tons of steel girder rails and 60 tons of fishplates. Specification, etc., on application to Mr. Wm. Mackison, C.E., Municipal Offices, 91, Commercial-street, Dundee. Tenders by March 28.

Wolverhampton.—The Tramways Committee invite tenders for the complete overhead equipment of about five miles of tramway route, and the supplying and laying of feeders, conduits, and switch pillars for the same. Tenders by March 22. Details in our advertisement columns.

Bilbao (Spain).—Tenders are invited for the electric lighting of the new prison. The installation must provide for 1,000 5-c.p. lamps. Particulars may be seen at this office. Tenders are to be addressed to the Office of Civil Construction, Plaza de San Lorenzo, 2, Cajo, Bilbao.

Burnley.—The Corporation invite tenders for the supply and delivery of steel rails, fishplates, soleplates, tiebars, and bolts and nuts required in the construction of about seven miles of double tramway track. Specification, etc., may be obtained at the office of the Borough Surveyor. Tenders by 26th inst.

Burnley.—The Tramways Committee invite tenders for the supply of the necessary materials for the overhead equipment in connection with the trunk line. Specification, etc., may be obtained from Mr. R. Birkett, borough electrical engineer, Aqueduct-street, Burnley. Tenders by March 23.

Ayr.—The Corporation invite tenders for the supply, delivery, and erection of (Section 5) water-tube boilers, stokers, etc.; (6) condenser and pumps; (7) accumulators, etc.; (8) balancers and boosters. Specification, etc., may be obtained from Mr. Arthur J. Fuller, burgh electrical engineer, Electricity Works, Ayr. Tenders by March 20.

Wolverhampton.—The Tramways Committee invite tenders for (A) the complete overhead equipment of about five miles of tramway route; (B) the supply and laying of feeders, conduits, and switch pillars for the same. Specification, etc., may be obtained upon application to Mr. C. E. C. Shawfield, borough electrical engineer, Commercial-road, Wolverhampton. Tenders by 23rd inst.

Colne (Lancs.).—Tenders are invited for the excavator, mason, bricklayer, carpenter, joiner, slater, plasterer, plumber, glazier, and ironfounder's work in connection with the proposed electric lighting station and chimney at Phillips-lane, within the borough. Specifications, etc., may be obtained at the office of Mr. T. H. Hartley, borough surveyor, Town Hall, Colne. Tenders by March 20.

Christiana (Norway).—The Government Railways Department are inviting tenders for 12,000 kilos of 4mm. galvanised iron wire, 4,500 kilos of 2½mm. copper wire, and 5,000 insulators complete. Conditions may be obtained from the Telegraph Inspector at Stenersgade 8, III, and tenders inscribed "Telegraf-og Telefon-material," addressed to Jernbanetorvet 8—9, both at Christiana. Tenders by March 20.

Warrington.—The Corporation invite tenders for (Section 1) supply, delivery, and laying of steel rails, paving, etc., forming permanent way; (2) supply, delivery, and erection of steel poles, brackets, trolley wire, insulators, etc., forming a complete overhead equipment; (3) electric tramcars. Specifications, etc., can be obtained at the offices of Messrs. Preece and Cardew, 13, Queen Anne's-gate, Westminster, S.W. Tenders by March 27.

West Ham.—The Town Council invite tenders for the supply of (1) high and low tension paper-insulated cables, boxes, etc.; (2) double-pole house cut-out boxes; (3) recording wattmeters; (4) transformers and transformer tanks; (5) house wire and wiring accessories; (6) engine-room stores. Particulars may be obtained at the Borough Electrical Engineer's Office, Central Electricity Station, Abbey Mills, West Ham. Tenders by March 22.

Manchester.—The Electricity Committee invite tenders for the supply, delivery, and erection at the Bloom-street generating station of (a) switchboard for connecting four 1,800-kw. generators to the lighting and traction systems; (b) four continuous current motors for driving mechanical stokers and economisers. Specifications, etc., may be obtained on application to Mr. F. E. Hughes, secretary, Electricity Department, Town Hall. Tenders by March 25.

Newport (Mon.).—The Corporation invite tenders for the supply and erection of: (Section 4) constructional steelwork, bunkers, etc.; (5) steel flue; (6) coal and ash conveyor; (8) overhead travelling crane; (9) steam-boilers; (10) mechanical stokers; (11) fuel economiser; (12) water-storage tanks; (13) compound condensing vertical engines; (14) electric generators; (15) condensing plant with cooling towers; (16) feed pumps. Specifications, etc., may be obtained from Mr. H. F. Parshall, 8, Princes-street, Bank, London, E.C. Tenders by March 25.

London, W.C.—The British Electric Traction Company, Limited, on behalf of the Gravesend and Northfleet Electric Tramways Company, invite tenders for the construction of new tramways in Gravesend and Northfleet, and the reconstruction of the existing tramways in Gravesend; for the supply and construction of the necessary electrical equipment for working the overhead system. Copies of the specifications and schedules can be obtained on payment of £10, returnable upon receipt of a bona fide tender, from the secretary, Mr. Charles Dade, Donington House, Norfolk-street, Strand, London, W.C. Tenders by 25th inst.

RESULTS OF TENDERS.

Salford.—The tender of W. H. Bailey and Co., Limited, for providing Jackson's electrically-driven motors with double reduction gearing at an extra cost of £1,972 has been accepted.

Ayr.—The following tenders for the car station have been accepted: D. J. Meikle, Main-street, carpenter and joiner-work, £308. 13s.; Wm. Watson, 18, Mill-street, excavator, mason, and brickwork, £1,415. 8s.

Brighton.—The Electric Lighting Committee have accepted the tender of the Brockie Pell Arc Lamp, Limited, at £1,753. 7s. 6d., for the supply of 115 double-carbon arc lamps and fixing 107 of such lamps on standards erected by the Corporation.

Islington.—The Electric Lighting Committee have accepted the tender of Messrs. J. Grover and Son, Wilton Works, New North road, at £5,782, for the erection of a water tower, tanks, and sundry additions at the electric lighting station.

London.—The London School Board have received the following tenders for wiring, etc., for electric lighting at Offord-road School:

G. Weston and Co.	£370	0	0
Drake and Gorham	365	5	0
Peto and Radford, Limited	331	0	0
Comyn Ching and Co.*	324	0	0

* Recommended for acceptance.

Sheffield.—The contract has been given to Hadfield's Steel Foundry Company to provide the necessary points, crossing blocks, curved and other rails, made of their special manganese steel, at the Post Office corner, in the Haymarket, for the sum of £1,160. The following tenders have been accepted for the construction of 25 new cars: G. F. Milnes and Co., double-deck car bodies, £253. 10s. per car; the Brill Truck Company, trucks, £56. 11s. per truck; the British Thomson-Houston Company, G.E. 56 double-motor equipments, at £330 each. The tender of the Leeds Steel Company for the supply of rails and fishplates, at a sum of £24 156 is to be accepted, subject to their agreeing to a bending test to be defined by the city surveyor.

BUSINESS NOTES.

TRACTION.

Middlesbrough.—On Monday a commencement was made with the tramways extension.

Ramsgate.—The Isle of Thanet Railway Company hope to start the service of electric tramways at Easter.

Southampton.—Mr. G. B. Carnon has resigned his position under the Corporation of tramways manager.

Kinver.—The tramway from Stourbridge to Kinver is now complete and awaiting inspection by the Board of Trade.

Warrington.—The Corporation have decided to present a petition against the South Lancashire Tramways Bill.

Wigan.—The question of providing workmen's cars on the new electric tramways is occupying the attention of the committee.

Leyton.—The Urban District Council will oppose the City and North-East Suburban Electric Railway and North-East London Railway Bills.

Paisley.—The Town Council on Tuesday confirmed their resolution to present a memorial in Parliament against the Paisley and District Tramways Bill.

Private Bills.—In the House of Commons on Monday the Bexley Tramways and the South Yorkshire Electric Power Bills were read a second time.

Blackburn.—The question of proceeding with the construction of the Audley tramways will be brought before the Tramways Committee at an early date.

Scarborough.—The Town Council have rejected the offer of the electric tramway company to hand over its Bill to the Corporation on payment of the expenses to date.

Perth.—The resident electrical engineer has been requested to report upon the Corporation's offer of £20,000 for the purchase of the tramway company's undertaking.

Cleator Moor.—The Urban District Council have resolved to oppose the West Cumberland Tramways Bill. A ratepayers' meeting has confirmed the Council's decision.

Liverpool.—The Tramways Committee has decided to stop the sale of scholars' tickets in consequence of their determination not to grant favours to any class or section of classes.

Manchester.—A consequence of the Liverpool accident will be the formation of a special sub-committee to consider the question of the removal of overhead wires in Manchester.

Proposed Electric Ferry.—The latest project for improving the means of communication between the parishes on the banks of the Medway below Aylesford is an electric ferry.

Farnworth.—The Urban District Council have instructed Messrs. Lacey, Clirehugh, and Sillar to prepare specifications for their tramway extensions, which consists of about five miles.

Darlington.—The Town Council have approved the resolution of the General Purposes Committee, recommending the Corporation to conclude the purchase of the tramway company's undertaking for £7,500.

Digitized by Google

Middleton.—At the monthly meeting of the Town Council it was stated that the arrangements with the British Electric Traction Company with regard to the laying of tramrails were now complete.

Hyde.—The Corporation have refused to allow the tramway company to open up the footpaths for the purpose of repairing the cables until a satisfactory settlement of the question in dispute has been come to.

Hoole.—At the monthly meeting of the Urban District Council on Monday, general regret was expressed at the action of the Chester Corporation in withdrawing the scheme for extending the tramways to Hoole.

Aberdeen.—At a recent meeting of the Tramways Committee the Convener submitted a proposal for supplying a service of late cars on the different routes, but consideration of the matter was deferred until May 1.

Belgium.—The much-talked-of project for an electric railway between Brussels and Antwerp is still to the fore. A commission, provided with complete plans by the Department of the Interior, is now examining the ground.

Wandsworth.—The Borough Council have resolved to present a petition against the London County Council (Tramway and Street Widenings) Bill, and have confirmed their decision to oppose the London United Tramways Bill.

Gomersal.—The District Council have agreed to accept Mr. Stephen Sellon to negotiate for the purchase of the Gomersal portion of the Dewsbury, Batley, and Birstall Tramway Company's undertaking by the British Electric Traction Company.

Hull.—The Watch Committee have decided to purchase india-rubber gloves for the use of the police on point duty, so that they may handle without fear of injury any telephone or telegraph wires that may fall across the electric tram trolley wires.

Portslade.—The Urban District Council have appointed delegates to confer with representatives from Shoreham, Kingston, and Southwick on the proposal of the Shoreham and Hove Tramway Company to introduce electric trams into these districts.

Hornsey.—The District Council have approved the engineer's suggestion that clauses should be pressed upon the promoters of the Charing Cross and Hampstead Railway Bill for the protection of the district regarding various matters, including vibration.

Halifax.—On the question of the tramway extensions coming before the monthly meeting of the Town Council, a motion that the recommendation of the committee, that the line to Wheatley be laid as early as possible, should be referred back, was defeated.

Southport.—The agreement between the Corporation and the tramways company for the reconstruction and electrical equipment of the Cambridge-road and Roe-lane routes has been sealed. Work will soon be commenced, the Cambridge-road route being altered first.

Hampstead and Charing Cross Railway.—The Opposition Committee has issued a memorandum setting forth the objections to the route at present proposed for the extension to Golder's-green, and indicating an alternative route free from such objections.

Walker.—The District Council have rescinded their resolution respecting the Tyneside Tramways and Tramroads Bill on the ground that the Newcastle scheme would come into the heart of the town and the other company only to the outskirts of the place.

Blackpool.—The Town Council have approved the decision of the committee to increase the tramway manager's salary by £100. From Whit-week to the end of the season the tram fare will be 2d. from Victoria Pier, to or from Cocker-street, or 3d. for the whole journey to the Gynn.

Coventry.—On the question of the steps which had been taken to prevent any accident from falling electric wires coming before the City Council on Tuesday, it was stated that the Telephone Company had applied for a great additional number of their wires to be laid underground in the town.

Batley.—The Tramways Committee recommend that the engineers be instructed to prepare estimates of the cost of laying and equipping the tramways authorised by the Tramway Order, 1900 and that the town clerk be authorised to apply for sanction to borrow the amount of such estimate.

London United Tramways.—The directors recommend a final dividend on the ordinary shares at the rate of 10 per cent. per annum for the half-year ending Dec. 31 last the interim dividend to June 30 having been at the same rate. The reserve funds will be increased from £36,190 to £39,467.

Dundee.—Mr. A. P. Trotter, of the Board of Trade, conducted the official inspection on Wednesday week of the electric equipment of the new east end route and of the Perth-road extension of the Corporation tramways. Some time ago Colonel Dunop examined the permanent way and found everything satisfactory.

Proposed Berlin Underground Railway.—The Berlin Press states that the Traffic Committee of the Corporation have decided that the city shall undertake the construction of the proposed underground railway according to its own plans. The north to south line, the plans for which are being drawn up, is to be laid first.

Proposed Public Motorcar Service.—A movement is on foot to run a service of light motorcars between Streatham, Upper Tooting, and Clapham Junction, *vid* Tooting Bec and Trinity-roads. The cars would complete the distance in 25 minutes, carrying from 10 to 12 persons each. A speed of 14 miles an hour is suggested.

Plymouth.—By the end of the present financial year the electric trams will be running to Compton. A ratepayers' poll is to be taken on the question of the Sunday trams. The Tramways Committee have reduced the hours of their employés from 62½ to 58 per week.

Watford.—On the undertaking of the promoters that the Tramways Bill will not be considered in committee by the first House unless and until terms are arranged between the District Council and the promoters to the satisfaction of the Council, the latter have withdrawn their opposition and given their unconditional consent to the Bill.

Barrow.—It is stated that the British Electric Traction Company have asked for a 28 years' lease of the tramways, and have promised to spend about £65,000 in converting the system to electric traction. At the Town Council meeting on Monday no definite decision was arrived at, but as we go to press we learn that the Corporation have accepted these terms.

Imperial Tramways Co.—The accounts of this Company for the year ending Dec. 31, 1900, will enable the directors to recommend a final dividend for the half-year on the ordinary shares at the rate of 8½ per cent. per annum, making with the interim dividend paid to June 30, 8 per cent. for the whole year. The reserve fund is to be increased from £69,203 to £72,789.

Leigh.—The town clerk has been instructed to take steps to watch the South Lancashire Tramways Bill through Parliament, with the view of opposing the authorisation of the additional lines proposed to be laid within the borough. Plans, sections, and estimates for the laying within the borough of the tramways already decided upon are being prepared by the borough surveyor.

Whitehaven.—The Town Council have passed a resolution in favour of lodging a watching petition in the matter of the West Cumberland Electric Tramway Bill. One of the principal objections is that with regard to the purchase clause, which in its present form is quite prohibitive, and would make the ultimate acquirement of the tramways by the local authorities practically impossible.

Brompton and Piccadilly Railway.—In compliance with the decision of the Standing Orders Committee of the House of Lords, the company have withdrawn from their Bill the whole of the proposed extensions with the exception of about six furlongs between Piccadilly and Bloomsbury-square. The estimated expenditure by the company on extensions is thus reduced from £1,569,689 to £334,944.

Thornaby.—At the monthly meeting of the Corporation the tramway company was instructed to consider how the efficiency of the guard wires on the overhead system might be increased so as to ensure public safety as far as possible from falling telephone wires. The Imperial Tramways Company wrote refusing to entertain the claim of the Corporation to participate in the alleged surplus profits of the company.

Cambridge.—At the half-yearly meeting of the Street Tramways Company it was stated that the whole question of the introduction of electric traction hung upon the question of electrical disturbance. The directors did not consider it advisable, in the face of difficulties of that kind arising, to at once proceed with the question of electrical traction in Cambridge, but to await the result of the Board of Trade enquiry into this matter in the case of the London United Tramways Company.

Cardiff.—At the meeting of the Tramways Committee on Friday last the Borough Engineer presented a report on the construction of the tramways, in which he expressed himself as perfectly satisfied with the progress made. In all, 15 miles of single track and eight miles of double track have to be constructed. A sub-committee to continue the discussion with Mr. Glenn, of the tramway company, with reference to the preparing of the existing track for electric traction, was appointed.

Manchester and Liverpool Electric Railway.—The total number of opposing petitions which have been deposited against this Bill is 15. The petitioners include the Liverpool and Salford Corporations, Manchester Ship Canal Company, London and North-Western Railway, Cheshire Lines Committee, Lancashire and Yorkshire Railway, Great Central and Wigan Junction Railways, and the Eccles Corporation. The time for presenting such petitions in the House of Lords has now expired.

Wolverhampton.—At the Town Council meeting on Monday it was stated that the Corporation were prepared to purchase the tramway lines to Bilston and Willenhall from the District Councils, to lay down new lines for electric cars similar to those which would be made in Wolverhampton, and provide a good service of cars at cheaper fares, but that Bilston and Willenhall had decided not to purchase the lines in their districts, and they thus deliberately cut themselves off from Wolverhampton.

Merthyr Tydvil.—Trial trips have been made on sections of the electric tramways which have been constructed by the British Electric Traction Company. The new lines connecting Merthyr with Dowlais and Cefn will serve localities immediately occupied by a population of 50,000 people. The company, who have adopted the overhead trolley system, propose at the outset to put on 13 cars, each accommodating 24 passengers, and to establish a five or seven minutes' service. Colonel Dewitt made an inspection of the lines on behalf of the Board of Trade on Tuesday.

Folkestone.—The Board of Trade enquiry into the application of the Corporation to apply for a tramways provisional order is announced for to-day. The Town Council have resolved that tramway No. 3 in the draft order be withdrawn on the understanding that powers shall be sought in the next session of Parliament to construct tramways along Guildhall-street and

Digitized by Google

Broadmead-road to Cheriton-road, and also subject to the West Ward Tramways Committee and Lord Radnor supporting the present application of the Corporation as amended.

Surbiton.—In his annual report to the Urban District Council, the surveyor says that, acting on the Council's instructions, he prepared plans, sections, and other particulars for a 4ft. 8½in. gauge tramway at Brighton-road and other streets, in all four miles odd in length, and estimated to cost £33,977, exclusive of power station and plant. He concludes: "The whole of this work necessitated a considerable amount of time and attention . . . and it was somewhat unfortunate that the application for the provisional order was refused in consequence of a very slight informality."

Glasgow.—In connection with the proposed introduction of an improved seat for the tops of the tramcars, it was stated at the monthly meeting of the Corporation that the Tramways Committee were trying seats of various kinds on the new cars, and were ready to hear suggestions. If any inventor in the West of Scotland or any other place could show them a better seat than they had yet seen, they were open to consider it. It was further stated that the first portion of the electric tramways, especially that leading towards the exhibition, would be open and in operation by the end of next month.

"Tube" Vibration.—The Board of Trade enquiry into the question of damage to property alleged to be due to this cause is to be reopened next week. The fullest investigation is to be made, and additional witnesses will be called. The committee's course of procedure necessitates the postponement of the sittings of the Joint Committee of both Houses of Parliament to consider the London Electric Railway Bills to an indefinite date. Speaking in the House of Commons a few days back, Mr. J. W. Lowther said the probability was that none of the 14 Bills dealing with underground electric lines in London would be proceeded with this session.

Workington.—The three most important conditions which the Electricity Committee recommend should be inserted in the West Cumberland Tramways Bill are: (1) that the Corporation shall have absolute right to put down trams in the borough; (2) shall have running powers over all lines laid down by the company in the borough; and (3) that the Corporation shall supply electric energy to the company for all purposes of working within the borough, and that no generating stations of the company be within three miles of the borough boundary for the time being, and that the company do not supply or sell any electricity for light or power within the borough.

Bradford.—An agreement has been come to between the Corporation and the Bradford and Shelf Tramway Company for the withdrawal of the opposition of that company to the Bill now before Parliament in regard to the extension of the Corporation tramway system. In connection with the Corporation tramways, the accounts for the year ended March 31, 1900, show on trading lines a profit of £1,349 on the Bolton-road section, but against this is charged interest on loans and sinking fund, turning it into a net loss of £177. For the Great Horton section there is a profit of £3,469, against which is charged interest on loans and sinking fund, leaving a net profit of £495.

Central London Railway.—Owing to the breakdown of the brake gear on one of the trains at the Post Office Station on Monday, a temporary block in the traffic occurred. The company are appealing to the Divisional Court on a special case from the decision of Mr. Rose, at the West London Police Court, imposing fines amounting to £25 and costs for smoke nuisance at their station in Wood-lane. The ground of appeal is that the company's special Act exempts them from all prosecutions for nuisance which they may commit at their generating station, unless it can be proved that they have been guilty of negligence. The proceedings, reported in a recent issue, were taken at the instance of the Hammersmith Borough Council.

Sheffield.—A recreation club for the tramway employés is to be provided. The work on the Broomhill section of tramways is rapidly nearing completion, and probably cars will be running as far as Manchester-road within a few days. Numerous tests of the guard wires in various parts of the city have been made, which show that they are efficiently connected to the rails, so that in the event of a telephone or telegraph wire dropping and making connection between the guard wire and trolley wire the current will be put directly to the rails through the guard wire, and cause the circuit breakers to immediately act and cut off the current at the power station. These tests have been repeated in the presence of the Board of Trade, Post Office, and Telephone Company's officials, and have been quite satisfactory. At the half-yearly meeting of the Sheffield United Gaslight Company on Monday the Chairman referred to the question of electrolysis of gas-mains by electric tramways. He stated that the directors were trying to obtain the insertion of a clause in the Corporation's Bill providing for compensation in this event.

LIGHTING AND GENERAL.

Fareham.—Sanction has been obtained to a loan of £460 for electric lighting.

Montrose.—The Harbour Board have decided not to change their present system of lighting.

Wigan.—Another instalment of £20,000 is being raised in connection with the electric undertaking.

Stafford.—The Council have resolved to lay electric cables along St. Patrick-street at a cost of £98. 16s.

Mansfield.—The Town Council are petitioning against the Derbyshire and Nottinghamshire Electric Power Bill.

Luton Bute Hospital.—The Management Committee are discussing the advisability of an electric light installation.

Leith.—The question of electric lighting of quays is engaging the attention of the Works Committee of the Docks Commission.

Sleaford.—The Urban District Council are about to take over the electric lighting provisional order from the syndicate holding the same.

Keighley.—The Town Council have decided to petition against the Electric Power (Yorkshire) and the South Yorkshire Electric Power Bills.

Newcastle-under-Lyme.—The Town Council have instructed Messrs. Lacey, Clirehugh, and Sillar to prepare a report on the electric lighting of their district.

Burnley.—The Guardians have decided to inform the Local Government Board that they would be able to produce the electric light cheaper than they could buy it.

Mexborough.—The Urban District Council's application for sanction to borrow £18,000 for an electric lighting installation and refuse destructor has been acceded to.

Share Market.—Electric shares kept steady and without much change during the week. County Electric and Citys hardened to 8; Dublin Trams were dealt in at 13.

Bristol.—Six small motor switchboards have been ordered for the Avonbank works. The continuous-current main is to be extended to Dighton-street and John-street.

Acton.—The electric lighting is still delayed owing to the Council not having been able to obtain a site for the works, but they hope soon to solve the difficulty and to proceed with the works.

Hammersmith.—The engineer is preparing the necessary plans for an application to be made to the Board of Trade for sanction to increase the capacity of the sub-stations from 75 kw. to 100 kw.

Morecambe.—The Urban District Council have confirmed the appointment of Mr. Richard Pape of Hull, as electrical engineer at a salary of £200 per annum. There were over 70 applicants for the post.

Hornsey.—The District Council have decided to send to the Local Government Board a strongly-worded request for a decision as to their application for sanction to borrow £80,000 for electric lighting.

Direct Spanish Telegraph Co.—The directors have decided to pay a dividend at the rate of 4 per cent., tax free, on the ordinary shares for the half-year ended December 31, payable on April 1.

Morley.—The estimates of proposed extension of electricity cables have been approved by the Town Council, and application is to be made for sanction to borrow the sum of £7,050 to carry out the works.

Clayton.—The maximum charge for electricity under the electric lighting order will be 7d. per unit. The Council are urging the National Telephone Company to establish a central call office at Clayton.

Keswick.—The Urban District Council have accepted the electric light company's offer to erect 20 lamps and to provide standards, energy, maintenance, etc., for the sum of 35s. per 1,000 hours per lamp.

Whitby.—The appointment of clerk of the works of the electric lighting station has been left in the hands of the Electric Lighting Committee, who are to be guided by the suggestions of the engineer, Mr. Preece.

Dewsbury.—Formerly the Corporation supplied the theatre with electricity. After that the theatre company put down a plant of their own, but negotiations have been opened again for a supply from the Corporation.

Seaford.—A committee has been appointed to confer with the Eastbourne Town Council in connection with the establishment of a municipal telephone exchange. The Eastbourne parliamentary division included the Seaford urban district.

Arbroath.—The Electric Lighting Committee have decided to recommend to the Corporation that Messrs. Matthew, Buchan, and Hogarth should be appointed the Corporation's engineers to carry out the installation of electric light in the burgh.

Winding-Up.—The following final meetings are announced in the *Gazette*: the Crowdus Accumulator Syndicate, Limited, April 15; the "Perfect" Arc Lamp and Accessories Company, Limited, April 18; St. Stephens Electrical Syndicate, Limited, April 10.

Bolton.—The electricity fund revenue account of the Corporation for the last year shows an income of £32,830 and an expenditure of £15,068, giving a trade profit of £17,762, against which is charged interest on loans and sinking fund of £12,988, leaving a net profit of £4,774.

Sudbury.—At Tuesday's meeting of the Town Council the motion that the Local Government Board be immediately informed that the Council proposed to withdraw their application for a loan of £20,880 for electric lighting works and construction of a refuse destructor was carried unopposed.

Bedford.—The Public Works Loan Commissioners having informed the Town Council that they are not able to entertain any application for a loan for electric lighting purposes, the terms already arranged with the Prudential Assurance Company are to be carried out as soon as possible.

Digitized by Google

The Institution Journal.—Parts 147 and 148 of the *Journal* of the Institution of Electrical Engineers edited by Mr. W. G. McMillan, the secretary, are now ready. They contain the report of the proceedings of the joint meeting in Paris, and a number of other papers, with the discussions thereon.

Crewe.—The borough electrical engineer's last monthly report states that 72 consumers are connected with the mains, representing about 4,000 8-c.p. lamps. The number of units sold registered by meter was 6,581. The maximum load reached at the works on Jan. 26 was 95 kw., and the supply had been maintained continuously.

Nuneaton.—The surveyor (Mr. J. S. Pickering) in his last report on work executed in connection with the electric lighting station, says the work is making good progress. The contract for the new chimney shaft is proceeding satisfactorily. The shaft is now about 15ft. in height. A new main about 140 yards in length has been laid in Seymour-road.

Penge.—The Urban District Council have decided to engage an expert to advise them in their negotiations with the Lewisham Electric Supply Company, Limited. It appears that they have obtained good terms from the company, who propose to charge 3d. per unit for public lighting in the streets, 3½d. for public lighting, and 4½d. for private consumers.

Leicester.—The accounts of the electric lighting undertaking for the half-year ending Dec. 31 last show, after paying interest on capital and £1,068 3s. 1d. on account of sinking fund, a profit of £1,287. 5s. 8d. The profit for the half-year ended June 30 last, as reported to the Council on Sept. 25 last, was £862. 5s. 4d., making a total profit for the year of £1,649. 11s.

Wireless Telegraphy.—The Admiralty have decided to establish wireless telegraphy stations at Dover, Portland Bill, Rame Head, Scilly, and other places. Sir R. Penrose Fitzgerald has given notice to ask the President of the Board of Trade in the House of Commons whether he can hold out hopes that the Government will apply the same system without delay for life-saving purposes.

Tunbridge Wells.—The electrical engineer has submitted a report on the system of incandescent electric light in other towns. Reports have also been received from Blackburn, Starling, and Co., Limited, and from the borough surveyor, borough electrical engineer, and Mr. T. E. W. Mellor, late borough surveyor, upon the suggested heightening of the chimney shaft at the central station.

Swansea.—The Electric Lighting Committee last week was again occupied with the delay in completing the installation. The engineers stated that they were now awaiting the erection of the battery. The British Schuckert Company wrote disclaiming responsibility for delays, and stated that much of the delay had been caused by the station not being ready to receive machinery.

Manchester.—The annual conference of the Postal Telegraph Clerks' Association was opened on the 7th inst. A resolution protesting against the inadequacy of pay in the telegraph department, and urging upon the Postmaster-General the necessity of a general increase in pay, and other resolutions protesting against the stagnancy of promotion and employment of temporary labour, were adopted.

Durham.—At the annual meeting of the County Council on Wednesday, the Clerk reported that the promoters of the Cleveland and Durham County Electric Power Company's Bill had agreed to insert satisfactory clauses for protection of the county's interests, with respect to the main roads under which ducts and cables were to be laid. It is understood that the Council will remain neutral in the matter.

Scotch Power Bills.—In view of the heavy opposition to the Caledonian Electric Power Bill and the Clyde Valley Electrical Power Bill, the authorities of the House of Commons have constituted the two measures as a group by themselves for consideration by one of the committees of the House. The opposition to the former is represented by 48 and to the latter by 30 petitions. Neither of the Bills will be taken before the Easter recess.

Commercial Cable Co.—The accounts for the year 1900 show that after transferring 150 000dol. to reserve for insurance of stations, apparatus, and repair steamer, and 350 000dol. to the general reserve fund, the profit, including 228,063dol. brought forward, was 2,007,730dol. Payment of debenture interest absorbed 720,000dol., and dividends amounting to 8 per cent. have been declared and paid, leaving 221,066dol. to be carried forward.

Southampton.—With regard to the sanction recently received to the borrowing of £12 000 for the purposes of electric lighting, the Town Council have applied to the Local Government Board to extend the term for the repayment of the amount from 22 to 25 years, being the period granted in respect of previous loans. The Tramways Committee are to be charged at the rate of £2. 2s. per annum for each 8-c.p. incandescent lamp on the tramways columns.

Dublin.—A special meeting of the Municipal Council will be held to-day, when a report of the Lighting Committee will come up recommending the acceptance by the Municipal Council of the tender of Messrs. J. and W. Stewart, of Belfast, for building a chimney shaft at the Pigeon House Fort; also giving particulars of the contracts already arranged and of the works in connection with the electric lighting scheme, for which tenders have not yet been invited.

Claret and Soda.—A peculiar claim came before the Tunbridge Wells Lighting Committee recently in the shape of a letter from a consumer asking the committee to repay him the cost of a bottle of claret and a siphon—namely, 6s. 6d.—which was smashed by an employé of the electric light department when attending to the meter at his house. In appreciation of the fact that the applicant was a consumer of current as well as of claret and soda, the committee agreed to meet the claim.

Brush Electrical Engineering Co.—The directors have decided, after placing £5,000 to reserve, to recommend payment of a dividend to the preference shareholders at the rate of 6 per cent. per annum for the half year ended December 31, 1900 (making the full dividend of 6 per cent. on the preference shares for the year), and a dividend at the rate of 5 per cent. on the ordinary shares for the year. The share transfer books of the company will be closed until after March 27.

Warrington.—The Corporation have taken possession of the plant, and completed the work undertaken by the Clayton Engineering Company, Limited, Mr. Preece having reported that, in view of the probable early introduction of electrical tramways, it was desirable that additions should be made to the plant at the works. The engineers have been requested to prepare estimates of the cost of such additional plant, and Mr. Grimsdale is preparing an estimate of the cost of the probable extension of mains.

Aylesbury.—The Urban District Council have decided to negotiate with companies for the execution and maintenance for a term of years of the works needed for the supply of electricity within the urban district of Aylesbury, and for the supply of electricity within such district, on the basis of the site of the electric lighting station being the property of the Council. A site for such station, which is to be utilised in addition as a depôt wharf, paddock, and stables, has been selected on the banks of the Grand Junction Canal.

Hamilton.—At the last meeting of the Town Council a report was submitted from the Electric Light Committee recommending that the report of the engineers should be approved of, and that the Secretary for Scotland be asked to sanction under the Act borrowing powers for £40,000. An amendment to the effect that the Council should agree to the proposal to apply for borrowing powers, but also instruct the committee to proceed with the negotiations for the purchase of power from wholesale electric supply companies, was carried.

Stock Exchange.—The Stock Exchange Committee have appointed March 21 as a special settling day for the Electric and General Investment Company's 19,900 6 per cent cumulative preference shares of £5 each, fully paid, Nos. 20,101 to 40 000. The committee have also ordered the said securities to be quoted in the official list. Application has been made to the Exchange Committee to appoint a special settling day in and to grant a quotation to the Central London Railway Company's scrip certificate for 4 per cent. debenture stock.

Cleveland.—A serious accident took place at the Saltburn electric power generating station, which resulted in much damage being wrought, whilst one employé had a miraculous escape. It appears that a bolt on one of the working parts of a 37-b.h.p. gas-engine snapped in two, and the next moment the room was full of flying pieces of metal. An engineer named Matson promptly turned off the gas supply and retreated by the door. No sooner had the latter closed than a piece of heavy metal struck it with tremendous force. Had he been a second later he might have been killed on the spot.—*Northern Echo.*

Newport.—At the Council meeting on Tuesday the Mayor said there had been no blunder, not even of seven farthings, much less £70,000. Mr. Parshall's original report was for £85 030, and the Corporation went to Parliament with a scheme for £130,000. Then they joined Cardiff, Swansea, and other boroughs to resist the inroads of the South Wales Electricity Company, and Parliament had given them four years in which to provide facilities for selling power to the various large industrial works in the district. Thus they would be able to provide power instead of steam. He believed the extra £70 000 was an excessive estimate, and that all the money would not be needed.

Middlesbrough.—Mr. Frank Baker, the borough engineer, on Wednesday, was made the recipient of two handsome presents on the occasion of his marriage. The first consisted of a silver salver, which had been subscribed for by the officials of the Corporation. It bears the borough arms and the following inscription: "Presented to Frank Baker, C.E., F.G.S., borough engineer, by the officials of the Corporation of Middlesbrough on the occasion of his marriage, Feb. 7, 1901." The Town Clerk presented the same with some appropriate remarks, after which Mr. Baker made his reply. Mr. T. D. Cooper, the oldest member of the staff, supported by Mr. B. J. Wolfenden, the senior assistant engineer, then presented Mr. Baker with a fine silver cake basket from the members of his staff. This is also suitably inscribed, and bears Mr. Baker's crest.

The Aberdeen Accident.—With regard to the accident at Aberdeen, in consequence of which the electric lighting was totally suspended for a short time on Monday, the 11th inst., for the first time since the starting of the works in 1894, we are informed that the failure of supply was due to the racing of a 420-kw. set which was still in the hands of the contractors, who were then adjusting the governors preparatory to the official test, which was arranged for Wednesday. This racing caused a break in the steam pipe connections, which necessitated steam being shut off at the boilers, thereby cutting off supply. According to the recording instruments, the lighting of the town was affected for 45 minutes, and the electrical tramcars were stopped for 23 minutes. The lighting was off this length of time owing to the fact that upon starting up on the town at nearly maximum load, the armature of one of the sets was burned out.

Digitized by Google

Ipswich.—The East Suffolk County Council have decided that all motorcars should carry a number both in front and behind, and should be registered. An application is before a committee from the East Anglia Telephone Contractors, who have asked the Council to grant them facilities for erecting wires in East Suffolk. This company have purchased plant of a firm who started a telephone system at Southwold and the neighbourhood.

Nelson.—Messrs. Gibbings and Baker have been appointed consulting electrical engineers. The electrical engineer's report for the last month gives the quantity of electric current sent out during the month in Board of Trade units as 150,169, an increase of 1·65 per cent. over the corresponding month of last year. The Local Government Board have agreed, in response to the request of the Corporation, to increase the period of loan repayment of £2,500 on works of electric lighting from seven to twelve years.

Lowestoft.—The Electric Lighting Committee's last report states that on March 1 68 private consumers, representing 3,500 c.p., had been connected with the mains. The scheme providing for an extension of street, not private lighting, has been adopted by the Council. Electric lighting mains are to be laid in North-parade (south and east sides), Lyndhurst-road, and back along Corton-road, to a feeding point opposite Royal-avenue. The loan asked for from the Local Government Board will amount to £30,000, making a total of about £60,000.

Carnarvon.—At the last meeting of the Gwyrfai Rural District Council the Chairman said that since the Board of Trade enquiry into the electric lighting scheme a letter had been received from Mr. Peterson, the promoter of the scheme, stating that if the Council wrote to the Board of Trade promising support to the scheme, Mr. Peterson was, on his part, prepared to give a legal undertaking to proceed also with the proposed light railways to Dinas Dinlle and Ebenezer, and the water-supply scheme of Cwmdwythwch. The matter was discussed, but no decision was arrived at.

Kendal.—At the annual meeting of the Chamber of Commerce last week the following resolution was adopted with reference to the telephone service: "That the secretary be instructed to communicate with the secretary of the General Post Office intimating that the trunk facilities and telephone to Kendal and district is, in the opinion of this meeting, insufficient. The chamber would strongly urge that another line between Kendal and Blackburn or Kendal and Manchester be laid immediately. The present delays in getting through are detrimental to the business of the town and district."

Cardiff.—The South Wales Electrical Power Distribution Company held their first meeting here on Monday. It is stated that all the money required at present has been subscribed. The promoters at first designed the establishment of generating stations at Pontypool, Treforest, and other convenient centres in Monmouthshire and Glamorgan, but for the present only one generating station will be set up at Treforest. The Rhondda, Aberdare, and Merthyr valleys, as well as Cardiff, Barry, and Newport, are easily accessible from Treforest, whence the electric mains are to run beside the railways.

Colchester.—The new engine and surface-condensing plant, which Davey, Paxman, and Co., Limited, and the Electrical Power Storage Company, Limited, are preparing, will be delivered and erected within two months from the date on which the battery-room is ready, which will be in about three weeks. The borough electrical engineer's last report states that the output of electricity in units during January, 1901, was 17,957, against 9,279 in January, 1900; the number of equivalent 8-c.p. lamps connected during the month was 200, against 20; the total number of lamps now connected was 9 998, against 4,523; and the number of consumers 170, against 89.

Northfleet.—At the last meeting of the District Council, a letter was read from the National Traction Company to the effect that they were pleased to learn that Northfleet were endeavouring to come to a working arrangement with regard to a generating station for the supply of electricity. As it was necessary for them to make early arrangements for the supply of electricity, and assuming the working arrangement would be come to, they were proceeding to come to agreement with the Gravesend Town Council on the subject. The Council decided to reply that if a working arrangement were not come to with Gravesend, then Northfleet would be able to undertake the electric supply.

Wheatley.—At Tuesday's meeting of the Wheatley Urban District Council a letter was received from the town clerk of Doncaster stating that the Corporation had received applications from builders in Avenue-road for a supply of electricity for the residences there now in progress, and the Corporation were prepared to extend their mains to that point providing that they could get the consent of the Wheatley authority. He asked that they would agree by resolution to the Corporation applying to the Board of Trade for a license under the Electric Lighting Act, 1882, to supply electricity for lighting or power in the urban district of Wheatley. The matter was adjourned.

Monmouth.—The Drainage and Electric Light Committee reported at the last meeting of the Town Council that Messrs. Siemens Bros. had accepted the terms offered by the Town Council in settlement of their claims, which amounted to £4,753. 4s. 5d. The terms are immediate payment of £757. 4s. 5d., and the payment of the balance, £3,996, with interest at 5 per cent., in quarterly instalments to spread over five years. Messrs. Siemens Bros. had also undertaken to investigate the condition of the high-tension mains, and what was necessary to put them in working order. The extra dynamo and engine are to be fixed 6in. higher than those already in place so as to prevent injury from floods.

Canterbury.—The tenders for condensing plant have been deferred for a further report by Mr. R. Hammond. Tenders for a spare armature for the new dynamo are to be obtained, and application made for sanction to a loan of £17,000 for the extension works. The engineer has been empowered to arrange for separate circuits to be made for wiring contractors for testing purposes, the charge for consumption to be 6d. per unit. The Town Council's estimates for the next year include a sum of £1 460 for electric lighting at the following rates: 12 arcs at £25, 320 incandescents at £3. 10s., six ditto at £7.

Eccles.—The Chairman of the Electricity Committee was asked at the last meeting of the Town Council the reason of the deficit in the working of the station. He said it was partly due to the light day load, but now that they had got a small engine to run the day load this would be reduced; and it was partly due to the high price of coal. Now that the new main cable was laid, they were in a position to supply as much again as they had done up to the present time. The committee had taken into consideration the mode of charging, and had adopted a new scale which he thought would prove satisfactory. Some of the customers were satisfied with the indicator system, and in their cases no change would be made.

Islington.—The Council propose to apply to the London County Council for consent to borrow £3,286 for valves, water service, and switch gear in order to complete the electric lighting extension works, which are nearly finished. These works are to be proceeded with as soon as the necessary consent to borrow the amount has been received from the London County Council. Various short lengths of distributing mains are required in order to connect consumers who have already applied for a supply of electricity. The estimated cost of this work, amounting to £388, has already been sanctioned by the London County Council. To-night the Council will be asked to authorise that the work be carried out.

Barrow.—The borough electrical engineer's plan in connection with the proposed application for powers to borrow money to carry out the electric lighting of Vickerstown has been adopted, and application is to be made to borrow £12,340 for the purposes of electric lighting. In addition to the sum of £6,207 required for the first portion of the scheme, the following sums are included in the application: for the completion of the scheme for the lighting by electricity of the houses, £4 243; for the lighting of the streets, in the event of the Highways and Lighting Committee deciding to use electricity for this purpose, £1,500; for the laying of additional conduits and distributing mains in Buccleuch, Duke, and Blake streets, £390—total, £6,133.

Ayr.—The monthly report by the electrical engineer (Mr. A. J. Fuller) states that during the month the cable in Prestwick-road, and also the long service cable from Prestwick-road to the hospital, together with the various connections required for this work, were completed and proved perfectly satisfactory on testing. With regard to extensions for lighting and tramways, Mr. Fuller gives details and concludes as follows: "Everything is well in order to meet the expected completion of the tramway route, and I have no doubt that, provided the contractors are well up to their time, we shall be able to give the necessary supply by June." Negotiations with the railway company have been broken off, as the company required a supply of direct current delivered at various points.

Stepney.—The Borough Council have decided to apply to the London County Council for a loan of the additional capital required during the next two years for the purpose of extending the street electric lighting distributing mains, feeders, and cable ways into the three additional districts of Mile End, Limehouse, and St. George's, and also making provision for the increasing demand in the Whitechapel area. The estimates are: on building account—additions to chimney shaft, economiser chamber, extension of cable culvert, £8,582; on plant—additional machinery and plant, £12,100; mains £68 106; house services, £7,200; arc and incandescent lamps, £16,687; stores, £2 720; tools, £200; stamp duties on loans, £250—which, with £6,355 for contingencies, made a total of £122,200.

Bury St. Edmunds.—The borough surveyor has been directed to give notice to the gas company to cease lighting the gas lamps in the vicinity of the new arc lamps. The gas company asked £750 for the posts and the brackets and for the cost of disconnecting. The Electric Lighting Committee offered £300, the company to disconnect at their own expense, the Council opening the ground. These terms have been accepted. The Electrical Engineer reported on Tuesday that since the last meeting 55 lamps had been connected for private lighting. The arc lamps in the centre of the borough having been completed, it was resolved that a charge of £13 per annum be made as arranged. The National Telephone Company were granted permission to erect overhead wires from their station in Lower Baxter-street to the Post Office to connect with the trunk line.

Woods and Co.—The name of this firm has been changed to Marshall and Woods, the partners being Mr. Alfred W. Marshall, M I Mech.E., A.M.I.E.E., who has been for the past six years electrical engineer and manager of the electrical department of the Crypto Works Company, Limited, Clerkenwell, and Mr. Maurice W. Woods, sole proprietor of Woods and Co., and partner in the late firm of Miller and Woods, established in 1890. We are informed that the firm's electric lighting business will be continued as before, and in connection with this the application and installation of electric motors for driving all kinds of machinery is to be made a speciality. The offices and showroom will remain at 2, Gray's-inn-road, but the workshop has been removed to a new

Digitized by Google

factory at Shepherd's Bush, adjoining the terminus station of the Central London Electric Railway.

South Yorkshire Electric Power Bill.—The South Yorkshire Electric Power Bill came before Earl Morley's Committee of the House of Lords on Monday. At the time when the Bill was considered by one of the Examiners of Private Bills a non-compliance was returned on account of certain Standing Orders not having been fulfilled. The company had in their Bill, without stating their intention in the notices, proposed to exempt the Bill from the provisions of Section 81 of the schedule to the Electric Lighting (Clauses) Act, 1899, which fixes the liability of the company for "any nuisance caused or permitted by them." M. Tahourdins (Tahourdins and Hitchcock) represented the promoters, and stated that the clause containing the proposed exemption had been struck out of the Bill, and their lordships dispensed with the Standing Orders and allowed the measure to proceed.

Kirkcaldy.—Satisfactory progress continues to be made in connection with the tramways and electric lighting schemes. The engineer's estimate is £50,000 as the cost of the electric light and power scheme, while the tramways, which will run from Links *vid* High-street to Oswald-road, Sinclairtown—a distance of three miles—are estimated to cost £37,000. The profit in connection with the electric lighting and power scheme is estimated at £544 per annum. The estimated annual expenditure in connection with the tramways is £7,686, and the income £8,502, leaving a balance of £906. A site for a generating station has been secured on the new road, and there is evidence that the preliminaries in connection with both schemes are getting into a more advanced state. The Town Council have resolved to apply to the Secretary for Scotland for consent to borrow £50,000 for the electric lighting of the burgh.

Perth.—In consequence of the very large number of applications for current already received, it has been resolved that one 400-kw. set with corresponding boiler plant be acquired. Mr. Hawtayne has been asked to prepare and submit the necessary specification for this additional plant. The Electric Lighting Committee have decided that the resident electrical engineer, Mr. Lambert, is to have the following staff: one switchboard attendant; two improvers, and one assistant, who would also act as outside inspector; one engine-fitter, to reside on premises; one engine cleaner; two firemen; a clerk and storekeeper; and a jointer and an apprentice jointer. The Special Destructor (Expert) Committee have been empowered to make further enquiries regarding the question of the desirability of erecting a refuse destructor, and to report, and the report is to be circulated amongst the members of the Council before the matter comes up again for consideration.

New Issue.—Crompton and Co., Limited, manufacturers of electrical plant and machinery, Chelmsford, announce the issue of 46,000 shares of £3 each at the price of £3. 5s. per share. The company was incorporated in 1888, and has an authorised share capital of £300,000 in 100,000 shares of £3 each, of which 54,000 have been issued and paid up. The company's works are situated at Chelmsford, and comprise some 22 acres of freehold land, with engineering workshops equipped with modern appliances and instruments for the manufacture of dynamos, motors, arc lamps, locomotives, and all kinds of electrical plant, machinery, and instruments. Notwithstanding a considerable addition to the works at Chelmsford during the past 12 months, further extensions are required to meet the rapid growth of the business. The present issue is being made with this object and to provide additional working capital required to enable the company to deal successfully with the increased business.

Prestbury.—Mr. Hamilton Kilgour attended a recent meeting of the Parish Council with reference to the Cheltenham Town Council's application for permission to lay the electric cable through the village to supply Cleeve Hill with the electric light. Mr. Kilgour explained that cables would be laid to serve the overhead line of the electric tramway, and it was desired, when the trench was open, to put in an additional cable for electric light purposes, several houses on the hill having already been wired. In consideration of the sanction asked for, the Corporation would be prepared to put up a 32 c.p. incandescent lamp at each of the three principal corners of the road in the village. It was decided to interview the Mayor, and to arrange, if possible, to grant the concessions which the Cheltenham authorities asked for, provided (1) that they had power as a parish council to do what was asked; (2) that the concession granted would not be used against them in any subsequent application for taking parts of Prestbury into Cheltenham; and (3) the concession of three lamps be granted to them. This was carried.

Darlington.—The borough electrical engineer, Mr. J. R. P. Lunn, in his last report states that the number of consumers connected during the month was 12, making a total of 53, and the total of 8-c.p. lamps connected 663, making a total of 3,877. Applications had been received from 22 intending consumers, who would require 2,400 8-c.p. lamps, and it was decided to recommend that the mains be extended from Stanhope-road, through Duke-street, as far as the Duke-street Club. The Corporation of Darlington intend to petition against the Cleveland and Durham Electric Power Bill. The electric street-lighting was inaugurated on Monday by the Mayoress of Darlington (Mrs. J. G. Harbottle), who switched on the current to the main streets of the borough. Amongst those present were Alderman Barron (chairman of the Gas and Electric Lighting Works Committee), Mr. Jenkin (partner of Prof. Kennedy), Mr. H. Maw, Mr. J. R. P. Lunn (the Corporation electrical engineer). The present installation comprises 40 arc lamps of the Crompton-Pochin S long type of 2,000 c.p., the arcs being 23ft. from the ground. The standards are by Mackenzie, of Edinburgh; the lamps have been erected and fixed by the Crompton Company, of Chelmsford; and the mains put down by Messrs. Callender and Co., of London.

Plymouth.—In consequence of the resignation of Mr. J. H. Rider, the borough electrical engineer, who has been appointed to a more lucrative position under the London County Council, Mr. E. G. Okell, the assistant electrical engineer, has been promoted to the post of electrical engineer at a salary of £350, increasing by annual increments of £50 to a maximum of £500. He is to have charge of the street lights. Mr. S. T. Allen, charge engineer, has been promoted to assistant electrical engineer at £200 a year, increasing by £25 per annum to a maximum of £300. This is a commendable proceeding on the part of the Corporation as compared with others who at every vacancy throw the post open to competition, instead of giving their men in subordinate positions a chance to rise. On the other hand, where the system which obtains at Plymouth is carried out, a premium is put upon an officer's industry in making himself well acquainted with local conditions, etc., and the Corporation must be the gainer by it. The Electricity and Street Lighting Committee in their last report expressed their high appreciation of the zeal and ability displayed by Mr. Rider during the five years he had held the post of electrical engineer to the Corporation. Negotiations with the telephone company have been concluded and an agreement signed with regard to underground telephone wires.

Walsall.—The annual statement of accounts presented by the Electric Lighting Committee on Monday showed that the amount already borrowed had amounted to £25,450, and that they had power to borrow the further sum of £20,049. The greater part of this is already required for extensions now in progress. The amount at present expended on capital account was £34,309, but of that £1,500 had been repaid. The expenditure on revenue account for the year had been £3,100. 9s. 10d., and the receipts were: for sale of current (less discount), £4,122. 5s. 1d.; public lighting, £488; rent of meters, £83. 1s. 6d.—total, £4,693. 6s. 7d. This left a balance in hand of £1,592. 16s. 9d., but against this there had been a deficiency at the close of the previous year of £394. 11s. 11d., and there had been paid for interest £756 15s. 6d., and for repayment of loans £716. 12s. 10d., making a total of £1,868. 0s. 3d., which left a deficiency of £275. 3s. 6d. still unpaid on the previous year's working, but a balance of profit of £119. 8s. 5d. on this year. The profit in the year 1899 was £61. 13s. 5d., but up to that time there had been a gradually decreasing loss each year. The statement of production showed a make of 404,682 units, which was accounted for as follows: public lighting, 29 280; private customers, 246,363; the works, 17,606—total, 293 249. The total unaccounted for was 111,433. The number of public lamps was 19, and the maximum supply demanded was 301 kw.

Rochdale.—An animated debate ensued at the last Town Council meeting upon the question to confirm the proceedings of the Joint Committee of members of the Health, Gas and Electricity, and Tramways Committees, which included the following resolution: "That this Joint Committee is of opinion that the steam raised by the burning of the refuse at the sanitary works should be utilised for the purpose of generating electricity." Finally it was agreed that the minutes be received, but that no action be taken for the present, but at a further stage of the meeting the following resolutions were carried: (1) "That this Council is of opinion that the refuse at the sanitary works should be utilised for the purpose of generating electricity." (2) "That no further extensions or additions should be made at the Dane-street works except those proposed in the minutes of the Gas and Electricity Committee meeting of Feb. 27, 1901, until the steam raised at the sanitary works has been used for the above purpose." The Council also adopted a resolution of the Gas and Electricity Committee, recommending them to make an order that the extra plant required at the electricity works be obtained. The extra plant was described in the committee's minutes as follows: "By October, 1901.—One 400-kw. steam dynamo, erected in existing building; one boiler, 8ft. by 30ft., together with steam and exhaust pipes; condensing plant and accessories in existing boiler-house. By May, 1902.—One 400-kw. steam dynamo, erected in existing building, including foundations; one boiler, 8ft. 6in. by 30ft., with steam and exhaust pipes, feed pumps, economisers, foundations, seatings, accessories in extension of boiler-house."

Cairo.—The Egyptian Government have given a contract for the installation of electric light in two important towns of Egypt (Cantah and Zeftah) to Messrs. Eug. Nahman and Co., electrical engineers, Cairo. The distance between the two towns is a little over 16 miles. Details of the installation have not yet been definitely fixed. The generating station will be at Zeftah, and will contain large steam-engines and three-phase generators. A pressure of 5,000 volts will be used and transformers will be installed at various points along the line. Current will be supplied for motive power as well as for light. Messrs. Eug. Nahman and Co. have just finished two installations of electric light—one at the National Bank of Cairo, and the other at the sugar factory of the Daira Saineh at Poodah. At the National Bank of Cairo the plant consists of 500 incandescent lamps of 10 c.p. and 16 c.p., an electric passenger lift and an electric goods lift (supplied by Messrs. Waygood and Co., of London), battery of 55 Tudor accumulators of about 900 ampere-hours, Crossley gas-engine, and a Brown dynamo giving 110-160 volts for charging the battery. At the Poodah sugar mill the plant consists of two 25-n.h.p. Robey's locomotive boilers working at 140lb. pressure, two horizontal duplex feed pumps, injectors, and water heaters. There are two Robey compound engines of 25 n.h.p., each capable of giving off 60 effective horse-power, fitted with Richardson's

Digitized by Google

patent automatic expansion governors. The two dynamos of the continuous-current system are of 320 amperes 115 volts, and work coupled in parallel for giving light to 500 incandescent lamps and 16 arc lamps of 10 amperes. The two installations have been completed by Mr. R. Levi, C.E., the engineer of Messrs. Eug. Nahman and Co., and we are informed that both are running very satisfactory.

PROVISIONAL PATENTS, 1901.

MARCH 4.

4530. Improvements relating to the jointing or terminating of electric cables or combinations of multiple-core cables. Rollo Appleyard and John Frederic Coote, 139, Church-lane, Charlton, Kent.

4532. Improved safety device for overhead electric wires. Alexander William Gilbody and David Robertson, the Municipal Technical College, Bradford, Yorks.

4533. Improvements in trolley wires and other overhead electric wires. Alexander William Gilbody and David Robertson, the Municipal Technical College, Bradford, Yorks.

4540. Improvements relating to the covering or casing of the electric wires or leads employed in house-lighting and for other purposes. Frederic Lennox Broughton, 18, Southampton-buildings, Chancery lane, London.

4549. An improved incandescent electric lamp. Albert Louis Reinmann, 15, Water-street, Liverpool.

4575. Improvements relating to electric power distribution. Henry Harris Lake, 45, Southampton-buildings, Chancery-lane, London. (Compagnie de l'Industrie Electrique, Switzerland.)

4578. Improvements in electric furnaces. Rámon Chavarria Contarde, 55, Chancery-lane, London.

4586. Improvements in primary batteries. Charles Nestor Gauzentès, 24, Southampton-buildings, Chancery-lane, London.

4591. Improvements relating to the preparation and treatment of filaments for incandescent electric lamps. Henry Edward Newton, 6, Bream's-buildings, Chancery-lane, London. (Charles Garner, United States.)

4697. Improvements in electric demand indicators. Arthur Wright and the Reason Manufacturing Company, Limited, Norfolk House, Norfolk-street, Strand, London.

MARCH 5.

4631. Improvements in electric stop motions of drawing frames. Thomas Chadwick, Penny Bank-chambers, Halifax.

4642. An improved underground or conduit system for the transmission of electromotive force for traction purposes. Richard Ridgway Harrison, 24, Temple-row, Birmingham.

4675. Improvements in cords for switchboards, telephones, and other electrical instruments. The London Electric Wire Company, Limited, and Burton Hawke, Anchor Works, Playhouse-yard, Golden-lane, London.

4695. Improvements relating to the regulation of dynamos. Frederic Strickland, 70, Chancery-lane, London. (Complete specification.)

4700. Improvements in or relating to trolleys and like current collectors for electric railways and tramways. Frederic William Leevers, 6, Lord-street, Liverpool.

4709. Sound and fireproof walls for use in connection with telephone apparatus. Hans Schäffer, 40, Chancery-lane, London. (Complete specification.)

4714. Improvements in electromagnetic traction. Max Nietzschmann, 45, Southampton-buildings, Chancery-lane, London.

MARCH 6.

4736. Improvements in swivelling trolley heads employed in overhead wire electric traction. Edward May Munro, Henry Brecknell, and Hugh Innes Rogers, Lloyd's Bank-buildings, Bristol.

4751. Process for insulating hollow conductors. Robert Detert, 10, Friedrichstrasse, Berlin.

4760. Improvements in electric measuring instruments. Albert Campbell, 15, Rothwell-street, Primrose Hill, London.

4763. Improvements in insulated electric conductors. Henry Edmunds, 47, Lincoln's-inn-fields, London.

4765. Improvements in and relating to the transmission of power in the electrical propulsion of railway, tramway, and other vehicles. Edward Walter Whiteman, 55, Chancery-lane, London.

4767. An improved cable for supplying the electric current to electrically-driven ploughs and for like purposes. Conrad Meissner, 11, Southampton-buildings, Chancery-lane, London. (Complete specification.)

4768. An improved electric bell circuit for mechanically-driven ploughs. Conrad Meissner, 11, Southampton-buildings, Chancery-lane, London. (Complete specification.)

4776. Combined engine and air-compressing means for electric railway systems. Reginald Walter Barker, 56, Ludgate-hill, London. (The Murphy Safety Third-Rail Electric Company, United States.) (Complete specification.)

4777. Improvements in switch mechanism for surface-contact railways. Reginald Walter Barker, 56, Ludgate-hill, London. (The Murphy Safety Third-Rail Electric Company, United States.) (Complete specification.)

4810. Improvements in electrolytic interrupters. Frédéric de Mare, 70, Chancery-lane, London. (Complete specification.)

4812. Improvements in coherers for wireless telegraphy. John Robert Milne, 22, Southampton-buildings, Chancery-lane, London.

4813. Improvements in wireless telegraphy. John Robert Milne, 22, Southampton-buildings, Chancery-lane, London.

4814. An improved method of operating an electric chopper switch. Joseph Gershom Childs, 145, Farringdon-road, London.

4815. An improved method of making fuse contacts and holders for my detachable fuse plug, patent No. 18651, 1898. Joseph Gershom Childs, 145, Farringdon-road, London.

MARCH 7.

4819. A new or improved device for connecting the trolley with the trolley wire in electrically-driven vehicles. Henry John Weintz, 4, New-street, Huddersfield.

4820. Improvements in switching apparatus for electric circuits. William du Bois Duddell and Thomas Mather, 47, Hans-place, London.

4822. Improvements in arc lamps. James S. Scott, 2, Wellington-place, Belfast.

4841. Improvements in and relating to swivelling trolley heads employed in the overhead wire system of electric traction. Henry Edwin Frank Brecknell, Lloyd's Bank-buildings, Bristol.

4863. Improvement in combined electromagnetic and carbon microphone. Walter Elliott Rossetter, 14, Elmers End-road, Anerley, London.

4868. Improvements in electric switches. Charles Wesley Scott, 111, Hatton-garden, London. (Date applied for under Patents, etc., Act, 1883, Sec. 103, Aug. 16, 1900, being date of application in United States.) (Complete specification.)

4870. Electric coupling for railway cars. Charles Denton Abel, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Siemens und Halske Aktien-Gesellschaft, Germany.) (Complete specification.)

4892. Improvements relating to electrical interrupters. James Mackenzie Davidson, 323, High Holborn, London.

4899. Improvements in and relating to overhead wires and guard wires for electric traction and other purposes. Henry Ridley Burnett, 18, Southampton-buildings, Chancery-lane, London.

4902. Improvements in electrical cables. Mervyn Joseph Pius O'Gorman, 24, Southampton buildings, Chancery-lane, London.

MARCH 8.

4928. Improvements in fuses for distribution boxes, the same being applicable for single fuses of electric light installation. Peter Mushet and David Buchanan Selkirk, 154, St. Vincent street, Glasgow.

4940. Improved coupling joint or connection for electric wires and fittings. Max Railing and George Henry Ide, 165, Queen Victoria-street, London.

4967. Improvements in electrical measuring instruments for use as power indicators and the like. Kenelm Edgcumbe and Edgar Isaac Everett, 22, Charterhouse-square, London.

4986. Improvements in and relating to electric switches and cut-outs. Frederick Hagger Headley, 322, High Holborn, London.

MARCH 9.

5007. Improvements in the manufacture of electrical switches. Alfred Watson, 180, Hockley-street, Birmingham.

5017. Improvements in batteries. Gustavos Heidel, 154, St. Vincent-street, Glasgow. (Complete specification.)

5038. Improvements in incandescent electric lamps. Henry Christopher Mance and Nernst Electric Light, Limited, 82, Victoria street, London.

5039. Improvements in preparation of Nernst conductors for electric lamps. Charles Cornfield Garrard and Nernst Electric Light, Limited, 82, Victoria-street, London.

5040. Improvements in Nernst incandescent electric lamps. Charles Cornfield Garrard and Nernst Electric Light, Limited, 82, Victoria-street, London.

5041. Improvements in incandescent electric lamps. James Swinburne and Nernst Electric Light, Limited, 82, Victoria-street, London.

5042. Improvements in glow bodies for Nernst incandescent electric lamps. Bernard Mervyn Drake, Maurice Solomon, and Nernst Electric Light, Limited, 82, Victoria-street, London.

Digitized by Google

5043. Improvements in rods for Nernst incandescent electric lamps. Legh Sylvester Powell and Nernst Electric Light, Limited, 82, Victoria-street, London.

5055. Improvements in alternating electric current induction motors. David Leonard Lindqvist, 322, High Holborn, London.

5062. Improvements in cord-controlled switches for electrical purposes. Arthur Thomas Milnor Thomson and the Thomson-Davis Telephone System, Limited, 22, Southampton buildings, Chancery-lane, London.

5063. Improvements in accumulators for secondary batteries. Thorvald Tage Agathon Hansen and Carl Christian Frederik Ferdinand Petersen, 22, Southampton-buildings, Chancery-lane, London.

COMPLETE SPECIFICATIONS ACCEPTED.

To be published on March 30.

1900.

4198. Time apparatus for making and breaking telephonic and telegraphic circuits. De Lamprecht.

4383. Electric controlling apparatus. Lincoln.

4500. Self-locking elbow joint for electrical fittings. Hirst and Collings.

4561. Bearings and lubricants applicable to electric trolleys and other electrically conducting bearings. Cothias.

5389. Electrically-operated railway signals. Shoecraft and Gardiner.

6499. Electric meter depending on electrolytic transport of mercury. Lehfeldt.

6727. Electric contacts. Halford.

6768. Construction of vehicle or car wheels and electric motors therefor. Isbills.

7861. Electrical reciprocating apparatus. Brown.

8123. Electric light wall plugs. Oppenheimer. (Actiengesellschaft Mix und Genest.

8234. Electric rail bonds. British Westinghouse Electric and Manufacturing Company, Limited. (Redou.)

8427. Electrical presses. Kammerer.

9971 Method of utilising electrical earth currents. Jahr.

14139. Electric railways on the closed-conduit system. Purvis.

14568. Toll-collecting machines for telephones. Haddan. (American Toll Telephone Company.)

17453. Electric perforating and recording machines, more particularly applicable for use with musical instruments. Davis.

19394. Lampholder switches for electric lighting. Chard.

23417. Galvanometers. Blondel. (Date applied for under International Convention, June 6, 1900.)

1901.

2474. Transmitters for telephones. Mellett and Henderson.

Supplement to "The Electrical Engineer,"

MARCH 15 1901.

INSTITUTION OF ELECTRICAL ENGINEERS.

The Electrical Power Bills of 1900—Before and After.

BY WM L. MADGEN, MEMBER.

The introductory part of this paper consisted largely of extracts from daily papers, showing the views expressed in them concerning the business of this country. The author went on to say:

There may be some of us who find amusement in the comments of the daily papers on technical subjects, but it should be remembered that the articles we scoff at are read by thousands of those of our fellow-countrymen who make up those sentiments and influences which affect us seriously, and it seems full time that steps should be taken to place the responsibility for our backwardness where it belongs. We shall have to take our own part, or we shall find the public ordering German plant with the same complacency as they purchase German pianos.

There were then references to visits and to the value of such visits to works in other countries, after which came the real matter of the paper as follows:

What is the reason, then, that our electrical industry is behind that of nearly every important country in the world? It is due in the first place to silly legislation by Parliament and to obstruction by the numerous local authorities entrusted with arbitrary powers. In the second place, it is due to a class of quasi-officials and their associates, to whose direct monetary advantage it is that an opposition should be entered to every project in which they are not employed. There may be contributory causes, but to these and others that flow from them our chief difficulties may be assigned. Ere this Institution was founded an obstacle had been prepared for us. In 1870 was passed the Tramways Act to which I have referred, and these are some of its leading provisions. A tramway cannot be authorised by provisional order without the consent of the local authority of the district. If the proposed tramway is to run through two or more districts, and consents have been obtained in respect of two-thirds of the length, the Board of Trade may upon enquiry dispense with consents for the remainder. When the procedure is by provisional order the construction of the line can be absolutely blocked by notice given in the prescribed manner by one-third of the owners, or of the occupiers, of the premises abutting upon the road where, for so short a distance as 30ft. or upwards, there would be less than 9ft. 6in. between the outside of the footpath on either side of the road and the nearest rail of the tramway. The most onerous condition is provided in the notorious Section 43, by virtue of which the local authority can purchase a tramway at the expiration of 21 years from the date of the order, or of any subsequent period of seven years, on the terms of paying the then value of the tramway, exclusive of any allowance for past or future profits of the undertaking, or any compensation for compulsory sale, or other consideration whatsoever. We shall agree with Mr. Granville C. Cunningham, general manager of the Central London Railway, that "there is perhaps nothing that has done so much to prevent the relief of overcrowding and congestion as the Tramways Act of 1870. Its provisions in rigidly limiting the term of the concession to 21 years, and practically fixing the price at which the municipality may take over the undertaking at something far below its value, have effectually checked the growth of electric systems." If procedure by special Act is resorted to, the Standing Orders of the two Houses require in like manner the consent of the local authority, so that the undertaking is not furthered in that respect, and is equally liable to be bled for the purpose. The frontagers are given a *locus* to oppose, so that a small number of them are not so well able, through caprice or other motive, to prevent the construction of an important line; but the expense and risk of procedure by special Act have been sufficiently serious deterrent. I think the net results will justify us in agreeing with Mr. Balfour Browne that this same Tramways Act was "a very silly contrivance indeed."

Consider the waste of energy and of enterprise in battling against such conditions, and whether it is any wonder our countrymen have to complain that we are lamentably behind the rest of the world in the cheap and rapid transport facilities afforded by electric traction. We have pleaded that there is no country in the world which would benefit more than our own by the provision of comprehensive electric tramway systems, or that stands more in need of them to relieve overcrowding, yet their introduction has been slow and halting, and carried out in the face of bitter opposition. Instead of lending a helping hand, governing bodies seem to have thought they were doing the public a service by narrowing enterprise down to the scantiest possible outlets, and in some cases by establishing an effective blockade against it. Twenty-six years elapsed—near upon a generation—and it was not until 1895 that the repose of the Board of Trade was disturbed—a body curiously constituted and still more curiously named—and it was found that something really must be done. A commission was then appointed to consider the question of tramways and light railways, and as a result of their report the Light Railways Act was passed in 1896, only four years ago. But this was only a tentative provision—it expires this year, and unless some measure of enfranchisement is passed, we shall be thrown back upon the Act of 1870, which remains effective upon the Statute-book.

The other great department of our domain, the general supply of electrical energy for industrial and domestic purposes, is even yet almost entirely governed by the Act of 1882, which was passed at a time when "the state of the art" was such that electrical energy could only be supplied economically for a distance of a mile to a mile and a half from the generating station. In effect the legislation was made to match the fact that at least one separate station was then required for each town, and the town council was constituted the authority which could either undertake the work itself, or consent to the acquirement of the necessary powers by a company. In either case the Act contemplated the local authority being the ultimate owner of the local undertaking. The clauses as to consent, the period and the terms of purchase, were inspired by the spirit of the Tramways Act of 1870, and the effect upon electrical engineering as a national industry has been equally disastrous. The result was a fiasco. What did Parliament then do? Nothing until 1888, when it climbed down in a half-hearted way—analogous to its performance in connection with the Light Railways Act—and passed another measure extending the purchase period from 21 to 42 years, but leaving the onerous consent clause and the ridiculous terms of purchase as they were.

Until after the Act of 1888 we could do practically nothing in the way of establishing electrical supply undertakings. Circumstances were more favourable in America and Germany during those six valuable years, and, encouraged by the home demand, which is an essential condition of enterprise abroad, the manufacturing trades of those countries laid the foundation of their great export business in electrical plant and accessories, the consequences of which we are feeling to-day. America and Germany now hold the great bulk of the export trade of this character, not only to the countries of Europe, and to South America where this country has heavy financial interests, but also to our own colonies and the United Kingdom itself. You will remember that the whole of the steam-engines, dynamos, electric lifts, etc., for the Central London Railway were supplied from America, and many other examples will occur to you. As I have said, the legislation was in effect made to match the fact that in 1882 it was necessary to put down at least one generating station for each town, and the conception of the situation by many local authorities is shown by their persistent endeavours to wall themselves in, so to speak, against the improvements by means of which the area of economic supply has vastly outgrown such limits.

The Acts of 1882-88 and their administration have proved entirely congenial to the narrow exclusiveness of these bodies, who are endeavouring even now, in their opposition to the Power Bills, to ensure themselves against the developments of science and a cheap supply rather than impair the prospect of their being able to have an isolated municipal plant all to themselves some day or other. The statistics available afford us the following figures for 1901: Electricity works in operation—local authority, 130; company, 68. Undertakings for which orders have been obtained, but works not yet carried out—local authority, 212; company, 55. Of the 55 undertakings which have not yet been carried out by companies, only three of the provisional orders (not taken by transfer from the local authority) are two years old yet, and 32 of the remainder only date from last session. Many of the works are now in course of construction, and very few are being hung up in any way that I am aware of. Of the 212 orders not yet carried out

Digitized by Google

by local authorities, the works in 89 cases are, I believe, in course of construction or have been more or less decided upon, leaving a balance undecided of no less than 123. Under a provisional order, the time within which a supply should be available is two years from the date of the order, but of the 212 towns referred to a large proportion have exceeded that period, some of the dates tailing back as far as 1891, 1892, and 1893. The figures do not really show the full extent to which business is retarded, because no one has tabulated the local authorities who not only have not applied for a provisional order, but of whom it is known that they would have blocked any application; but the state of affairs is sufficiently shown by the fact that throughout the whole of the United Kingdom electricity supply under the Acts is only available to the public in some 250 districts. Now, we know that the consumer can procure his electrical energy on a more favourable basis for all concerned from an undertaking dealing with a comprehensive area and varied classes of demand than he can get it from a relatively small local station. This being the case, it may be supposed that it could only be a question of time when the obstacles, obstinate though they have been, to the cheap supply and to a large extension of the industry must give way somewhere.

The first break in the clouds was observed in 1898, when a Joint Select Committee of the two Houses was appointed (at the instance of the Lords) to consider and report upon a reference in regard to "Electrical Energy: Generating Stations and Supply." Time does not serve to detail the circumstances which led up to the appointment of this committee to describe the Bills then pending in Parliament, in which it was proposed to give effect to the developments of electrical science, nor can I read you the full terms of the reference or of the report,* but I extract the following paragraphs from the latter: "Where sufficient public advantage is shown, powers may be given for the supply of electrical energy over an area including districts of numerous local authorities, and involving plant of exceptional dimensions and high voltage. The committee further think that undertakings of this character may properly be authorised on conditions differing in some respects from those imposed by and under the existing Acts." "The committee consider that the provisions of the Electric Lighting Act, 1888, which require the consent of the local authority as a condition precedent to the granting of a provisional order, should be amended. In their opinion the local authority should be entitled to be heard before the Board of Trade, but should not have, so to speak, a provisional veto, only to be dispensed with in special cases by the Board of Trade."

It was the feeling of electrical engineers that the report was too moderate considering the attitude maintained by the local authorities and their notorious misuse of the powers conferred upon them by the Acts, but this feeling is turning to one of dismay at finding that during the two or three years which have ensued nothing whatever has been done to carry out the recommendation last mentioned—which is a full justification of much that I have urged—and that their exertions continue to be very largely wasted. It might be gathered from the continued lamentations of the Press that the electrical engineers of this country were likely to be put upon their defence, and this might, indeed, be a consistent involution of the legislation which has already tried us very severely in another sense, but it cannot be said that we have been slow to act upon any measure of encouragement available to us. This was true of the Act of 1888 so far as its provisions would allow, and there has been absolutely no hesitation or delay in turning to practical account the paragraph in the report from which I have just read, with reference to the supply of electrical energy over extensive areas, by means of plant of exceptional dimensions and high voltage. I have referred to the Bills pending in Parliament at the time of the report, and we must acknowledge the valuable pioneer work of some of our members in connection with them.

The Bill which affected our prospects most strongly, although it did not pass, was promoted by the General Power Distributing Company in 1898-9, and was familiarly known as the Warsop scheme, the project being to distribute electrical energy over an area comprised within a radius of 26 miles from Warsop, in Nottinghamshire. This district includes such populous centres as Sheffield, Rotherham, Nottingham, Lincoln, Doncaster, Derby, and Chesterfield. The powers sought were to lay trunk mains throughout the area, to give a supply of electrical energy except where the local authority was itself empowered to supply under an order or Act and agreed to take a supply in bulk from the company on arbitration terms. To supply direct in all cases to consumers taking 10,000 units per annum and upwards. The conditions in regard to district, etc., were favourable, and large quantities of coal slack were available at 2s. per ton in the neighbourhood of the proposed power station. The Bill, as we know, did not then pass, but the powers which it sought to obtain have a considerable interest from the point of view of to-day, as in varying degrees they are reflected in the four Power Bills which were passed last session.

Before summarising the considerations relating to the supply of electrical energy over extensive areas, it will be convenient to follow the course of events. Public opinion became gradually informed on the subject, and, it is to be hoped, a little moved at the sense of national backwardness, and in the session of 1900 four Electric Power Bills, each for supply over important English areas, passed through Parliament. These were:

The County of Durham Electric Power Supply.—This area, about 250 square miles in extent, comprises the main portion of the Durham coalfields and one of the leading manufacturing and shipbuilding districts of the north-east coast. Provisional orders had been obtained authorising the retail supply to consumers in the chief towns—viz., Gateshead, Jarrow, and Durham City. The British Electric Traction Company had undertaken an extensive system of electric tramways in Gateshead and district, and have since obtained powers for lines in the Jarrow and Durham city districts. The Power Act authorises the laying of trunk mains throughout the area, and the supply of electrical energy in bulk to undertakers authorised to supply, and also to undertakers authorised to use it for prescribed purposes. Thus the supply may be given at once for general use in Gateshead, Jarrow, and Durham City, and for electric tramways and light railways in Gateshead, Jarrow, and other parts of the county. The first portion of the main power station on the River Tyne at Gateshead is rapidly approaching completion, and will be available this spring for a comprehensive system of supply which is being prepared in readiness for it.

The North Metropolitan Electric Power Supply.—This area, about 325 square miles, includes the great suburbs to the North of London, from Tottenham on the east to Harrow on the west, and the growing manufacturing districts along the River Lea. It covers the area within which the extensive North Metropolitan electric light railway has been carried through by interests friendly to those of the Act. The provisions and general considerations are the same as in the County of Durham Bill, and the same general policy was followed.

The Lancashire Electric Power.—This Act takes in the whole of Lancashire south of the River Ribble (except Manchester, Salford, Bootle, and Stockport), an area of about 1,000 square miles. The district may appear somewhat large, but a great part of it is undoubtedly very suitable, since it comprises a large number of collieries, engineering works, cotton mills, and a variety of other industries. The Act contains powers to lay trunk mains throughout the area, and to furnish electrical energy in bulk to undertakers authorised to supply, the promoters having relied upon the cheapness of production at large generating stations as sufficient to secure holders of electric lighting provisional orders as customers for bulk supply.

The South Wales Electric Power Distribution.—This includes the whole of the county of Glamorgan and extends into Monmouth as far as the River Usk (also including Newport), an area of about 1,050 square miles. The principal towns are Cardiff, Swansea, Newport, Barry, Merthyr, Pontypridd, and Neath, and the district thus comprises the great colliery, shipping, and manufacturing districts of South Wales. The provisions of this Act are similar to those of the Lancashire Act, with one important difference. The South Wales Company were given powers to supply direct to *any* person for power purposes, and for lighting any premises on some part of which the power is utilised, provided only that in a local area where an electric lighting provisional order exists, the consent of the authorised distributor in such area is first obtained. If such consent is withheld, the Board of Trade may dispense with it if, in the opinion of that body, the authorised distributor under the provisional order is not willing and in a position to give the requisite supply to the power user upon reasonable terms and within a reasonable time.

All these Acts contain a sliding-scale clause as regards prices and dividends, also powers for the revision of the scale every 10 years by the Board of Trade, 8 per cent. being taken as the normal maximum dividend. The general clauses follow pretty closely the usual electric supply practice; for details reference should be made to the Acts themselves. There are a few examples of groups of provisional orders having been obtained for adjoining districts by arduous negotiations extending over several sessions. These undertakings typify many of the difficulties with which electrical engineers have had to contend, but they are not more fully referred to here as the form of procedure was not by Power Bill. There is, however, an important Northumbrian undertaking dealing with the north bank of the

* In the House of Commons, July, 1898, Mr. Ritchie, replying to Mr. Kimber, said that the report of the Joint Committee would be carefully considered by the Board of Trade, but legislation would be required to give effect to some of the committee's recommendations, and he was afraid that the prospect of passing a Bill through that session was very small. The prospect must have been small indeed, for the process of official consideration has extended not only over 1898, but also beyond 1899 and 1900.

Tyne from Newcastle to North Shields (excluding the latter) with part of the hinterland, which belongs to both classes and should not be omitted from the list, especially as it has been one of the first to get to work. The main purpose of the Power Acts is to keep the number of power stations within economical limits, and by the selection of suitable sites and the equipment of works of considerable magnitude to enable electrical energy to be transmitted in such a manner that the retail price to the consumer will be reduced to a figure which will compare with, and in many cases be far lower than, that of any other form of power, whether gas, steam, oil, or other agent. The enormous development of electricity in the United States and Canada and on the Continent of Europe, and the numerous great electrical power distributions over large areas in those countries, are in themselves practical evidence in favour of the principles we are advocating. It cannot be urged that the requirements of this country, so far as trade and cheap production are concerned, are different to those obtaining in the countries mentioned.

The absence of undertakings of the kind in the United Kingdom has not been on account of any difficulty or impossibility on the engineering side, or from lack of suitable conditions. We have few large water powers it is true, but there is an equally good source of power available, and coal in this country can replace, on favourable terms, the water power available elsewhere for the generation of electrical energy. Moreover, even in those parts of the country where coal is more expensive than in the coal districts themselves, relatively cheap electricity may be available if it is generated in sufficient quantity at large power stations, and the supply from such stations is distributed over a suitable area. Capital charges, management, rent, rates, and taxes usually form a larger proportion of power station costs than fuel, but the greater the importance we have to attach to the fuel item, the more necessary it is to adopt the most comprehensive methods and to concentrate and economise its use. Under the Electric Lighting Acts and the conditions heretofore existing, the scarcity of the electricity supply in this country has been due to the high cost of production. Even in the more developed areas the cost has been too high, as a general rule, to admit of its being freely used by the consumer on terms more advantageous than those upon which he can employ steam or gas for industrial purposes, or gas or oil for domestic service. Statistics have shown us that the average cost of production and supply to consumers becomes lower as the output of the power station increases, but the difference between stations supplying one million and four million units per annum is less, and not in proportion to that obtaining between smaller stations with much less difference of output. Without an increasing "diversity factor" this difference would tend to disappear as stations increased in size. A good "diversity factor' can only be achieved by combining with electric lighting the supply of energy for as many and as various other purposes as possible, and, so far as lighting is concerned, the supply to every class of consumer. As the area of supply is extended, the "diversity factor" tends to improve owing to the difference in the incidence of the demand in different districts.

I shall not attempt to follow the more technical aspects of the subject just now, as they afford scope for many papers, and certainly for more discussion than you can give to them this evening; but it may be well to summarise the points for and against the old system and the new—*i.e.*, the supply from small local stations and the supply from main power stations.

Supply over Comprehensive Areas from Main Power Stations in Selected Positions.

Advantages.—(1) Comparatively large field for development; (2) high load factor obtainable, all the plant being used to the best advantage; (3) cost of fuel and handling can be reduced to a minimum, as the power station can be located where fuel is cheapest, fuel handling most economical, and water is available for condensing; (4) low running costs, management expenses, and maintenance per unit sold, as the result of a very large and regular output; (5) the low cost of plant per kilowatt installed, and the increased economy in running with very large sets; (6) low rents, rates, and taxes (the difference between town and country); (7) economical provisions for extensions to plant and buildings; (8) low costs and charges for electrical energy for all purposes possible in consequence of above advantages; (9) removal of the power station with its chimneys, etc., outside the residential district.

Disadvantages (from point of view of local authority).—(1) The transmission mains must pass through their area whether supply be taken or not; (2) sentimental preference for complete independent plant of their own.

Supply in Small Local Areas from Separate Stations.

Disadvantages.—(1) Small field for development; (2) relatively low load factor; (3) cost of fuel, handling it, and water supply depend on immediate local conditions, favourable or unfavourable; (4) high running costs, management expenses, and maintenance, the costs per unit sold being generally higher the smaller the station; (5) higher relative cost of machinery per kilowatt installed, and lower economy in running; (6) rents, rates, and taxes relatively higher; (7) the extension of buildings is frequently very expensive, owing to disturbance and other difficulties incidental to town sites; (8) high charges for electrical energy for all purposes as result of these disadvantages.

The story of George Stephenson and the cow on the line has come down to us as typical of the prejudice and the ignorance with which* railways had to contend in their early days; and so, too, when the early history of the electrical industry comes to be written, the part played by the local authorities in their strenuous opposition to the Power Bills will be a record of reproach to them. For the purposes of this opposition there was a conference of local authorities in Manchester in January and a meeting of the Association of Municipal Corporations in May. The object of the first meeting was to prevent the second reading, and that of the second to influence the decision of the Parliamentary Committee. The methods adopted by those who endeavoured to wreck the Power Bills were strongly condemned in the course of the second reading debate, and the President of the Board of Trade found it necessary to repudiate a garbled report which had been circulated as to his remarks upon the Bill for the Warsop project in the previous session. Everyone interested in the welfare of the industry should read and think over that debate. True, the Bills were read a second time and committed, but what a curious light is thrown by the discussion upon the difficulties with which we have to contend! Perhaps there is time to mention two examples. Mr. Ritchie said: ". . . I hope the House will give its attention to the very important considerations in this case before they decide to reject on second reading a Bill that, it is fraught with so many possibilities. It is true, I think, that the electrical enterprise of this country is in an exceedingly backward condition; it is inferior with regard to light, and certainly with regard to the conveyance of power, to many European countries, and it is greatly inferior to North America and Canada. It may almost be said that there are villages in North America which are in possession of advantages in connection with electricity which some of our largest towns do not possess. It cannot be doubted that there is a demand for something to be done. At present electric light matters are governed largely by the legislation of 1882, and it has been said that this Bill is largely in opposition to many of the enactments in the Act of 1882. If no other charge or argument could be brought against this proposal, the argument of the opponents to this Bill would indeed be weak. It must be remembered that it was the Act of 1882 which more than anything else had delayed and hampered the development of electrical supply, and in so far as this Bill departs from that Act, I think its departure is amply justified by the condition of things at present existing in the electrical world." Here we have a member of one of the strongest Governments of modern times, the Minister entrusted with legislation affecting the trades of the country, who has realised the extent and cause of our backward condition in relation to a great industry, and ingenuously confessing that during five long years of office one of the main causes of the trouble has remained effective upon the Statute-book. Sir William Harcourt said, ". . . I do not altogether share my hon. friend's (Mr. Broadhurst) objections to great enterprises being carried on through private sources. That was a question which occupied 50 or 60 years ago the attention of this country, and that was at the time of the commencement of the great railway interest. That question was decided by the wisdom of the great statesman Sir Robert Peel. We know that Sir Robert Peel was much attacked at that time for throwing the railway enterprise of this country into private hands, and not adopting the system so largely followed on the Continent. I look forward to this question of electricity and electric supply as the great question of the future, and it is from that point of view that I wish to refer to the subject. If this company is prepared upon proper conditions to supply electricity to any part of the country, I am not opposed to that. No man can say to-day what part electricity may not play in the industry of the country, and that is a point which the House of Commons should keep in view. But what are the conditions which ought to be imposed? What was the policy which was pursued with regard to the railway companies? Parliament did not leave it altogether to particular promoters of Bills; Parliament did not leave it to the discretion of individual committees. They placed the whole of that great enterprise, upon which more than a thousand millions of private money has been expended, greatly to the benefit of the country—a sum larger than the National Debt, and now paying interest

* In 1801 we had no railways in the sense we now use the term. To-day the railways of the United Kingdom extend to about 22 000 miles of line, constructed at a cost of about 1 300 millions of pounds. The annual gross receipts now exceed 100 millions, and of the expenditure, which amounts to over 60 millions, fully one half is distributed in wages to over half a million employés.

Digitized by Google

at least of 4 per cent., and one of the greatest investments for the savings of the country—under general legislation. I think that a model which we ought to follow in this instance. But what was the method which Parliament in those days adopted in dealing with the railways? They did not allow particular promoters to take their chance in individual committees. They placed the whole of that great enterprise, as I have said, under general legislation. . . ." This statement of Sir William Harcourt goes to justify the charge that the Legislature has neglected an industry the importance of which he describes in suitable terms, and it also leads us to the economic aspect of the question. Comparisons have been drawn between the benefits first derived by every class of our community from the applications of steam power and of railways, and those which have accrued to other nations in larger measure than to ourselves from the uses of electrical energy. The United Kingdom itself has not yet lost any material part of its natural advantages for the manufacture of engineering material, or of scope for their employment. In what way has destructive legislation acted so as to place us in the position of inferiority we are reproached with to-day? It has, among other things, tended to destroy cumulative investment effect. Savings out of the profits of a business tend to go back, as an additional investment, into that business or some department of trade allied with it. Part of the profits derived from railway enterprise undoubtedly went in again, and attracting new capital to it, provided means for building new lines and for equipping rolling mills, foundries, engine works, and other undertakings which have provided employment for thousands of our fellow-countrymen. No influence has done so much during the past 100 years to stimulate enterprise, to encourage commerce, and to develop the resources of any country.

In our own time legislation has not only deprived the great mass of the people of the direct benefits of electric science, but it has made much of what little has been done indistinguishable to the investor from local government loans for drainage, refuse destructors, slaughter-houses, and other purposes most necessary in themselves, but somewhat in the backyard of civilisation. It may be replied that Sunderland, for instance, has just declared a profit out of its municipal tramways, but what advantage has this been to anyone? The fares have been substantially the same as would have been charged by private enterprise or the amount would not have been earned. The local rates we may be sure will not go down, and if they are a trifle lower than they otherwise would have been, those to benefit most will be the railway company and other large ratepayers who have contributed least to the tramway revenue. The banks, insurance companies, and such institutions which provide much of the local government loan capital will get their 3½ per cent., and part of it may be reinvested in colourless loans elsewhere, but of that great encouraging influence towards the growth of healthy industry which I have imperfectly described as the cumulative investment effect, there will be little or nothing. And the money for the purpose has been deflected elsewhere. The subject is a complicated one, and it may not be in place to follow it here, but it is a significant fact that, *exclusive* of foreign loans, the yearly increase of capital from this country invested abroad averages at present about £30,000,000. One tendency of this has been to set more people to work abroad instead of at home, and to increase the competition against home industries. In the interests of which class of the community the enactments I have referred to were passed and have been administered by the various authorities, it is difficult to say. They have not benefited the general public, the complaint made on their behalf is that they are debarred from the advantages of electricity; and least of all have they benefited the working-man, who finds that while the electric light and comprehensive electric tramways are not for him, hundreds of thousands of pounds' worth of foreign-made plant and accessories are landed on our shores. The working classes have suffered in another and, perhaps, a more serious way from the division of the country under innumerable local authorities endowed with powers such as I have described. The more or less arbitrary boundaries of these authorities, derived in some cases from the Middle Ages, are not and cannot be adapted to one and all the various means by which science and enterprise can be brought to the aid of the general community, and it can be shown that in practice the system tends to aggravate some of the grievous social and industrial problems of our own times. These authorities number among them men of great ability and benevolence, but their collective action is frequently controlled by traders, property owners, and others who act upon the view that the best interests of their several districts lie in the direction of increase of ratable value and of population. Add to this a large official class alive to the advantage of increasing the importance of its own environment, and there need be little wonder that each district shows a tendency to "cuddle up" all it can attract, and that there should be grave reason for our being urged "to get rid of that which is really a scandal to our civilisation, the suffering which many of the working classes have to undergo in order to obtain even the most moderate, the most pitiable accommodation." There may be many fibres to the scandal of the housing of the poor, but the conditions most favourable to its growth are to be found in our system of local government and its administration.

The future of the electrical profession is so interwoven with social questions that we cannot escape their consideration. Mr. Balfour has said, "I believe that electrical traction is going to play a far larger part in the solution of this difficulty"—the housing of the working classes—"than any of the strange schemes I have analysed"; Mr. Lough that "It has been agreed by everybody that the chief means of improving housing accommodation is to spread out the city and destroy congestion, and it is agreed that there is no way of doing this effectually except by providing better facilities for traffic." No one can question the advantages of improved traffic facilities, but if the direction morning and evening is to and from a congested trade centre the problem is only half solved. It is to electric power distribution on a sufficiently comprehensive scale to adapt the country districts to manufacturing purposes, in company with inter-urban connection by means of electric traction, that we must look for the greatest agency in ameliorating the conditions of the working classes in all their surroundings. It can scarcely be asked what has all this to do with the Institution of Electrical Engineers, for we have seen that the community is conscious of the backwardness of our work, and faced by social phenomena such as those to which I have referred, we are called upon to perform our part in counteracting them. Electrical science is ripe for the occasion, and it therefore appears to be our duty and to our interest to convince the Legislature as to the means it should take to enable us to carry on the services assigned to us. As some technical objection might possibly be raised to any action we may take in this direction, we shall find, on consulting the memorandum and articles of association, which describe the scope and general organisation of the Institution, that (among allied objects) it was established "To promote the general advancement of electrical and telegraphic science and its applications, . . ." (Section 3 B), and "To do all such other lawful things as are incidental or conducive to the attainment of the above objects" (Section 3 D). Article 53 says that "It shall be the duty of the Council to adopt all due means for the advancement of the Institution; to provide for properly conducting its business in all cases of emergency . . ."; and a preceding Article 49 provides that ". . . the Council may appoint committees chosen from their own body, and committees for special purposes, consisting of members of Council and members, associate members, or associates of the Institution and others, with such powers as the Council may prescribe."

Thus the terms of our constitution not only authorise action being taken, but they also appear to intimate the course to be followed in dealing with any obstacles with which we may have to contend, and I trust that the discussion will give the Council an indication as to the desirability of appointing a special committee, as provided by Article 49, to consider what steps should be taken to remove the restrictions upon us, some of the effects of which I have endeavoured to describe.

Discussion.

Prof Perry (the president) read a letter from Mr. Vesey Knox regretting his inability to accept the invitation of the Council to be present that night. He had read Mr. Madgen's paper, he wrote, and the question involved seemed to him to be altogether one of price. In the case of tramways no doubt other considerations operated, but so far as mere electrical supply was concerned, Parliament had now in principle decided that any company offering economical advantages should be encouraged, of course with due regard to vested interest. In his opinion it was in the power of companies practically to force local authorities to take current by offering it at a cheap price. Capital expenditure on the part of such authorities would thus be saved. It was in the interest of companies to supply the current cheaply, because the cost of supply at a high rate was much greater than the cost of supply at a low figure. In some ways it was a pity that the sliding-scale clauses were not applied to electric lighting undertakings, instead of the clauses giving the Board of Trade power to alter the scale of charges after seven years. The sliding scale had now been applied in the case of the Power Bills, and it was to be hoped that this would have a natural commercial effect upon the undertakings.

Mr. R. Percy Sellon said so much of the time of the Institution was taken up in the discussion of subjects of a purely scientific character, that it was seldom they had before them a paper of the kind Mr. Madgen had read, which dealt with electrical engineering questions from their political and industrial aspects. The paper went into details and touched the very foundation of the issues upon which the life or death, the success or failure, of electrical engineering depended. In his opinion, therefore, the paper was one of great importance, and its chief interests fell under two heads. First of all, there were the intrinsic interests attaching to it, and then there was the matter viewed from the collectivist or political standpoint. With regard to the first, Mr. Madgen had

Digitized by Google

drawn up fully and fairly the *pros* and *cons.* of these large power distribution schemes which depended upon that question. Was it in the interest of the public as a whole that there should be a few large distributing stations distributing over large areas, or a great number of small stations distributing over small areas? Having regard to the fact that at the present time everything was making for the consolidation of industries in all directions, he thought the intrinsic merits of the large power-distributing schemes over the small stations located from town to town were clearly established. It was a reproach to the Institution that they should debate over the question as to whether these schemes were possible while countries which were far behind England in point of industrial progress had solved it, and were still solving it by such stations as Niagara in America, and other. Why was it that they were in that backward state? It was because the progress of the electrical industry in England was not being determined by its intrinsic merits, but from the political standpoint. The industry had come to be the plaything of politicians, and of those who were advocates of municipalisation in the interests of the democracy. That was the real explanation of the fact that in that country they were quite without those large distributing stations, while abroad they were already in existence. In the case of electric lighting, the Legislature retarded the growth there; and with regard to tramways, the Act of 1870 was only after great difficulty amended by the Light Railways Act, which had really given electrical tramways the possibility of existing. Parliament had banded about electrical concessions in such a way that it was very small wonder that the investor could not be got to believe that there was for him a commercial advantage, at least, in going in for electrical enterprise. They in England possessed all the advantages—materials, finance, technics—which their great rivals in America, Germany, and Switzerland had, and the theory that the matter would in the end muddle itself out was one which he contended must be dismissed. The practical question was, what could their Institution do in its own sphere to add its quota towards the removal of the disability under which the industry suffered? He contended it was open to the Institution to take a more active interest in the support of those bodies, associations, and individuals who were engaged in trying to better the conditions in which they worked. Of course, there was the legislative question which just now was menacing the development of the tramway industry and the electric lighting and power distribution schemes. He trusted that the reception which the Institution would give to the paper before them would strengthen the hands of the Council in feeling that the body of the members was behind them in lending the weight of authority of the Institution in the support of any measures which would help to remove the disabilities which the industry was subject to.

Mr. J. S. Raworth agreed as to the great importance of the subject. The two main points were: were electrical engineers behind the position which they ought to have achieved? and, secondly, what were the causes which had brought that lagging into existence? He would compare the position of the gas companies with that of the electrical undertakings in this country. The total revenue of all the electric light and power undertakings in Great Britain and Ireland was £1,606,000 per annum. It would perhaps astonish the meeting when he told them that the revenue of the gas companies in the two years from 1896 to 1898 had increased from 19 millions to 21 millions odd, the exact increase being £1,600,110 All that ought to have gone into electrical engineers' pockets. In the face of all the electric light stations in the country, it was the fact that the gas companies had been able to steal that amount of money from electrical engineers and put it into their revenue account. Further, the profit which the three large gas companies in London made per annum was £1,630,000, which was greater than the revenue of all the electric light undertakings put together. Who could say, then, that their industry had not been choked. His objection to municipal trading was based on the ground that corporations did not manage business as well as companies. Besides, the companies could supply the article at a lower price than could municipalities. It was only on account of the growth of tramways and electric lighting that the new principle was introduced of giving the advantage to the corporation as against the company. In the great industry of gas there was no advantage to the municipality that the company did not enjoy. There were two or three provisions of the Act of Parliament which brought about the present state of affairs from which they were suffering. In 1882 the Legislature made it almost impossible for any electric lighting stations to be established, because the necessary capital could not be raised. That matter was somewhat mended by the purchasing clause being altered from 21 years to 42 years, but even now it was a difficult matter to get capital for these undertakings. If the legislative restrictions were removed, and private undertakings were put on the same terms with municipalities, he foresaw there would be no further trouble.

Mr. A. A. Campbell Swinton deplored the fact that they did not have more discussions like the present at the Institution. Mr. Madgen had given the reasons for the backwardness of the electrical industry in this country, but until only a very short time ago engineers would not have agreed with these. They would have said it was due to the speculation which took place in 1882 There was no doubt at all now, however, that the primary reason why the industry was so backward was because of the Tramway and Electric Lighting Acts, and the administration of those Acts by the Board of Trade. He had been led to look into the constitution of the Board of Trade. He had consulted several books on the subject, one of which told him that the Board of Trade had been in existence for some centuries, and after leading a chequered career was entirely suppressed. This, however, he did not believe. The "Encyclopædia Britannica" explained that the Board of Trade was formed of high officers of State, including the Lord Great Chamberlain and, *ex officio*, the Archbishop of Canterbury. This work went on to state that the Board of Trade was seldom called together, and existed merely in name. That really went, to some extent, to the root of the present state of affairs. If they would follow the example of Oliver Cromwell, and appoint to the Board of Trade a number of citizens who would be representative of the industries of this country, it would be a good thing. Placing any new industry in the hands of municipalities must necessarily lead to that particular business proceeding very slowly. Corporations could not speculate with the ratepayers' money, and, therefore, could only go in for a business the success of which was absolutely assured. That was one great objection to municipalisation. Private enterprise was the only legitimate way of trying new work. Speakers had alluded to the fact that it was not easy at the present time to raise money for electrical schemes and, again, he thought the reason was largely because the larger portion of the electrical industry was in the hands of municipalities. In Newcastle, a town with which he was familiar, there were two companies, both of which were prosperous. Both the Scarborough and the Cambridge electric lighting companies were almost entirely capitalised from Newcastle, which showed that the people there found the enterprises in their own town profitable. If the electric lighting undertakings at Edinburgh, Glasgow, Liverpool, etc., were in the hands of companies paying 10 or 12 per cent., there would be no difficulty whatever in getting any amount of money. What was required now was that some body representing the electrical industry should assert themselves. Parliament was pushing all it could for municipalisation, and it wanted someone to push the other way. He thought this Institution might do it to a certain extent.

Mr. Atherley Jones, K.C., M.P., admitted that Parliament had been perhaps remiss in the efforts which it might have successfully made in order to encourage and develop that great enterprise, which, whether it were traction or whether it were lighting, had had such marked success in other countries, but which in this country, through causes which had been traced by Mr. Madgen, had not met with corresponding success. He thought probably they would all agree, however, that within the last few years at any rate there had been a growing tendency on the part of Parliament that the interests of the community could perhaps be better served by deferring to the dictates of private enterprise rather than to municipalities. He was far from saying one word which would reflect on the municipal government, but they had perhaps coddled the municipalities a little too much. One of the greatest hindrances to the development of electrical enterprise had been the veto which could be exercised by local authorities over private undertakings. That, he thought, would be removed before long. Parliament, in passing the Power Bills last session for the county of Durham and a certain portion of Wales, recognised that the effect of municipalities was to over-ride the interests of private bodies. The Bills now before Parliament were likely to meet with as much opposition as those he had just mentioned. He thought even that much-abused body, the Board of Trade, would admit that it was desirable that facilities should be offered—to what length it was impossible to say—for tramway and light railway companies to construct under more favourable conditions, so as to provide a means of communication from the centres of industry to those places outside the large towns, where the working classes could get cheap and healthy homes. If the President of the Board of Trade, who, he thought was desirous of promoting the well-being of the public in this direction, would devote his attention to carrying through the Light Railways Act which was to some extent to succeed the present Light Railways Act, and probably part of the Tramways Act, it would in no small measure lead to the greater development of the electrical industry in this country. He had been able to induce the President of the Board of Trade to receive a deputation and to disclose the precise scope and direction of the new Tramways Act, and these matters which Mr. Madgen had dealt with would undoubtedly be laid before the President before long, and, he hoped, would bring forth good fruit.

Dr. S. P. Thompson thought they were all indebted to Mr. Madgen for his paper, for he doubted whether a more important topic could have been brought before the Institution at the present time. To be able to supply electrical power to their industries was a national question. It was sometimes thrown against them, when they advocated the establishment of these large power stations and adduced practical reasons why they should be encouraged, that all the power stations abroad were worked by water, whereas in this country they had no such driving power. That argument could not be admitted. In the first place, water power was not to be had for nothing, and if they had waterfalls in this country the owners would want payment for the use of them. The price for the same would be estimated on the cost of running the works by some other power. The problem was how to make use of the natural sources they had, whether it were coal or water. The dearer the power was in itself, the more was there to be gained by distributing that power as economically as possible. He would ask Mr. Madgen to give some information as to the relative working of large stations by coal as distinguished from large stations worked by water power. Another thing he would like to know was, what

Digitized by Google

was the proper basis for reckoning out a suitable size of unit for a big power station? Up to now, facts as to this had never been stated in a compact and concise manner which could be used for convincing those who could not at present be convinced. Was it true that when they got a station up to the size of 10 000 h.p., it did not pay to go on increasing it to 20 000 h.p.; that it was better to put up another station a short distance away? Was there, in other words, a limit of size where an increased output would decrease the profits? In Bradford, practically all the industries which required electric power were textile, and began and left off work at the same hours. That was certainly not one of the most favourable conditions for the supply of electricity, as everyone knew it was much better to have a variety of industries taking the supply working at different hours of the day. Therefore, in determining the unit, they must consider the different places all over the country, and the circumstances under which the supply was made at each. When one compared the state of things in Italy—comparatively speaking, a poor country—and saw how station after station had been built, one felt perfectly ashamed of what was going on in this country. While in Bradford he found a firm which was supplying looms to the textile industry of Lombardy, each of which was fitted up with a three phase motor, whereas in Bradford itself the firm had not supplied a single loom electrically fitted. They now came to find that a central station was an absurdity. It was far better to have the station outside, which did away with the necessity of carting coal and other materials into the heart of the towns. A few large stations outside the towns would pay a great deal better than a number of small stations inside, each serving its own particular district. He would close with a parable. In Aldgate, in the City, there was the old village pump surviving to this day. The time was not far distant when these pretty little electric stations would be looked upon as being just as useless as the Aldgate pump was to-day for supplying water to London.

Mr. R. Hammond said that during the discussion of the Power Bills last session before Sir James Kitson's Committee, some vital interesting engineering questions arose in connection with the generation of electrical energy at centres of distribution, and of energy for large areas. These questions still awaited decision. They were: (1) what was the limit of distance from the generating works to supply the consumers beyond which the extra cost of distribution counterbalanced the advantages of concentration of plant; (2) what was the limit of kilowatts installed in a central station beyond which economy of centralisation of plant ceased; and (3) what were the means that were going to be adopted in order to preserve, over a large area with various consumers, large and small, pulling at the line, uniformity of pressure so as to be able to give electric light within efficient limits? The paper before them had an excellent title, but not one of the engineering questions which they, as electrical engineers, were interested in was touched upon by the author. The paper might be summed up under about four heads: (1) a lament—a dirge, he might almost say—over the fact that they in this country were terribly behind in electric lighting; (2) an intimation that this backwardness was due to the ignorant Legislature, to the foolish Board of Trade, and to the selfish local authorities; (3) an intimation that what they should do was to copy the Germans and Americans; and (4) an appeal to this Institution to form a committee in order to make the path of the company promoter at all events a little smoother. He was glad to be there that night to say that he distinctly dissented from these four propositions. The real reason why we were behind in this country in electric lighting was that they had to compete with gas at 2s. per 1,000 cubic feet. Throughout America and the Continent gas was abnormally high in price, and that was why the electric lighting undertakings flourished in those countries. Mr. Madgen said the backwardness in this country was due to local authorities. That was an absolutely mistaken idea to nourish. As matter of fact, out of the 25 millions of money spent on electric lighting undertakings in the United Kingdom and Ireland no less than 14 millions had been contributed by local authorities and they, he thought, owed a great debt of gratitude to them. Local authorities could produce electricity at a price hands down below companies. Then as regarded Germany, they heard a lot about the wonderful power schemes there. As a matter of fact, practically all the largest works were owned by municipalities. He also disagreed with the suggestion that a committee should be formed to put these local authorities right and to straighten out the Legislature. It would be better far if some member—he could not because he was a member of the Council—would move an amendment that a committee be formed to consider the engineering questions connected with power supply, and to report to the Institution to what extent the power schemes are likely to overcome the present difficulties.

Mr. S. Morse suggested to the last speaker that his speech was one better undelivered. He regretted that Mr. Hammond had stated that being a member of the Council he could not himself move an amendment. He might have said he did not dare to move it. The present position of the electric lighting industry was largely due to the unreasonable conditions put in the way of its progress by local authorities. He agreed that Parliament was responsible for many of them, but local authorities had gone further, and entered into an alliance by which they exercised an undue influence, which ought not to be permitted, over members of Parliament when these matters came before the House. It was essential for the industries of this country that there should be available to every manufacturer a supply of electric power at rates which would enable him to compete with his foreign competitor. Last session a body of local authorities went to the President of the Board of Trade, and said in effect, "If you sanction these Power Bills, we will vote against you on every question." Whereupon the Bills came out of committee with the decision that nothing should be done affecting local authorities unless they desired it. Local authorities wanted to spend the largest possible amount of money on their electrical schemes, and did not work from the point of view of giving a cheap supply to manufacturers. He was surprised to hear Mr. Hammond make the statement that because 14 millions had been spent by the local authorities on electric lighting schemes we should be grateful. That sum was a very small part of what would have been spent had companies had a free hand. Traders had a right to have their schemes discussed on the merits, and the veto given to local authorities to prevent that being done ought to be abolished.

Mr. G. L. Addenbrooke largely agreed with Mr. Hammond—at any rate, as regarded his facts; but he thought he had drawn wrong inferences from them. The fact was that, while on the Continent electric light and power had been supplied for the last seven or eight years, we in this country had done practically nothing in power supply. If proper regulations putting private enterprises and local authorities on even ground had been passed, instead of the Electric Lighting Acts some years ago, they would have seen the industry in a far more advanced position than it was at present. By the end of this session of Parliament something like £100,000 would have been spent in promoting these Power Bills. It was perfectly true that in Germany and Switzerland practically all the power schemes were in the hands of municipalities. As stated by Mr. Hammond, the engineering question of the subject ought to be discussed by this Institution, but each power scheme must be dealt with on its own merits. Unless local authorities could see absolute detriment to themselves by the passing of the Power Bills, a free hand should be allowed as far as possible.

Mr. E. Garcke said he felt very strongly on this question, and if he had followed Mr. Hammond, as requested, he was sure he would have been discourteous to him. That gentleman was once a company promoter himself—an occupation which he now looked down upon. He much regretted that Mr. Hammond should have put forward statements which were so misleading to the younger members of the Institution, where he had looked for a fair-minded view of that very complex question. Mr. Hammond wanted them to be thankful that the municipalities had spent 14 millions on the industry. As a matter of fact those who were capitalists would have spent that sum five or six years previously had they had the chance. He must say he was strongly in favour of municipal enterprise, but he did think it was not one of the provinces of local authorities to take the profits of trade from private individuals and put them in the pockets of collective capitalists of local authorities. He would undertake to refute any suggestion that gas had been an obstacle to electric light. Another argument Mr. Hammond used was that the local authorities supplied electrical energy at a lower rate than companies. His (Mr. Garcke's) argument was that if the corporation undertook to supply electric light at all, they should do it in the common interests of the community. The lower the price the better they could do their work, and on this ground he contended that the municipalities were able to carry out certain undertakings better than private companies. The backwardness of the electrical industry in this country was due to a plurality of reasons—social and political, among others.

Prof. W. E. Ayrton thought the paper was well worthy of their most careful consideration. The science of electrical engineering comprised the application of correct reasoning of all that appertained to the electrical welfare. He ventured to think that there was a certain obscurity of logic at the beginning of the discussion, for it was endeavoured to be proved that the electrical backwardness in this country arose wholly from the obstruction of local authorities. He was not there as a champion of officialism, but no one had been more anxious to see the wide development of the electrical industry than he. Taking the example of the Metropolitan Railway, why were the trains not run electrically to-day? Was this stagnation not rather due to the lethargy of the chairman and directors of a private company than to any restrictions imposed upon them by the kingdom, Parliament, or the County Council. The Bill to sanction the running of the Inner Circle electrically became an Act of Parliament four years ago, and yet ——. There were endless like examples. Coming to the question of the distribution of electrical energy, was it the fact that in those districts which were under the control of municipalities electrical energy was always so dear, and in other places where private companies ruled it was so cheap? He did not believe it. He knew of an instance where a large private company refused to supply energy in bulk to the local authority at less than 3d. a Board of Trade unit. Needless to say, the offer was not accepted.

Mr. C. B. Clay, of the National Telephone Company, referred to the case of the telephones in this country. He proceeded to read editorial extracts from the *Times* of June 13, 1884, with a view to showing that the Government threw every possible obstacle in the way of the introduction of telephones. One extract ran: "It is much to be wished that Parliament could find time to liberate the telephone from the bonds of red-tape, and allow its future to be shaped by the operation of the ordinary laws of economy," and drew the moral that the practical applications of science could not be prosperously committed to the hands of the Government. This, said Mr. Clay, applied not only to telephones, but to all branches of the science. One of the conditions on which

Digitized by Google

the company were allowed to open up call offices was that they should charge 1s., and half of this went to the Government.

General Webber rose to a point of order, complaining that Mr. Clay's remarks were irrelevant to the question before the meeting.

The **President**, however, ruled that the speaker was entitled to proceed.

Mr. Clay said the title of the paper was "The Electrical Power Bills of 1900—Before and After." He was dealing with the "before." Proceeding, he referred to the veto of municipal authorities. In London the County Council had the right to say whether the telephone wires should be placed under the streets or not. Even now there was comparatively a small amount of underground work going on in London, and this was solely due to the County Council, who, after keeping the company waiting a year or two inserted two clauses in the agreement which could not be accepted by the company. He complained that the company were unable to lower their rates owing to the hindrances of the Post Office, and urged upon the Institution the necessity for doing everything possible to get rid of the obstructions of municipal authorities. If competition were allowed on fair grounds, he had nothing to say.

General Webber and **Mr. J. Gavey** both repudiated the statements of the last speaker. The latter was of opinion that the Telephone Company had had an absolutely free hand to charge what rates they liked. It was not right to say that they had been hindered by the Post Office as regarded the reduction of rates. The present state of affairs was rather the result of public pressure than of the action of the Post Office. It was untrue that the Post Office had acted unfairly in preventing the public receiving a proper telephone service either from the company or the Post Office. The company, on the other hand had in certain places resorted to the device of offering to the Post Office subscribers a free service.

Colonel R. E. Crompton, having read the paper with the very greatest interest, was in full sympathy with the author. He agreed that it was not on account of their inefficiency as engineers that they were so behind in the electrical industry in this country. It was due to extraordinary causes, one of which dated from the Tramway Act of 1870, which sought to fetter private enterprise and enabled municipalities to compete by means of the rates. Mr. Hammond must have forgotten that for years after the Electric Lighting Acts came into force municipalities had numbers of provisional orders lying idle. They never lifted a finger until private enterprise showed them that the industry could be made profitable in this country. The question was, Could electrical transmission in this country be made to pay? The municipalities would hang back until this was proved just in the way they did in the days of the electric lighting. But in spite of them the Power Bills would be brought forward, and within a few years municipalities would be applying for parliamentary powers for transmission schemes themselves. There was no doubt that the public opinion was that in England the electrical engineers were to blame—a most shameful and unmerited suggestion. When they remembered what such men as Hopkinson and Swan had done, and when they knew what was done to introduce accumulators and the hundreds of other things in England, they asked themselves what had other countries done that they in this country had not done first? There were no central stations abroad so economical as those in this country. The fact that the machinery for these stations had been very largely made abroad, was mainly due to climatic conditions. The real cause of the backwardness of the electrical industry in England was municipal restriction, and nothing else.

Mr. Madgen, in reply, expressed his regret that the question of municipal trading had necessarily to be brought into the discussion. But it would not have been well had the opinion of this Institution gone forth to the world without some opposition from the apostle of municipal trading. Mr. Hammond attributed the backwardness of the industry to the cheapness of gas. He (the speaker) had never heard such a weak argument addressed to such a body of men before. The engineering and technical questions which arose on this subject might usefully absorb the attention of the Institution for two or three years. With regard to the economical limit of a central station, some five years ago it was put at 5,000 h.p., but now that was much too low a limit. Referring to an article in the *Electrical World* of New York, Mr. Madgen said increasing the size of a central station always caused a continuous increase in the economy of generation. At a certain point, however, it was met by the disadvantage of long feeders, etc. The character of the area to be dealt with went to determine the limit of the station to some extent. Mr. Edgar, the president of the Boston Edison Company, had written him that their plant was so arranged that for all practical purposes it was one station of 20,000 h.p. Mr. Hammond had referred to the value of the work done by local authorities in this country. At the present time throughout the United Kingdom there were only 250 districts where a supply of electricity was made. Mr. Hammond evidently did not recognise the dog-in-the-manger nature of the local authorities, who at the present time had 212 provisional orders outstanding. With regard to Prof. Ayrton's remarks about the Metropolitan District Railway, it was owing to finance that the line was not at present run electrically. Prof. Ayrton also gave an instance of a company refusing to supply the local authority with energy at less than 3d. per unit, but it must be remembered that they only wanted 500 kw. as a maximum demand. He should have charged them 6d. a unit. With regard to telephones, the Telephone Company had been treated in an exceedingly unfair way by the Government. Anyone could realise the difficulties under which they had been carrying on their work. Practically all their business was overhead, and they had to get wayleaves wherever they went. Mr. Gavey had reproached the company with offering the Post Office subscribers a free service, but the Government was itself responsible for any devices which the company might have resorted to in order to carry on their business. He was glad Mr. Crompton had appreciated the purpose of this paper. It was a bread-and-butter question. How could it be in the interest of anyone that local authorities should deal with the industry in the way they were were doing? It was in their interest, as electrical engineers, to see that these legislative hindrances were removed. It had now been discovered that electric tramways were a means of relieving congested districts. Personally, he believed that electric power distribution was going to do more to relieve such districts, as it would assist in the migration of industries into more open country.

A vote of thanks to Mr. Madgen for his valuable paper closed the meeting.

COMPANIES' REPORTS.

NEWCASTLE-UPON-TYNE ELECTRIC SUPPLY.

Directors: Alderman T. G. Gibson (chairman); J. H. Armstrong; F. W. Dendy; G. B. Hunter; Dr. J. T. Merz; J. H. B. Noble; J. Tennant; Dr. R. Spence Watson; Sir Lindsay Wood, Bart.

Report of the directors (with abstract of accounts) for the year ended December 31, 1900:

The directors, in presenting the balance-sheet and profit and loss account for the year ending Dec. 31, 1900, have pleasure in stating that the total units sold for the year amounted to 1 095,519, as against 967 098 in 1899, and 803 789 in the year 1898. The profits of the year, including the balance of £1,811. 1s. 6d. brought forward from 1899, amount to £10,605. 6s. 11d., out of which interim dividends at the rate of 5 per cent. per annum upon the amount paid up on the preference shares, and at the rate of 8 per cent. per annum upon the ordinary shares, were paid in July last, absorbing £3 680. 2s. 3d. The directors now recommend the payment of further dividends at the rate of 5 per cent. per annum on the amount paid up on the preference shares, and at the rate of 8 per cent. per annum upon the ordinary shares, absorbing £4 537. 13s. 10d.; and that the balance of £2 389. 10s. 10d. be carried to next year. The high price of coal which ruled during the year has increased the cost of production compared with the previous year by about £1,600. At present prices the larger portion of this increased expense will be saved during the current year. The reserve and depreciation account, which at Dec. 31, 1899, stood at £20,000, has been increased during the year by the sum of £20,000, being the premium of £1 per share on 20,000 preference shares issued, and now stands at £40,000. Two sets of plant, with a capacity of 500 kw. each, have been erected at Pandon Dene, so that the continuous-current service referred to in the last report is now supplying current in the city of Newcastle-on-Tyne. The Bills which were promoted in Parliament last year to give powers to the Company outside the area of their original provisional order, and also for the supply of electricity in Gosforth, have been successfully carried through, as reported to the shareholders on Sept. 20 last. Pursuing the policy foreshadowed in that report, the Company is now in possession of an extensive central generating station at Wallsend, having taken over and enlarged a station commenced by the Walker and Wallsend Union Gas Company. A suitable riverside site at Carville, the provisions for the purchase of which were included in the Company's Bill of last year, has also been secured upon satisfactory terms, and is available for future development. The central generating station is under the management of a joint committee of the directors of this Company and of the Walker and Wallsend Union Gas Company. The Company under the above arrangements is in a position to meet the present and growing demand for electricity for both power and other purposes. The purchase price of the riverside site referred to above was settled at £22,500, on the understanding that the vendors received preference shares for their purchase money, and in settlement thereof there were allotted to them in January of the present year 3 750 5 per cent. fully-paid preference shares of £6 per share, £1 of which is premium. This allotment is additional to the 20,000 preference shares issued at a premium of £1 to the shareholders during the year 1900, and there now remains unissued 10 000 ordinary shares and 6,250 preferences shares, which will be offered to the shareholders of the Company on the same terms as the last issue during the forthcoming autumn, by which time it is expected the remaining calls will have been made on all the allotted shares. The directors propose to create 4 per cent. mortgage debentures to the amount of £250,000, which will be issued from time to time as the extended operations of the Company require, the total issue not to exceed one-half of the paid-up capital. Towards this contemplated issue considerable sums have already been received, and are treated in the accounts as loans. The expenditure on capital account during the year has amounted to £127,261. 2s. 9d., the greater portion of which was not productive of revenue during the year. The Board has been increased under Article 74, as amended by special resolution dated Oct. 4, 1900, and the directors have pleasure in stating that they have secured as colleagues Sir Lindsay Wood, Bart., Mr. J. H. B. Noble, Mr. F. W. Denby, and Mr. G. B. Hunter. The confirmation of the appointment of these gentlemen as directors is required under the articles of association at this meeting. The directors regret to have to report the loss of the valued services of Colonel

Digitized by Google

F. F. Sheppee, who, owing to his having ceased to reside in the district, has resigned his seat on the Board. Consequent upon this resignation, Dr. J. T. Merz is the only director who retires by rotation. He is eligible, and offers himself for re-election. The auditor, Mr. Thomas Harrison, also retires, and is eligible for re-election.

ELECTROLYTIC PARENT COMPANY.

The report of the directors for the year ended Jan. 31 last shows a net balance at the credit of profit and loss account of £49,536, represented by £62 in cash and 49,474 fully paid up ordinary shares in the Company. The directors recommend that 45,772 of these shares be distributed among the shareholders by way of dividend, at the rate of eight shares for every five shares held in this Company. Satisfactory progress has been made with the construction of the works of the Company at Middlewich, Cheshire.

NOTTING HILL ELECTRIC LIGHTING.

Directors: Sir William Crookes F.R.S. (chairman); Arthur Ellis Franklin, Esq.; Alexander Howden, Esq; James Thomas Jervis, Esq.; Joseph Wilson Swan, Esq., F.R.S. Engineer and manager: Geo. Schultz Secretary: R. G. Rawkins.

Abstract of the eleventh annual report of the directors and statement of accounts for the year ended Dec. 31, 1900:

The expenditure on capital account, which at the date of the last balance-sheet stood at £137,350. 13s. 7d., has been increased during the past year by £27,639. 9s. 4d., of which the principal items are: £12 198. 16s. 11d. for new mains (principally the trunk main from Wood-lane to the distributing stations); £3 336. 15s. 6d. for the freehold property in Lancaster road (bought for the purpose of erecting a subsidiary station to supply the northern portion of Notting Hill); £3 177. 14s. 5d. for the erection of the buildings in Lancaster road and Bulmer-place, to contain the transformer machinery; and £8 282. 2s. 9d. for the necessary machinery for equipping these stations. To provide the capital necessary for this expenditure, the balance of £19 000 debentures was issued, and at a general meeting held on Aug. 1 the capital was increased by £100,000. Of this fresh capital 2 200 £10 shares have been issued to shareholders, at a premium of £2 per share. As it was not possible to carry through the full scheme of extension during the course of the year, the sum of £18,000 remained unspent, and is on deposit to meet instalments due to contractors when they mature. The number of lamps connected is 68 505, and the number of consumers is 1,191, and of these 91 per cent. are supplied at 200 volts. It will be seen that for the first time the net profit of the Company shows a decrease, notwithstanding the fact that the gross revenue showed an increase of 10 per cent. This is accounted for by increase in expenditure for coal (£1,000), and by the expenditure of £1 200 on "repairs to accumulators," which involved the entire renewal of one set of batteries. Moreover, in May the directors found the new works in Wood-lane would not be in working order in time for the winter supply, and, therefore, they were compelled to refuse fresh supply contracts. The result was that the fresh capital expenditure has been unproductive, and the increase in the number of lamps, which promised to be large, amounted to only 9,400. It is expected that early in the current year the Company will resume making fresh connections. From the number of applications already received a large increase may be anticipated. In the south-western portion of the Company's area, bounded on the east by the grounds of Holland Park, and comprising Addison-road and its neighbouring streets, a difficulty has arisen. It is intended to supply this district from a transforming station at the southern end of Addison-road, and a suitable long leasehold site was purchased, subject to the consent of the freeholder to the transfer. This consent has been withheld, and it has become necessary for the directors to apply to Parliament to enable them to acquire this site by compulsory powers, as it is necessary for the proper carrying out of their obligations to supply current in this portion of their area. The Bill which is now before Parliament is confined to this one object. At a special general meeting held on the 27th inst. the shareholders passed a resolution approving it, and a notice of the necessary confirmatory meeting to be held after the annual meeting is sent herewith. In the last report it was stated that in conjunction with the Kensington and Knightsbridge Electric Lighting Company, Limited, a new generating station was to be erected at Wood lane for supplying current wholesale to the two companies, to be distributed through transforming stations in their respective areas. It was estimated that the cost of these joint works would be £100,000, and this estimate has not been exceeded. The capital was obtained by the issue of special debenture stock, amounting to £100 000, and no part of the capital of our Company has been utilised for this purpose. The works are now approaching completion, the machinery is running, and the tests having proved satisfactory some amount of current is already being supplied to the respective companies. The premium arising from the issue of shares and debentures during the year amounted after deducting expenses to £4 257. 17s. 7d. The directors have added to this the sum of £742. 2s. 5d. out of current revenue, making a total of £5,000, which has been transferred to the depreciation, renewal, and reserve fund, bringing that account up to £11,000. Although the expenditure on the renewal of accumulators might have been taken from this fund, the directors preferred to charge it against the revenue for the year. Of the remaining net profit, after paying interest on the debentures and new ordinary shares, depreciation, etc., amounting to £7,444. 14s. 8d., the directors recommend the payment of the usual dividends of 6 per cent. on both the preference and ordinary shares, amounting to £5,670. Of the balance, according to the articles of association, one-half, amounting to £887. 7s. 4d., is credited to the holders of the founders' shares, and the other half to the ordinary and preference shares. This will enable a further 1 per cent. to be paid on both ordinary and preference, with a distribution of £1. 12s. per share on the founders' shares. An interim dividend of 3 per cent. was paid on July 1, and the balance of 4 per cent. will be paid forthwith, together with the distribution on the founders' shares. The preference shares having received their full 6 per cent., the 1 per cent. bonus will be added to the interim dividend on these shares, to be paid on July 1 next. The directors desire to place on record their appreciation of the services of the engineer and manager, secretary, and staff generally; the amount of extra work thrown upon them in connection with the construction of the joint station and of the subsidiary stations has been very large, and has been ably carried out. They desire also to express their satisfaction at the friendly assistance they have received received in all matters connected with the joint station from the directors and staff of the Kensington and Knightsbridge Electric Lighting Company, Limited. The directors retiring in rotation are Messrs. Alexander Howden and J. W. Swan, who, being eligible, offer themselves for re-election. The shareholders will recollect that on the occasion of the last meeting Mr. J. W. Swan, F.R.S., was elected a director to replace the late Mr. Francis Radford. The shareholders' auditors, Messrs. Fox, Sissons, and Co., retire, and, being eligible, offer themselves for re-election. The accounts will be audited in due course on behalf of the Board of Trade.

NOTES.

Canadian Telegraphs.—There are still persistent rumours abroad to the effect that the telegraph system in Canada will soon be under State ownership. The Government is reported to be negotiating for the purchase of the lines with a view to conducting the business, but up to the present no authoritative statement has been made.

Lecture on Electricity.—Mr. E. T. Williams, of King's Lynn, delivered an interesting lecture in the lecture hall of the Union Chapel, Manchester, on the 5th inst. on "Electricity in the Service of Man." Mr. E. W. Hoyle, M.A., of Owens College, presided. The lecture was illustrated by lantern views, and a discussion followed.

The Institution Journal.—The *Journal* of the Institution of Electrical Engineers for February, 1901, contains Mr. W. Langdon's valuable paper "On the Supersession of the Steam by the Electric Locomotive." Mr. W. Duddell's paper "On Rapid Variations in the Current through the Direct-Current Arc," which aroused so much interest among the various members of the Institution, also appears, followed by Lieut.-Colonel Crompton's descriptive lecture "On the Electrical Engineers (R.E.) in South Africa."

Electrical Developments.—Hitherto the primary batteries employed in the central telegraph office in Calcutta have given considerable trouble and inconvenience to the department. These have now been supplanted by an installation that has been set up for the storage in secondary batteries of electricity from the street mains, which is used in the transmission of messages to a number of long-distance lines. The apparatus is most compact, and has shown itself to be a great improvement on the old arrangement.

Cooper's Hill.—It is with great satisfaction we note that the seven professors at Cooper's Hill Engineering College who were recently requested to send in their resignations are to be given a hearing. As a result of urgent representations which have been addressed to the Secretary of State for India, Lord George Hamilton has intimated that these gentlemen are to be permitted to state their cases to the Visiting Committee of the college. After this has been done the matter will be further considered by the Secretary of State in Council.

The Tesla Telegraph.—A short note appears in the issue of the *Scientific American* for March 9 to the effect that Mr. Tesla's agent has left London for Lisbon to establish a receiving station on the Portuguese coast at the fortieth parallel of latitude, which will be in communication with a Tesla transmitter located on the New Jersey coast. We had no idea that an actual experiment was proposed, and trust that our contemporary is correct in the above statement. We, personally, should have thought that to make experiments on a smaller scale over a shorter distance would have been a more reasonable procedure.

The Yorkshire Electrical Power Bill.—It will be remembered that the directors of the syndicate which is promoting the above-mentioned Bill had inserted a clause in it which would allow them to supply energy without the consent of local authorities in certain cases where it was proved to the satisfaction of the Board of Trade that the company would give a cheaper supply than the local authority in question. Owing, however, to the strenuous opposition which has been brought against this clause, it has now been revised, so that the consent of the local authority will in every case have to be obtained. We much regret that this has been the case, as the interest of the consumers and also of the electrical profession would be better served if the Bill were passed in its unamended condition.

Mandalay Tramways.—*Indian Engineering* gives some further particulars regarding this scheme, from which it appears that the Burma Electric Works Syndicate, Limited, propose to lay down and work a double track from the Zegyo Bazar to the Arakan Pagoda, and another from the railway station to the steamer landing stages on the Irrawaddy. It is suggested that the rent payable to the Municipality for the road should be £33. 6s. per mile per annum for the first six miles for the first five years, and for the next five years £5 per mile. For any additional mile up to 12 miles £33. 6s. per annum, and for any extension over 12 miles £13. 6s. per mile.

Wireless Telegraphy in War Time.—The decision of the Admiralty with regard to utilising wireless telegraphy for naval signalling purposes in war time testifies to the fact that the Government has fully recognised the value of this system of signalling. Stations for this purpose are to be established, it has now been decided, at Culver Cliff, Dover, Portland Bill, Rame Head, Roche Point, Scilly Isles, Gibraltar, and Malta. These two latter stations will, of course, be for use in connection with the Mediterranean and Channel fleets. As to the English stations, Culver Cliff is to be in direct communication with Portsmouth and Rame Head with Plymouth. By these means the naval commanders-in-chief at these ports may receive rapid and continuous information of what is happening in the outlying portions of their command. Special staffs for peace and war will be allocated to each station.

The Central London Railway.—The committee of experts which is considering the question of the alleged damage caused by the working of the above railway to houses along the line of route is still taking evidence at the Board of Trade. We understand, unofficially however, that the experiments which the committee are making tend up to the present to show that the vibrations have been exaggerated by the householders, who hoped to obtain damages from the company. In certain cases instruments which have been used elsewhere for similar purposes have failed to reveal appreciable vibrations due to the running of the line. Certain witnesses at the enquiry have stated that the vibration is more at certain times of the day when the rush of traffic is on. Engineering evidence, however, is brought to the effect that this is extremely unlikely, as the weight of the people in the train is such a small proportion of the total weight.

Imperial Telegraphs.—Some important resolutions, mostly originating from the provincial towns, on the question of Imperial telegraphic communication were considered on the last day of the annual meeting of the Associated Chambers of Commerce last week. For convenience these were ultimately consolidated into one resolution, which, while expressing satisfaction with the progress made in the formation of an all-British Pacific cable, urged on the Government the absolute necessity for the construction of all-British lines between all parts of the Empire, and advocating that support be given by the association to the Imperial Telegraph Committee of the House of Commons in their efforts to promote enquiry into the question of charges and increased efficiency and economy. The resolution in this form was agreed to. There was another motion on the agenda paper, urging the Government to establish without delay additional and improved cables between the United Kingdom and the Continent, and to arrange for more direct wires to the principal European centres of commerce and manufacture. This was also adopted, and resolutions drawing attention

Digitized by Google

to the need for more efficient telegraphic and telephonic service between the commercial and manufacturing centres of the United Kingdom and for the cheapening of telegrams were next moved and carried.

Personal.—When the question of Mr. J. H. Rider's resignation came before the Plymouth Electric Lighting Committee it was accompanied by a note from him expressing his deep sense of the kindness and support he had experienced at all times from the committee, and adding that he would leave Plymouth with the utmost regret. We are pleased to be able to state that the committee, putting on one side the loss to the town, congratulated Mr. Rider on his new appointment, and expressed their high appreciation of the zeal and the ability displayed by him during the five years that he had acted as electrical engineer to the Corporation. In view of what happened when the tramway engineer of the London County Council resigned his previous position in order to take up work in London, it is exceedingly pleasant to read of the goodwill which exists between Mr. J. H. Rider and the Plymouth Electricity Committee. We are also glad to note that his position at Plymouth is to be filled by his first assistant, Mr. E. G. Okell. Here, again, the committee are to be congratulated in that they have promoted an engineer who has been Mr. Rider's right-hand man in the design and laying down of the plant from the commencement up to the present time, and he will be able to render much more valuable service as chief than any outside man coming into the district.

Motor-Wagon Trials.—As previously stated in these columns, the Liverpool Self-Propelled Traffic Association will hold a series of automobile trials early in June this year. The main object of these trials will be to test the different types of heavy motor-wagons suitable for haulage operations in Lancashire prior to their being taken over by a Lancashire syndicate, which will be formed for the purpose of conducting road transport between Liverpool and manufacturing towns in Lancashire. We are now informed that the entry forms for this competition are ready for issue to intending competitors. Upon representations that a number of vehicles will otherwise be debarred from competing, the Council have decided to add a fourth class, to be known as class D. In this section there are no restrictions upon the tare or platform area, and all the conditions already published apply. The minimum load to be carried is four tons, but an excess may be declared, according to the rules. There is no alteration in classes A, B, and C, the specification for which remain unchanged. The days on which the tests will be made are Monday, June 3, to Friday, June 7 (inclusive). They include hill climbing at Everton Brow, manœuvring at Prince's Dock, and long-distance runs—such as from Liverpool to Manchester *viâ* Warrington, and back *viâ* Bolton. Some important results should be obtained.

Internal Resistance of the Lead Accumulator. In the digest of the *Electrical World* for March, we notice an abstract of a paper by Messrs. Dolezalek and Gahl on this subject, being an account of an experimental investigation of the variation of the lead accumulator during the charge and discharge. This internal resistance, it appears, is very small, and is some ten-thousandths of an ohm in the cells used in practice. The resistance increases gradually during the discharge. It decreases during the charge. In spite of its small value, the internal resistance is greater than it ought to be if calculated from the conductivity of the electrolyte. It must, therefore, exist in certain transition resistance at the plates, due to films of non-conducting lead sulphate on the spongy lead and lead peroxide, or due to variations of concentration of the acid at the plates. The authors find that in practice the increase of the resistance of the negative electrodes during discharge is entirely negligible. There is practically only an increase of resistance of the positive plate during discharge. But of greater importance in practice is the drop of voltage due to variations of the concentrations at the electrodes and to the resistance of the support of the active mass, especially of the negative plates. In comparison to these essential factors, the real internal resistance, which consists of the resistance of the electrolyte and the transition resistance between acid and plate, is negligible.

Electric Light in Johannesburg.—We have just had an opportunity of perusing a copy of the *Johannesburg Gazette* for Feb. 21 last. The major portion of the issue of this paper is taken up with proclamations and notices inserted by the military authorities. Two of these concern the electric lighting of the town. It seems curious to read under the initials "V. R." a municipal notice that consumers of electric light can use the telephone at the fire brigade stations at all hours for the purpose of making complaints to lighting department as to their electric light. This notice, which is dated Nov. 16, 1900, is signed by the acting burgomaster. Under the date of Jan. 24, 1901, the same gentleman, now called the acting mayor, informs the consumers that "as no electric light can be obtained from the Rand Electric Supply Company, the whole supply of current for the Municipality of Johannesburg has now to be generated at the town lighting works. The capacity of the plant at these works being small, the public is particularly requested to limit the number of lamps in use during the early hours of the evening to as few as possible." This last notice, which was issued in consequence of the central electricity works being badly damaged by a band of marauding Boers, reminds us of the notice which certain electric lighting undertakings in the United Kingdom have had to issue at various times to their contractors for electrical plant who had not fulfilled their obligations.

Street Railway Convention.—The twentieth annual meeting of the American Street Railway Association has now been fixed for Oct. 9, 10, and 11 next. On each of the first two days there will be two sessions of the convention, the third and last day being set aside for the inspection of exhibits. With regard to the papers to be read at the meetings, the executive committee have decided that these shall be printed and advance copies sent to the members, in order that the time of the members may not be taken up in hearing the various papers read. Among the subjects which will be considered on this occasion are these: "The Economies resulting from the Use of Four Motors instead of Two on Double-Motor Equipments"; "The Best Form of Car for City Service—a Consideration of the Various Types of Car as to Size of Car and Arrangement of Seats, including the Best Types of Brakes and Wheels"; "The Best Manner and Mode of Conducting the Return Circuit to the Power-House"; "Practical Results obtained from Three-Phase Transmission and Rotary Transformers or Motor-Generators in Transmitting Power on Railway Lines"; and "The Modern Power-House, including the Use of Cooling Towers for Condensing Purposes." Mr. Vreeland, of the Metropolitan Street Railway Company, confidently hopes that all the important new work upon that system will be completed by the time of the convention in October, so that the visitors may be able to witness the largest street railway in the world in full swing.

Permanent Phonograph Records.—In a recent patent Mr. Edison describes a new way of preserving

Digitized by Google

phonographic records for indefinite periods. The method is simple, consisting as it does of producing a perfect duplicate made of silver, with a thin plating of gold, from an ordinary wax record. The process followed by Mr. Edison is this: He takes a copper electroplate of a wax record. This copper relief obtained is then electroplated with silver, the surface of which next the copper, of course, has precisely the form of the original wax surface. The copper matrix is then dissolved away with acid. In the electroplating process the wax record is revolved under a bell jar in a Crookes vacuum, through which an electric discharge is passing between electrodes of gold. This causes a discharge of a vapour or infinitesimal particles of gold, which attach themselves to whatever they strike, forming a continuous coating of excessive thinness, and following the outline of the surface with absolute fidelity. Upon this coating the copper matrix is plated, to form the inside surface upon which the silver is deposited when the wax is removed. The gold, like the silver, being unaffected by the acid used, remains as a plating on the silver record when the copper matrix is dissolved away. In giving these details, the *Scientific American* points out that the amount of gold used is scarcely appreciable, and the silver may be a thin shell, backed up by other material, so that the records are not as expensive as might be at first conceived.

Velocity of Ions.—In an article on this subject in the *Physical Review*, Mr. C. D. Child adopts a new method for determining the velocity of ions in a gas which was suggested by Prof. J. J. Thomson in a recent number of the *Philosophical Magazine*. A test was made by applying this method to the determination of the velocity of ions produced by a flame. The author points out that no attempt has been made to secure great accuracy, since the quantity to be measured — *i.e.*, the velocity of the ions — is one depending on a great variety of conditions, and because this work is rather the test of a method than anything else. The accuracy of the result given, however, will compare quite favourably with those hitherto secured in attempting to measure such velocities. There was considerable objection to determining the potential with a wire, and accordingly a water dropper was used in the test carried out by the author. In the first place, application of the method suggested by Prof. Thomson showed that the velocity of the positive ions drawn from a Bunsen burner is approximately 2·2cm. per second for potential gradient of one volt per centimetre, and that for negative ions 2·6cm. In the case of an unlimited supply of ions, if the discharge takes place between two regular surfaces, the velocity may be determined by simply measuring the current per unit area and the difference of potential between these surfaces; and if the surfaces be not at all regular, the relative velocities of the positive and negative ions may be determined by comparing the positive and negative currents.

West London Tramways.—No decision has as yet been arrived at either way as to the running of the electric cars on the West London tramways. The Kew Observatory authorities are still anxious as to the effect which any stray electric currents may have on their recording instruments, and on Friday last the ordinary horse-car traffic on the system was entirely suspended for an hour or two in order to allow of tests with the new electrically-driven cars being made. Some 30 cars were in operation, and at the same time a gentleman was watching the measuring instruments in the generating station at Chiswick in the interest of the Kew Observatory authorities. The particulars thus obtained were for comparison with the readings of the magnetometers at Kew in order to ascertain what effects, if any, were produced by the running of the electrical cars, and whether the latter give rise to any disturbances in the records, in addition to those already noticed as a result of the Central London Railway or of other causes. If it be found that the instruments at Kew were injuriously affected by the running of the electric cars on this occasion, it is expected that an agreement will have to be come to between the authorities and the London United Tramways Company before a start can be made with the public electrical service. Mr. A. P. Trotter, of the Board of Trade, carried out the official inspection of the electrical equipment of the line on the same day, and having regard to the great delay which has already occurred in putting the electric cars on the road for public service, we trust that something definite may be done as soon as possible. In the case of no disturbances at the observatory being discovered, there can be no reason, subject to the sanction of the Board of Trade, for any further delay, but in the other event, of course, arrangements must be made for setting up the observatory instruments in some more suitable locality than Kew.

Bradford's Precautions.—Mr. C. J. Spencer, the tramways manager, and Mr. R. A. Chattock, the electrical engineer to the Corporation of Bradford, have drawn up a list of regulations for the guidance of the police in the event of falling overhead wires making earth contacts on the city tramways. A strict obedience to these regulations should to a large extent reduce to a minimum the risks attending the falling of electric wires. In the first place, it is pointed out that all traffic should at once be stopped. The nearest tramcar driver must then be informed of the occurrence, and he will immediately take steps to cut off the current. Failing this notice, communication with the nearest tramway depôt by telephone or other means should be made, but the drivers of the trams must not be called on to interfere with the wires, except for the purpose of saving life or preventing persons from being injured. Of course, if a fallen wire should encircle any person, it must be immediately removed, and with this in view the following advice is given: (*a*) never touch it with your hands; (*b*) never touch the skin of the person in contact with it; (*c*) use a dry rope, dry stick, or any article of dry clothing to drag the wire away with, or to drag the person away from the wire; (*d*) use indiarubber gloves for pulling the person away from the wire, it being safest not even to touch the wire with them; (*e*) in case it is impossible to get the wire away from the person, the wire should be dragged to the nearest tramway rail and held down upon it in order to discharge the current, or the wire should be cut by means of insulated shears, which can be procured from the cars. Gloves should be worn when these are used. Gloves and insulated shears, referred to above, are provided on each car and also at each tramway depôt, police, and fire station. In conclusion, the regulations point out that animation can often be restored to persons suffering from electric shock by using the methods adapted to resuscitation from drowning.

The Barmen-Vohwinkel Suspended Railway.—The first section of the new suspended railway between Elberfeld, Barmen, and Vohwinkel, officially opened by the German Emperor in October last, was thrown open to the public last week. It will be remembered that we fully described and illustrated this railway in our issues of Dec. 14 and 21 last. Great interest in the event was manifested by the people of Elberfeld and the other inhabitants of the Wupper Valley, although directors of the concern had the foresight to keep the fact and date of opening a secret so as to avoid too great a crush. Final trial runs were made early on the morning of the opening day, and as these came off without the slightest

Digitized by Google

hitch, the barriers leading to the stations and waiting-rooms were thrown open shortly after 8 a.m., and the unique railway was opened without special ceremony. The cars were immediately besieged by passengers, and all space, even standing room, was crowded by people anxious to experience the novel sensation of travelling on a monorailway with the car suspended in mid-air. The runs were made without any hitch whatever, the cars travelling quietly and without shock or jarring, as in the preliminary trials. They take the sharpest curve without any appreciable tendency to turn out or to rock, and enter the stations with perfect smoothness and regularity. The entrance and exit of passengers at the stations is effected without loss of time. By pressing a stud the doors may be locked automatically by the guard. Tickets are supplied by automatic machines (10 pf. for first class, two tickets), and are punched by the guards travelling with the cars. At the termini the cars are transferred over loop lines to the return rail in a few minutes. It can already be safely asserted that the question of dealing with the traffic in this district, which had become more and more acute during the last few years, has been most satisfactorily solved by the ingenious scheme carried out by the contractors, the well-known Schuckert Company.

Electrolytic Process of Producing Phosphorus. Dr. F. J. Machalske, having carried out some extensive experiments on the production of phosphorus by electrolytic means at his laboratory in New York City, is stated to have obtained such satisfactory results that a company, known as the Anglo-American Chemical Company, has been formed to produce yellow and red phosphorus on a commercial scale by the process developed from these experiments. The *Electrical World* for the current month gives some valuable details of the system from the inventor himself. In the first place, the raw material consists of the ordinary phosphate rock used generally as a fertiliser. At present two electrical furnaces are installed, each furnace having a chamber 12in. by 18in. in area, with a carbon bottom and sides lined with calcined magnesia, the cover being composed of fireclay and red brick. Further, each furnace has an aperture on top for feeding the phosphate rock, and an aperture for inserting an electrode 8ft. long and 4in. in diameter. The inventor claims that five minutes after current is turned on a temperature of 7,000deg. F. is produced, which will reduce in 15 minutes 150lb. of phosphate rock. The phosphorus vapours thus set free are condensed under water, and the residual slag allowed to run off, the operation being a continuous one. Current for driving the plant is furnished from the circuits of the New York and Queen's Electric and Power Company. It is asserted that yellow phosphorus may be produced by this method at a rate of 3½d. per pound, the cost of electric power being 1½d. per horse-power hour. Dr. Machalske claims to have separated by means of the electric furnaces a new metallic compound which has the appearance of silver, and is not affected by sulphuric or hydrochloric acid, though slightly attackable by concentrated nitric acid. The metal has a specific gravity of 10·02, and is a good conductor of electricity at common temperatures, but a non-conductor at temperatures at 100deg. and above. He also claims that in the course of his experiments he found that by means of an electrical furnace connected with a properly-constructed condensing apparatus chlorides of carbon, and especially carbon tetrachloride, may be produced by treating in an electric furnace a mixture of common salt, carbon, and sand.

Possible Uses for the Manometric Telephone.—Mr. Louis W. Austin, in the *Physical Review* for February, considers a convenient method of showing visually the complex motions of the diaphragm of a telephone receiver. He refers to the great sensibility of the manometric flame to small changes of gas pressure, and this, he points out, suggested the possibility of its use in making visible the sound-waves produced in the telephone. Accordingly, a telephone receiver was connected to an ordinary manometric capsule by means of a rubber tube passing through a cork cemented into the opening in the telephone cap. The telephone having been connected in a shunt from the alternating circuit, about ·01 ampere was sent through it, which caused the flame to dance excitedly. On examination in the revolving mirror, however, the image little resembled the known form of current wave, and the real cause of the inaccuracies was not at first apparent. In a new arrangement, however, the connecting tube was done away with, a jet being inserted directly through the rubber cork in the telephone cap, and another hole drilled in the cap through which the gas was introduced, thus making a manometric capsule of the telephone itself. This turned out to be a great improvement on the former arrangement, which proved that at least a large part of the difficulty lay in the friction and elasticity of the connecting tube. Again, on the gas opening in the cap being constricted to about the size of the opening in the jet, the lower edge of the luminous part of the flame, as seen in the revolving mirror, assumed nearly the sine form. Thus the sensibility of the apparatus was increased in a marked degree. The apparatus in its final form has been tried with a number of different alternators, and the curves from all of these showed their known peculiarities of form, although a certain distortion seemed to be present, due probably in part to the flame itself and its tendency to flare. From the above observations the author draws several suggestions as to the possible lines of usefulness for the manometric telephone. In the first place, it may be used to show in the lecture room the motions of the telephone diaphragm and illustrate the undulations of an alternating current. Again, it may be so developed as to offer a practical and convenient method of tracing alternating-current curves, while in connection with a second manometric flame, actuated by a tuning-fork of known period, it becomes a frequency teller. Two other possible applications of the manometric telephone suggested by Mr. Austin are in studying the distortions in sounds produced by telephone transmission, and in comparing small alternating E.M.F.'s.

Glasgow and its Telegraphic Communication. The chief topic of interest before the meeting of the Glasgow Chamber of Commerce last week was a communication from the Postmaster-General in regard to the interruption of the telegraph service between London and Glasgow, due to storms. This was in reply to a memorial of the directors of the chamber calling attention to the matter, and urging the extension of the underground system of wires. The Postmaster-General was unable to agree that "on the Continent, and especially in Germany, interruptions are now, through the adoption of the underground system of telegraphy, unknown." He pointed out that the international service was frequently interrupted by storms abroad. In fact, whereas the proportion of underground wire to the total of mileage of wire was in Germany 9·8 per cent., it was in this country 14·8 per cent. In the case of Glasgow, in the last 10 years the number of times it had been necessary to issue a notice of delay in the telegraphic service to Scotland had averaged only five a year, the average duration of delay being only 1 hour 24 minutes. Lord Londonderry referred to the London-Birmingham underground line, and

Digitized by Google

expressed the hope that within a very short time this line would be extended further northwards. He also anticipated that another section from Preston northwards would be commenced during the next financial year, which would especially add to the stability of the Scottish service. On the question of the respective percentage of underground wires in Germany and in this country, a letter was read from Mr. Paul Rottenburg. He had it, he asserted, on the best authority that "an entire collapse of the telegraph connections, such as is often experienced with overhead wires during severe weather, is entirely excluded in Germany," and expressed the opinion that the Postmaster-General must be under some grave misapprehension as to his figures. It was urged that the underground system should be adopted with the least possible loss of time. A report is now being prepared by the committee which formerly had the subject under consideration. The Postmaster-General has also replied to the memorial of the Bristol Incorporated Chamber of Commerce and Shipping, in which he again held out strong hopes of the London-Birmingham underground line being extended. This experimental section, he mentioned, was due to the introduction of the paper-insulated cable, which was so much better suited to the purpose, both from an electrical and a commercial point of view, than the guttapercha-covered wires. He is not without hope "that some of the difficulties and drawbacks still connected with an underground system will be surmounted, and that the Department will be justified in extending it. But it is necessary to proceed with caution."

The Behr Express.—The particulars given in the paper on the monorail high-speed railway between Liverpool and Manchester by Mr. F. B Behr at the meeting of the Society of Arts on Wednesday week, are not new, inasmuch as the whole details of the scheme were well thrashed out before a committee of the House of Commons last year. Owing to various reasons, the Bill, which was then under consideration, did not get through, but the company are returning to the struggle this year with certain alterations in their plans and equipment, which it is hoped will enable the Bill to be passed by the new committee before whom it will come. The description of the line given before the Society of Arts will be interesting reading to those who are unacquainted with the proposal of the company for the maintenance of a quick and frequent service of trains between the two large towns mentioned. The undertaking will require a capital of nearly three millions, and it is estimated that with 3,500 passengers per day it will be able to pay 5 per cent. on its capital. Dealing with the question of brakes, over which considerable comment arose before the committee, Mr. Behr explained that, besides the Westinghouse brake, the company proposed to have emergency electric brakes. These, it is suggested, will consist of electromagnets energised by the motors on the trains used as dynamos. These electromagnets will act on the guide rails, of which there are four. The magnets are said to be 18in. long, each capable of exerting a pull of 200lb. per square inch. The description, however, of this electric brake in the paper is not sufficient to meet with the usual requirements of a Patent Office specification, in that the brakes could not be constructed from the description given. It was explained by the author, however, that these emergency brakes will practically never be required, in consequence of the long length of line between the various signalling stations. This length will, of course, vary with the number of trains it is proposed to run, but with a six-minute service the sections would be four miles long, and the Westinghouse brakes will be able to stop the train when travelling at 110 miles per hour in 37 seconds, during which time it will have made just under 1,000 yards. This seems to give an ample margin. The discussion which followed was opened by Sir W. H. Preece, who was in the chair. He alluded to the energy of the author in carrying out his scheme. He thought there was no difficulty over the braking of the train, and that the emergency brake proposed was really not so essential as it was on an ordinary line. Another speaker referred to the advantage of the monorail system, in that it kept the centre of gravity below the point of the support of the carriages. The discussion concluded with a vote of thanks to the author.

Electric Railway Patents. — Some important decisions were recently given by the Circuit Court of Appeals in New York on three patents relating to electric railways. All three were declared invalid. The first dealt with was the Knight patent, issued in May 20, 1890, which relates to electric railway controllers having a reverser and regulator manipulated by separate handles, in combination with a stop or lock so constructed and arranged as to leave both the reverser and the regulator free to be operated independently of each other. The question the Court had to decide in this case was whether Knight invented the locking arrangement whereby one device locks the other. From a report of the judgment in the *Electrical World*, we gather that the view taken by the tribunal was that, although the patent was in no sense a pioneer one, it did add a new or locking feature to preceding devices in which the regulator and reverser were operated by different methods. The Court, however, considered that while this locking device was undoubtedly an improvement, it was not an invention of such novelty and importance in motor apparatus as to make a distinct step in the progress of the art as contrasted with mere improvement or perfection of what had gone before. The other questions before the Court were as to the validity of two Thomson patents issued on Aug. 14, 1883, and April 9, 1889, respectively. The first of these covered the magnetic blow-out principle as applied to street railway controllers. The second patent related to the application of a shield of insulating material between the opposed surfaces of the arc-rupturing device and the electrodes between which the arc to be ruptured is formed, thereby preventing an arc from forming at any other portion of the electrodes than is directly subjected to the arc-rupturing force, and permitting a conducting material to be applied, without danger of defect of action, very closely to the electrodes. With regard to the first, the Court referred to the early experiments of Davy and others, stating that the old scientists demonstrated that the magnetic field pulls the arc away from the electrodes and extingnishes it. The theory of the divisibility of the Davy discovery of the effect of a magnetic field upon a voltaic arc which burns, from the alleged discovery of Thomson of the effect of the magnetic field upon the ends of the conductor between which the arc is burning, was held not to be strong enough to bear the weight that the experts placed upon it. The Court concluded that if the patent was to be sustained, it would rather rest in its support upon the declaration that Thomson applied the law which the scientists observed in laboratory experiments upon magnets and electric wires to a switch of commercial use and efficiency, and made the experiments of practical utility. As to the second patent, the Court could not conceive that the effect of the insulation in an arc-rupturing device was anything more than the old effect which had always accompanied insulation, and which was accomplished by the old mechanical means, although it was used to prevent lateral discharges in connection with an arc-rupturing device. This, then, was also declared invalid.

THE TRAFFORD PARK POWER WORKS.

(Continued from page 371.)

The exhaust steam from the engines is condensed in injector condensers of the Ledward type, which are shown in Fig. 7. The circulating water is obtained from the Bridgwater Canal. This water is drawn up by means of

MR. H. ALCOCK, CHIEF ELECTRICAL ENGINEER OF THE TRAFFORD POWER AND LIGHT SUPPLY COMPANY.

centrifugal pumps, which are placed on a separate foundation below the floor line. The pumps are driven by means of Royce motors, and under ordinary conditions they can each supply 430 gallons per minute when working against a 25ft. head. The maximum output, however, can be carried up to 670 gallons. These pumps, the feed pumps, and the station lighting are all supplied from a separate station board, which is placed at the spot marked "balancers" in Fig. 2. The balancers are placed under the switchboard platform, and can be seen in Fig. 12. The whole of the station circuits are supplied at 250 volts, and are each equipped with a throw-over switch, so that they can be thrown on to either side of the three-wire system. This affords an additional means of balancing the system, and in consequence the size of the balancing machines has been able to be kept down. Two balancing sets have been supplied by the Electric Construction Company, of Wolverhampton, and they are each able to transfer 50 amperes from one side of the system to the other.

SWITCHBOARD.

The main switchboard, of which we give a good number of illustrations, is one of the best low-tension boards we have ever seen. It was manufactured for the company by Messrs. Cowans, Limited, of Salford, to meet the special requirements of Messrs. Lacey, Clirehugh, and Millar's specification. The front and side views of the board are shown respectively in Figs. 13 and 14. In Fig. 15 is given a front elevation of the board, with the details of the instrument filled in in the case of two of the panels only. Cross-sections of the board are shown in Figs. 16 and 17. The great object in the design of the arrangement has been to keep down the over-all dimensions in spite of the large current-carrying capacity which the various parts are required to have. Thus all the main parts of the board are designed to carry safely 1,500 amperes, and in spite of this the width of the panels is only 8½in. The framework used consists entirely of wrought and cast iron, while the back panels carrying the switch gear are of heavy slate. The side panels, which form an insulating mechanical division between the adjacent circuits, are also of slate. As will be seen in Fig. 17, the field regulating resistances are placed on a table in front of the switchboard, while the field resistances come under the same, and can be easily got at by removing the front panels of this table. The substantial plug bars which run along the top of the switch gear and underneath the measuring instruments, are made with exceedingly good contacts. Up to the present there has been no need to run at two different voltages in the station for different parts of the district, but the two plug bars will enable this to be done should the need arise in the future. In the meanwhile the arrangements are exceedingly convenient in the event of a trial being made on one machine, while the other large steam generator is supplying load through the other set of plug bars. In the fuses used in this board there is a novel construction of splitting up the fuse into a number of parallel parts separated the one from the other by means of slate divisions. For this purpose a slate grid is provided, as can be seen in Fig. 15; the fuse is then made up of a number of wires, which are soldered on to the copper end connections of the fuse. Each of these wires, when the fuse is inserted in place, comes in one of the ¼in. gaps of the slate grid. In this way the arc will be divided up, and the cooling effect of the slate is expected to

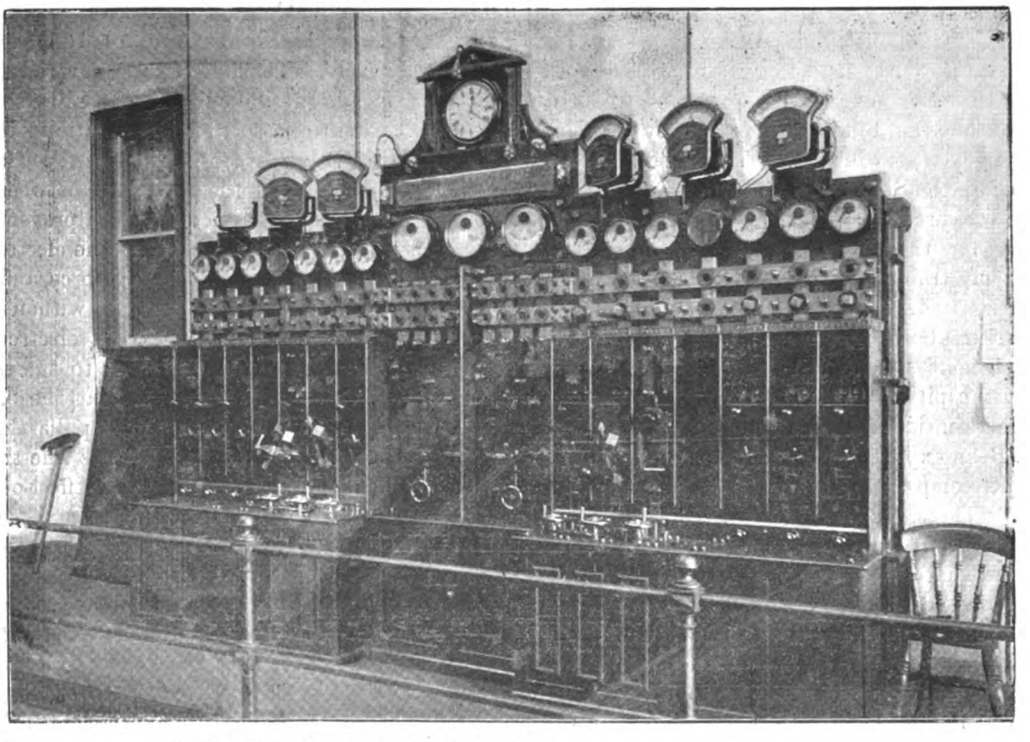

FIG. 13.—View of the Switchboard, taken from the top of the second dynamo.

Digitized by Google

materially reduce the ordinarily destructive defect caused by a 500-volt arc with a heavy current. The voltmeters used are of the Weston type, with illuminated dials, which can be read from the engine-room floor level.

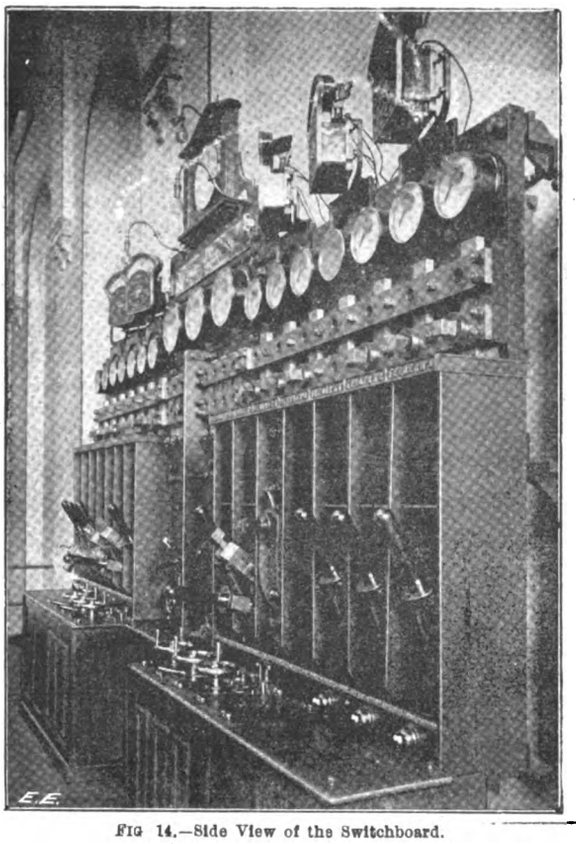

FIG 14.—Side View of the Switchboard.

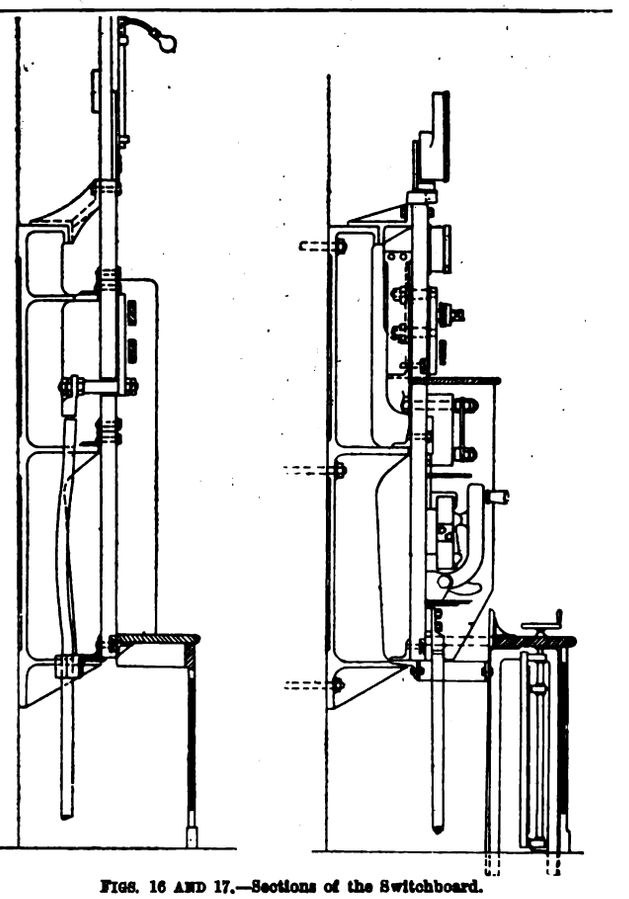
The ammeters were supplied by Messrs. Nalder Bros. and Thompson, and are of their latest type. Another special feature of the board is the use of the Andrews return-current cut-outs, one of which is placed in one pole of each of the large dynamos. These are interlocked with the field-breaking switch, and as they operate immediately a reverse current passes through them, they avoid the objection to all zero cut-outs—viz., the liability to hold in when there is a very sudden reversal of current. Pilot wires are brought back from the various feeding points, so that the switchboard attendant knows exactly what voltage the consumers are receiving.



FIGS. 16 AND 17.—Sections of the Switchboard.

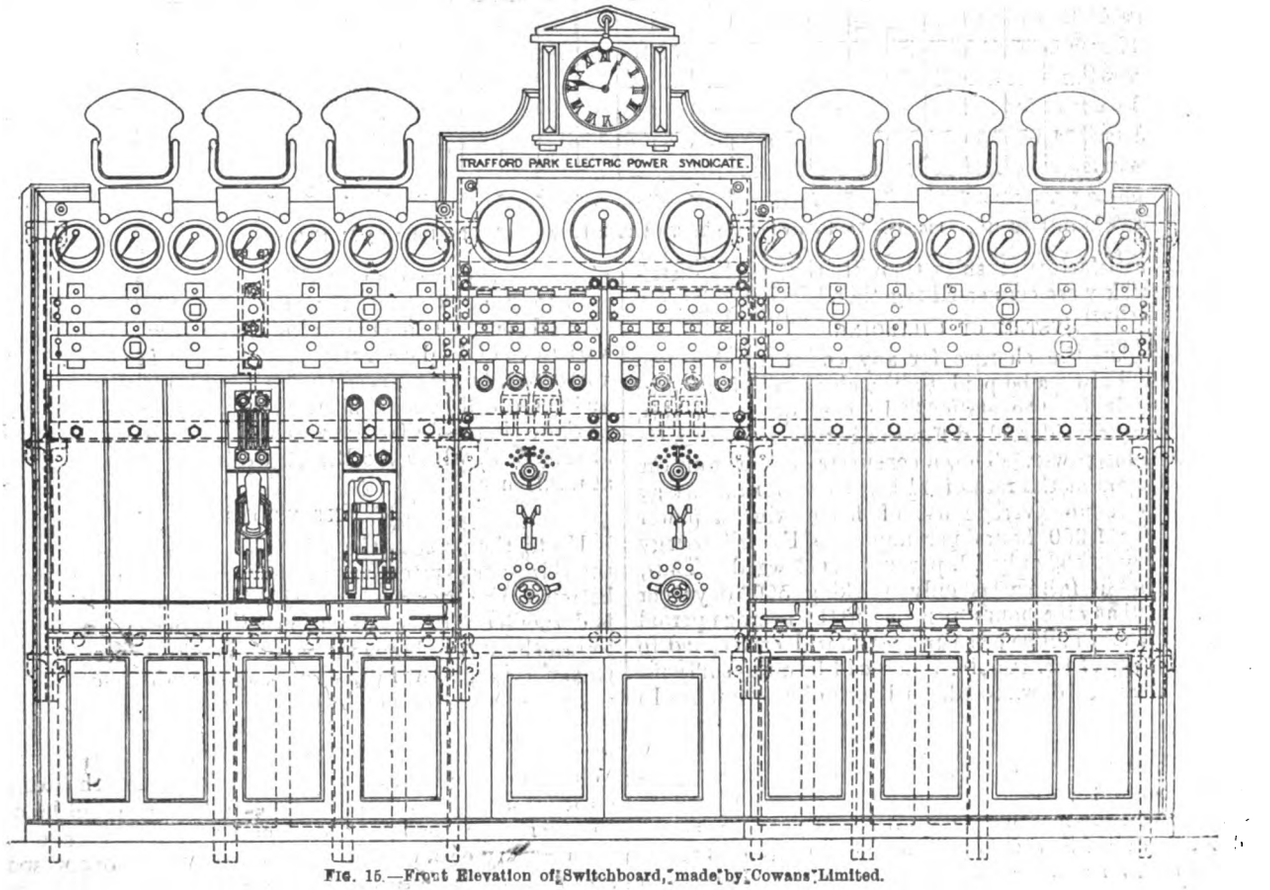


FIG. 15.—Front Elevation of Switchboard, made by Cowans Limited.

DISTRIBUTING SYSTEM

There are at present three distinct feeders laid down by the company for supplying their various consumers. The first of these goes to the main gates of the park, the next

Digitized by Google

is laid into the works of Messrs. W. T. Glover and Co., while the third is laid to the workmen's cottages which have been erected by the Trafford Park Dwellings, Limited. These feeders, and also the distributors, were all supplied and laid by Messrs. W. T. Glover and Co. The feeders consist of three separate single cables insulated with diatrine paper and then lead covered. A serving of jute is put on over the lead. The section of the copper is half a square inch in the outside conductors, and one-eighth of a square inch in the zero wires. The whole of the feeders are drawn into 2½in. Doulton conduits, a separate duct being provided for each conductor. The conduits are in each case provided with three ways, and they are laid in a vertical plane in order to economise space. On the extensions which are now being put in hand some Howard bitumen conduits are being used. All the joints are being made in cast-iron split joint-boxes placed in brick pits, which are accessible through manhole frames and covers. The joints are made with copper sleeves, which fit tightly over the conductors, and which, when in place, are sweated up solid. These joint-boxes are then filled with diatrine compound. We understand that it is intended to work the distributing system on independent sections, which will

are all provided with electric light, the charge being included in the rent. Thus, in a seven-roomed house, one light is put in each room, and can be burnt at the will of the occupier for an addition of 9d. per week to his rent. For a four-roomed house the charge is 6d. per week for the four lights. The supply from the company is taken by meter by the Trafford Park Dwellings, Limited, two meters being provided for each large block of dwellings. As between 2,000 and 3,000 houses are being erected by the company, it will be seen that a very considerable power will be required for lighting them. As mentioned in our last article, with respect to the supply of power it is pleasing to note that the consumers have not complained of their bills for electrical energy. This shows that the basis of charges must be correct, and the engineers of the company assure us that the load on the supply station will soon show a profit at these low rates. It would seem thus that the company in attacking the problem boldly will be able to show that it is advantageous to a manufacturer, even though a large one, to take his supply of energy from a distributing centre. We need hardly say that in starting such an undertaking the most unfavourable conditions for supply occur at first before a great variety

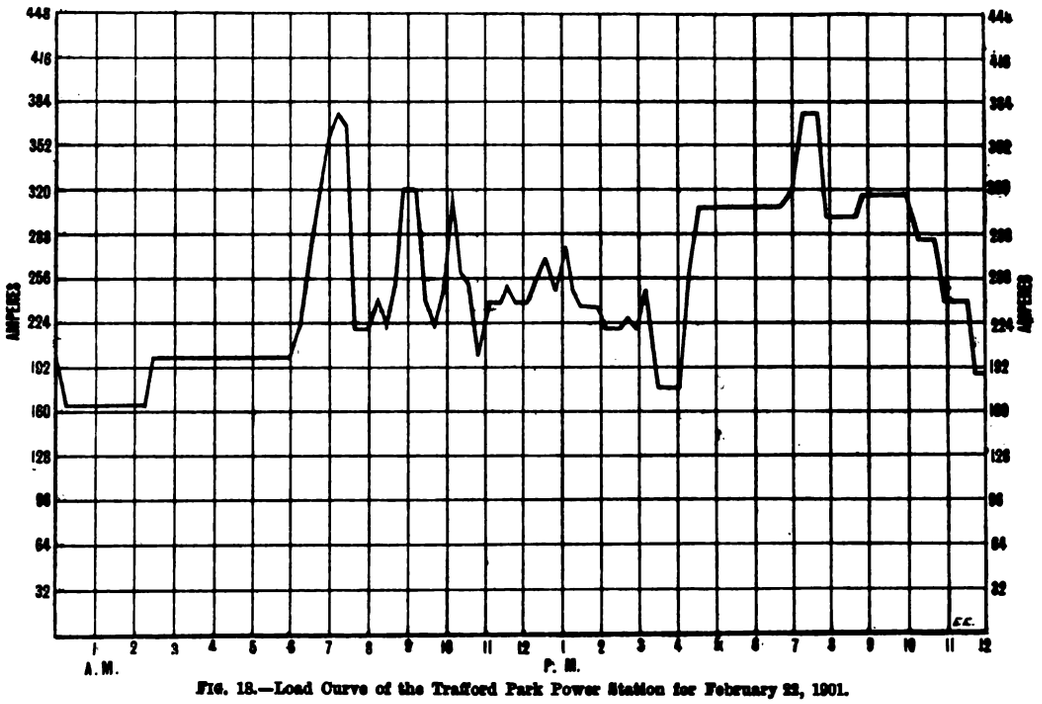

FIG. 18.—Load Curve of the Trafford Park Power Station for February 22, 1901.

give more satisfactory results than if the whole distributing network were connected together.

System of Charging.

In making-up the charges for any consumer, due consideration will always be paid to the character of the load he will provide for the station. In consequence of this, there is a very considerable difference between the cost for lighting and for power. Thus a consumer of power on the estate is charged at the rate of 1½d. per unit for all energy supplied up to an average use of his maximum power demanded for 1,200 hours per annum. For all energy supplied above this, only ½d. per unit is charged. Thus, assuming that a factory is only working 300 days per annum, and that nine hours per day is the average period over which the machinery is running, it will correspond to 2,700 hours' use of the supply, which will be quite sufficient to bring the charge down to 1d. per Board of Trade unit. In this no allowance is made for overtime or for night shift work, from which it will be readily seen that in an ordinary engineering factory the charge per unit will come out considerably below 1d. For lighting purposes the charge is again made on the maximum demand principle at the rate of 4d. per unit for the first 400 hours per annum, and 1½d. per unit for all above this quantity. The supply for lighting is at present given by means of overhead wires for all the main routes on the estate. Another large consumer for lighting is the Trafford Park Dwellings, Limited. The large number of workmen's houses erected by this company

of consumers are connected. The load curve which we give in Fig. 18 shows that the all-night load is already a good one. The curve also shows how sudden are the variations of load on a station supplying factories. These variations, however, occur at well-known periods as a rule, and there will be no difficulty in preparing to meet them at these times—in fact, the curves may be said to show the alacrity with which the British working-man drops his tools at mealtimes.

Extensions.

Up to the present the whole of the supply is given on the three-wire system with direct currents, with 500 volts between the outer conductors. When, however, the current is demanded farther away from the station, it is proposed to use the three-phase system. It is also expected by the engineers that in future gas-engines direct-coupled to dynamos will be employed instead of steam-engines. Tenders have now been received by the company for gas-engines of the large size which would be required. With these engines it is proposed to so arrange the exhaust outlets that the heat in the gases discharged will be used to generate steam for gas-producers. This will result in the recovery of a considerable quantity of heat which is now allowed to go to waste in all gas-engines.

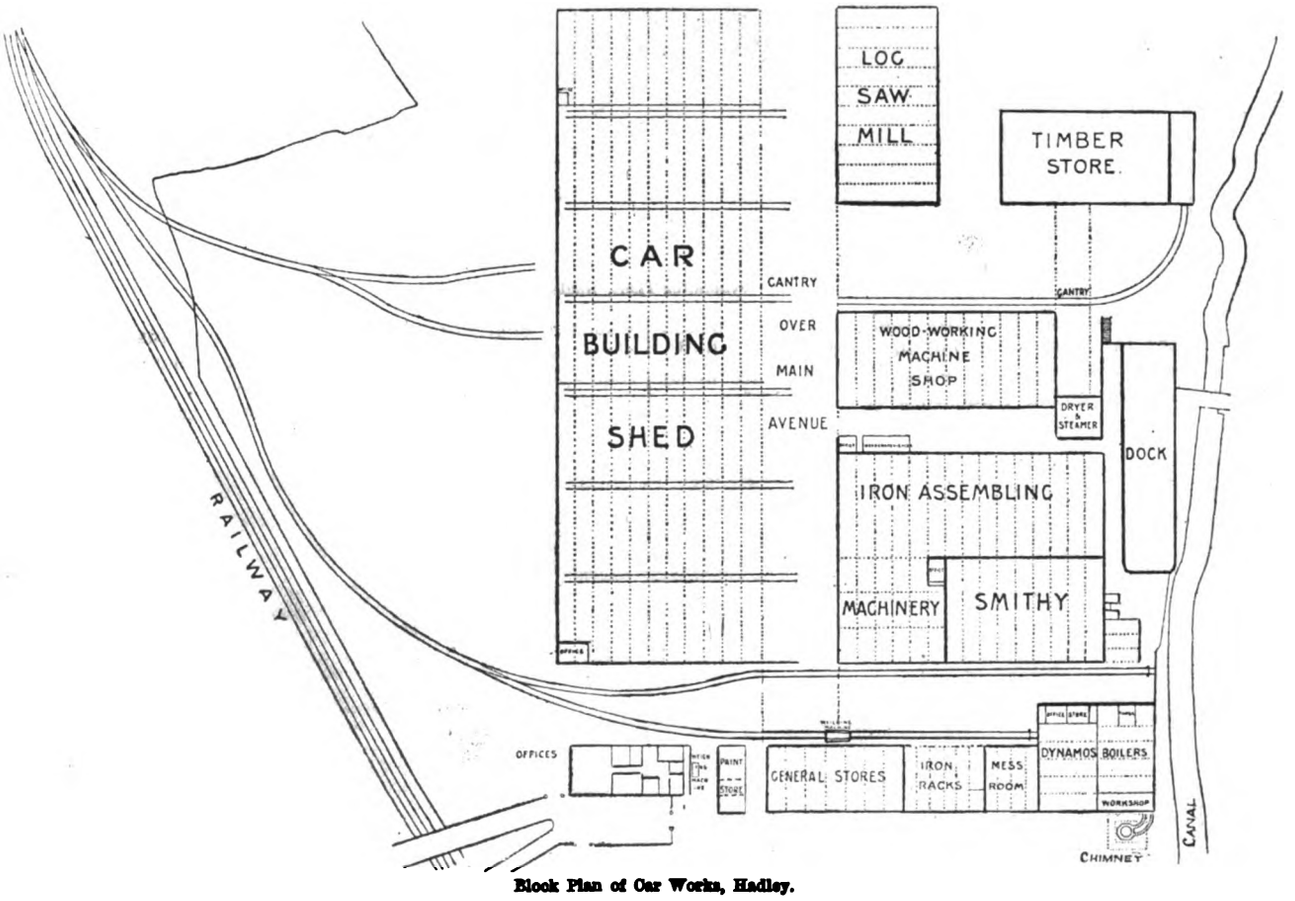
In conclusion, we have to thank the engineers of the company (Messrs. Lacey, Clirehugh, and Sillar) and Mr. L. B. Atkinson for their kindness in placing the information and drawings at our disposal. We gather from the

Digitized by Google

last-named gentleman that from his original calculations, on which Messrs. W. T. Glover and Co. took up the organisation of the undertaking, there is every probability of the cost to consumers coming down even below the present low scales.

TRAMCAR CONSTRUCTION.

Messrs. G. F. Milnes and Co., Limited, who have just issued in book form a comprehensive description of the work carried out by them, may be regarded as the pioneers in the industry of tramcar construction. The issue in question is beautifully illustrated and of a most interesting character. Tracing the history of this industry from its introduction into this country from America some 40 years ago, the descriptive matter deals with every branch of the work done at the main works of the firm at Hadley, Salop. The accompanying plan shows that these works, which have only recently been erected, are completed on the most approved style. The easy accessibility both by rail and waterway is an undeniable advantage. On the one side, there is the Shropshire Union Canal, by which the timber or other material required by the company is conveyed direct from seaports to the dock facing the chief centre of operations; on the other side, a railway which enters the works and is connected with the trunk line of the London and North-Western Railway Company at Hadley Junction. Another impression one readily receives from the plan is the excellent situation of the various workshops and stores with a view to facilitate production by saving time and labour. All the workshops and stores are so arranged that each immediately commands the next in the order of requisition, so that from the moment the raw material out of which the car is evolved is begun to be operated on, till the moment when the vehicle emerges from the company's shed a finished and handsome structure, the work proceeds step by step with extreme regularity and precision. A broad avenue bisects the works almost in the centre, it is a spacious roadway running from the general stores at the one end practically to the log sawmill at the other, and having the car-building shed and the principal workshops on either side. It is furnished with a large gantry crane, worked by electricity, which traverses the entire length of the avenue commanding the entrances to, and the exits from, all the different departments. As before stated, the timber is brought direct into the works by water, and as the logs are required they are conveyed to the sawmills, which department is equipped in a most complete manner. The sawn timber is afterwards taken by trucks to the electric crane in the main avenue, which in turn deposits it in the timber yard. Finally, they are transferred to the stores to undergo the natural drying process. The wood remains here for at least two years. Turning to the wood-working machine shop, the first thing one is impressed by is the extensive nature of the machinery employed for shaping, sawing, mortising, planing, moulding, tenoning, and ornamental work. A particularly noticeable feature about the shop is the total absence of shafting and belting, whereby the risks to the company's employés in this department are considerably reduced. All the machines are worked from the basement. Each of the large ones is independent of the others, the electric current being switched on and off at will—a most important factor in economic production. All shavings and sawdust falling from the machines are carried to a large main beneath the shop, and thence are deposited at the feet of the firemen for consumption in the furnaces. As the woodwork leaves the machine shop it is transferred to the cabinet room, where it undergoes almost its final treatment.

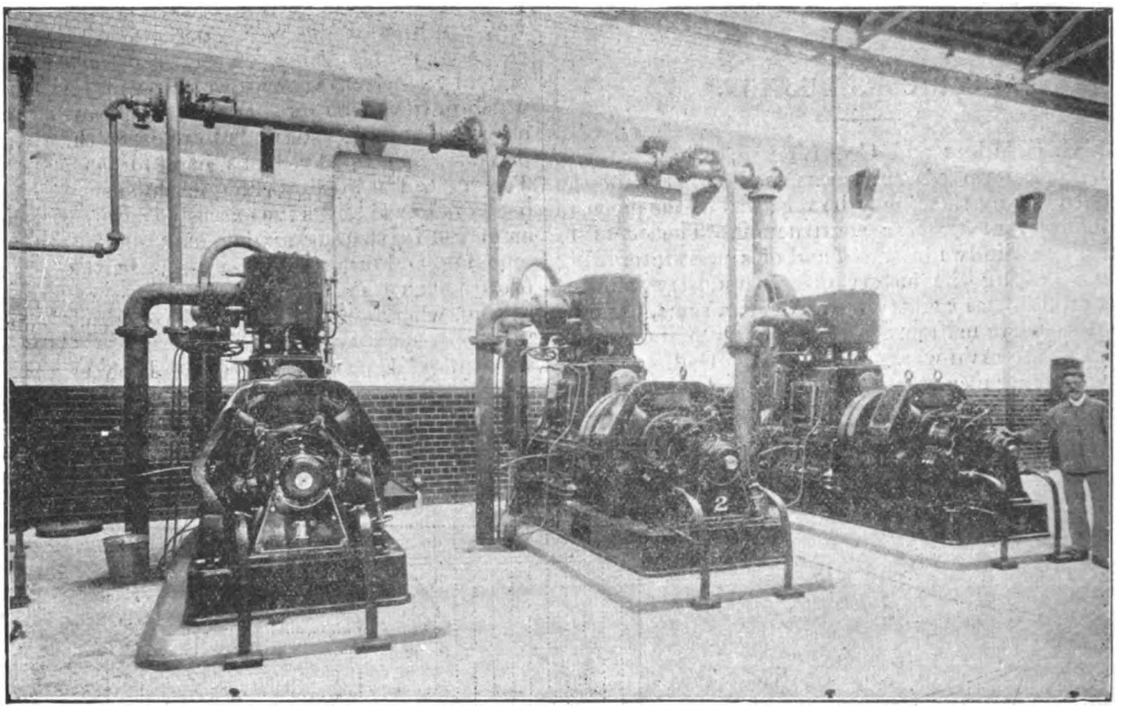


Block Plan of Car Works, Hadley.

Some interesting information is given about the smithy. This is provided with single, double, and quadruple hearths and all the latest plant incidental to the nature of its requirements. At the present time there are at work four steam hammers of varying sizes, and two more are being laid down. The blast to each of the fires is created by means of a powerful fan. In point of rapidity of production the smithy ranks with all the other workshops on the firm's premises. Not less interesting is the shop where the ironwork for the car is made ready for the fitter. It is replete with machinery of the latest construction. Lathes, drills, and numerous other machines of the most approved types, as well as the latest devices for sharpening tools, etc., are everywhere noticeable. As the various sections of the metal portions of the car are here produced, they are immediately transferred to the next department to be

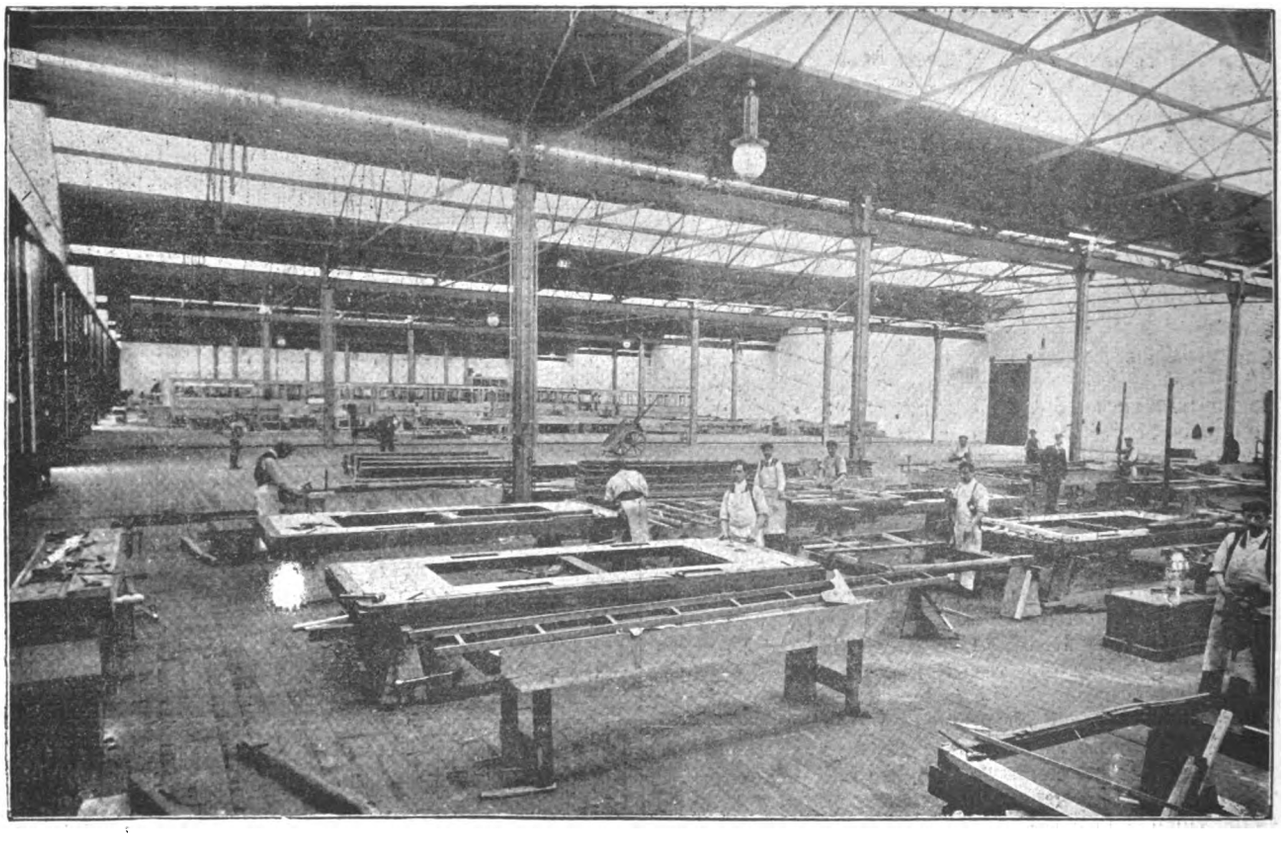
Digitized by Google

finished and fitted together as the underframe work of the car. Then comes the iron assembling room, which is so named from the fact that here are gathered together, the power is generated by which this complex system of machinery is set and kept continuously in motion is, perhaps, the most interesting part of the works to the



Generating Plant, Hadley.

finished and fitted, all the iron and steel and wooden sections of the car upon which the superstructure is built. All the parts or the sections being completed are fitted together, and the entire framework is dispatched to the electrical engineer. The boiler-house contains three Lancashire boilers, each 30ft. in length, and having an inside diameter of 8ft. As may be inferred, the boilers are designed for the consumption of wood cuttings, shavings,



Corner of Car-Building Shed, Hadley.

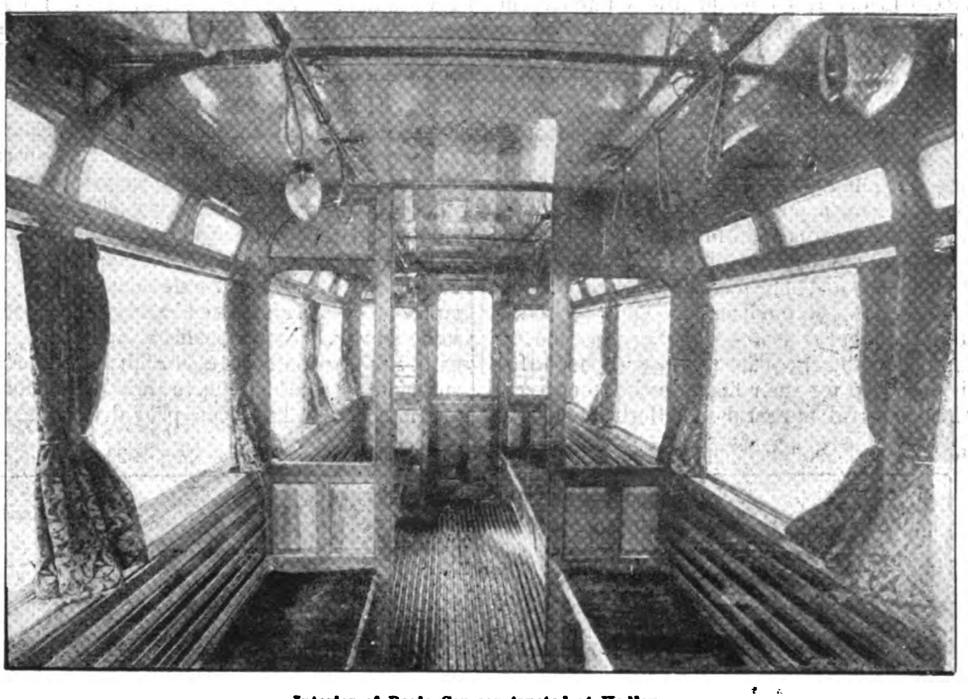
car-building shed, where the final processes of construction are carried out.

We may mention at this stage the Busch's lifting jacks employed in the works. They play an important part in the economy of all departments, used as they are for raising both light and heavy weights. The place where sawdust, and other refuse. They have a working pressure of 120lb. to the square inch.

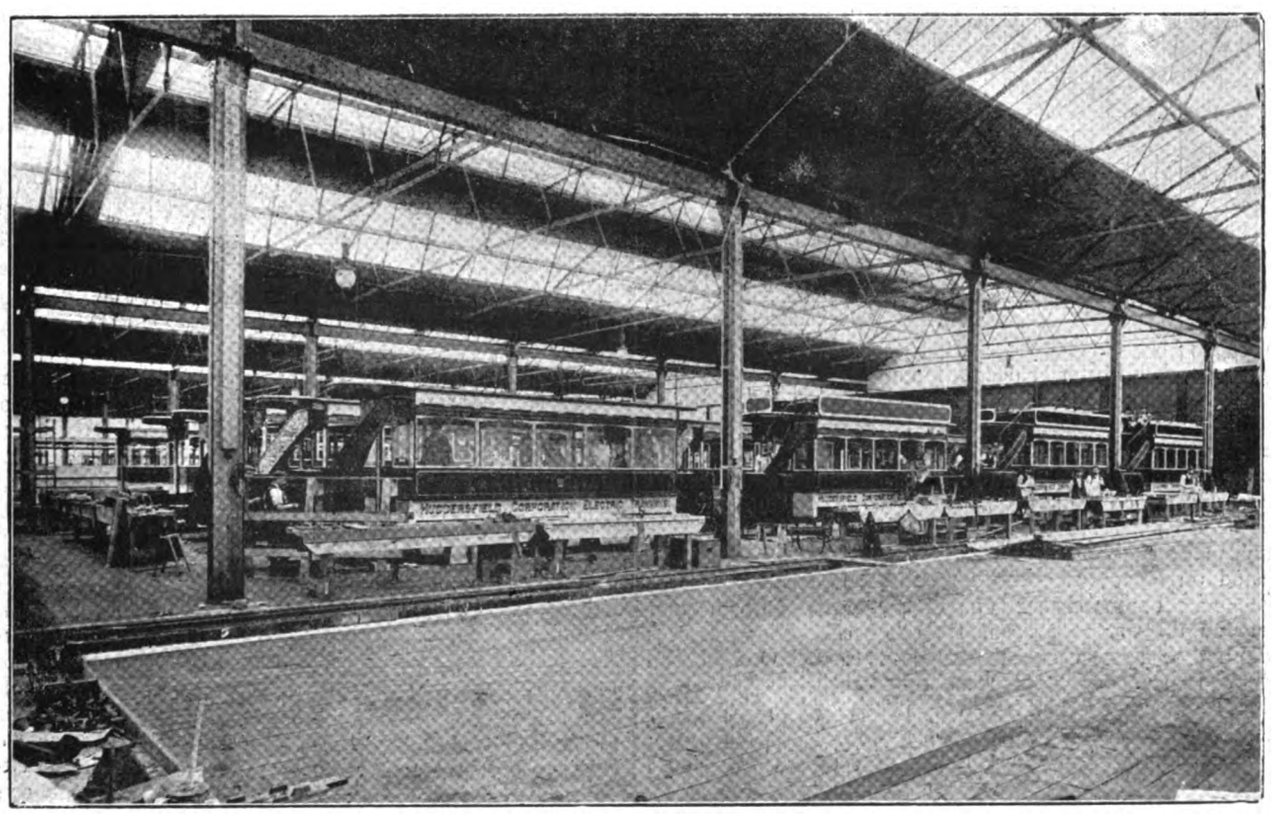
The generating station is equipped with three six-pole continuous-current generators, as will be seen from the accompanying photograph. Each of these generates a current equal to 115 kw. at a voltage of 230. The speed

Digitized by Google

attained to produce this is, as nearly as possible, 400 revolutions per minute. The dynamos are connected direct with three of Browett and Lindley's vertical compound-condensing engines, and are very carefully insulated. The power plant consists altogether of 50 continuous motors of the latest type. They range from 2 h.p. to 60 h.p. each, and were supplied by the British Thomson-Houston Company, Limited. Each motor is supplied with a controlling panel fitted with a double-pole switch, fuse magnetic blow-out, and starting rheostat. On the switchboard there are in all four generating panels, each of which is provided with an automatic circuit breaker, main ammeter, positive and negative main switch, shunt field regulating rheostat, pilot lamp, and discharge resistance. On either side of these panels the feeder panels are fixed. These are supplied with 24 double-pole switches, each of which controls the feeder line of both the light and power plant, with all necessary accessories. The feeders are led to the main distributing boards fixed in each department. Here the boards are furnished with main and sub switches to regulate the different light and power circuits. It may be stated here that the lighting plant is fitted up in the latest style of distribution. There are in all throughout the works nearly 800 incandescent and 100 large arc lamps. The latter are arranged in series of four, controlled by double switches.



Interior of Bogie Car constructed at Hadley.



Car-Finishing Shed, Hadley.

A brief description of the methods adopted in the final stages of the building of a car is then given. The photograph we give of a corner of the car-building shed will indicate the magnitude of the building. When the framework of the body of the car is completed, it is taken here in sections to be fitted. The underframe, as it comes from the

Digitized by Google

assembling-room, being first laid down—an operation which occupies only a short space of time—the upper skeleton of the car is fixed upon it ready to be panelled and framed. Whilst the latter process is being carried on outside, the finishers are inside bringing the interior into shape. Very soon afterwards the body of the car becomes almost an accomplished fact. It ought to be mentioned that there are pits in the shed in order to facilitate the fitting of the underneath gearing, such as the brake, etc. The fitters next apply themselves to the construction of the dash-plates, staircase ladders, and top railings. When these are finally adjusted, the car is handed over to the painter, glazier, and upholsterer.

Of course, the foregoing operations constitute only the substantial part of the work put into a car. There are a thousand and one other details that might be enumerated all requiring careful and skilful manipulation. Sufficient, however, has been said to demonstrate that as a modern industry car-building has become an art far beyond the conception of the average person.

The illustration showing the cars as they appear before leaving the finishing shed for their final destination gives a good idea of their general appearance. Both in external appearance and interior decoration and upholstery they are remarkable for their workmanship, elegance, and comfort. The firm claims that the best only of every kind of material required in their construction can find space in the workshops both at Hadley and Birkenhead, and this is a matter which obtains their first consideration. Every car before it leaves the works is subjected to the closest examination by some qualified and responsible person and tested on a tramway line specially constructed for the purpose. The particular type of car most in favour and demand up to the present time is that which is best adapted to the overhead haulage system. One of the latest improvements is that the ventilators are now placed on the sides of the car instead of on the top, thereby leaving for the passengers more headroom in the centre. The windows are fewer in number, but afford quite as bright a light as formerly, and each window is curtained with tapestry. A much better kind of staircase ladder is now constructed, being easier of ascent and descent than that of the old horse cars—an improvement which will be much appreciated. A special design of car is at present in course of construction by this company. Its chief features in the way of novelty are that its entrance and exit platforms are entirely enclosed, so that the driver is sheltered from inclement weather and the passengers derive the benefit whilst entering or leaving the car. As in the case of the Central London Railway, the entrance to the platforms is closed by means of collapsible gates. The cars, of course, are lighted by incandescent electric lamps. In the upholstery department a staff of both male and female employés is maintained. The workroom, as will be seen from the accompanying view, is perfectly equipped with all the appliances needed for furnishing the inside of the cars. Passing the paint-house, the iron stores call for some mention. Hundreds of tons of the metal are stored both in bars and in sheets in and about the building. An obvious advantage in the construction of the cars by the firm is that the whole of the ironwork required in the factory is manufactured on the premises. The general offices of the company speak well in favour of the business done. While, of course, in the first place the aims of the firm are principally directed towards the construction and equipment of the cars, the interests of their employés are by no means lost sight of. Not only do the workpeople perform their duties under the most salubrious conditions, but their more substantial comforts have not been forgotten. Ample accommodation has been provided for the men who wish to take their meals on the premises. There is a large mess-room, where they may be either provided with good substantial food at the lowest possible prices, or where, if they prefer to carry their own provisions with them, these can be reheated and eaten in comparative comfort. This is a privilege highly appreciated by the hands.

Workmen's Cottages, Hadley.

In the matter of local habitation for the employés, provision has to some extent already been made, and is continuing to be made, on model principles. One hundred and fifty cottages have been constructed or are in the course of construction, and the advisability of still adding to that number is under consideration. It is also in contemplation to erect a large concert hall, with billiard-room and library, and to arrange for courses of popular lectures. The firm are, moreover, bringing pressure to bear on the railway company to give cheap fares to the workmen to and from Wellington and the surrounding district, a concession which, it may be remarked, has already been granted in the matter of week-end tickets, by means of which places of interest at some distance may be visited.

Mersey Railway.—The report of the directors for the half-year ended Dec. 31 states that arrangements for working the railway by electricity are receiving the careful consideration of the Board.

Digitized by Google

ELECTRIC RAILWAYS.

BY MAJOR P. CARDEW.

In the second Cantor lecture on the above subject, delivered on Monday last at the Society of Arts, Major Cardew commenced with the consideration of gearing. The advantage of gearing was that it allowed a motor to be run faster, and, in consequence, the weight of the motor could be reduced. Another point was that when the motor was built upon the axle, no spring was possible between the weight of the motor and the axle. In consequence of this, at every unevenness of the track the whole weight of the motor had to be suddenly displaced, which caused a great blow on the track, tending to make the inequality worse. By means of gearing the unspring-borne weight could be reduced. Major Cardew then showed a model of the Ganz Company's arrangement for a motor the whole weight of which was spring-borne. This motor, which was of the induction alternating type, had a hollow axle, through which the axle of the wheels passed. The space between the two was sufficient to allow for considerable vertical play without the axles coming into contact. In spite of this, the driving between the rotor and the motor on the wheels was positive in any position. The driving was effected by means of two connecting rods, one of which was always in tension, and the other always in compression. The next division of the subject was that of polyphase systems of traction, such as had been developed in Switzerland by Messrs. Brown and Boveri and by the Oerlikon Company, while Messrs. Ganz and Co. were now equipping a long length of railway line in Italy. Major Cardew proceeded to give a general explanation of the way in which polyphase currents were generated, showing that from an ordinary direct-current machine, by means of slip rings, multiphase currents could be taken. As regards the motors to be used on such polyphase systems, they could be divided into two classes, the first of which was practically a generator reversed. A machine of this class would only act as a motor at a speed which was absolutely in synchronism with the supply. In consequence of this, these motors were of no use for traction purposes. The other class were the asynchronous motors, which gave good starting torque, which could be regulated at will by the insertion of resistance in the rotor circuit. An advantage of this class of motor was that the three-phase currents received from the line were connected to the stator, and high voltages could be used, which was not possible with direct-current motors, in which the high voltage would have to be conveyed by brushes to the revolving armature. He stated that the efficiency of the two classes of motors, polyphase and direct current, was much about the same. He then explained how Messrs. Ganz and Co. have devised what is practically a series-parallel controller for such induction motors. The firm used two motors, the rotor of the first of which is connected up to the stator of the second. As the two axles are coupled together, the first motor and the second are bound to run at the same speed. Thus the speed to which the two motors when so connected tend, is half that of the first motor when used in the ordinary way on the line with a short-circuited rotor. When starting up, the acceleration is effected by means of resistance in the rotor of the second motor. When, then, the locomotive has got to nearly half speed, the second motor is cut out of circuit and the rest of the acceleration done by the first motor. Major Cardew pointed out that in the first condition of starting the whole of the energy taken from the line has to go through the first motor, and that half of this energy in that motor is converted into mechanical energy, whereas the other half is passed on as electrical energy to the second motor. He gave diagrams to show the acceleration which could be obtained in this way, and in one example a locomotive increased in speed up to 11·5 miles per hour in 11·5 seconds, which was an increase in acceleration of one mile per hour per second. When, however, the second motor was switched out the acceleration was slower, it taking 25½ seconds to increase the speed up to 23 miles per hour. The watts consumed in accelerating with the two motors up to half speed were 3,170, while in the other period 2,845 watts were taken to bring the speed up to the maximum. Another advantage of the system was that when it was wished to stop the train, the second motor was again switched in. In consequence of this, the speed of the two motors was over synchronism, and power was returned to the line. In bringing the speed of the train down to 11·5 miles per hour again, some 30 per cent. of the kinetic energy was returned to the line.

As regards the frequency, Messrs. Ganz and Co. found that this should be kept as low as possible, as the maximum torque varied inversely as the square of the frequency. They preferred a frequency of 15 complete cycles per second. With this frequency it was not easy to obtain a good lighting effect, as the pulsations of the light were most noticeable. The firm had overcome this to a certain extent by using incandescent lamps with three filaments, one for each of the three phases. He thought, however, that it would be well to make the lighting independent of the traction circuit, using, perhaps, a small motor-generator on each train. Another feature of the system was that they used compressed air control for all the switch gear, and a liquid resistance for the motor circuit in starting up. The resistance was altered by means of changing the level of a liquid in a tank by compressed air. As the liquid rose it came in contact with peculiarly shaped iron plates, which as the height of the liquid increases offer a greater surface for the current to pass. In this way an absolutely even acceleration could be obtained. With respect to the conductor, there were considerable objections to a third rail along railways in view of the trouble which such a rail caused to platelayers. Owing to the use of high voltages, the Ganz Company were able to revert to an overhead construction in consequence of the small current required. While such high-voltage conductors would not be allowed over public roads, he saw no reason why they should not be for railway lines, which were private property. Major Cardew then described a system of earthing the conductor in the event of fracture which had been adopted by Messrs. Ganz and Co. At each of the poles along the track a wire was connected higher up the pole than the trolley wire, and then on to the trolley wire at a short distance. In the ordinary way there was no weight on this wire, and a ring of earthed guard wire was placed round it. In the event of the trolley wire breaking, this subsidiary wire received the strain and short-circuited on to the earthed ring, which would blow the fuses. As regards the rails as a return, there would be a certain amount of difficulty in adhering to the seven-volt drop allowed by the Board of Trade, owing to the fact that the steel rails were not good conductors for alternating currents. It would either mean laying a good return feeder connected at frequent points of the railway system, or else an insulated return by the side of the main track. It must be remembered that seven volts was a very small percentage of a 3,000-volt working pressure, whereas it was a reasonable percentage when 5,000 volts was the working pressure. An illustration of the trolley used in the Ganz system, in which compressed air is employed for elevating the trolley or for removing it from the wire in case of accident, was then explained by the lecturer. In conclusion, Major Cardew considered that with polyphase working there would be no difficulty in working with a 12,000-volt pressure in the supply, which, with a current density of 600 amperes per square inch and a 5 per cent. drop in the line, would allow the generating stations to be placed 30 miles apart. He thought anything from 30 to 50 miles was a reasonable distance for these generating stations.

The lecture, which was continued until nearly half-past nine, owing to the clock being hidden by a lantern, was mostly devoted, as will be seen above, to a description of the Ganz system, which we suppose is the actual system proposed to be used by that company on the District Railway. We missed, however, that critical comparison between the polyphase system and the ordinary direct-current system of traction which we should have expected from an engineer like Major Cardew. This may be found in the lecture when printed in full, but was obviously lacking in the discourse delivered.

A METHOD OF COMPENSATING VOLTMETERS FOR THE VOLTAGE DROP IN LONG FEEDERS.*

BY MICHAEL B. FIELD, A.M.I.C.E.

(Concluded from page 382.)

Neither Mershon, Crompton and Ashley, nor Heap, however, give any method for obtaining the average voltage at any desired group of feeding points, nor, with one exception referred to later on, is any method given in the above-mentioned patents applicable to case (*b*)—*i.e.*, when unequal currents exist in the go and return feeders, as in the case of three-wire systems and the like. This case, however, is just as important as the foregoing, owing to the extensive use now made of the three-wire system.

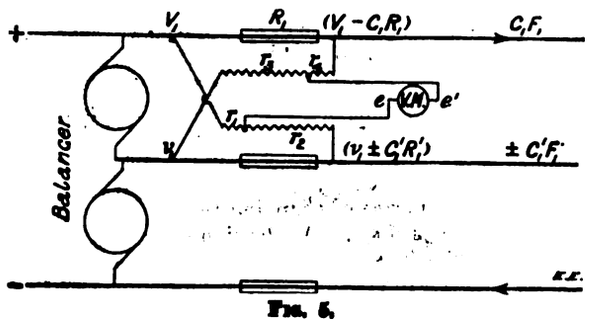

FIG. 5.

In such cases the voltage at the network between the neutral and each outer may be required to be known. The switchboard apparatus needed is very similar to that already described, the difference being that in this case series resistances must be inserted in each main, and the potential resistances are somewhat differently arranged. Fig. 5 shows the arrangement as applied to but one set of feeders. The voltmeter, V, will then be compensated for the combined drop both in the outer and neutral mains with which it is connected. If the average voltage between, say, the positive outer and the neutral at several feeding points be required, the arrangement of multiple-contact switch as in Fig. 2 may be employed. The principle involved in this case is somewhat different to that of case (*a*), and may be best understood by comparison with a Wheatstone's bridge. Fig. 6 may be considered as equivalent to Fig. 5

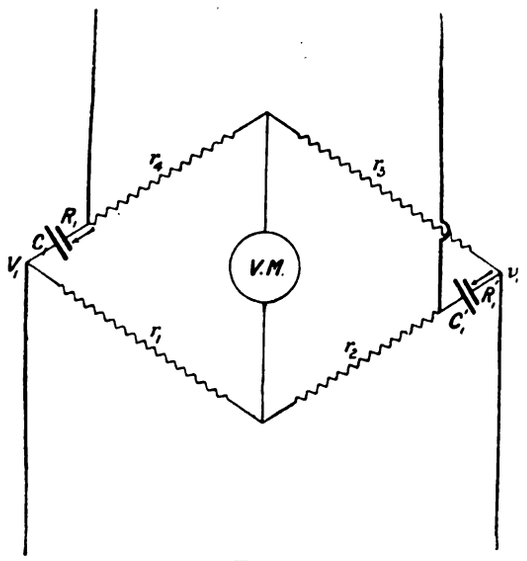

FIG. 6.

if we consider the potential differences called into play by the drop across R_1 and R'_1 as replaced by opposing E.M.F.'s. If, now, the ratio arms of the Wheatstone's bridge be slightly out of balance, it is clear that the current through the voltmeter will be proportional to the expression $\{V_1 - v_1 - (\alpha C_1 R_1 + \beta C'_1 R'_1)\}$, where α and β are numerics, the value of which may be adjusted as desired by merely altering the resistance of the ratio arms. If, therefore, they be adjusted so that αR_1 equals the resistance of the outer, and $\beta R'_1$ the resistance of the neutral, it is clear the voltmeter indications will be proportional to the voltage obtaining at the far end between outer and neutral. With the device just described it is of utmost importance to select as sensitive a voltmeter as possible in order to minimise the losses which take place in the shunt resistances. In the latter portion of this communication this is shown to be the case, the following result being arrived at analytically: If the method be applied to a three-wire system with 400 volts between outers, and if the series resistances in the outer and neutral mains are as large as is at all practicable to make them—

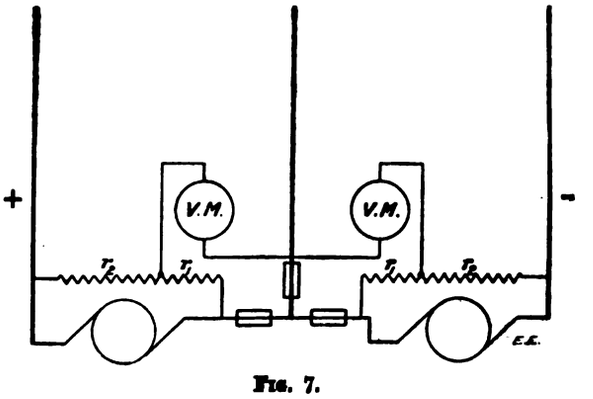

FIG. 7.

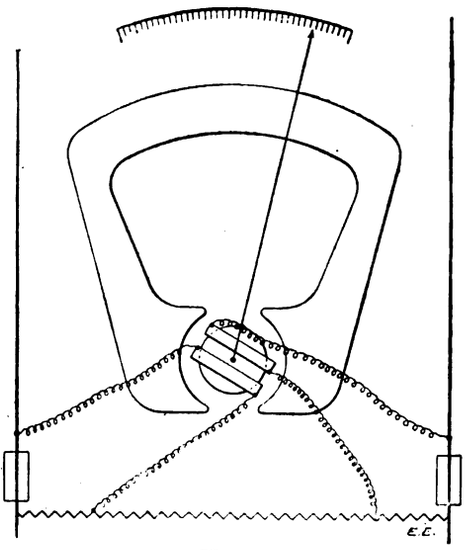
e.g., the drop of volts along $R_1 = 0{\cdot}2$ volt and along $R'_1 = 0{\cdot}4$ volt with an average full load—(the drop along the resistance R'_1 may be taken higher than along R_1, since the current in the former case is much less than in the latter, so that a larger drop does not necessarily imply a large loss of power), and if the voltmeter required $\frac{1}{100}$th ampere to give the full scale deflection, then the resistance of $(r_1 + r_2)$ and $(r_3 + r_4)$ could not well be more than 890 ohms. This would involve in them alone a continuous loss of nearly 90 watts. Instruments of the dead-beat suspended-coil D'Arsonval type made up in switchboard form, with a needle swinging in a horizontal plane as in a Kelvin low-tension electrostatic voltmeter, would therefore be best for this purpose, for with suspended-coil voltmeters of this description not only can the values of the resistances $(r_1 + r_2)$ and $(r_3 + r_4)$ be increased to 3,000 or 4,000 ohms, but the maximum drop of volts across R_1 and R'_1 may also



IG. .

be greatly reduced. When employing this method for determining the average of several feeding-point voltages, a multiple-contact switch as shown in Fig. 2 is necessary. It is also necessary to shunt the voltmeter by means of the resistance, S. but the resistance, ρ, of the various connecting wires may be made as low as is convenient, since the resistances r_1 r_2 r_3 r_4 will themselves prevent any appreciable interchange of current between the various feeder circuits. Fig. 7 shows a particular case where the voltage at the end of a set of three-wire feeders may be simply arrived at. The figure is a sufficient explanation

* Paper read at a meeting of the Glasgow Local Section of the Institution of Electrical Engineers, Feb. 13, 1901.

Digitized by Google

of itself. It is, however, clear that this case is rarely applicable in practice. In Heap's patent 8,348 of 1898, instruments of the Weston type are described for use in three-wire circuits, where the moving member has two distinct coils and four terminals, as shown in Fig. 8. The great disadvantage of this arrangement is, of course, the difficulty of insulating the coils on the movable member from each other, the difference of potential being the full voltage between outer and neutral wire. A further device is described, as shown in Fig. 9, with reference to instruments depending on the attraction of a small piece

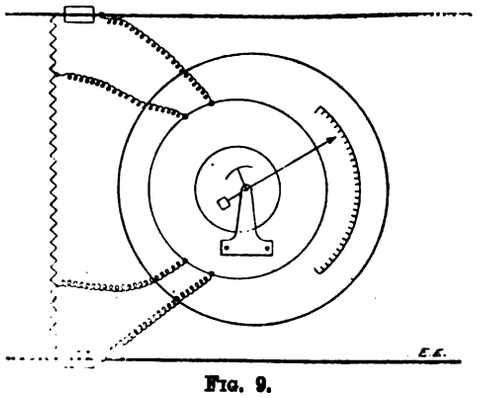


FIG. 9.

of iron. If these instruments be used at all, they may quite as readily be compounded with a few turns in series with the outer and neutral mains in accordance with the original scheme of Dr. Hopkinson. In any case, the device described above of Heap possesses the disadvantage that unless a large drop be allowed in the inserted resistances in the mains, the available voltage across the terminals of the voltmeter is altogether insufficient. For example, on a 250-volt circuit, if the series resistance caused an added drop of, say, 2 per cent. of the feeder drop, the available difference of potential for working the voltmeter would be only about 2·5 volts. With an instrument of the above type to be actuated by only 2 5 volts a comparatively large current would be necessary, causing a relatively large watt loss in the whole arrangement.

Case C.—This case—viz., the compensation for the ohmic and inductive drop in long alternate-current transmission lines—has been very ingeniously handled by Mershon. As already intimated, Fig. 3 gives the pith of Mershon's arrangement, but in his American patents a considerable number of very pretty modifications are shown; but all of these, as he is careful to point out, depend upon the employment of potential or current tranformers, or both. The following method, therefore, which is quite independent of all transformers, not even necessitating one for the voltmeter, may be of interest. In this instance not only must an extra resistance be inserted in the line, but similarly an extra self-induction, unless, indeed, a portion (say a $\frac{1}{100}$th part of resistance and self-induction of the line itself) be employed for the purpose by running back a pilot wire to the station from a point on the line situated at a distance from the power station equal to $\frac{1}{100}$th part of the whole length of the line.

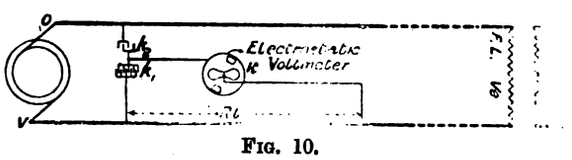

FIG. 10.

To fix our ideas, let us consider a specific case where the line voltage is 30,000 volts, the line being 50 miles from end to end. At the station a 100-volt multicellular electrostatic voltmeter of the Kelvin type is employed, and connected as shown in Fig. 10. It would, of course, have to be thoroughly insulated from earth. k_1 and k_2 are condensers replacing the resistances r_1 and r_2 shown in Fig. 1. The condenser k_2 has a capacity approximately equal to the maximum capacity of the voltmeter—*i.e.*, the capacity between the fixed and movable vanes, the latter being in the position they normally occupy when the voltmeter is indicating its maximum voltage. The capacity of the condenser k_2 is accordingly very small; it must, however, be capable of withstanding practically the full line voltage of 30,000 volts. The writer therefore proposes to employ for this condenser a slab of glass with pieces of tinfoil pasted on the two opposite surfaces, the slab being sufficiently thick to withstand the voltage, and the area of the tinfoil coatings being chosen to give a capacity approximately equal to the maximum capacity of the voltmeter. To prevent leakage and condensation on the edges of the slab, the whole might advantageously be immersed in a bath of special oil or be embedded in a block of paraffin wax or other suitable dielectric. The condenser k_1 must have a capacity nearly 300 times as great as that of k_2; since, however, the voltage across the former will be of the order of 100 volts, it can readily be constructed in the usual way of sheets of tinfoil and mica, and will not be an expensive matter. It is important that the ratio of the capacities of $k_1 : k_2$ be maintained exactly, but it is not of any importance that the capacity of k_2 shall bear any very exact ratio to that of the voltmeter. Thus the voltmeter, if deranged, might be replaced by another of the same pattern, and the latter would indicate correctly. If a portion of the line itself be utilised, instead of inserting extra resistance and inductance, a pilot wire must be run back from a point one-third of a mile distant from the power-house. This wire must be protected, of course, from the inductive action of the current in the line in a manner explained latter on. One advantage in utilising a portion of the feeder itself instead of inserting extra resistances, etc., which may, of course, be done in this or any of the foregoing cases, is that no error is produced by a change of resistance of the line due to changes of atmospheric temperature. We thus have a simple and inexpensive arrangement whereby a 100-volt electrostatic voltmeter may be arranged to measure directly the potential at the far end of a 30,000-volt line, the voltmeter being compensated for both ohmic and inductive effects of the line itself. It is obvious that similar arrangements may be applied to many such useful purposes—*e.g.*, in the last case the voltmeter might be arranged to compensate not only for the line drop, but also for the drop due to both copper resistance and magnetic leakage in the transformer at the far end, and thus indicate the voltage at the low-tension terminals of the transformer irrespective of what kind of load may be connected to the same—*i.e.*, one possessing self-induction capacity or anything else. The drop in the transformer might be exactly imitated by inserting in series in the circuit (now containing a perfect transformer with no drop) a definite self-induction and resistance. These might then be considered as forming part of the transmission line, and therefore by adjusting k_1, k_2, and the inserted resistance and self-induction, or possibly the position at which the pilot wire is connected, the drop due to the extra resistance and self-induction—*i.e.*, the drop in the transformer at the far end of the line—may also be compensated for.

Analytical Investigation.—A simple and straightforward, though possibly a somewhat lengthy, method of dealing with this subject is to consider n feeder circuits (Fig. 11), where F_1, F_2, F_n, etc., represent the total (go and return) feeder resistances of the various circuits. At the station end the positive and negative feeders of each circuit are bridged over by resistances $r_1 + r_2$, and all the points—1, 2, 3, etc.—of these resistances are connected together and to one terminal of the voltmeter. The potential of this terminal is e. The resistance of the voltmeter is r, and the current flowing through it i. It is further shunted by a resistance, s.

Let $V_1\ v_1$, $V_2\ v_2$, etc., be the potentials of the positive and negative feeders of the different circuits respectively, then it is easy to show that

$$e = \frac{r_2}{r_1 + r_2} \cdot \frac{\Sigma (V_1 + V_2 + \ldots V_n)}{n} + \frac{r_1}{r_1 + r_2} \cdot \frac{\Sigma (v_1 + v_2 + \ldots v_n)}{n} + \frac{r_1 r_2}{r_1 + r_2} \cdot \frac{s + r}{s} \cdot \frac{i}{n} \quad \ldots \quad (1)$$

Digitized by Google

Let $R_1, R_2, \ldots R_n$ be the series resistances inserted in the feeder circuits, and let the far end of each of these be connected by a wire whose resistance is ρ to the second terminal of the voltmeter. Calling the potential of this terminal e', we may write:

$$e' = \frac{\Sigma(V_1 + V_2 \ldots V_n)}{n} - \frac{\Sigma(C_1 R_1 + C_2 R_2 \ldots C_n R_n)}{n} - \rho \cdot \frac{s+r}{s} \cdot \frac{i}{n} \quad \ldots \ldots \quad (2)$$

where $C_1, C_2, \ldots C_n$ are the various feeder currents, which may be taken as identical with the currents flowing through R_1, R_2, etc., provided ρ be sufficiently large to prevent any appreciable interchange of current between the various feeders.

We have further

$$e' - e = i r \quad \ldots \ldots \quad (3)$$

Hence, eliminating e and e', we have

$$i = \frac{\frac{1}{n}\Sigma\left(V_K - v_K - \frac{r_1+r_2}{r_1} \cdot C_K R_K\right)}{\left(\rho \cdot \frac{r_1+r_2}{r_1} + r_2\right)\frac{s+r}{s n} + s\left(\frac{r_1+r_2}{r_1}\right)} \quad \ldots \quad (4)$$

If $$\frac{r_1+r_2}{r_1} = \frac{R_1+F_1}{R_1} = \frac{R_2+F_2}{R_2} = \text{etc.},$$

the numerator of the above expression is merely the average voltage existing at the far ends of all the feeder circuits. We will call this V_a. It is then clear that the current flowing through the voltmeter is proportional to V_a, if any given number of feeder circuits be connected.

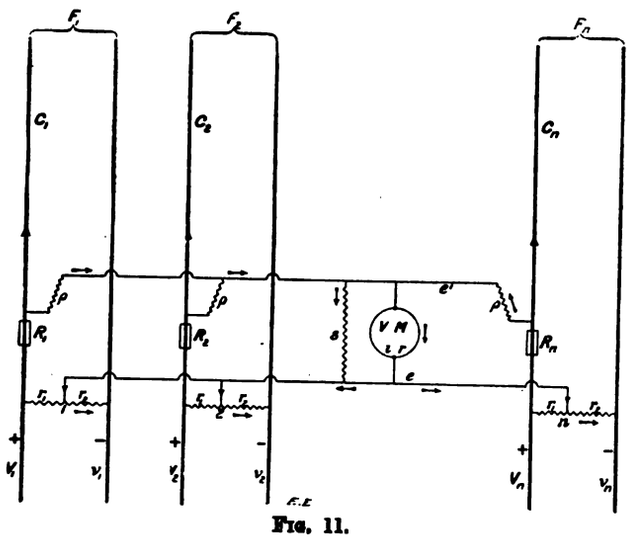

FIG. 11.

The constant of the instrument, however, involves n; in order, therefore, to make the same calibration serve for all values of n, and to obtain the most sensitive arrangement, we must keep $\frac{s+r}{s n}$ equal to unity—in other words, s must always equal $\frac{r}{n-1}$. This therefore is the function of the shunt, s, in Fig. 2, and if by means of the multiple-contact switch s be made to depend on n in the above manner, we have

$$i = \frac{V_a}{r_2 + \frac{(\rho+r)(r_1+r_2)}{r_1}}.$$

If $n = 1$ we may make $\rho = 0$ and $s = \infty$—*i.e.*, no shunt is required. This is the arrangement of Crompton and Ashley, and also of Heap.

The equation holding for the device represented in Fig. 1 is slightly different from the foregoing:

We must insert in equation (1)

$$n = 1, \quad V = \frac{1}{n}\Sigma(V_1 + V_2 \ldots V_n), \quad 0 = \frac{1}{n}\Sigma(v_1 + v_2 + \ldots v_n),$$

and in equation (2) merely

$$V = \frac{1}{n}\Sigma(V_1 + V_2 \ldots V_n).$$

Combining (1) and (2), we have

$$i = \frac{V_a}{\left(\frac{\rho}{n} \cdot \frac{r_1+r_2}{r_1} + r_2\right)\frac{s+r}{s} + \frac{r(r_1+r_2)}{r_1}}.$$

Now in this case, if ρ be very small compared with r, we may say that i does not depend on n, hence s may be made ∞—*i.e.*, no shunt is required—and we have

$$i = \frac{V_a}{r_2 + \frac{r(r_1+r_2)}{r_1}}.$$

Applying the above results to an actual case, let $V = 200$, and let the current required by the voltmeter for maximum scale deflection, corresponding to, say, 220 volts, be 0·01 ampere, the resistance of the voltmeter being 60 ohms.

Let, further

$$\frac{F_1}{R_1} = \frac{F_2}{R_2} = \text{etc.} = 99,$$

then we have $r_2 = 16{,}000$ ohms,

$r_1 = 161\,6$ ohms.

We may take it that the maximum feeder drop will not exceed 10 per cent., hence the maximum volt drop along R_1, R_2, etc., cannot be greater than 0·2 volt. If, therefore, $\rho = 0{\cdot}75$ ohm, we may say that the interchange of current

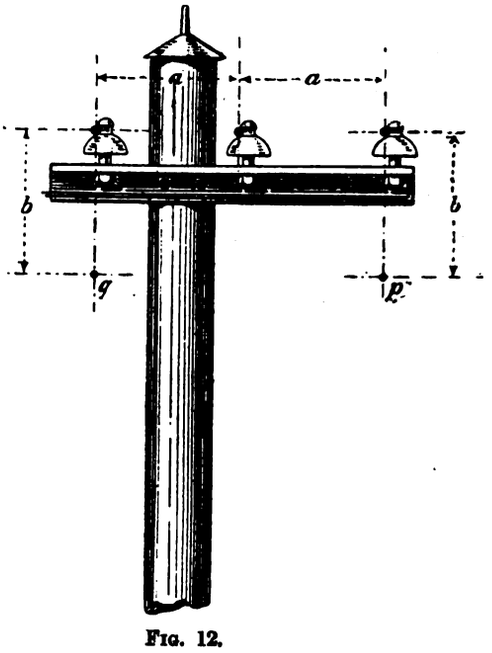

FIG. 12.

between any two feeders cannot be more than 0·13 ampere, or an amount which is quite inappreciable, and at the same time the maximum error introduced by the variation of the value of $\frac{\rho}{n}$ as n is varied cannot exceed one-fifth of 1 per cent.

With the arrangement shown in Fig. 2, ρ must be much greater than heretofore assumed, for if one set of feeders be switched out, the voltage at the near end of the positive of the same might differ by as much as 20 volts from that of neighbouring positive feeders, and a serious interchange of current between them would occur if ρ were not of considerable magnitude. Since, however, from equation (4) it appears that no error whatever is produced by the variation of n, provided s is always equal to $\frac{r}{n-1}$, we may, if we like, take $\rho = 100$ ohms. In this case, taking the same constants for the voltmeter as before, r_2 will come out 6,000 ohms and r_1 60 6 ohms.

It has been assumed throughout the foregoing that the same current returns by the negative feeder as goes by the positive feeder of the same circuit; this will generally be true, unless, indeed, the resistances of the positive and negative feeders are different, or the problem is complicated by the fact that there are faults at different parts of the system. In such cases, however, where the out-

Digitized by Google

going current is of different magnitude from the return current, the following arrangement might be employed, which, moreover, is particularly applicable to three-wire systems and such like.

To derive an expression for i in case (b)—see Fig. 5—we have from equation (1):

$$e = \frac{r_2}{r_1+r_2} \cdot \frac{\Sigma V_\kappa}{n} + \frac{r_1}{r_1+r_2} \cdot \frac{\Sigma v_\kappa \pm C'_\kappa R'_\kappa}{n} + \frac{r_1 r_2}{r_1+r_2} \cdot \frac{s+r}{s} \cdot \frac{i}{n} \quad . \quad . \quad . \quad . \quad (5)$$

To obtain e' we must substitute in this same equation:

e' for e	$V_\kappa - C_\kappa R_\kappa$ for V_κ	
r_4 ,, r_1	v_κ	,, $v_\kappa \pm C'_\kappa R'_\kappa$
r_3 ,, r_2	$-i$	,, i

and we may further write $r_1+r_2=r_3+r_4$, hence:

$$e = \frac{r_3}{r_1+r_2} \cdot \frac{\Sigma V_\kappa - C_\kappa R_\kappa}{n} + \frac{r_4}{r_1+r_2} \cdot \frac{\Sigma v_\kappa}{n} - \frac{r_3 r_4}{r_1+r_2} \cdot \frac{s+r}{s} \cdot \frac{i}{n} \quad . \quad . \quad . \quad . \quad (6)$$

Combining (3), (5), and (6) we get

$$i = \frac{\frac{i}{n}\Sigma (V_\kappa - v_\kappa - C_\kappa (R_\kappa + F_\kappa) \mp C'_\kappa (R'_\kappa + F'_\kappa)}{(p r_4 + q r_2)\frac{s+r}{sn} + \frac{r(r_1+r_2)}{r_3 - r_2}} \quad (7)$$

where $$\frac{r_3}{r_3-r_2} = 1 + \frac{F_1}{R_1} = 1 + \frac{F_2}{R_2} = \text{etc.} = p,$$

and $$\frac{r_1}{r_3-r_2} = 1 + \frac{F'_1}{R'_1} + 1\frac{F'_2}{R'_2} = \text{etc.} = q.$$

Now the numerator in (7) is the average voltage obtaining at all the far ends of the feeder circuits between the outers F_1, F_2, etc., and the neutrals F'_1, F'_2, etc. Call this average voltage, as before, V_a.

If, then, we again, by means of the multiple-contact switch, keep $\frac{s+r}{sn}$ equal to unity, we have for case (b)

$$i = \frac{V_a}{p r_4 + q r_2 + \frac{r(r_1+r_2)}{r_3 - r_2}},$$

from which the necessary values for r_1, r_2, r_3, and r_4 are calculable for any given instance.

The last case is that of (c), Fig. 10. We can readily derive the equation for the voltage existing across the voltmeter (which may be designated v') from equation (4), by writing:

$n=1$, $s=\infty$	$R + l\theta$ for R_1	$\frac{1}{k_2\theta}$ for r_2
$\rho=0$, $\nu=0$	$\frac{1}{k_1\theta}$,, r_1	$\frac{1}{\kappa\theta}$,, r;

where R and l are the resistance and self-induction respectively of that portion of the line spanned by the pilot wire, κ is the capacity of the voltmeter (this being a function of the position of the movable vanes), and θ represents the operator $\frac{d}{dt}$. We have then

$$v' = \frac{i}{\kappa\theta} = \frac{V - \frac{k_1+k_2}{k_2} \cdot (R + l\theta) C}{\frac{\kappa + k_1 + k_2}{k_2}}.$$

If $$\frac{k_1+k_2}{k_2} = \frac{F}{R} = \frac{L}{l},$$

the numerator of the above expression represents the voltage obtaining at the end of the line. Call this V_e.

As already explained, k_2 may advantageously be made about equal to the maximum value of κ, in which case, owing to the comparatively large value of k_1, we may write with great accuracy—

$$v' = \frac{k_2}{k_1+k_2} \cdot V_e.$$

It has been pointed out in the previous part of this paper that it is necessary to shield the pilot wire from the inductive action of the line. If the line be a single-phase one carried overhead, it will be simple to place the pilot wire symmetrically with regard to the two-line wires, in which case all inductive effects will be obviated.

If the line be an overhead three-phase one, it is not always possible to place the pilot wire in a symmetrical position with regard to all three-line wires. The inductive action may, however, be neutralised by running the pilot wire for part of the distance nearer the one or other of the lines. Thus, if the three-line wires be carried in a row (see Fig. 12), and a pilot wire be run for a total distance of 500 yards from the station, it might be located for 250 yards in position p, and for the remaining 250 yards in position q. The inductive action of each line wire on the pilot wire depends on the logarithm of the reciprocal of the distance between them plus a constant, which latter is the same for all the line wires.

If, therefore, we adjust matters so that

$$\frac{1}{2}\log.\left(\frac{1}{b}\right) + \frac{1}{2}\log.\left(\frac{1}{\sqrt{4a^2+b^2}}\right) = \log.\left(\frac{1}{\sqrt{a^2+b_2}}\right),$$

or, $$b = \frac{1}{\sqrt{2}}a,$$

the inductive action of each line wire on the pilot wire will be the same, and since the total current flowing in the three-line wires at every instant is zero, the total inductive effect will likewise be zero.

With other arrangements of the line wires corresponding modifications of the positions of the pilot wire will be requisite.

CATALOGUES.

Messrs. Maguire and Baucus, of 5, Warwick-court, Holborn, inform us that they have now taken up the agency for the American-made Cahall water-tube boilers in the United Kingdom. From the illustrations in the list which the firm have forwarded to us, we gather that there are two distinct types of boilers manufactured under this name. In the first of these practically vertical tubes are used to connect the water-drum below the firebar levels, with the water and steam drum at the top. The boilers constructed in this way require exceedingly small ground space for their output, and they have been extensively used in iron and steel works in America. They have in many cases been fired by the furnace gases by means of a burner which is placed inside the ring of vertical tubes referred to above. The circulation of water and steam through these tubes tends to keep the inner surfaces clear of deposit. The other type of boiler has inclined tubes, and is not unlike in form one or two other makes which have obtained a large number of orders for electric lighting stations. The list of repeat orders which is given in the catalogue shows that the firm have a reputation in the States for reliable work.

We have received from Messrs. Geipel and Lange, of Parliament-mansions, Westminster, an interesting specification which has been drawn up by Messrs. Ward Leonard and Co. of the requirements from a well-designed motor starter. This specification we have already reprinted from one of our American contemporaries, and we think it is one which engineers would do well to peruse when specifying what they require from their motor starters in large power installations. The object of the specification is two-fold—first, to secure that the motor shall not be injured in starting, or in consequence of an unexpected interruption in supply; and, next, that the operation of the motor starter shall not in any way injure either the switch contacts or the resistance which is used for regulation. We believe that this specification can be obtained on application to the firm.

The Electrical Company have forwarded to us their latest list of alternating-current electricity meters, which include a large range of meters for various purposes, either with single-phase two-wire supply, single-phase three-wire supply, or for multi-phase working. The mechanism in every case is of the motor type, the motor being constructed on the Ferraris principle, while the armature is of the short-circuited, squirrel-cage type, consisting of a single winding of copper. This moving part is made exceedingly light in order to reduce the bearing friction to a minimum. In fact, the whole weight of the revolving part, including the brake disc, is only 60 grm. The calibration curves which are given in the list, show that good results are obtained with the combination. The accessories at the end of the catalogue for testing meters, and also the model forms of meter cards and reports, will be found of service to electrical engineers.

ELECTRICAL ENGINEERS IN THE NAVY.

The statement of Mr. Arnold-Forster, when explaining the navy estimates the other day, so far as it referred to the new rating introduced into the navy is of interest to all electrical engineers. Hitherto electrical engineers have been employed, but not recognised as a separate profession. As a matter of fact, however, the organisation has been in the act of evolution for months past, and a department (under the direction of Mr. L. J. Steele) was months ago instituted at Portsmouth. This department was a new departure, and now further development is promised by Mr. Arnold-Forster. If we consider for a moment the extension of electrical work on board ship during the past twenty years, the necessity of a trained scientific staff will be recognised. Starting with the introduction of the electric light, generally finishing, as far as the present is concerned, with the introduction of the wireless telegraphy, every step has necessitated the employment of men trained in the use of such apparatus. Perhaps we ought to have gone even further back to the time of Davy for the useful introduction of electrical methods to maritime purposes. It is well, then, for the electrical engineer to have a recognised position, and not to be any longer merely a man called in to assist. However, we desire more particularly to call attention to the statement that "men will pass through examinations into the navy, and will form, I hope, a valuable contribution to the staff of torpedo lieutenants in ships." It is difficult to suggest an alternative to examinations, nor if examinations were taken as means to an end, rather than the end itself, would the ordinary man desire to get rid of them? The truth, however, needs to be continually emphasised that the examination craze is run to death. There is no certainty that the best men for any position are those who obtain the highest marks by examination, yet these are the men who succeed in obtaining positions, and others not necessarily worse men are "plucked." The passing of men into the army, navy, civil service, etc., has grown to be like that of men going in for a university degree, merely a question of marks. It may at once be admitted that a good electrical engineer for work on board ship, must have a certain amount of general knowledge. Whether he has this or not can be ascertained by a written or a *vivâ voce* examination. We would suggest the abolishment of "marks," and that the examiners' duties be rigidly confined to the ascertaining if a man's general and special knowledge is sufficient for the duties to be undertaken. Besides this there should be other conditions favourable or otherwise to the passing of a man into this special branch. Experience can hardly be expected at the age which will probably ultimately prevail at entrance, and it is very difficult to foretell or to get an indication by examination whether a man is able to grapple with a difficulty when it arises. Hundreds of men can follow, few can lead, and what is wanted on board ship are men who can lead as well as follow. Neither book

Digitized by Google

knowledge nor experience will give the best man—he is born, not made—though the ordinary man is made better by reading and thinking—that is, by making himself acquainted with other people's experience, and getting personal experience off his own bat. We candidly confess that we fear the introduction of what this word "examination" forecasts, and trust our impressions may not be borne out by lapse of time.

CORRESPONDENCE.

"One man's word is no man's word,
Justice needs that both be heard."

OVERHEAD TROLLEY WIRE PROTECTIVE DEVICES.

SIR,—I am much obliged for your reply to my letter of the 11th inst., but I was not aware that the practice of feeding the half-mile trolley sections at one point only was so general as your editorial note would seem to imply. I believe that at Dublin, Bristol, Blackburn, and Leeds, and one or two other places at least, it has been the custom to use the trolley wires as supplementary to the "line feeders," and no less an authority than Mr. Philip Dawson states in his "Electric Traction Pocket Book" (p. 142) that "to ensure the best results being obtained, all main and line feeders, *as well as the overhead line*, should work in parallel."

I cannot help thinking that it is rather the exception than the rule to discard the 0·16 square inch of copper so obtained as a supplement to the feeders.

Mr. Ernest Wilson's book on electric traction also bears out my suggestion; but, of course, I understand that practice may have altered since this book was written.

Having prepared tenders for most of the earlier electric tramways in this country, I may say I do not remember one case in which the number of pillar boxes differed from the number of sectional insulators for a single line of trolley wire, the Bristol line being pretty generally taken as the model. Of course, it may be different now, but it would seem that Mr. Quin's device is inapplicable to those lines at any rate, if not to a good many new ones.—Yours, etc.,

Birmingham, March 18, 1901. PUZZLED.

THE LATE PROF. G. F. FITZGERALD.

At the ordinary general meeting of the Dublin Section of the Institution of Electrical Engineers, held at the Dublin United Tramway Company's Power Station, Ringsend, on March 9, 1901 (Prof. W. F. Barrett in the chair), further reference was made to the death of the above-named scientist.

Prof. W. F. BARRETT, F.R.S, said: We meet to-night under the shadow of a great loss; one of the most eminent and brilliant of physicists, one of the most honoured and beloved of friends, the chairman of our section, has passed away. When on the Saturday morning, a little more than a week ago, I saw the announcement of the death of Prof. Fitzgerald, the fact seemed almost incredible. We knew he was ill, but only a few days before I had a letter telling me how much better he was, and we hoped for a speedy recovery. Alas, it was not to be! A sudden change for the worse occurred, and he passed away a few hours later. When the sad news was known, the uppermost feeling of all of us who had a privilege of knowing and loving him was as if part of our life was taken away. Writing to me a day or two after, Dr. Oliver Lodge said, "I can think of nothing but the death of dear Fitzgerald," and that is just how most of us felt. Not only has science lost one of her most eminent and brilliant sons, but we all have lost a dear, personal friend. It was his genuine goodness, his great sympathy, his ungrudging helpfulness, his unsparing self-sacrifice, his large-heartedness, his beautiful simplicity—in a word, the affectionate regard in which he was held, that was the dominant note in our grief at the news of his death. But beyond this sense of a great personal loss, there comes also the realisation of the great national loss we have sustained. For 20 years past I have seen how incessantly he laboured for the public good: as honorary secretary of the Royal Dublin Society; as one of the Commissioners of National Education; as a member of the consultative board of the new Agriculture and Technical Instruction Department, he brought his great powers to the service of those distinguished bodies. The cause of technical education in this country owed very much to him. From the first he worked incessantly on various committees to forward this object, in quiet and inconspicuous work, generously spending his time and strength; and when we pass to the field of pure science, where his brilliant gifts and immense knowledge are now recognised over the whole world, what an irreparable loss we have had. Not only by his researches and his suggestive papers and his wonderful insight into profound physical problems will he be remembered, but also by his ever-ready helpfulness to other workers, freely giving to them his advice and assistance, yet with a humility and self-forgetfulness all too rare. I myself can testify how often I have benefited by his kindness in this respect. Though I have had the privilege of knowing numbers of scientific men from the time of Faraday onwards, yet I can recall no one, whether of high or low degree, who approached in generous and ever-ready helpfulness our dear friend Fitzgerald. He had a lavish hospitality of mind; not only would he cheerfully lay his own work aside when consulted by a friend, but he would put into his conversation or letters the most valuable and original suggestions, unconcerned whether his ideas were acknowledged or not, so long as truth was advanced or the world was benefited. His was, indeed, one of the most gifted and highly trained yet modest and unselfish of natures, closely resembling both intellectually and in character that great Englishman, Clerk Maxwell, who also passed away at the same age, in the prime of his intellectual power. To quote from the happy eulogy expressed by Prof. Lodge: "A good man Fitzgerald was if ever there was one; devoting himself to public work, free from all petty ambition, caring nothing for himself, throwing out his ideas right and left with splendid prodigality, rejoiced if they were absorbed and utilised by others. How quick he was to seize a point, how keen to criticise, to extend, to illuminate a subject, . . . how willing to enter into the work and the difficulties of others" And when such a loss as this is ours, what must be the inexpressible grief of his wife and family. We pray that God in His mercy may comfort and sustain them, and we now tender to her and to them our deepest and most sincere sympathy.

Dr. F. T. TROUTON, F.R.S., seconded the resolution. He said that all who had had the advantage of knowing Prof. Fitzgerald would feel the appropriateness of what they had just heard Prof. Barrett so beautifully and fittingly express. He, however, had been assistant to Prof. Fitzgerald for a number of years, and had thus had more opportunities than many of judging of the extraordinary enthusiasm for work he was able to evoke in those he came in contact with. He never spared any trouble in assisting those seeking his advice, and the services of the brilliant genius were ever at the service of all serious students of science. The one thing above all, however, that rose up most clearly in the speaker's memory was the infinite sympathy ever evinced with others in all their ideas and plans. Personally, he felt that scientific association with Prof. Fitzgerald had been a great opportunity, but to have had his friendship the privilege of his (the speaker's) life.

Dr. A. TRAILL, S.F.T.C.D., said he had known Prof. Fitzgerald as a personal friend ever since he came to Trinity College, and their relations had been most intimate. Nothing could be more delightful in private life than his simplicity and absolute want of personal ambition. During the experimental work in connection with the Portrush and Giant's Causeway Electric Railway in 1882, a work in which many problems had to be solved and difficulties overcome, when what is now commonplace knowledge was

Digitized by Google

then unknown, much interest had been taken in the matter and much assistance given by Prof. Fitzgerald. At that time, and on subsequent occasions, both he and Lord Kelvin had stayed with the speaker at his residence in County Antrim, and many interesting experiments were made on the spot. It was a perfect treat to hear Fitzgerald and Kelvin discussing not only electrical problems, but other deep scientific subjects in after-breakfast conversations, and Lord Kelvin had stated to him since then that he knew none superior to Fitzgerald as a scientific man. He had a melancholy pleasure on this occasion in testifying to the great personal worth as well as the scientific attainments of Prof. Fitzgerald, and there were few men whom he would miss more and whose loss he would more keenly feel.

The motion "That our sincerest sympathy be extended to Mrs. Fitzgerald" was then put, and carried in silence, the members standing.

PHONO-ELECTRIC WIRES.

We have just received from Messrs. Maguire and Baucus, of 5, Warwick-court, Holborn, some interesting particulars of a new type of overhead conductor which they are introducing with considerable success in this country. The material is manufactured in America by the Bridgport Brass Company, who did so much in the earlier days of telegraphy in perfecting the processes of the manufacture of hard-drawn copper wires. The material out of which what the firm call phono-electric wire is drawn is a new alloy of copper which they have succeeded in producing, and which possesses exceedingly valuable properties. The main object of the new material is that of strength. In the hard-drawn copper wire such as is used for overhead traction and for telephone purposes, the mechanical strength lies entirely in the surface layer of the material. If this is abraded or is corroded, due to atmospheric conditions, the wire loses its mechanical strength, as the inner layers consist practically of soft copper. In a trolley wire in particular this abrasion is sure to occur, and also the influence of arcing on the wire tends to soften the outer layer and to render the wire liable to fracture. The above firm have placed before us a number of experiments which have been made with the phono-electric wire to prove that it is reliable as a substitute for hard-drawn copper, and that it possesses, in consequence of its uniformity and great strength, numerous advantages which are not possessed by the material previously used. These tests show that the phono-electric wires are for the same size twice as strong as annealed copper wire and 50 per cent. stronger than hard-drawn copper. We gather that its specific resistance, however, is lower, as the makers state that it is as tough as milled steel and four times as good as a conductor. In order to show how uniform is the strength of the material of this new wire, experiments were made on the tensile strength per square inch of a conductor of 00 gauge, its diameter being greatly reduced by removing surface layers. The same experiments were also made with hard-drawn copper wire. Before any material was removed the breaking strain on the copper wire was 52,000lb. per square inch, and on the phono-electric wire 73,500lb. The original diameter of wire was 365 mils. After 17·5 mils had been removed from the outside of each conductor, the tensile strength of the phono-electric wire had not been reduced, while the hard-drawn copper had dropped down to 48,500lb. per square inch. The process was continued, repeated experiments being made, and it was found that when 32½ mills had been taken off the wires, the tensile strength of the hard-drawn copper had been reduced down to its lowest limits of 34,500lb. per square inch, whereas practically no difference had been made in the strength of the phono-electric wire. The conclusion of these experiments is that after 1-32in. of the surface material has been removed from hard-drawn copper there is nothing but soft copper left, whilst most of the extra strength due to the hard drawing is removed when only half this thickness has been taken off. A table of breaking weights for various gauges of wire given in the pamphlet before us shows that, as a rule, the phono-electric wire is from 41 to 47 per cent. stronger than the hard-drawn copper. The elastic limit is also higher, which is a considerable advantage in overhead work. The ordinary twist test which is made on wire to show its power to resist bending also is in favour of the new material. It is, however, with respect to arcing such as would occur on trolley wires that a great claim is made, and experiments in this direction show that while the arcing such as takes place when the trolley is not running evenly anneals the copper conductors very quickly, it has practically no effect on the tensile strength of this new alloy. Against these advantages, the only disadvantage is that of slightly higher resistance, but as a trolley wire is not now often used as a feeder, this is of not so great importance as the mechanical strength. The corrosive effects due to atmospheric conditions are considerably less than on copper. We understand from the above-mentioned firm that they have already supplied considerable lengths of this material for the trolley lines at Dublin, Sheffield, Hull, and Liverpool, where it is finding favour with the engineers after continued use.

CONCRETE CONDUITS.

A London syndicate, having its offices at 109, Victoria-street, is introducing into this country a type of concrete slab for electric cables and telephone wires, etc., which has been largely adopted on the Continent, notably by the German Post Office authorities. Each slab contains only one row of troughs, each trough to contain one cable. The separate slabs are built up, if necessary, in good bond, as is done in brickwork, until the required number of troughs is obtained. Each slab forms in itself an integral whole of great stability. Though the walls of the troughs are constructed with the strictest regard to economy, they are so strong that a slab covered only with 2ft. of earth can safely resist the weight of a steam-roller passing over the roadway above. Iron pins inserted in the slabs prevent vertical and horizontal deflections of the slab troughs. If laid down in side-walks, the ordinary slabs can be employed even with a minimum of earth covering. In building up the conduits, the bottom course of trough is supported at the joints by a concrete bed. The slabs are, we understand, pointed at both ends, adjoining ends thus forming a groove, around which is wrapped a bag of cement so as to form a close joint flush with the body of the conduit. The slabs are manufactured with two, three, or four troughs, whereby any desired combination may be effected. The troughs are impregnated with a patent insulating material to protect the lead covering of the cables against injurious influences, the process being carried out under a pressure of 140lb. per square inch, whereby all alkaline reactions are destroyed and absolute protection thus afforded from moisture and the potassium contained in cement. Economy in initial cost, ease of laying in small trench, and great durability are amongst the advantages claimed for this type of conduit. It may be mentioned, in conclusion, that concrete slab troughs with iron linings are also supplied by the syndicate.

FORTHCOMING EVENTS.

FRIDAY, MARCH 22.

Board of Trade.—Adjourned enquiry into the application of the Electric Lighting Companies to increase the standard pressure of supply.

SATURDAY, MARCH 23.

Glasgow and West of Scotland Scientific Society.—At 7.30 p.m., ordinary meeting. Paper: "Glasgow's Water Supply," by Mr. James B. Wyllie.

MONDAY, MARCH 25.

Society of Arts.—At 8 p.m., "Electric Railways," by Major Philip Cardew (Lecture III.).

TUESDAY, MARCH 26.

Institution of Electrical Engineers (Manchester Section).—At 7.30 p.m., general meeting. Paper on "Direct-Current Generators," by Mr. S. H. Short.

Institution of Civil Engineers.—At 8 p.m., ordinary meeting. Paper to be further discussed: "The Æsthetic Treatment of Bridge Structures," by Mr. Joseph Husband. Paper to be read, time permitting: "The Burrator Works for the Water Supply of Plymouth," by Mr. Edward Sandeman.

WEDNESDAY, MARCH 27.

Institution of Electrical Engineers (Birmingham Section).—At 7.30 p.m., general meeting in the Physical Theatre of the University. Paper on "Polyphase Equipment in Factories," by Mr. W. Wyld.

Institution of Civil Engineers.—At 2 p.m., students' visit: Inspection of the Ilford Sewerage Works, and Sewage Disposal by Bacteriological Methods.

Society of Arts.—At 8 p.m., ordinary meeting. Paper on "Clocks, Carillons, and Bells," by Mr. A. A. Johnston.

THURSDAY, MARCH 28.

Institution of Electrical Engineers.—At 8 p.m., ordinary meeting. Papers: "The Electrical Transmission of Power in Coal Mines," by Mr. H. W. Ravenshaw, and "Portable Electric Lamps," by Mr. S. F. Walker.

FRIDAY, MARCH 29.

Electro Harmonic Society.—Smoking concert at St. James's Restaurant, W.

Royal Institution.—At 9 p.m., Lord Rayleigh on "Polish."

SATURDAY, MARCH 30.

Royal Institution.—At 3 p.m., Lord Rayleigh on "Sound and Vibrations."

SEPT. 3, 4, 5, AND 6.

International Engineering Congress (Glasgow).

THE INSTITUTION OF JUNIOR ENGINEERS.

Anniversary Dinner.

The sixteenth anniversary dinner in connection with the above institution was held at the Westminster Palace Hotel on Saturday evening last, when Prof. John Perry officiated as chairman in the absence of Sir Edward J. Reed, who was prevented from attending through indisposition. There were about 130 guests present. After the Royal toasts had been duly honoured,

Sir JOHN JACKSON proposed "Our South African Field Forces," referring to the splendid courage displayed by the volunteers. Sir DAVID TENNANT, Agent General for Cape Colony, responded.

In proposing "British Engineering," Sir WALTER PEACE, Agent-General for Natal, said that, although not himself an engineer, he had had much to do with engineers, and knew of what importance the profession they represented was to the British Empire. He had considerable doubt sometimes as to whether British engineers were keeping abreast of the times. Hitherto they had held a monopoly in the Colonies for iron and steel manufactures, but that condition of things was passing away. With regard to steel rails, he did not believe those of American manufacture were equal in quality to the British article, they being deficient in durability owing to a superfluity of carbon in their composition. In this connection it was a serious matter that there was no central autho ity established to fix a proper standard of quality of materials they wanted to buy. There was, consequently, no firm making to such a standard. The existing mode of classification, whereby the different grades of iron were stamped "Best," "Best Best," or "Best Best Best" was quite inadequate for modern requirements. Articles of a given quality were wanted, classified under some intelligible system, such as that instituted by Lloyd's in reference to ships. This plan would assist buyers. He coupled with the toast the name of Prof. John Perry.

Prof. JOHN PERRY, who responded, insisted that B B B evidenced that England had created the iron trade. The multiplication of B's denoted successive improvements of the original standard. It was all very well for young colonies to criticise, who, when they got to B B, would, he presumed, mark it B^2, but we at home had already got to B^3. One of the principal characteristics of the British public was inventiveness. This trait was especially noticeable in the Press. It was just because we Anglo-Saxon people had been free for 700 years or more that we now refused to be led. While susceptible to new ideas, we were, on the other hand, never slaves of new notions. Our ideas were used cautiously and experimentally. It was, however, interesting to observe that when a notion was once digested it was done thoroughly. We created engineering, but that was no blame to Continental folk. We taught the world that mining, etc., imbued a country with strength. It was, however, just as well to remember that accidents would happen. He would ask were we going to wait? One of the most important functions of the institution was to visit works. His (Prof. Perry's) own impression was that relatively few works in this country were comparable to what might be found elsewhere. To remedy this state of things, it was in the first place essential to educate the capitalists to put their trust in young engineers with whose education and competency no fault could be found.

Mr. WALTER HUNTER also responded. He outlined the industrial and commercial progress made by the country during the past century, giving comparative figures, and remarked upon the marvellous developments of electrical engineering. He looked to the junior engineers to carry on the good work and maintain the country's supremacy among the scientific nations of the world.

The next toast was "The Commonwealth of Australia," proposed by Mr. ERNEST KING, who dwelt upon the immense importance of the compact to the future prosperity of our Colonial brothers. Having regard to the enormous resources of the country, there was, in his (Mr. King's) opinion, a vast amount of work awaiting the attention of the engineer.

Sir HORACE TOZER, Agent-General for Queensland, in replying, said he would like to express a few words of hope to the young engineers. Neither they nor their industry was deteriorating or likely to deteriorate. The young engineers who had gone out from the Mother Country to the colony which he represented, were a benefit and a credit to the colony which they had made their home. Not one farthing's worth of engineering work for Queensland had ever gone out of the United Kingdom. The manner in which British firms of contractors had executed very considerable contracts in the colony left nothing to be desired, and proved the superiority of British thoroughness. There need be no fear of the decadence of British trade; it would never be left behind. He rejoiced in the new Commonwealth, which marked the development of the brain power of a young and rising nation.

"The Institution of Junior Engineers" was proposed by the Hon. W. P. REEVES, Agent-General for New Zealand. He maintained there was a great deal to be said for the juniors. The nation was not a nation of amateurs, as had been somewhere suggested, but a nation of energetic young men somewhat dominated by old men. He had no complaint to make about British engineers. Everything was satisfactory when it could be obtained, but the colony which he represented had been compelled to patronise Transatlantic competitors owing to the difficulty of getting work executed promptly by British firms. As an instance of British method, he would mention that the colony some time since wanted some new locomotives, and ordered them from an English firm. In reply, the firm said they would be glad to supply locomotives of a certain pattern and a certain weight. The authorities, however, pointed out that the bridges over which the locomotives were required to run would not stand this weight, whereupon the firm suggested that the bridges should be altered. Needless to say the order was lost. In his (Mr. Reeves's) opinion the weak spot in our armour was that we were a nation of over-capitalised industries. The weak spot was to be found in our financiers, promoters, and jobbers—not in our engineers or workmen.

The toast was acknowledged by Mr. PERCIVAL MARSHALL, who referred to the very low margin of safety sometimes allowed by American engineers, giving as an example the reputed case of an American bridge which successfully bore the weight of train for which it had been designed, but collapsed through the extra weight caused by a shower of rain. The junior engineer might be defined as one who did his duty. The institution was in a more prosperous condition than ever before; its finances were better, its membership on the increase, and, moreover, the work which was its function to perform was done better. It also fell to Mr. Marshall's share to propose "The President," which toast was acknowledged by the Chairman.

An excellent programme of music was rendered during the evening, the violin solos contributed by Mr. T. E. Gatehouse being especially appreciated.

ELECTRIC LIGHTING ENQUIRY.

Question of Increased Pressure.

In our last week's issue we continued the report of this enquiry up to mid-day of Thursday, March 14. After the consultation between the counsel in opposition to the proposed change, they proceeded to call witnesses in support of their case.

Mr. T. P. GUNYON, examined by the Hon. A. Lyttleton, put in his evidence the results of some enquiries he had made for electric lamps for both 100 and 200 volts. These showed that in practically every case the higher-voltage lamps cost more than those of 100 volts, and that the makers would only guarantee a shorter life. He also put in the results of some tests which he carried out on four groups of 8-c.p. 200-volt lamps supplied by different makers. Six lamps of each kind were tested. In all but one case there were considerable variations in the watts consumed per candle, the variations running from 4·2 up to 9 watts per candle. In the best group of lamps, however, the watts per candle for the six lamps were respectively 3·9, 4·2, 4·7, 3·7, 4·5, and 3·9. The names of the lamp-makers was not disclosed. The guaranteed life of the different lamps varied from 600 up to 1,000 hours. He thought the

Digitized by Google

security against fire was less with the 200-volt supply than with the 100-volt. He had, on behalf of the London County Council, had to investigate 13 cases of supposed fire from electric light; six of these were on premises with the 200-volt supply, and the rest with the 100-volt. He thought there were cases in which insulation might be safe with 100 volts and would not be safe with 200. He thought that there might be considerably more damage done to consumers in consequence of this change, and that consumers had to pay more for their lamps and got a worse article.

In reply to Sir Courtenay Boyle, Mr. Gunyon said the increased danger from fire was due to the higher-voltage current passing through badly insulated parts of fittings.

Cross-examined by Mr. R. W. Wallace, Mr. Gunyon said the increased risk was due to bad workmanship, as if the work was well done there was practically no danger. He thought that the electric lighting undertakers had quite sufficient powers under the Electric Lighting Act to inspect consumers' premises, and to insist on good fittings being used. He had not made a sufficient number of life tests on 200-volt lamps to be worth giving, but he thought that the maker's guarantee was a good means of ascertaining the life of such lamps. He did not know that certain of the lampmakers he had asked to quote did not make 200-volt lamps. His comparisons between the lamps he had obtained and 100-volt lamps were made on the assumption that 100-volt lamps would take from 3½ to 4 watts per candle. He admitted that the lamps marked as "B" in the table gave fairly good results. The larger number of lamps tested, the more accurate the results would be.

Mr. BERNARD DRAKE gave it as his experience that 200-volt lamps were more expensive than 100-volt lamps, and he had received a large number of complaints as to the results of the change over. There was, in his opinion, no benefit to the consumers to the change. He could only explain Prof. Kennedy's evidence on the supposition that consumers had been more careful in turning out their lamps since the change over. In cross-examination he suggested that Prof. Kennedy's conclusions on his own figures were probably wrong. He did not believe in testing small quantities of lamps, but preferred to take evidence from people who complained of the worse light they got in practice. From these complaints he gathered that the lamps supplied by the Westminster Company on Prof. Kennedy's tests were the worst of the lot. He found no difficulty in making a 200-volt supply safe against fire.

Mr. JUSTICE ECK said that as engineer to the late firm of Messrs. Laing, Wharton, and Down he had had charge of a large number of wiring installations. In his experience, it cost about 15 per cent. more to wire with the higher voltage, and the cost of energy should be reduced by 39 per cent. to give the same light with the 200-volt lamp as with the 100. In cross-examination, the witness admitted that he had changed over a number of installations for companies, and that he had left in circuit switches which were not suitable for the high voltage. In reply to Sir Courtenay Boyle, he said that he had not communicated with the insurance companies or informed the consumers of these fittings being left in circuit. The figures he had given regarding the increased consumption and decreased light were the result of recent experiments in his own home. He agreed that Mr. Gunyon's tables of tests did not bear out his evidence.

Prof. AYRTON was then examined as to the cost and efficiency of high-voltage lamps. He gave particulars of a series of tests on 8-c.p. lamps for 200 volts, which were most unsatisfactory. He explained the evidence given by Prof. Kennedy in the appendix as being correct, but held that the conclusions based on it were wrong; while the units used per lamp remained the same, the consumers probably got much less light. There was considerable danger from shock when the three-wire system was used on a consumer's premises. In cross-examination, Prof. Ayrton said that his evidence was to the effect that manufacturers were selling high-priced inefficient lamps for the higher voltage. The lamps marked "B" in Mr. Gunyon's tests were not tried after they had been burning some time. He agreed that these higher-voltage lamps might be improved, and that it would be unfair to estimate the compensation to consumers on the supposition that the present lamps were the best obtainable.

The last witness called was Mr. N. W. APPERLEY, who gave evidence as to the increased cost of current in Lord Londonderry's house in Park-lane since the change over. The increase was from £180 to £288 without any increase in the number of lamps. He did not agree that the house had been used more during the year in question than during the previous years.

MONDAY, MARCH 18.

On the opening of this, the fifth day of the enquiry, the Hon. A LYTTELTON summed up the case for the London County Council. He said that the proposed change was one which the Board of Trade proposed to authorise, and that the London County Council were chiefly concerned with the terms as they would be revised. He held that after elaborate enquiry they had shown that the change would not be so satisfactory to consumers as had been represented by the undertakers, and that hence it was a serious matter to dispense with the consent of the consumer which had been required under the 1896 regulations. Without this consent the undertakers would claim to have the right to enter a consumer's premises and to alter his fittings in such a way as they thought right. This was, he thought, an infringement of the ordinary law of the country. In view of the facts of the case, he thought that any dispute should be taken to arbitration at the expense of the suppliers of electric light.

The same counsel then opened the case for the Windsor Hotel and the Junior Constitutional Club, and called Major CARDEW as the first witness. Major Cardew's evidence in examination was to the effect that certain alterations were required in the fittings and wiring of premises in consequence of the change, and that in his opinion the whole cost of these changes and the incidental expenses should be borne by the company. Under cross-examination by Mr. Roskill, the witness admitted that it would not be advisable for the Board of Trade to veto the change. He was still advising the use of 115 volts in certain new schemes, but had not advised any undertaking using 220-volt lamps to revert to a lower voltage.

Mr. A. H. ROSE, examined by Mr. Craies, said that in his experience a 200-volt lamp consumed on the average three-quarters of a watt more per candle than a 100-volt lamp. He thought that in changing over the consumer lost about 25 per cent. in the light he got for a given consumption of energy. Any improvement in the 200-volt lamp would also affect the 100-volt, and so the proportion would remain about the same.

Mr. V. D. B. COOPER was the next witness, and he gave, in examination, the whole history of the disputes between the Windsor Hotel and the Junior Carlton Club and the Westminster Electric Supply Company. As adviser to these two installations, he recommended that good contractors should be employed to make the alterations necessitated by the change over. In the case of the Windsor Hotel, which was wired originally in 1883, a considerable amount of rewiring was required. It was brought out in evidence that the company had refused to pay the amount of the suggested contractor's estimate, and that with a view of bringing pressure to bear they had raised the price to 8d. per unit. The Hotel Windsor had been previously charged 4d. per unit under a special agreement. As well as the suggested charge for rewiring, the hotel company asked for a guarantee that the bills should not exceed the average for the last three years before the change was made, or that they should guarantee a supply at 3d. per unit.

After a brief cross-examination, Mr. BALFOUR BROWNE said that in view of the fact that there were no less than 86 electric light undertakers in favour of the change, he did not propose to waste time over a squabble between an hotel and an electrical engineer, which could be settled by an arbitrator in half an hour. He did not see what objection these people could have to arbitration, provided their cause were just. Coming now to the draft of the proposed new clause which Sir Courtenay Boyle had given them, he suggested that it should be amended as follows: "Provided that no change shall be made in the pressure of the supply to any premises which on ——— were supplied with energy by the undertakers, except with the consent of the consumer; but where the consumer withholds his consent after the undertakers have offered to pay what in their opinion is the whole reasonable cost of and incidental to the change, and where the undertakers and consumers have failed to come to an agreement within one month, the undertakers may appeal to the Board of Trade, and that Board may, if it thinks fit, dispense with the consent of the consumer on such conditions as the Board impose." He thought that the alteration would prevent any undue delay in bringing the matter before the Board of Trade; he thought that the arbitration clause suggested by Sir Courtenay Boyle was much more fair than the amendment proposed by the councils for the City and the London County Council. He saw no reason why the arbitration should come under the Lands Clauses Act, as there was no analogy between taking a man's property and remodelling a few electric lighting fittings.

The case was then adjourned until Friday at 11 a.m., when other counsel will be heard, but no more witnesses called.

COMPANIES' MEETINGS AND REPORTS.

BAKER-STREET AND WATERLOO RAILWAY.

The half yearly meeting of the proprietors was held at the Westminster Palace Hotel on Monday.

Mr J T Hare who presided referred to the agreement with the London and Globe Finance Corporation of Nov. 4, 1897, for the construction of the railway. Up to now, he said, the works had been carried on by Messrs. Perry and Co. under agreements in pursuance of which this Company had paid them the amount of the engineers' certificates, less retention direct. The position

Digitized by Google

now was that the railway company was entitled to enter on the works and employ Messrs. Perry and Co. or other contractors direct, in which case the London and Globe Corporation would have a claim only for the difference, if any, between the contract price and the sums already paid, plus the future costs. If, on the other hand, the Company was able to show damage by reason of the default of the corporation, they were entitled to have such damage estimated, and to prove for the amount of the estimate in the winding-up. The position with regard to the contract entered into for the construction of the railway authorised by the Acts of 1899 and 1900 was that the contractors had so far not been called on to commence, but by going into liquidation they had rendered themselves unable to perform it, and the Company was at liberty to regard the contract as abandoned, and prove in the winding-up for any damages it could show it would suffer by that contract not being carried out. The Company had ample assets to provide for the completion of the line, and negotiations were in progress for the transfer of the contracts to a strong financial syndicate, and the directors had reason to hope that these negotiations would terminate satisfactorily. He afterwards referred to the progress that had been made in the construction of the railway, etc., and pointed out that a large amount of the work had already been done. The line would run through the very heart of central London, and forming a connection with about 12 other railways and numerous tramway lines, followed a route second to none in London, and when it was completed it should not only be of the greatest benefit to the public, but also prove remunerative to the shareholders. A committee was now enquiring into the cause of the vibration of which so much had been heard in the case of the Central London Railway; there was little doubt that the Company's engineers would be able to obviate this on their railway. He moved the adoption of the report and accounts.

Sir Algernon West seconded the motion

In answer to a question, the **Chairman** said that all the capital of the Company was unaffected by the collapse of the Globe except the shares issued to the latter.

The motion was then carried unanimously.

A special meeting was afterwards held, when resolutions were passed approving the Bills for conferring further powers on the Charing Cross, Euston, and Hampstead and the Brompton and Piccadilly circus Railway Companies.

NEWMARKET ELECTRIC LIGHT.

The annual meeting of the shareholders was held on Monday at the Company's offices at Newmarket, Mr. G. H. Verrall, J.P. (chairman), presiding.

The **Chairman**, in moving the adoption of the report and accounts, stated that at the present moment there were connected with the mains 7,431 8-c.p. lamps, for 101 consumers, and applications had been received for a further 1,415 lamps from eight consumers. The Company were putting down additional plant for the supply of 6,000 8 c.p. lamps. When the mains were extended to additional roads, he had every reason to believe that there would be many more applications. Electric lighting companies did not usually pay a dividend before the fourth or fifth year, but he expected that they would be able to declare a dividend in the third year.

Mr. F. E. Gripper seconded the motion, and it was unanimously adopted, and the retiring directors, Messrs. H. J. Garrod and F. E. Gripper, were re-elected.

POTTERIES ELECTRIC TRACTION.

At the ordinary general meeting of this Company on Tuesday at the Cannon-street Hotel, **Mr. E. Garcke**, who presided, said that the directors had to congratulate the shareholders on the satisfactory report that they could present that day. The growth of business in the Potteries district since the introduction of an extended system of electric traction had been very remarkable. They would have done better still had it not been for the unfortunate strike in the district of potters and bricklayers, which lasted for two months (April and May), and not only interfered with the traffic, but delayed the work on the new generating station and the opening of the Chesterton and Silverdale lines, which did not get to work till Jan. 1 last. At the present time the Company was operating 28½ miles of line, and when the terminal extension to Blythe Bridge, now in course of construction, was completed they would be running over 30 miles of line.

The report was adopted, and further resolutions carried for the increasing of the capital of the Company in accordance with notice circulated to the shareholders, and also making a variety of alterations in the articles of association of the Company consequent thereon.

DIRECT SPANISH TELEGRAPH.

The accounts for the year ended Dec. 31 show a balance to the credit of revenue of £10,817. After adding the usual sum of £5,000 to the reserve fund, the balance will amount to £5,817, and the directors recommend dividends of 10 per cent. on the preference shares and 4 per cent., free of income tax, on the ordinary shares, amounting to £5,448. Half of this amount has been distributed as an interim dividend for the half-year ended June 30, 1900 There will then remain a balance of £369, which it is proposed to transfer to the contingencies account, and this account will then amount to £566. The traffic receipts show an increase of £1,029 as compared with the year 1899. The ordinary working expenses show a decrease of £210.

CHARING CROSS AND HAMPSTEAD RAILWAY.

The half-yearly meeting of the proprietors of this Company was held on Wednesday.

Mr. W. E. Jones, who presided, stated that 451 shares had been subscribed for, on which £2 had been paid; and the expenditure had been £151, leaving a balance at the bank of £780. He moved the adoption of the accounts.

Mr. Ernest Halsey seconded, and the motion was then carried.

An extraordinary meeting was afterwards held, when the **Chairman** proposed a resolution for raising the capital authorised by Section 37 of the Company's Act of 1899 by the creation and issue of new ordinary shares or stock at such time in such manner, and upon such terms and conditions as the Board should from time to time deem expedient, and for exercising the borrowing powers conferred upon the Company at such time as the Board should think fit.

Mr. W. T. Potts having seconded the motion, it was carried unanimously, and the proceedings terminated.

IMPERIAL TRAMWAYS.

The directors in their report for the year ended Dec. 31, 1900, state that the gross receipts of the Middlesbrough, Stockton, and Thornaby electric tramways amounted to £47 218. 17s. 9d., and the number of passengers carried to 8,782 970, compared with totals of £45 372. 13s. 8d. and 8,307,322 in the preceding year. These figures indicate a steady development and increasing popular favour, results which the directors are fostering in every possible way in their conduct of this important business. The net profit for the year amounts to £14,637. 10s. 9d., which is slightly in excess of that of the previous year and represents a return of about 6¾ per cent. upon the capital employed. The extension of the Middlesbrough line to Clarence Ferry is in course of construction, and the additional rolling-stock under order so that this branch will be opened in good time for the summer traffic. The net revenue account for the year shows an available balance of £35,286. 3s 2d., and after payment of interest on the debenture stock for the whole year and interim dividends on the preference and ordinary shares in respect of the half-year to June 30 last, amounting together to £23,386. 9s. 2d. it is proposed to appropriate the balance as follows: In payment of dividend at 6 per cent. per annum on the preference capital, £3,000; final dividend at 8½ per cent. per annum on the ordinary capital, £8,500; and to carry forward to the next account the remaining sum, £399. 14s. In addition the reserve funds have been increased during the year from £69,203 to £72,789.

HOVE ELECTRIC LIGHTING.

Directors: Colonel A. J. Filgate, R.E. (chairman); Colonel H. Wood, C.B (vice chairman); Harold A. Hoare, Esq.; Carleton F. Tufnell, Esq. Engineers: Messrs. Crompton and Co., Limited, London and Chelmsford. Secretary: Francis R. Reeves, Esq., M.I.E.E.

Report of the directors (with abstract of accounts) for the year ended Dec 31, 1900:

In common with all other industrial undertakings requiring steam power, the Company's revenue has suffered by reason of the increased cost of coal during the year, but, on the other hand, the increase in the consumption of electricity has more than compensated for the extra cost of coal. The progress of the Company is best shown by the following statistics:

Year.	Houses.	8-c.p. lamps.	Units sold.	Gross revenue.	Net revenue.
1897	397 ..	27,777 ...	268,243 ...	£7.269 ...	£3 602
1898	513 ...	36 967 ...	350.254 ...	9 480 ...	5 089
1899	671 ...	44,824 ...	444,499 ...	12,070 ...	7.097
1900	802 ...	52,919 ...	539,208 ...	13,828 ...	7,715

The result of the year's working is a net profit of £7,715. 14s. 5s., to which there has to be added the sum of £345. 17s. 9d. balance from the previous year, making a total of £8 061. 12s. 2d. After deducting debenture interest paid and accrued, the interim dividend at the rate of 7 per cent. per annum paid in October last, and providing for income tax, there remains a net balance of £5,161. 19s. 1d. to the credit of net revenue account. In addition to the £262. 5s. written off the preliminary expenses and installation account, as mentioned in last year's report, the directors have now written off £126. 12s. 1d., the balance of the preliminary expenses. The expenditure on general administration and management expenses during construction and fees on capital and registration, originally taken to account with the outlay on preliminary expenses, will stand as a final charge against capital. The directors propose to place £2,250 to the credit of the reserve fund, to declare a dividend (payable on April 15 next) at the rate of 9 per cent. per annum for the half-year on the share capital, making, with the interim dividend, 8 per cent. for the year, and to carry the balance of £545 15s. 1d. forward. During the past year the directors have issued 1,000 additional shares at the price of £7. 10s. per share, the premium on the issue being added to the reserve fund. With the addition now proposed to be made, the sum at credit of reserve fund will amount to £17 037. 17s. The amount (£600) annually set aside for repairs and maintenance, in accordance with the contract with the Hove Commissioners, has proved insufficient to meet the outlays on this account during the past year, in consequence chiefly of the renewal of the Company's battery of accumulators. As a result, the balance of £315. 12s. 5d. has been taken from this reserve account, which now amounts to £945. 14s. 11d. The

Digitized by Google

expenditure on capital account during the year has amounted to £6 862. 9s. the total expenditure up to Dec. 31 being £100,523. 3s. 9d. The site for a second generating station, referred to in last year's report, has been acquired by the Company, and the conveyance is expected to be completed during next month. The plans for this station are nearly ready, and is is intended to commence erection at an early date. In accordance with the articles of association, Colonel A J. Filgate retires from the Board by rotation, but offers himself for re-election. Messrs. J. H. Duncan and Co., the auditors, also offer themselves for re-election.

BOURNEMOUTH AND POOLE ELECTRICITY SUPPLY.

Directors: Aymor H. Sanderson (chairman); J. Atkinson Hoaker; F. W Reynolds; F. E. Savory; R Percy Sellon M.I E.E. Consulting engineer: C. P. Sparks M.I C.E. Engineer: E. L. Ingram, A M I E E. Secretary: H. B. Renwick.

Report of the directors (with abstract of accounts) for the year ended Dec. 31, 1900:

The capital expenditure incurred during the year in respect of the Bournemouth Provisional Order, 1890, amounted to £26 342. 2s. The issue in March, 1900 of £70,000 4½ per cent. debenture stock was over-subscribed, and the premium received therefrom, after deducting the expenses of issue, has been carried to reserve. The balance from revenue account, together with the balance brought forward from last year, amounted to £12,579. 13s. 2d., from which must be deducted interest charges, depreciation, etc., leaving the sum of £8,052 10s. 5d. to the credit of net revenue account, as against £6 799. 13s. 5d. for 1899. Out of this sum the full year's dividend on the preference shares has been paid, and the directors now recommend the payment of a dividend on the ordinary shares of the Company at the rate of 6 per cent., less income tax, for the year ended Dec. 31, 1900. These payments absorb £7 391. 5s. 9d., leaving a balance of £661. 4s. 8d. to be carried forward. The equivalent of 53 379 8 c.p. lamps were connected to the Company's mains in Bournemouth at Dec. 31 last, showing an increase of 9 283 8 c.p. lamps for the year, and applications representing a further 1 896 8-c.p. lamps were then awaiting connection. The application of the Bournemouth Corporation in the last session of Parliament for a provisional order in competition with the Company was refused by the Board of Trade in respect of private lighting. The construction of the tramways between Bournemouth and Poole is practically completed, and the Company will shortly be supplying the necessary power for the working of the line. The Richmond (Surrey) Electric Light and Power Company, Limited, continues to make satisfactory progress. The directors have declared a dividend upon the ordinary shares of that company at the rate of 5 per cent. per annum in respect of the year ended Dec. 31 last, as against 4 per cent. for 1899. The retiring directors are Mr. Aymor H Sanderson and Mr. J. A. Hosker, both of whom, being eligible, offer themselves for re-election. The auditor, Mr. R. H. Marsh, also retires, and offers himself for re-election.

NOTTING HILL ELECTRIC LIGHTING.

The fourteenth ordinary general meeting of this Company was held at the offices, High street, Notting Hill-gate, on Tuesday.

Sir William Crookes presided, and, in moving the adoption of the report and accounts said they had had a serious difficulty to contend with—the overloading of the present mains and the inability of the plant and machinery adequately to meet the demand for current during the winter months. As far as the customers were concerned, all that they had suffered had been an occasional dimness of light. Sufficient power had, however, already been obtained to cope with the Company's present requirements, and the directors trusted that such annoyances would not recur. With reference to their Bill, the powers they were taking in it were to acquire compulsorily a site in the Addison-road district in order to erect thereon a distributing station. Petitions had been lodged against the Bill by the owners of the freehold and by some residents adjoining the two sites, but they hoped to satisfy the objectors. A considerable quantity of current could now be sent out from Wood-lane, but it

Digitized by Google

would not be available in the Addison-road district until the Company could erect machinery to distribute it in the area. To supply the northern part of the district in Notting Hill a distributing station had been erected, and would soon be in operation in Lancaster-road. The other distributing station in the rear of the offices had been working satisfactorily for some time The engineer advised that these arrangements as soon they were complete would enable the Company to resume connecting new customers in all parts of their area of supply, and very largely to increase the business.

Mr. J. W. Swan seconded the motion, which was unanimously adopted, and a resolution was afterwards passed approving the Bill referred to.

CITY OF LONDON ELECTRIC LIGHTING

Directors: Sir David L. Salomons, Bart. (chairman); Joseph Bevan Braithwaite, jun.; George Herring; Herbert Samuel Leon; Edward Lucas; Colonel B. H. Martindale, C.B.; Frederick W. Reynolds; Philip D. Tuckett. Frank Bailey, engineer. J. Cecil Bull, manager and secretary.

Abstract of report of the directors and accounts for the year ended Dec. 31, 1900:

The expenditure on capital account during the year ended Dec. 31, 1900, amounted to £242.974. 11s. 3d. The total revenue for the year was £223,776. 10s. 3d., from which must be deducted the following items: expenses of generation and distribution, £106,750. 16s. 4d.; rent, rates, taxes, general and special charges, £33 009. 18s. 4d.; transfer to repairs and maintenance fund, £25,000; expenses of issues of ordinary shares and second debenture stock, £2,285. 7s. 9d.; interest on loans, etc., £4 422. 9s. 5d.; leaving £52,307. 18s. 5d., to which must be added the balance brought forward from 1899, £1,622. 14s. 5d., making a total available revenue of £53.930. 12s. 10d. Of this sum the following amounts have been distributed or provided for: interest on first and second debenture stock for year ended Dec. 31, 1900, £19,687. 13s. 8d.; interim dividend on £400,000 6 per cent. preference shares paid in July last on account of the distribution for the year, £11.500, leaving a balance of £22.742 19s. 2d. Your directors recommend that a final dividend of 6s. per share for the six months ended Dec. 31, 1900, be declared, subject to the deduction of income tax, on the Company's preference shares, Nos. 1 to 40,000, making with the dividend of 6s. per share paid on account in July last a distribution at the full rate of 6 per cent. per annum on such shares. This will absorb £11,400 and leave a balance of £11,342 19s. 2d., which your directors propose to carry forward. The generation and distribution expenses for the year, including repairs and renewals were 61·13 per cent. of the gross earnings as compared with 49·31 per cent. for 1899, 36·1 per cent. for 1898. 31 3 per cent. for 1897, 34 per cent. for 1896 36 87 for 1895, 46 for 1894, and 54 2 for 1893. This unsatisfactory result is due to the high price of coal which obtained in 1900, and to the low average price per unit received from consumers. The average price per unit obtained in 1900 was 4·09d. Your directors, in view of these circumstances, have made a modification in the tariff, which it is believed will result in a substantial increase in the revenue. As a result of the recent capital expenditure it is anticipated that very considerable economies in the works costs will be possible during the current year. The number of customers and 8-c.p. (equivalent) lamps connected at Dec. 31, 1900 was 9 855 and 511 113 respectively. On March 6, 1901, there 540 389 8-c.p lamps (equivalent) applied for out of which 521,651 were connected, and the customers numbered 10 074. The Board of Trade units sold during the year 1900, excluding public lighting, were 11,272 968, as compared with 7 446,703 for 1899. The City of London Electric Lighting Act, 1900, has relieved the Company of the statutory obligation of setting aside a fixed percentage for depreciation every year, and the matter is now left to the discretion of your directors. In view of the fact that the sum of £16,349. 6s. 6d., which had been accumulated mainly out of revenue in former years, and which, until the passing of the Company's 1900 Act, could be used for any purposes of the undertaking other than for equalising dividends, has now been added to the depreciation fund, which stands at £96 045 15s. 7d., and that the large sum of £23,486. 4s. 11d., out of £25 000 set aside from revenue for the purpose, has been expended during the past year in maintaining the Company's plant, buildings, etc., in an efficient state of repair, your directors have not thought it necessary to provide any further amount for depreciation out of the revenue for the past year. This Act also authorised the Company to acquire compulsorily certain properties which are essential to the development of the Bankside works. Some of the properties have been purchased since Dec. 31, 1900, and negotiations are proceeding as regards the others, and there is a further capital liability in respect of the cost of the same, which will have to be provided for. As only 10,595 ordinary shares out of the 20,000 offered to the shareholders were subscribed for, your Board, to meet the commitments for capital expenditure, were compelled to obtain the sanction of the shareholders to further borrowing powers to the extent of £400 000, and these powers have been exercised by the creation of second debenture stock for this amount, of which £200 000 has been issued and subscribed. The declaration of Mr. Justice Farwell in favour of the Company that the three contracts with the late Commissioners of Sewers were valid has been varied by the Court of Appeal to the extent that two are invalid and that one is valid. This decision does not affect the Company's statutory right to supply electricity for private purposes throughout the City, but concerns principally the arrangements made with the Corporation, by the Company's predecessors, for the public lighting of the streets in the central and western districts of the City. Your Board are giving their careful consideration to the matter In accordance with the articles of association, three of their number (Mr Joseph Bevan Braithwaite, jun., Mr. Herbert Samuel Leon, and Mr. Edward Lucas) now retire, and, being eligible, offer themselves for re-election. Messrs. W H. Pannell and Co. retire, and, being eligible, offer themselves for re-election.

QUESTIONS AND ANSWERS.

If thou hast knowledge, let others light their candle at it.

Under this heading we insert questions and answers of a practical character relating to central-station work, tramway work, or construction work; and for each suitable question offer *one shilling*, and for the best solution of any question we offer *ten shillings*. We also give *five shillings* for every other answer we print. The answers to any question should be sent within 10 days after the question has appeared. We would call the attention of those sending in answers to the fact that the neatness of any sketches (which must be in *ink*) sent in is considered when marking the relative values of these answers. All formulæ should be carefully written to prevent mistakes as to symbols, and all loose sketches should be signed by the author. The matter must be written on one side only of the paper. Questions may be sent at any time.

QUESTIONS.

361. What percentage losses are in modern machines usually allowed (*a*) in the armature, (*b*) in the field windings; and to what extent are these allowances dependent upon the purpose of the generator?—Z.

362. What is the practical method of calculating the air-gap reluctance of dynamos having slotted armatures? This little calculation is avoided in most text-books, and even in the one or two in which it does occur the results are widely different.—P. W. F.

ANSWERS.

Question No. 355.—In the event of a short-circuit occurring at night on a low-tension distributing network, what is the best course to pursue?

Best Answer to No. 355 *(awarded* 10*s.).*—The question is a general one, covering a multitude of particular cases, each of which may require different treatment. To indicate two main divisions, it is not clear whether the low-tension distributing network of a high-tension alternating-current system is meant, or the distributing network of a low-tension two or three or five wire system. As the first effect of the short-circuit will be felt at the station, the difference in systems involves a large variation in the means at the disposal of the engineer in charge to put things right again. The solution in each particular case is more usually found by the use of "gumption" on the part of the engineer than by his knowledge of theory. It is doubtful whether anyone can think out a set of cut-and-dried rules of procedure for every accident that can occur on his shift, or can remember his rule at the critical moment if he happens to have thought it out.

Treating the matter generally, however, it must be remembered that in every well-regulated station the minimum working plant and the minimum staff consistent with safety is employed on the night shift. (The question presumably deals with the time after the heavy load has gone off, as that is usually fairly early in the evening.) There is in every probability no mains engineer on the works, as even if repairs or extensions are being carried on, the mains engineer is nearly always in some inaccessible part of the area of supply. There should, however, be a telephone connection between the station and the mains superintendent's house, or at least it should be possible to ring up the chief engineer in desperate cases. If a short-circuit occurs, it is usually possible to (*a*) cut it out or (*b*) burn it out. In some low-tension stations, however, the chief engineers have discarded fuses throughout, and the only thing to do is to bring to bear all the power available from spare plant, battery, etc., until something goes. Occasionally, in the case of a heavy short, the plant gives way before the fault. In any case severe strains are produced both in the electrical and mechanical parts of the plant, which it seems a mistake to incur without some precaution. In alternating-current work it must be remembered that it is almost useless trying to parallel a machine with another working on a short—in fact, a heavy short will often pull the machines out of step. Even in direct-current work one cannot run up spare engines *ad lib.* to burn out a short, as the boiler power on night shift is (or ought to be) very limited, and a spare boiler cannot usually be got up in under half an hour even if it be a water-tube boiler under favourable conditions. In some cases it is found that where a short cannot be burnt out supply can be resumed by simply shutting down and starting up again—the explanation probably being that an arc has been set up bridging some insulation, which arc, of course, dies down on stopping the current, and is not renewed.

If a short occurs on a distributing network fed by transformers from high-tension feeders, one of three things will happen. The short, if small, may blow a fuse somewhere on the network, or may burn itself out; or if it is large, it will blow the primary fuses of the transformer or transformers feeding it. The engineer in charge must exercise his discretion as to whether any further attention (beyond logging the incident) need be paid to it. A complaint next day will probably indicate where the fault is if it is small. If a primary short occurs, it will blow the feeder fuse on the switchboard. The feeder should be tried once more with a light fuse, and if this goes the feeder should be locked off with the switch open, and the mains superintendent communicated with.

In low-tension work, a short on the network will probably be seen on several feeders. An attempt must be made to burn it out. If any protecting device, such as a circuit breaker or fuse, is in circuit, this will act if the machines will take the load. It is not always a safe thing to attempt to switch out a circuit on which there is a heavy short, as even with some so-called quick-break switches the heavy current may produce an arc which may get over on to other metal, wrecking the board. If the short is persistent, it is worth while shutting down for a moment and running up again. If this is no good, switch out the feeders showing the fault (if they are not all affected) and run up on the circuits which remain good. Communicate at once with the mains department, or failing this, the chief engineer.

The duty of the mains engineer varies with the magnitude of the area affected by the short. If the short is only slight, it may be difficult to locate, and may, therefore, be left until a complaint is received. If it is a serious affair, it must be located as soon as ever possible—the indications available being the feeders affected and the condition of fuses at junction boxes, etc. Possibly a complaint may arrive to assist matters, though this is not likely on night shift. It is not much use attempting to test a network for position of a fault, except in specially simple cases. A common method in serious cases is to cut the cable at a likely place and test the two sections for insulation. The fault will be found in one section only, which must be judiciously sub-divided until the fault is located. Another method where alternating currents are used is to keep supply on the cable and follow its course with a telephone and coil of wire. The induced currents in the coil make a hum in the telephone, which ceases at the point where the current goes to earth. Particular precautions must, however, be taken to avoid following an iron drain-pipe instead of the cable.

When the fault is found it must be cut out (if this is not already done) as close to the fault as possible, and notice given to the station engineer to resume supply to the surrounding consumers whose connections are intact. The question is now one of expediency and cost. It may be worth while to put a jointer on repairs at once, but he will want overtime money for nightwork, and possibly, if the job is a big one, personal supervision of the engineer himself will be necessary. The counter-balancing considerations are the time it will take to get the repair finished, the number of consumers cut off until the job is complete, and any special facility which any one of these consumers has for "making it hot" for the engineer if he finds his supply cut off. In the event of a short on a feeder, it is, of course, a matter of getting the work done in the shortest time possible to secure good work, and the mains engineer should grudge neither time spent in personal supervision nor expense in extra labour until the work is complete.—J. A. S.

Answer to No. 355 *(awarded* 5*s.).*—In the event of a short-circuit occurring at night on a low-tension distributing network, the best course to persue would be to burn out the fault. In most networks the sections are so arranged

Digitized by Google

that each section can be isolated by taking out fuses, and consequently when a short develops in one of these sections the fuse is blown and the section isolated, and would soon be discovered. In a central station supplying current on the three-wire direct system, a short in the network would probably be between the neutral, or earth wire, and one of the outers. Now, if the resistance of the fault is very low, a large current will flow between the inner and the outer main, and if the section is properly fused, this would soon burn out the fuses, leaving the faulty section isolated. When the section had been discovered, the choice of leaving the repairing until next day or calling up the mains engineer, depends upon the nature of the load on the section. If a fault develops with sufficient resistance to prevent the rush of current, and thus blowing of the fuses, the best way is to disconnect the feeder nearest to the faulty section, which feeder is easily discovered by the state of the ammeters. The disconnection of the nearest feeder causes a rush of current through the faulty district, which, added to the current flowing through the fault, blows the fuses of the faulty section.

The result of a serious short would mean the fuses of the battery and balancer blowing, or failing this the armature of balancer would burn out, or one side of the battery would have to supply so large a current that it would probably ruin the battery. For this reason, upon a fault developing it is advisable never to use the battery to supply the current necessary. If the sections are not properly fused, the best way is to shut down and discover the fault as quickly as possible. This does not mean that the station is to be shut down, but only those feeders supplying the district in which the fault is discovered.—F. M. M.

Answer to No. 355 (*awarded* 5*s.*).—A very successful way of dealing with a short-circuit on a low-tension network at night is as follows: The system of wiring is not stated, so I take the triple-concentric with three feeders. Immediately the fault is observed by the switchboard attendant, either by the fuse blowing—in cases where you have a battery for nightwork—or where you have a generator feeding the mains and the fuse be too strong by the ammeter pointer falling off its pivot—such is the case

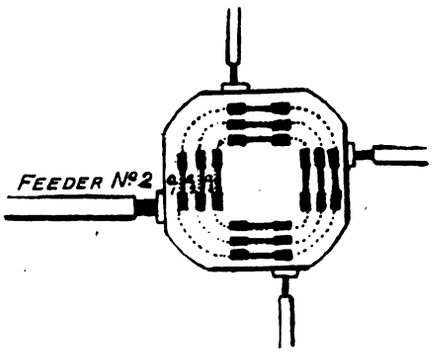

Fig. 1.

with Lord Kelvin's ampere-gauge—all switches should be taken out, including feeder switches. Instructions are then given, either to the mains foreman or jointer, whichever is the nearest to call, as to what part of the system the fault is on. This is known by looking at the feeder ammeters, and the one which has its pointer off the pivot is the feeder on which the fault is or nearest to. Suppose it to be No. 2 feeder, the man at once proceeds to the feeding point, where he disconnects the links at a_1, a_2, and a_3 (Fig. 1). A light fuse is then put in circuit with feeder at station, switch closed, and either battery or generator coupled to feeder. If the fuse stands, feeder is clear. Links are put back and still on No 2 feeder part of network is disconnected as at x (Fig 2). All switches are closed at station, and you again try battery on system with light fuse. If fuse blows, more network should be cut out, but if it stands you are sure that the short-circuit is cut out, and you again have supply on greater part of system. The man then takes out all connections in boxes on dead network, and commences from feeder box or other box with one line circuit in, with two short lengths of wire, with a light fuse connected across the two ends to test each circuit from line terminals to corresponding terminals of different circuits. If none of these blow the fuse they are connected to line circuit, and the man proceeds to another box on dead network, where he still uses the wires and fuse until he comes to the circuit which

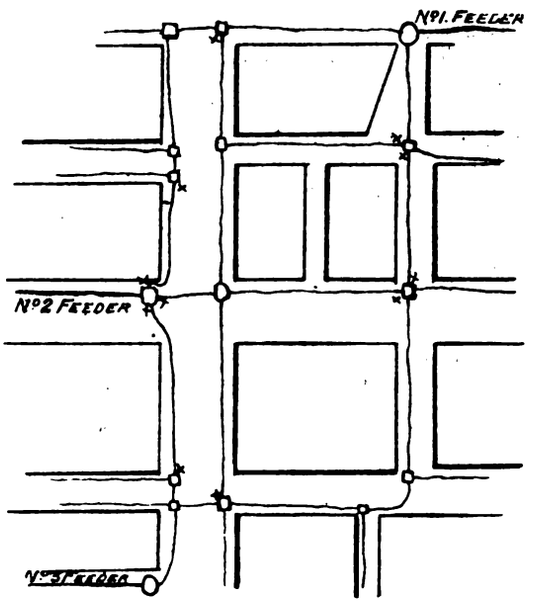

Fig. 2

blows the fuse. He then makes good all connections except faulty one, which is left cut out until examined and repaired in daytime.—A. R. W. A.

Answer to No. 355 (*awarded* 5*s.*).—A properly laid out network contains disconnecting boxes at every place where two or more streets containing mains join. These boxes should contain fuses properly proportioned to the size of the mains they connect. It is not necessary that every box should be fitted with fuses, but each box must have suitable means for disconnecting all the street mains which enter same. The fuses should then be distributed as nearly as may be on the circumferences of circles, of which the various feeding points are the centres. Each feeder box should be fitted with suitable means for easily disconnecting each pole separately, but should not contain any fuses on the feeder poles, but only on the distributors it feeds. At the station end each feeder may or may not be fitted with a fuse or an automatic cut-out; in the absence of the latter a switch should be provided on each pole. The sizes of the fuses in the disconnecting boxes should be governed by the section of the mains which are fused. If each main is fused to a current density of 1,500 amperes per square inch, they will be fully protected against damage from heating through excess current, while allowing sufficient margin for small faults and leaks to exist without interrupting the supply. With a network equipped as described, a short-circuit occurring even at top load need cause no great anxiety, though it may cause a local interruption of supply.

For the purpose of considering the best course to pursue, we may suppose a short-circuit of low resistance suddenly occurs on a distributor not very far from a feeding point. Then obviously most of the current through the short will be taken from the feeder nearest same, and the ammeter at the station will show at once the feeding point which is nearest the fault. If the current exceeds 150 amperes per square inch in the distributor on which the short occurs, the fuses on outers will blow; if, as will probably be the case, the distributor is alive from the other end as well, then, as all the current will now be fed from this end, the fuses here will give way, and the short will be completely isolated. If the faulty section was not detected by the ammeters, it would now be disclosed by the telephone. The only thing to do then would be to proceed at once to the section in question, disconnect at every box within the dead section, and connect up one at a time to the live network, flashing into each before joining up. The faulty piece is easily detected by the large flash due to the

Digitized by Google

short as compared with the smaller flashes due to lamps switched on and bridging the outers. If the short occurs between neutral and one of the outers in a three-wire system the same reasoning holds, but the question is a little more complicated on account of the effect on the station balance. On thinking it over, however, it comes to this: that the balancer must be capable of supplying the maximum out-of-balance current which occurs in ordinary working, plus sufficient current to blow the largest fuse on any neutral distributor. This is at once obvious, when we consider that the balancer may be supplying, say, 100 amperes on positive side in district A at the moment a positive short of 200 amperes occurs in district B.

There is one species of short-circuit not covered by the above remarks—viz, a short on a feeder itself. In this case, if the current as shown by the feeder ammeter rises to an amount dangerously in excess of that for which the feeder is designed, the latter should be switched off at the works. This will cause the distributor fuses in the feeder box to blow, and the fault will thus be isolated.—E. M.

Question No. 356.—Describe a tramway scheme with distribution carried out on the three-wire system at 1,000 volts. Consider insulation and balancing difficulties; also saving in copper as compared with two-wire system at 500 volts.

Best Answer to No. 356 (*awarded* 10*s.*).—We will assume that the scheme comprises, say, five miles of main line, double track with four lines branching out of this, two on either side, each from one to two miles in length and single track with turn-outs. Such a route might, I think, be supplied with success on the three-wire system, with 1,000 volts across the outers. Some 40 cars would probably be required, and allowing an average of 30 amperes per car we should have to supply 1,200 amperes at 500 volts or 600 amperes at 1,000 volts. Three 400-kw. generators, allowing one as spare, giving 400 amperes each at 1,000 to 1,200 volts could be arranged to feed the network from a three-wire board similar to a lighting board, and fitted with the necessary traction instruments. There would be no difficulty with the insulation of such machines, nor any special novelty.

We will assume the generating station to be near the double line, and about in the middle of same. Two trolley wires will be necessary for the double line, and these should be fed, one from positive 'bus bar and the other from the negative, so that all cars going in one direction would be taking current from positive side and cars in the other direction from the negative side of system. With regard to insulation of car motors and wiring, since the rails would always be neutral, there would be no increased difficulty to be met provided the system is kept well balanced. The single lines on either side of the double track would be provided with a single trolley wire and worked in the ordinary way, being balanced one against the other alternately positive and negative.

The success of the scheme would mainly depend on the efficient balancing of the system, and for this purpose it would be necessary to have several balancer sets, consisting of ordinary shunt motors and dynamos working at 500 to 600 volts with fields crossed. These sets should be placed at different points of the line in sub-stations or suitable buildings. With the route above described probably three sets would be found sufficient, one at the central station and one about a mile to a mile and a half from each end of the double track. The station set should be of somewhat greater capacity than the others. To ascertain the necessary size of the balancers, we must consider the maximum out of balance likely to arise. The most unfavourable case would be a steep grade on the double line near the point where one of the single lines is taken off. In this case we might have two cars coming up the grade, taking, say, 100 amperes each, and the cars on the branch line another 100 amperes, or total of 300 amperes out of balance. This would require each balancing machine to be capable of dealing with something more than 150 amperes, and machines of 200 amperes capacity would be large enough. It must be remembered, however, that this want of balance may be partly neutralised by an opposite out of balance in some other part of the system. In any case the drop in the rails may easily be calculated. If we use 100lb. rails the resistance of a double track per mile, well bonded, will be about ·075 ohm; 300 amperes would give a drop of 22·5 volts per mile, and would produce a difference of pressure across the two sides of the system of over 45 volts. This shows at once the necessity of *distributing* the balancing machines so as to avoid contravening the Board of Trade regulation allowing seven volts drop between station and furthest point in rails. The balancers would have to be protected by automatic cut-outs, and would require restarting after a serious short on one side, unless the sections of track were nicely protected by cut-outs which would open before the sub-station cut-outs, but even if it were necessary to keep a man in each sub-station to attend to balancers it would certainly pay to use them. The outlay in copper for feeders would be exactly half, to which must be added cost of balancers and sub-stations, etc.; the net result would probably be a saving.

No doubt *the* one great difficulty in the working of such a system is the providing for the large out-of-balance currents which are likely to occur in ordinary working, and this fact, coupled with the Board of Trade regulations *re* maximum pressure, has operated to prevent any tramways being run on this system. The City and South London Railway, however, have adopted it for their extensions, and as the Board of Trade have sanctioned three-wire supply for lighting at 500 volts across outers, the pressure to earth being less than 300 volts, it seems not impossible that in course of time they may be induced to sanction supply of power for tramways at 1,000 volts across outers, more especially as, in the case of traction, the neutral is *permanently* earthed, and it should be quite impossible for the pressure to rise dangerously above 500 volts on either side.—E. M.

Answer to No. 356 (*awarded* 5*s.*).—The three-wire system for tramway work is the outcome of the various

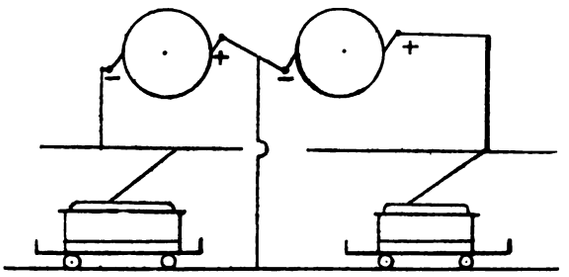

Fig. 1.

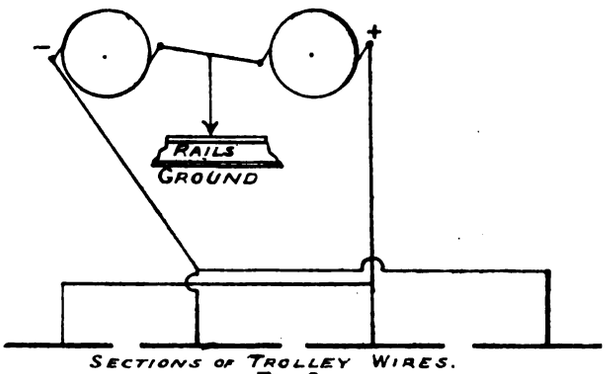
proposals made to avoid the troubles due to electrolytic action in connection with an earth return, and its general connections are shown in Fig. 1. The rails forming the centre or neutral wire or conductor, the earth, therefore, is mainly confined to the distance between the cars, instead of between the cars and the power-house, as shown. In Fig. 2 is shown the feeder and sections of the trolley wires. If the cars were



Sections of Trolley Wires.
Fig. 2.

bunched on one section of the trolley wire, this would, of course, disturb the balance, and a large flow through the earth to the power-house would result. This is a condition not at all likely to happen in practice.

The three-wire system is in use at Portland, Oregon, and the results are very satisfactory, the current being

Digitized by Google

received from the Union Power Company, the distance from the power-house to the centre of the system being about 3½ miles, the load being about 2,000 h.p., and the three-wire plan was adopted to reduce the cost of feeders. A point showing the advantages was shown during construction. As the work was proceeding, it was found necessary to run part of the cars on the ordinary plan of two-wire tramway operation, and to change over when completed. As the feeders were calculated for the three-wire basis some difficulty was found in maintaining the pressure, the machines being speeded up to 600 volts, the loss on the lines being about 350 volts. When the work was completed and the full number of cars added the voltage of generators was lowered to 550 volts, and in spite of this lowering the pressure on the cars did not fall below 450 volts. The high pressure between the sections does not give trouble, except, I believe, that the section insulators have had to be lengthened, and care exercised in making all points and frogs of the same polarity. The wiring of the cars is the same as for the ordinary or two-wire system, and the saving of copper in feeders is about 50 per cent. over a complete metallic circuit. At the same time, the success of the system depends very much upon the judgment of the engineer in the laying-out of the overhead sections and their respective polarities with relation to the tracks lying in parallel streets, and if sufficient care is exercised the earth circuits can be made as short as possible, and thus maintain a fairly even balance of the load.—A. W.

APPOINTMENTS VACANT.

Electrical Engineer, Nelson Corporation, £200 per annum, March 25. Details in our advertisement columns.

Switchboard Attendants, Carlisle Corporation, March 25; Southend-on-Sea Corporation, 35s. per week, April 1. Details in our advertisement columns.

Meter Inspector, Brighton Corporation, in meter department, 25s. per week of 50 hours. Details in our advertisement columns.

Electrician, electrical works in the North-East of England. Details in our advertisement columns.

Inspector of Motormen, etc., Southend-on-Sea Corporation, 35s. per week. April 1. Details in our advertisement columns.

Canvasser, Aberystwyth and Chiswick Electricity Supply Corporation, Limited. Details in our advertisement columns.

Agents, by leading British manufacturing firm, making cables and wires, arc lamps, meters, instruments, etc. Details in our advertisement columns.

Assistant, Area Electricity Meter Company, Limited. Details in our advertisement columns.

CONTRACTS FOR ELECTRICAL SUPPLIES.

CONTRACTS OPEN.

Piatra Neamtz (Roumania).—The Municipality invite tenders for the electric lighting of the town for 30 years. Tenders by April 25.

Sunderland.—The Corporation invite tenders for indiarubber-covered cables, etc. Tenders by March 29. Details in our advertisement columns.

Sunderland.—The Corporation invite tenders for the supply of 104 arc lamp pillars, lamps, and accessories. Tenders by April 3. Details in our advertisement columns.

Ploesti (Roumania).—The Municipality invite tenders for the laying down and working of electric tramways for 30 years. The provisional deposit is £2,000. Tenders by April 3.

Kirkcaldy.—The Corporation invite tenders for engines and dynamos, storage battery, and overhead travelling crane. Tenders by April 15. Details in our advertisement columns.

Salford.—The Corporation invite tenders for wiring for motors, dynamo leads, engine room and switchboard connections, etc. Tenders by April 9. Details in our advertisement columns.

Hornsey.—The Urban District Council invite tenders for the supply and erection of various plant for electricity works. Full details in our advertisement columns. Tenders by April 11.

Leith.—The Town Council invite tenders for the supply, delivery, and erection of a 350-kw. steam dynamo, suitable for either private or traction supply. Details in our advertisement columns.

Grosswardein (Austria).—Tenders for electric lighting are required. The town has a population of 51,000, and 1,220 lamps, averaging 2,000 hours per year, will be guaranteed. Particulars may be obtained from the Municipal Authorities. Tenders by March 30.

Cheltenham.—Tenders are invited for the electric lighting of St. John's Church, Cheltenham. Specifications, etc., can be had from Mr. Weaver, Carlton-place, Hewlett-street, Cheltenham. Tenders by March 25.

Zagazig (Egypt).—The Local Commission invite tenders for the electric lighting of the town. Specifications, etc., may be obtained from the Public Works Department, Cairo, where tenders may be addressed until April 15.

Darwen.—The Corporation invite tenders for the supply and delivery of feeder cables, pillars, and overhead electrical equipment in connection with the electric tramways. Tenders by March 25. Details in our advertisement columns.

Dublin.—The Lighting Committee invite tenders for condensing plant, pipework, feed pumps, superheaters, mechanical coaling apparatus, overhead crane, and workshop equipment. Tenders by April 22. Details in our advertisement columns.

Farnworth (Lancs.).—The Urban District Council invite tenders for the wiring of the electricity works in Albert-road. Specifications, etc., may be obtained from Mr. J. D. Pember, electrical engineer, Council Offices, Farnworth. Tenders by 25th inst.

Bradford.—The Corporation invite tenders for the supply, delivery, and erection of a combined motor balancer and boosters, with switch gear for same, at their electricity works, Bolton-road, Bradford. Tenders by April 3. Details in our advertisement columns.

London, W.—The Directors of the Metropolitan Electric Supply Company, Limited, are considering the expediency of adopting larger units, and are prepared to receive designs for complete two-phase steam units. Full particulars appear in our advertisement columns.

Wallasey.—The Urban District Council invite tenders for the supply of tramway points and crossings. Further particulars may be obtained on application to the district engineer and surveyor, Mr. W. H. Travers, Public Offices, Egremont, Cheshire. Tenders by 26th inst.

Dundee.—The Town Council invite tenders for the supply and delivery of about 1,540 tons of steel girder rails and 60 tons of fishplates. Specification, etc., on application to Mr. Wm. Mackison, C.E., Municipal Offices, 91, Commercial-street, Dundee. Tenders by March 28.

Burnley.—The Corporation invite tenders for the supply and delivery of steel rails fishplates, soleplates, tiebars, and bolts and nuts required in the construction of about seven miles of double tramway track. Specification, etc., may be obtained at the office of the Borough Surveyor. Tenders by 26th inst.

Burnley.—The Tramways Committee invite tenders for the supply of the necessary materials for the overhead equipment in connection with the trunk line. Specification, etc., may be obtained from Mr. R. Birkett, borough electrical engineer, Aqueduct-street, Burnley. Tenders by March 23.

Metropolitan Asylums Board.—The Board invite tenders for the supply and erection of a complete electrical generating plant and a complete boiler plant for heating at the asylum now in course of construction at Tooting Bec., S.W. Tenders by April 24. Details in our advertisement columns.

Christiania.—Tenders are invited by the Norwegian State Telegraph Department for supply of telegraph wire, bronze wire, and telephone cables. Specifications and conditions of tender may be inspected daily between 12 and 1 on application at the Technical Department of the Telegraph Office in Christiania. Tenders by April 6.

Wolverhampton.—The Tramways Committee invite tenders for (A) the complete overhead equipment of about five miles of tramway route; (B) the supply and laying of feeders, conduits, and switch pillars for the same. Specification, etc., may be obtained upon application to Mr. C. E. C. Shawfield, borough electrical engineer, Commercial-road, Wolverhampton. Tenders by 23rd inst.

Warrington.—The Corporation invite tenders for (Section 1) supply, delivery, and laying of steel rails, paving, etc., forming permanent way; (2) supply, delivery, and erection of steel poles, brackets, trolley wire, insulators, etc., forming a complete overhead equipment; (3) electric tramcars. Specifications, etc., can be obtained at the offices of Messrs. Preece and Cardew, 13, Queen Anne's gate, Westminster, S.W. Tenders by March 27.

Manchester.—The Electricity Committee invite tenders for the supply, delivery, and erection at the Bloom-street generating station of (a) switchboard for connecting four 1,800-kw. generators to the lighting and traction systems; (b) four continuous current motors for driving mechanical stokers and economisers. Specifications, etc., may be obtained on application to Mr. F. E. Hughes, secretary, Electricity Department, Town Hall. Tenders by March 25.

Palencia (Spain).—Tenders are invited for the installation and working of a telephone system for not more than 20 years; 10 per cent. of the annual receipts will have to be paid to the Government. Tenders may be addressed to the General Post and Telegraph Department by April 21. Such particulars as have been received may be examined on personal application at the Commercial Department of the Foreign Office any day between 11 a.m. and 5 p.m.

Newport (Mon.)—The Corporation invite tenders for the supply and erection of: (Section 4) constructional steelwork, bunkers,

Digitized by Google

etc.; (5) steel flue; (6) coal and ash conveyor; (8) overhead travelling crane; (9) steam-boilers; (10) mechanical stokers; (11) fuel economiser; (12) water-storage tanks; (13) compound condensing vertical engines; (14) electric generators; (15) condensing plant with cooling towers; (16) feed pumps. Specifications, etc., may be obtained from Mr. H. F. Parshall, 8, Princes-street, Bank, London, E.C. Tenders by March 25.

London, W.C.—The British Electric Traction Company, Limited, on behalf of the Gravesend and Northfleet Electric Tramways Company, invite tenders for the construction of new tramways in Gravesend and Northfleet, and the reconstruction of the existing tramways in Gravesend; for the supply and construction of the necessary electrical equipment for working the overhead system. Copies of the specifications and schedules can be obtained on payment of £10, returnable upon receipt of a bona fide tender, from the secretary, Mr. Charles Dade, Donington House, Norfolk-street, Strand, London, W.C. Tenders by 25th inst.

RESULTS OF TENDERS.

Walsall.—The Corporation have accepted the tender of T. Tildesley, Willenhall, near Wolverhampton, at £2,020, for enlarging the electricity generating station in Wolverhampton-street, Walsall.

Batley.—The tender of Messrs. John Fowler and Co., Limited, of Leeds, for the supply and fixing of steam dynamos and balance motor-generator, etc., at the new electric generating station, has been accepted by the Council.

Dagenham (Essex).—The West Ham Town Council have accepted the tender of Foster Bros., Suffolk-road, Norwood Junction, at £595 10s., for erection of a dynamo-house at their small-pox hospital, Dagenham, Essex.

Bristol.—The Electrical Committee have accepted the tenders of Messrs. W. Bennis and Co., Bolton, for coal-discharging plant; Messrs. Babcock and Wilcox, London, for coal conveying plant; and Messrs. W. H. Allen, Sons, and Co. for condensing plant.

Great Yarmouth.—The following tenders have been accepted: W. H. Allen, Son, and Co., Limited, Bedford, two 300-h.p. engines with dynamos by the British Schuckert Electric Company, Limited, £3 693; Babcock Boiler Company, two boilers, £1 810.

Whitehaven.—The Electricity Committee have accepted the tender of R. G. W. Bradley, Millom, for the construction and completion of a chimney shaft, 120ft. high, and flues, in connection with the extensions at their electricity station, West Strand, Whitehaven, at £800. 19s.

Wolverhampton.—The Corporation have accepted the following tenders for extensions at the generating station in Commercial-road: Electric Construction Company, generator and Davey-Paxman engine, £3 240; Willcock and Co., further buildings, £1,332; T. Parker, Limited, electric fittings, etc., £374.

Middleton (Lancs.).—The Corporation have received the following tenders for a traction switchboard (Contract No. 8): Brush Electrical Engineering Company, London (accepted); Cowans, Limited, Salford; Crompton and Co., Limited, London; General Electric Company, Limited, London; Mechan and Sons, Glasgow; B. Thomas, Manchester; J. Fowler and Co. (Leeds), Limited, Leeds; W. J. Fryer and Co., London; Walsall Electrical Company, Limited, Walsall; R. W. Blackwell and Co., Limited, London; Dorman and Smith, Manchester.

BUSINESS NOTES.

TRACTION.

Dufftus (Scotland).—The Parish Council have withdrawn their opposition to the proposed Hopeman tramway.

Glamorganshire.—The County Council have decided not to oppose the granting of the Pontypridd tramways order.

Glastherpes.—Provided the weather permit, the erection of the poles for the overhead system of traction will be commenced at once.

Gravesend.—The National Electric Traction Company have deposited plans with the Town Council for the proposed electric tramways.

Kinver.—We understand that Colonel Yorke, R.E., will inspect the new electric tramway to Stourbridge on behalf of the Board of Trade to-day.

Brierfield.—The District Council have decided to apply for sanction to a loan of £4,000 in connection with the purchase of the Burnley tramways.

Manchester.—The Tramways Committee are considering a proposal in favour of forming a sick and benefit society for the tramway employés.

Cardiff.—The Mayor has received a letter from an occupier in Cathedral-road urging the extension of the electric tramways to the top of the road.

Southport.—The Corporation have received a memorial from occupiers in Lord-street objecting to the proposed electric tramway in that thoroughfare.

Portmadoc.—The Urban District Council at a special meeting passed a resolution to oppose the scheme of the proposed electric railway from Beddgelert.

Merthyr Tydvil.—Major Trotter has carried out the official inspection of the electrical equipment of the tramways.

Glasgow.—The Town Council have agreed to the magistrates making the regulations for the Corporation tramways, subject to the approval of the Council.

Wallsend.—The Town Council have agreed that they could not approve the Tyneside Electric Tramways Bill if goodwill were included in the purchase clause.

Plymouth.—The result of the poll which has been taken on the question whether there should be a Sunday service on the Corporation tramways is as follows: for, 7,633; against, 4,817.

Whitehaven.—At the last Town Council's meeting another spirited discussion took place with regard to the West Cumberland Electric Tramways Bill, which the Council recently decided to oppose in Parliament.

Berlin.—It is reckoned that 458,445 648 passengers travelled last year on the elevated railway, the trams, omnibuses, and electric cars of the city, being a total increase of 43,763,227 persons on the preceding year.

Aston.—The District Council have passed resolutions in favour of giving notice to the Birmingham and Aston Tramways Company of their intention to purchase the undertaking and making application to the Board of Trade to hold the usual enquiry.

Heston.—The School Board have decided to grant the use of a portion of the site for the Spring-grove Schools to the London United Tramways Company for the purpose of erecting sheds, etc., in connection with the transforming station in course of construction.

Continental Tramways.—While the Parisian local railway authorities are considering the adoption of electric traction for steam, it is interesting to note that several of the tramways are now run by electricity—for example, the lines to Auteuil, Sceaux, and Vincennes.

Folkestone.—The Board of Trade enquiry in regard to the Corporation's application for a provisional order for a scheme of tramways came to a conclusion on Saturday. We understand that the original scheme, involving an outlay of over £90,000, is very much pared down.

Fulham.—The Law and Parliamentary Committee have recommended that the promoters of the King's-road and Victoria Station Railway Bill be requested to insert a clause in the Bill making themselves liable for the general rate during the pulling down and rebuilding of properties.

Tynemouth.—The electric tram service was inaugurated on Monday. The new line, which is worked on the overhead system, reaches from North Shields to Whitley, a fashionable watering resort three miles away, and it is intended to still further extend it. The cost up to the present is about £60,000.

Ashton-under-Lyne.—The Board of Trade have sanctioned the borrowing by the Corporation of £26,570 for the construction of the tramways authorised under the Ashton-under-Lyne Tramways Order, 1900. Of this £17.110 is for permanent way and £9,400 the estimated expenditure on electrical equipment.

County of London and Brush Provincial Electric Lighting Co.—The directors recommend a final dividend upon the ordinary shares of 4 per cent. per annum for the half-year ended Dec. 31 last, making 4 per cent. for the year, and on the preference shares of 6 per cent. per annum for the half-year to Dec. 31, 1900.

Birmingham Tramways Co.—The directors recommend a dividend of 5 per cent. per annum for the six months ended Dec. 31 last, together with a bonus of 5 per cent. for the year, making a total dividend of 10 per cent. per annum on the ordinary shares. This will leave £38,559 to be carried to reserve fund.

West Riding.—The County Council have adopted the recommendation that the County Council are of opinion that all motor-cars should, for purposes of identification while travelling, be numbered or otherwise marked and registered, and that the drivers should be under obligation to stop when signalled to do so.

Local Authorities' Veto.—The West-end Tramways Opposition Association have circulated a letter among local authorities calling attention to the alteration proposed to be made in the Standing Orders of the two Houses of Parliament with reference to Tramway Bills, which will abolish the veto hitherto vested in local and road authorities.

Pembroke (Ireland).—On Monday the Urban District Council again received a deputation from the Wexford Railway Company in reference to the proposed Dublin Scalp and Enniskerry electric tramway. It is contended that the advertisements published did not correctly state the object sought to be obtained under the provisional order.

Sheffield.—At a meeting of the Tramways Committee on Tuesday the Chairman reported that at a recent meeting of chairmen of all the standing committees of the Corporation he offered, on behalf of the Tramways Committee, to pay a further sum of £5,000 out of the tramway receipts in relief of the rates. The chairman's action was approved.

Warrington.—The question of the overhead system of traction, which it is proposed to adopt in the town, was raised at the monthly meeting of the Council, when it was stated that the Telephone Company had agreed to place their wires underground, and that probably the Government would do the same in the case of the telegraph wires.

London County Council.—The newly-constituted Highways Committee consists of the following gentlemen: Sir J. Dickson-Poynder, Messrs. J. A. Baker, R. M. Beachcroft, J. W. Benn,

Digitized by Google

E. Browne, N. W. Hubbard, W. C. Johnson, S Low, M. Maybew, R. Parker, W. R. W. Peel. R. C. Phillimore D S. Waterlow, T. Wiles, and T. McKinnon Wood.

Southampton.—At the City Council meeting last week, the report of the Tramways Committee was presented, including the estimate for the year ending March 31. 1902 The estimated income was £41,500, and the estimated expenditure £33 260, leaving a net estimated profit of £8 240 of which they proposed to allocate £5,000 to the reduction of the borough rate.

West Cumberland Electric Tramways.—The following have petitioned the House of Commons for leave to oppose by counsel the Bill at the committee stage: Workington Corporation, Lord Leconfield, London and North-Western Railway and Furness Railway Companies, Whitehaven Corporation, Cleator Moor Urban District Council, North British Railway Company, and others.

Bury, Rochdale, and Oldham Tramway Co.—At the half-yearly meeting of this Company last week, the Chairman referred to the approaching purchase of the tramways by the local authorities, and said fair progress was being made, but they did not yet know what the purchase price would be fixed at, nor when it would be fixed. He was hopeful of a price being mutually agreed upon.

Wolverhampton.—At a meeting of the Town Council last week the Chairman of the Tramways Committee stated that the present position was this—the Corporation had had to agree to the insertion of a clause in their Bill that the powers to purchase the tramway lines in certain outlying districts should not be exercised without the consent of the owners of the undertaking, now the British Electric Traction Company.

Leeds.—The question of a reduction of the fares on the Roundhay Park route will be discussed at the next meeting of the Tramways Committee. The Corporation have now received the Board of Trade certificate as to the efficiency of the permanent way of the Beeston and Elland-road tramway. With regard to the electrical equipment of the lines, it is expected that the Government inspection will take place shortly.

Hampstead.—On the motion of Sir Richard Temple, the Hampstead Heath Protection Society resolved on Tuesday night to offer vigorous opposition to the proposed tube railway under Hampstead Heath. The Earl of Mansfield presided at the meeting, and it was stated that a petition against the proposal would be sent to the House of Lords. The Borough Council have withdrawn their opposition to the Charing Cross and Hampstead Railway Bill on certain terms.

Bath.—At a meeting of the Corporation on Tuesday a report was presented from the Electric Traction Committee which showed that the Light Railway Commissioners, in the draft of an order for the establishment of electric trams in the city, had made considerable alterations in the agreement entered into between the private promoters and the authority when they consented to jointly apply for the order. After some discussion, the further consideration of the report was deferred.

Bury.—The clerk has been instructed to communicate with the Rochdale Corporation with a view to inducing the latter to run the trams to Bamford. The Norden District Council are also being communicated with. The Town Council have resolved that the estimates for the permanent way, overhead equipment, cars, and car sheds be approved, and that application should be made to the Board of Trade for borrowing powers for the sum of £60,000 for carrying out the work.

Chester.—The City Council and the Rural District Council have intimated that no objection will be offered to Messrs. Watson's intention to try a service of motorcars between Chester and Farndon. At a recent meeting of the Lighting Committee, Mr. Thursfield reported he had occasionally to charge small accumulators on electric vehicles, and the following charges were fixed: 6d. per unit, with a minimum charge of 2s., to cover cost of supervision; exceeding 20 units, 3d. per unit.

British Columbia Electric Railway Co.—This Company have convened an extraordinary general meeting, to be held in London on the 25th inst., for the purpose of obtaining the sanction of the proprietors to a further issue of capital. In their covering circular the directors state that, in anticipation of a further increase both in the railway and lighting business, they have decided to purchase additional rolling-stock, and to considerably increase the electric lighting plant and make other extensions rendered necessary.

Tunbridge Wells.—In a letter to the editor of the *Kent and Sussex Courier*, Mr. R. N. Goldie says: "I feel confident that Tunbridge Wells would reap large benefits by introducing electric tramways but unless the scheme is thorough and complete from its inception and in all its details, with a view also not so much to present profits but rather future benefits, it will be far wiser to leave the matter in the hands of the next generation, for a compromise between those for and those against electric tramways can only mean disaster as far as the success of the enterprise itself is concerned."

Tube Vibration.—The Special Committee appointed to enquire into the question of the alleged damage to frontages and others caused by vibration in the working of the traffic of the Central London Railway resumed its sittings this week. Lord Rayleigh presiding. Further evidence was given as to the vibration in premises in Holborn, New Oxford-street, and other places. The City Corporation have instructed the remembrancer to get leave of the property owners on the line of route of the Central London Railway to appear on their behalf before the Board of Trade Committee.

Newport (Mon.).—In July next the Corporation will take over the whole of the tram services from the present lessees, and the system will be worked by the Municipality. The initial work in connection with the proposed central power station, which is to be erected upon a site purchased from Lord Tredegar at cost of over £8,000 off the Corporation-road, is nearly complete. The cost of the buildings, machinery, etc., is estimated at £200,000. For this outlay the Corporation will be able to supply power for various industrial operations.

Newcastle.—At a meeting of the Tramways Committee last week the deputation appointed to visit Glasgow reported in favour of the adoption of the Chisholm iron blocks in all parts of the system where heavy traffic existed, as they were an excellent contrivance for strengthening the rails. The electrical engineer, Mr. Hopkinson, reported that the first orders for cars were now in a fairly well advanced state of completion, and that the firm were prepared to deliver five cars every week after the lapse of a certain time. It was further reported that 11 miles of track were now completed.

Scarborough.—When the Scarborough Electric Tramways Bill came before the Standing Orders Committee of the House of Commons, the Examiner of Private Bills reported non-compliance with the Standing Orders the company not having obtained the sanction of the Scarborough Town Council. The Chairman decided that the Standing Orders could not be dispensed with, and the Bill is therefore rejected for the present session. The Corporation intend to retain in their own hands the powers to construct tramways, and will this year apply for a provisional order to construct tramways in various parts of the town.

Liverpool.—Owing to a telephone pole weighing about two tons falling on to the electric tramway trolley wire, traffic on the Wavertree route was delayed for more than two hours on Sunday morning. The wire did not break, but was forced almost to the ground by the weight of the pole. The Bootle magistrates were recently engaged in hearing a number of summonses taken out by the Liverpool Corporation against persons for travelling on the electric tramcars beyond the penny stages without paying the additional fare. The defendants stated that the stages were most confusing, and caused people to get muddled. In each case a fine of 2s. 6d. and 2s. 6d. costs was imposed.

Richmond.—With regard to the opposition of the Town Council to the tramways scheme, the London United Tramways Company, it is reported, offer not to insist on the overhead electric system, but to let the Council choose any system it likes if it will only assent to the company's Bill. The company also offer to carry out street widenings at a cost of £30 000 pay an annual subsidy of £500 carry ordinary passengers from Richmond to Hammersmith for 2d. and workmen for 1d., and to bind themselves to carry out no extensions in the borough without the consent of the Corporation. The Council have not yet assented. A meeting of tradesmen has passed a resolution strongly in favour of the scheme.

Dundee.—From a statement showing the rates of wages on the electric cars it appears that the motormen are paid 24s. per week for the first six months, and 25s. per week during the second half-year. In the second year the pay is raised to 26s., in the third year to 27s., and thereafter it remains at 28s. Motormen, however can have an addition to their pay by means of merit badges awarded at the pleasure of the committee, each carrying an additional 1s. per week, and the maximum number being five. The conductors to begin with receive 22s. per week, rising after three years' service to 26s. Ten hours constitute one day, including 15 minutes in the depôt either before or after the time employed on the road.

Bradford.—The City Council have approved the action of the Tramways Committee in rescinding a previous resolution that 5 per cent. of the gross receipts from the tramways, together with the revenue from advertising on the cars, be set aside annually as an insurance fund commencing from Jan. 1, 1900, and deciding, in lieu thereof, that 5 per cent. of the net profits, or such other proportion as may be from time to time determined, be set aside annually as an insurance fund against accidents. During a three minutes' sitting of the City Council on Tuesday, £30,000 were voted on account of electrical and tramway works. Intimation was also given that sanction had been obtained for the borrowing of £140,000 for the same purposes.

County Councils and Tramway Schemes.—In the House of Commons last Friday Mr. J. W. Lowther moved amendments to Standing Orders 134 (c) and 170 (a) with the object of giving the county councils a *locus standi* to appear against tramway schemes when the tramways proposed were to run along roads for which the county councils were responsible, and of extending from 21 years to a maximum of 42 years the period at the end of which the local authority might purchase a tramway undertaking, as it was found, especially in the case of electric trams, the life of which was put by engineers at 42 years, that the shorter period was not sufficient. These alterations would apply to the whole of the United Kingdom. The amendments were agreed to.

London County Council Tramways Bill.—This Bill came before the Standing Orders Committee of the House of Commons on Tuesday, Mr. Halsey presiding. The report of Mr. Campion, one of the examiners of private Bills, with reference to non-compliance with Standing Orders, was submitted. In this it was pointed out that the promoters had failed to obtain the necessary consent of certain of the borough councils, the road authorities of districts through which it was proposed to construct lines. The opposing authorities included the Councils of Hackney, Stoke Newington, St. Pancras, Holborn, Marylebone, Westminster, and the city of London

Digitized by Google

among others. Ultimately the committee decided to allow the Bill to proceed, on the condition to which the County Council had assented—namely, to strike out of the Bill the powers to make the tramways objected to by the local authorities.

LIGHTING AND GENERAL.

National Electric Wiring Co.—The directors recommend a dividend of 4 per cent. for 1900.

Camberwell.—The Borough Council object to the erection of overhead wires by the Postmaster-General.

Watford (Herts).—A report has just been submitted by Messrs. Cardew and Preece on the electric light scheme.

Sunderland.—The Town Council have decided upon an extensive scheme of street-lighting by electricity, involving the erection of nearly 100 lamps.

W. T. Glover and Co., Limited.—The preference and ordinary share transfer books will be closed until the 31st inst., inclusive, for the preparation of dividend warrants.

Cleethorpes.—Mr. C. S. Vesey Brown, Lincoln, is to visit Cleethorpes next week to confer with the Electrical Committee regarding incandescent lamps for street-lighting.

Wednesbrough.—The District Council have appointed delegates to attend a proposed conference to be held at Wakefield in connection with the South Yorkshire Electric Power Bill.

Gourock.—A deputation from the Town Council visited London last week in connection with their application for a provisional order for the supply of electricity for lighting purposes.

Stamford.—The Urban Electric Supply Company will shortly commence operations in Stamford in order to fulfil their obligations under the Stamford Electric Lighting Order, 1900.

Bournemouth and Poole Electricity Supply Co.—The directors recommend a dividend on the ordinary shares at the rate of 6 per cent. per annum, less income tax, for the year ended Dec. 31.

Share Market.—During the past week electric shares have been steady, with some demand for lighting shares. A fair number of traction shares changed hands. B.E.T. continued to rise.

London Gazette.—A receiving order has been made out *re* A. I. Greenberg, carrying on business as the Midland Electrical Company, 20, Caroline-street, St. Paul's, Birmingham, on debtor's petition.

Rothesay.—The engineer has been instructed to obtain from an independent expert a report upon the whole electric lighting system of the burgh on account of the complaints which are being made.

Maybank Power Station.—The British Electric Traction Company have placed an order with Messrs. Frank Suter and Co., 66, Berners-street, W., for two "Helios" tramway generators of 440 kw. each.

Burton.—The charge for electrical energy for heating and power has been fixed at 2d. per unit for 117 hours or less per quarter, and at 1d. per unit for any additional number of hours during daylight.

Pudsey.—A public meeting of owners and ratepayers on Tuesday sanctioned the opposition by the Corporation of the Bills of the South Yorkshire Electric Power Company and the Electric Power (Yorkshire) Company, now before Parliament.

Farnham.—The Urban District Council in committee last week heard Mr. Gripper (from Edmundsons' Electricity Supply Corporation) and afterwards decided to recommend the Council to take the necessary steps to light the town with electricity.

Weston-super-Mare.—The Urban District Council are making enquiries of the Weston-super-Mare and District Electric Supply Company, as to whether they would be prepared to light any portion of the Marine-parade with electric light by July 1 next.

Luton.—The Borough Engineer states that the electric light and power buildings are nearly completed, and the works are being carried out to his satisfaction. A correspondence is taking place with the National Electric Wiring Company *re* free wiring.

Arc Lamp Pillars.—Messrs. J. W. Brook and Co. inform us that the lamp standards supplied at Lowestoft were also designed by them. This design has been registered under No. 350 728. An illustration of these handsome columns appeared in our issue of March 1.

Edinburgh.—During the fortnight ended the 14th inst. the amount of fresh electrical energy applied for was equal to 4,481 8 c.p. lamps. Of this total, the equivalent of 300 was asked in respect of motor power, and the remaining 4,181 for lighting purposes.

Leeds.—The Highways Committee of the Corporation have just granted an application by the Lighting Committee to lay cables for electric lighting in a number of streets in the east end of the city, including South Accommodation-road, Cross Green-lane, and Easy-road.

Cable Communications Committee.—At a meeting of this committee on Tuesday evidence was given by Mr. B. T. Ffinch, Director-in-Chief of the Indo-European Telegraph Public Works Department, and Mr. C. H. Reynolds, late Director-General of Telegraphs in India.

Hebburn.—The Electricity Company have received deputations relating to the supply of electricity in the district from the Northern Counties Electrical Power Company, the County of Durham Electrical Power Distribution Company, and from Messrs. Hancock and Balfour.

Arbroath.—The resolution of the Corporation to undertake the electric lighting of the burgh in place of allowing a company to carry out the scheme is being criticised by a considerable section of the ratepayers.

Sale of Plant.—An important sale of electric light fittings of all kinds will be held, on account of dissolution of partnership, at 22 and 23 Victoria-parade, Torquay, on March 27 and 28. Particulars of this and other sales will be found in our advertisement columns.

Brighton.—The Town Council's scheme for the improvement of the Aquarium contains a complete electric installation, which is to take the place of the existing gas lighting, and a special form of lighting at night will be applied to the fish tanks, and help to illuminate the corridors.

Merthyr Tydvil.—The Board of Trade have transmitted for the observation of the Council the system proposed to be adopted for the supply of energy under the Merthyr Electric Lighting Order of 1899, and the matter has been referred for report to Messrs. Hancock and Dyke, of London.

Whitehaven.—The blower for forced-boiler draught has been tried, and Mr. Stiven has reported on it as very satisfactory, stating that it would effect a saving in coal, as it would enable an inferior coal to be used. Mr. Bradley's tender for the erection of the new chimney has been accepted.

Alleged Non-Compliance.—Mr. Elijah Hawkes, of Cathall-road, Harrow Green, has applied for a writ of sequestration against the Leyton Urban District Council for alleged non-compliance with the order of the Court in working the gas-engines at the electric light works in Cathall-road so as to cause a nuisance. The case is to be heard during the latter part of this week.

Greenock.—The accounts of the electricity department for the period from Aug. 14 1897, to Dec 31, 1900, show that the amount authorised to be borrowed was £100,000, and that £50 000 had been borrowed. The total expenditure was £40 769. 4s. 10d., of which £2 700 went in lands, £6 341. 16s. 3d. in buildings, £12 151. 3s. 7d. in machinery, and £13 288. 13s. in mains and services. The revenue account shows a balance of £764. 3s. 3½d., which has been carried to net revenue account.

New Firm.—Mr. A. H. Hunt has opened an office and warehouse at 59 Gresham street, E.C., for the supply, to the trade only, of electrical plant, fittings, switchboards, and accessories. Mr. Hunt, who has been connected with the electrical industry for over 16 years, was on the staff of the Edison and Swan Company for the last 12 years, during the greater part of which he had complete charge (under the general manager) of the estimating, buying, pricing, catalogue, and advertising departments, as well as other technical administrative work at the company's head office, Queen street. We wish Mr. Hunt every success in his new venture.

Farnworth.—The electric lighting and traction schemes of the District Council are rapidly approaching completion. Hitherto the lighting in the district has been solely by gas supplied by a private company. The new project for electric lighting and the tramway will, it is expected, involve a cost of about £22 000. At present the tramway system is being operated by the Bolton Corporation. When their undertaking is complete, however, the Farnworth Council will supply the current and run their own cars, which are now building; and by an agreement with the Kearsley District Council, Farnworth will also supply the current for lighting and traction in the Kearsley area, but the Council of the latter district will lay their own lines and erect their own poles. Operations for laying the cables in Farnworth have commenced this week, the work being in the hands of the British Insulated Wire Company, Limited. The Council's generating station in Albert-road is advancing towards completion, both as regards structure and equipment, and it is expected that on an early date the current for lighting purposes will be available. The plant includes three Lancashire boilers, driving three vertical compound engines of 200 h.p., coupled to three dynamos of 120 kw. output. There is also being provided a set of accumulators consisting of 250 cells. The engineers are Messrs. Lacey, Clirehugh, and Sillar, of Westminster and Manchester.

Stock Exchange.—The Stock Exchange Committee have appointed April 3 a special settling day for Edmundson's Electricity Corporation's 13 363 6 per cent. cumulative preference shares of £5 each, fully paid, Nos. 6,638 to 20.000; and Johnson-Lundell Electric Traction Company Limited, 37 398 shares of £5 each, £3 paid, Nos 20,008 to 52,581; 52.654 to 53.119; 53 353 to 53,766; 53,814 to 53.850; 55,715 to 58,923, and 59,110 to 59,807. The committee have also ordered the undermentioned securities to be quoted in the official list: British Insulated Wire Company, Limited further issue of 30,000 ordinary shares of £5 each, fully paid, Nos. 40 001 to 70.000 and 30 000 6 per cent cumulative preference shares of £5 each, fully paid Nos. 40,001 to 70 000; and Edmundson's Electricity Corporation, Limited, 13,363 6 per cent. cumulative preference shares of £5 each, fully paid, Nos. 6.638 to 20.000, and a further issue of £45,000 4 per cent. first mortgage debenture stock. Application has been made to the committee to appoint a special settling day in, and to grant to, Cape Electric Tramways, Limited, further issue of 40 000 shares of £1 each. Application has also been made to allow the following securities to be quoted in the official list: Buenos Ayres and Belgrano Electric Tramways Company, Limited, £120,000 5 per cent. second debenture stock, in lieu of provisional certificates now quoted, and 100,000 ordinary shares of £5 each (special application); Kensington and Knightsbridge Electric Lighting Company, Limited, and the Notting Hill Electric Lighting Company, Limited, further issue of £26,991 4 per cent. debenture stock.

Digitized by Google

Fulham.—The resident engineer's last report states that since the last meeting applications equivalent to 133 8-c.p. lamps had been received, making the total applications 162 in number, equivalent to 12,132 8-c.p. lamps.

Ludlow.—The electric lighting scheme prepared by Mr. Packer has been deposited at the town clerk's office for the inspection of members of the Council. The Electric Lighting Committee are prepared to move its adoption at a special meeting. The question has been adjourned until the 28th inst.

Nantwich.—Mr. G. R. Peers, electrical engineer to the Nantwich Urban District Council, having asked on behalf of that Council whether the Guardians would use the electric light in the workhouse in case the Council took the main cables up the Barony-road, the Guardians have decided not to accept the offer at present.

Macclesfield.—We learn that the Town Council have received an intimation from the Board of Trade that the application of the Electrical Power Distribution Company for an order enabling them to supply Macclesfield with electricity has been disallowed, and that the application of the Corporation is now being considered.

Bradford.—At Tuesday's meeting of the City Council the Electricity Committee notified the receipt of sanction from the Local Government Board to the borrowing of £140,000 for lighting and traction extensions. They recommended the letting of contracts for works extensions amounting to £21,937, which was approved.

South Yorkshire Electric Power Bill.—When this Bill came before the Standing Orders Committee of the House of Lords on Monday, it was decided that compliance with the Standing Orders should be dispensed with, on condition that the proposed exemption of the company from the provisions of Section 81 of the Electric Lighting (Clauses) Act, 1899, should be struck out.

Cardiff.—At a meeting of the Electric Lighting Committee on Tuesday the Electrical Engineer stated that he thought the time had now come for the committee to reduce the charges for electrical lighting, and intimated that it was his intention by the next meeting to draw up a new scale of charges for electric lighting and for the supply of electricity for motive purposes.

Driffield.—We have already referred to the negotiations between Dr. Brand and the National Telephone Company and the Postmaster-General with a view to the establishment of a telephone exchange in Driffield and the connection of that town with the trunk system at Hull. We learn that half the amount of the seven years' guarantee of £100 demanded by the latter has been raised.

Teddington.—The District Council have given general consent to the laying of the Post Office telephone distributing pipes under the footways and streets in the district on condition that the Postmaster-General makes good the footways and streets disturbed to the satisfaction of the Council's surveyor, and that the option of restoring the paths and roads at the cost of the Post Office Department be first given to the Council.

Personal.—We are informed that Mr. Wm. Boyd, A.M.I.M.E., A.M.I.E.E., has severed his connection with the Central London Railway Company. Mr. Boyd was on the engineering staff of the Electric Traction Company during the construction of the Central London Railway, and joined the railway company's staff when the line was opened to organise their electric lighting department, of which department since he had entire control.

Bristol.—The Town Council are about to appoint a committee to enquire as to the extent to which telephonic communication is used by the inhabitants of the city and the payments made therefor, and to consider and report to the Council upon the expediency of applying to the Postmaster-General, under the powers of the Telegraph Act, 1899, for a license to enable the Council to provide a system of telephonic communication.

Colwyn Bay.—We understand that Mr. A. R. Tudman has been appointed manager of the electric lighting undertaking of the Urban District Council. Draft specifications for the extension of the electric plant submitted by the engineer have been approved, and tenders will now be issued. The engineer has been requested to report on the cost of supplying an arrangement to stop the noise and vibration caused by the exhaust steam.

Abersychan.—At the last monthly meeting of the Urban District Council the Clerk intimated that the Council could not take any steps in the matter of the proposed provisional order for the lighting of the district with electricity until October next, and when the provisional order was obtained the Council would have the prior right of supplying the district over others, and to purchase the electricity from the South Wales Electric Power and Light Company, and to retail it to the inhabitants.

Bury (Lancs).—The estimates for the generation of electricity for purposes of lighting and traction have been approved, and application is to be made for borrowing powers for the sum of £21 500 for the purpose, repayable within a period of 30 years. The whole of this sum is not in addition to the £60,000, borrowing powers for which are already obtained, but simply an addition of £4,000 or £5,000 for extra plant required in connection with the traction scheme. Reference to a loan of £50,000 for the latter will be found in another column.

St Marylebone.—At last night's meeting the Legal and Parliamentary Committee recommended the Borough Council to communicate with the other metropolitan borough councils in favour of immediate action being taken for the promotion of legislation for the removal of the restrictions imposed upon metropolitan borough councils in relation to the promoting and opposing of Bills in Parliament, consequent upon the application of the Borough Funds Act, 1872, by Section 6 of the London Government Act, 1899, and that such legislation be retrospective.

Matlock.—It is reported that the Smedleys Hydro. Company have bought the old disused mills near the railway station, Matlock Bridge, for an electric power station. The mills have been empty for years, and have a right to water power from the River Derwent, which will be invaluable. The Urban District Council are petitioning in the House of Commons against the Notts and Derbyshire Electric Power Bill, to prevent the local authority losing control over electric lighting in this district.

Grimsby.—At Tuesday's meeting of the Public Lighting Committee a sub committee recommended that a number of incandescent lamps be kept in stock and sold to consumers at a small profit. Objection was taken to that course on the ground that they would be entering into competition with tradespeople who were ratepayers. The Chairman explained that the profit was not the idea of the committee. What they desired was to offer the people a good article, and thus in the end make a saving at the works. The recommendation was adopted.

Bingley.—At the last meeting of the District Council it was reported that the electrical engineer consulted by the Council—Mr. Quin, of Blackpool—had recommended that the Council should oppose the Yorkshire Electric Power Bill, and should make terms with the promoters of the South Yorkshire Bill. The latter had agreed to every requirement that the Council had made. The Clerk added that the opposition to the Yorkshire Electric Power Bill was intended to be carried forward if terms could not be arranged with the company. He believed there would be a combination formed of local authorities to oppose that Bill. The recommendation was adopted.

Beckenham.—In reply to a letter from a consumer offering to guarantee 20 per cent. on the outlay if the Council would lay a cable to his house in 14 days, the Council have decided to accept the offer provided the time condition was withdrawn. They have decided not to lay a cable in Mackenzie-road at present, unless requisitioned by the necessary number of inhabitants. The South Hill Park district is now receiving electric light from Beckenham. It is proposed that all the parishes within the Bromley union situated in the metropolitan district be asked to unite with the Council in approaching the General Post Office with a view of a telephone installation being commenced by them in the district at the earliest possible moment.

Dublin.—A long discussion took place at the special meeting of the Council last week in regard to the electric lighting loan. The following resolution was proposed: "That Standing Order No. 12 be suspended to enable the Council to forthwith take into consideration and to confirm the report of the Lighting Committee (No. 36), recommending the acceptance by the Municipal Council of the tender of Messrs. J. and W. Stewart of Belfast, for building a chimney shaft at the Pigeon House Ford, also giving particulars of the contracts already arranged and of the works in connection with the electric lighting scheme for which tenders have not yet been invited." The necessary three-quarter majority not being forthcoming, the meeting was adjourned.

Incandescent Electric Lamp Co.—The new extensions to the "Robertson" lamp factory at Brook Green were opened on the 16th inst., when the Company gave a tea to 300 of their employés. The tea was followed by a concert, to which the employés had invited their friends, and a company of nearly 700 enjoyed an excellent concert, which, judging from its length and its last number, called "Awake, and Hail the Morn," appears to have been rather a protracted one, see that the sun did not rise on that day before a quarter past six. The concert was held in the large hall 130ft. long by 40ft. wide, which has been set apart by the directors of the Company for the purpose of a dining hall for the employés. In addition, this room is intended to be used for concerts, dances, etc., which are held periodically by the employés.

King's Lynn.—The Town Council have resolved that, on completion of the electric lighting extensions a bonus of 100 guineas be given to the electrical engineer in consideration of his services in the designing and construction of the extensions; also that his salary be increased by £50 per annum, as from March 31 next, with house, garden, rates and taxes free, and coal, light, and water found as heretofore. The Mayor has been asked to turn on the current when the extensions (which are nearly finished) are ready. The electrical engineer's last report showed that applications had been received for 68 additional lamps of 8 c.p. or equivalent, making a total of 7,945 lamps for private consumers. An additional recording ammeter is to be fixed at a cost of £18. The small gas-engine which drives the pump will be offered for sale, and the pump driven by an electric motor.

London County Council.—At Tuesday's meeting of the Council the following report of the Fire Brigade Committee was agreed to: "We have it in contemplation to recommend the Council to extend the electric light installation at the chief station, and in that connection it will be necessary to obtain additional plant. As some time will doubtless be occupied in the manufacture of the plant, we desire to obtain tenders for it from selected firms at once, so that everything may be in working order by next autumn. The cost of the plant will probably somewhat exceed £500 and we accordingly ask authority to open the tenders at our meeting on the 28th inst., with a view to our submitting a recommendation to the Council at its last meeting before the Easter recess. We recommend (*a*) that standing order No. 210 be suspended in order to admit of the following resolution being passed; (*b*) that the Fire Brigade Committee be authorised to open tenders for electric lighting plant for the chief station of the brigade."

Ashton.—According to the minutes of the Lighting Committee passed at the last Council meeting the engineer was instructed to draw up particulars and obtain quotations for the following

Digitized by Google

matters and things recommended by Mr. Hammond, and arising out of his inspection and report on the existing plant—viz.: (1) one weir-type feed pump; (2) alteration of steam-pipes; (3) duplicate feed to boilers; (4) scheme to deal with the coaling of the works; (5) alterations to the switch gear. The chairman and engineer were empowered to engage a draughtsman to prepare drawings of the proposed alterations and extensions. The town clerk was instructed to apply to the Board of Trade for permission to raise the declared voltage from 200 to 240. Mr. Appelbee was instructed to obtain a quotation from Messrs. Browett and Lindley for the work necessary to be done in order to deal with the water in the low-pressure cylinder of the engines. A quotation for the supply of an artificial load was accepted. An additional oil filter is to be purchased. The application of the Guardians for the supply of current to their offices was granted.

Hornsey.—At the last meeting of the Urban District Council the Electric Lighting Committee submitted the following report, which was agreed to: "The committee had before them a letter received from the Local Government Board enclosing their sanction to the borrowing by the Council of £73,500 for purposes of electric lighting and their formal approval of the use of the proposed site in Tottenham-lane, Hornsey, for a generating station. The committee also had before them and carefully considered and approved forms of tender and contract, with general conditions and specification, for the machinery and other works, prepared by Mr. R. Hammond, the engineer, and recommend that advertisements for tenders be issued in the *Electrical Engineer* and other journals. The tenders when received will be referred to Mr. Hammond for him to schedule and report thereon to the committee. The committee also had before them plans and an estimate prepared by the Council's engineer, in consultation with Mr. Hammond, for the erection of a chimney shaft and engine and boiler houses, which the committee approved. They recommend that advertisements be at once issued for tenders for erection of the chimney shaft, and also for the erection of the other buildings as soon as the specification is ready."

Private Bills.—In the House of Lords the following Bills have been read a second time: Barrow-in-Furness Corporation, Belfast Harbour, Bolton Corporation, Bournemouth Corporation, Bristol Corporation (Docks and Railways, etc.), Dover Corporation, Folkestone Corporation, Handsworth Urban District Council, Islington and Euston Railway, King's Norton and Northfield Urban District Tramways, Leeds Corporation (General Powers), Llanelly Harbour, Manchester and Liverpool Electric Express Railway, Manchester Corporation, Mersey Docks and Harbour Board, Piccadilly and City Railway, Ripon Corporation, Salford Corporation, Sheffield Corporation, Smethwick Corporation, Harrogate Corporation, Mersey Docks and Harbour Board (Canada Dock Works, etc.), Tyneside Tramways and Tramroads, Chester Corporation Tramways, Charing Cross, Euston, and Hampstead Railway (No. 1), Charing Cross, Euston, and Hampstead Railway (No. 2), Brompton and Piccadilly-circus Railway, South-Western and Isle of Wight Junction Railway, Birmingham (City) Tramways, Wigan Corporation Tramways, etc., Charing Cross, Hammersmith and District Electric Railway, King's-road Railway, and the South Lancashire Tramways Bills. In the House of Commons the following private Bills have been read a second time: Bingley Urban District Council, Blackburn Corporation, Bradford Corporation, Brighton Corporation, Bury Corporation, Bury Corporation Tramways Burton-upon-Trent Corporation, Caledonian Electric Power, Cardiff Corporation, Cleveland and Durham County Electric Power, Clyde Valley Electrical Power, Derby Corporation, Derbyshire and Nottinghamshire Electric Power, Devonport Corporation (Gas), Eccles Corporation, Humber Commercial Railway and Dock, Kingston-upon-Hull Corporation, London County Council (General Powers), Mansfield Corporation, Newry Port and Harbour Trust, Pembroke Urban District Council (County of Dublin), Rhyl Improvement, Shannon Water and Electric Power, Stalybridge, Hyde, Mossley, and Dukinfield Tramways and Electricity Board, Thames Piers and River Service, Wallasey Improvement, Wells Corporation Water, Yorkshire Electric Power, Dublin St James's Gate Brewery Tramways, Gateshead and District Tramways, Bexley Tramways, South Yorkshire Electric Power, Swansea Harbour, and Metropolitan Electric Supply Bills. Notice of opposition to private Bills deposited for consideration this session has been given in the House of Commons against the Metropolitan District Railway and the Caledonian and the Clyde Valley Electrical Power Bills. A number of other Power, Gas, and Water Bills already mentioned are being opposed. Notices of a similar kind have been given in the House of Lords against the Piccadilly and City Railway, Manchester and Liverpool Express, Central London Railway, Charing Cross, Hammersmith, and District Electric Railway, City and Brixton Railway, City and North-East Suburban Electric Railway, Islington and Euston Railway, King's-road Railway, and the North-East London Railway Bills.

LEGAL INTELLIGENCE.

GUTTA PERCHA CORPORATION, LIMITED.

The public enquiry into the promotion and failure of this corporation was resumed this week at Bankruptcy Buildings, Carey-street, before Mr. Registrar Hood.

Mr. George Shenton, one of the promoters of the Gutta Percha Corporation, said the patents which were taken over by the corporation were the Serullus and Honrant patents, the owners of them at that time being the Isonandra Syndicate of Paris. He went to Paris with Prof. Ramsay in order to enquire into the value of the patents. The syndicate had already manufactured samples, and possessed the necessary plant and machinery for carrying out the Serullas process. They also had a large stock of leaves. The plant and machinery were eventually sent to Borneo, by instructions of the Isonandra Syndicate. The first contract which he entered into with regard to the promotion was with Omnium, Limited. A number of other persons were interested in the promotion. The Globe Venture Syndicate afterwards took up the promotion, and agreed to "issue the company," to provide directors, and to find money for promotion expenses. The syndicate carried the matter through. By an agreement of Aug. 14, 1897, Mr. Joseph Bruer, as agent of the Isonandra Syndicate, sold the patents to Mr. Ernest Stanier, and by agreement of the following day Stanier sold them to Mr. Harry Parson Smith, as trustee for the proposed corporation. Under the agreement of Aug. 14, 1897, the purchase price was £63,500. The witness thought he had something to do with the fixing of that price. The price payable by the corporation to Stanier was £150,000. Stanier was the nominee of the witness and of others—for instance, the Globe Venture Syndicate, who were his co-promoters. The witness was to receive through Stanier a portion of the difference between these prices. Stanier was under an obligation to divide the profit between a number of interested parties, including Omnium, Limited, and Mr. Hubert Waldron, the solicitor in the matter. The witness could not render an account showing the manner in which the profit was distributed. He thought that the accounts of the Globe Venture would show the figures. He could not say the amount of cash which he received, but it exceeded £1,000. He received shares for between £10,000 and £15,000. No cash was, he thought, received by him in respect of the shares. He passed on the shares to other persons. Baron Olliveira, who had introduced witness, was interested in the promotion, and received a commission from the witness. By the agreement of Aug. 15, 1897, the vendor was to provide underwriting by responsible persons for £30,000. The witness considered that he was under an obligation in respect of this underwriting. He obtained some of the underwriting letters, but not all. The Globe Venture Syndicate obtained some of them One Crick, a junior clerk, underwrote the balance of the £30 000 which was not underwritten by others. The public subscriptions had been small, and the underwriters were called upon to the extent of 68 per cent. According to the prospectus the working capital was to be provided by £50,000 of preference shares, reserved for that purpose. He thought this provision for working capital to be sufficient. Prof. Ramsay said he had made improvements on the patents, and the witness suggested that they should be sold to the corporation. The price was fixed at £1,000 in cash and £10,000 in shares. The improved process was taken over by the company, and the witness received half the cash and shares.

Mr. Brougham said that Prof. Ramsay had stated that he was willing to give the patents to the company, and witness suggested that he should sell them, but the witness did not agree to this statement.

Mr. James Aratoon Malcolm, upon examination, stated that he was manager of the Globe Venture Syndicate, Limited, and of the Corporation. He and Mr. Waldron were appointed by the first directors of the Corporation to report on the underwriting letters. He reported that the underwriting for £30,000 was good. He had no reason to doubt the accuracy of the Official Receiver's statement that only £4,133 was received in respect of the underwriting.

The examination of several other witnesses closed the enquiry.

UNAUTHORISED CONNECTIONS.

At the Stratford Police Court on Saturday last, Kenneth Ling, a hosier, of 326, High-road, Leyton, was summoned by the Leyton District Council for laying or causing to be laid an electric line connecting with the electric light of the Council without having the consent of the Council; and he was further summoned for using the current generated by the Council by means of the line.

Mr. Ralph Vincent, who prosecuted for the Council, said that the proceedings were taken under the Electric Lighting Act of 1882, whereby the provisions of the Gasworks Clauses Act of 1847 were incorporated. Section 180 provided for a penalty of £5. The defendant had apologised to the Council, who had not, under the circumstances, charged him with the theft of the electric current.

Defendant pleaded guilty, and said he had explained the matter to the Council. His light broke down some time previous to the dates on the summons, and when he made a connection with the Council's line "he found he got a light, but he did not see how he obtained it." The result was that he got the current without it going through the meter.

Mr. Barnett Tabrum: In other words, you were helping yourself to the Council's electricity without paying for it?

Defendant: I did not mean to do that.

Mr. Tabrum said it was a curious defence, and imposed a fine of £5 and 7s. costs.

The money was paid.—*Daily News.*

DUNDEE ELECTRICAL ENGINEER'S FAILURE.

Sheriff Campbell Smith in Dundee Sheriff Court last week examined in bankruptcy James Matthew Hiley, who was a partner of the firm of Hiley and Orchar, electrical engineers, Dundee, against whom a petition for sequestration was submitted. On

Digitized by Google

examination Hiley stated that Orchar and he began business two years ago, the former supplying the machinery. In February of this year Orchar left for Hong Kong. The machinery had been sold at £76. 10s., but he did not know who got the money. The state of affairs of Hiley and Orchar, which was submitted, showed assets to be £174. 16s. 5d.; liabilities £378. 3s. 11d. Hiley's assets amounted to nil, while Orchar's were set down at £121. 5s. Their respective liabilities amounted to £5 each.

PROVISIONAL PATENTS, 1901.

MARCH 11.

5087. **Electric alarm attachment to nickel alarm clocks.** David Mundell, 490, Crown-street, Glasgow.

5088. **"Simplex" trolley head for electric tramcars.** James Delaney Russell, 64, Woodside street Edgehill, Liverpool.

5089. **Improvements in multiple-conductor cable terminal or analogous fittings.** George Hinde Nisbett 15, Water-street, Liverpool. (Complete specification.)

5121. **Improvements in insulating strips or cores for rheostats, electric heaters, and similar devices.** Philip Middleton Justice, 55, Chancery-lane, London. (The Erie Exploration Company, United States.) (Complete specification.)

5124. **Improvements in conduits for electric cables and the like.** Carl Axel Wilhelm Hultman, 6, Lord street, Liverpool. (Complete specification.)

5153. **Improved means for increasing the efficiency of electric incandescent lamps.** James William Thomas Cadett, 43, Southampton-buildings, Chancery lane, London.

5164. **An improvement in brakes for induction coils.** Jules Carpentier, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London.

5165. **An improvement in switches for varying electrical resistance.** Siemens Bros. and Co., Limited, and Maurice Hird, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London.

MARCH 12.

5171. **Improvements in non-inductive resistances.** William Du Bois Duddell and Thomas Mather, 47, Hans place, London.

5172. **Electric thermal device for working switches, registering apparatus, and the like.** George Charlton and Walter Edward Barton, 24, Cavendish-road, Leicester.

5175. **Self-lubricating pulley for electric car trolley head.** Richard Myers Tyrer, 150, Boundary-road, St. Helens.

5220. **Improvements in electric bipolar dilator.** Charles Leonard Mosher, 111, Hatton-garden, London. (Date applied for under Patents, etc., Act, 1883, Sec. 103, Aug. 25, 1900, being date of application in United States.) (Complete specification.)

5227. **Improvements in or relating to the arrangement of electrical cables or groups of conductors.** Carl Axel Wilhelm Hultman, 6, Lord-street, Liverpool. (Complete specification.)

5247. **Improved switch for controlling electric motors.** Arthur George Bloxham, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Helios Electricitäts Actien-Gesellschaft, Germany. (Complete specification.)

5260. **New or improved apparatus for automatically registering the time during which an individual telephone instrument has been in actual use.** August Carl Krause, 16, Oakden-street, London.

5262. **Improvements in receivers for electric demand indicators.** Arthur Wright and the Reason Manufacturing Company, Limited, Norfolk House, Norfolk-street, Strand, London.

5265. **Improvements in and relating to the recovery of precious metals by electrolysis.** John Frederick Webb, Joseph Edward Lilley, and John Chapman, 1, Queen Victoria-street, London.

MARCH 13.

5292. **Improved system of guard wire protection for electric trolley or other high-pressure uninsulated wires.** Edward Woodrowe Cowan, Alfred Still, and Thomas Lodwick Miller, Springfield-lane, Salford, Manchester.

5305. **Improvements in micro-telephones.** Emil Volkers, Görlitz, Germany. (Complete specification.)

5306. **An improved means of picking up positive electric pressure from a closed tubular rail or subway without a longitudinal slot or a surface contact by a wheel suspended over it, and returning the negative current to the tube.** Robert Cooke Sayer, 11, Clyde-road, Redland, Bristol. (Complete specification.)

5343. **A method of and apparatus for actuating devices on public electric supply or distribution systems.** Arthur Wright and the Reason Manufacturing Company, Limited, Norfolk House, Norfolk-street, Strand, London.

MARCH 14.

5391. **An improved switch for electrical lampholders and the like.** Joseph Herbert Bosworth and George Major, 181, Osler-street, Birmingham.

5402. **Improvements relating to electric pendant lamps.** Robert Hall Best, 18, Southampton-buildings, Chancery-lane, London.

5411. **Improvements in electric measuring apparatus.** Rudolf Ziegenberg, 78, Fleet-street, London. (Complete specification.)

5413. **Generator for the intensification of gravitational or electric stress.** Gordan Earl-Adams, 10, Canterbury-road, Brixton, London.

5421. **Improvements relating to electrical "reformers."** Albert Nodon, 45, Southampton-buildings, Chancery-lane, London. (Date applied for under Patents, etc., Act, 1883, Sec. 103, Aug. 17, 1900, being date of application in France.) (Complete specification.)

5427. **Improvements in the manufacture of electric cables and apparatus therefor.** Horace Walter Dover, 53, Chancery-lane, London.

5449. **Improvement in underground conduits and accessories therefor for use with electrically-propelled tramcars and like vehicles.** George Wilkinson, 165, Queen Victoria-street, London.

MARCH 15.

5452. **Electrically-heated radiators.** William Herbert Milnes, 333, Oxford-street, London.

5460. **Improvements in and relating to prepayment meters for the supply of electricity.** James Finlayson and William Scott, 96, Buchanan-street, Glasgow.

5464. **Improvements in or connected with overhead conductors for electrical tramways and the like.** Herbert Hampton Hall and George Smith, 57, Barton-arcade, Manchester.

5477. **New or improved means for diverting or cutting off electric currents in overhead electric trolley or like wires or cables and guard wires, and disconnecting broken cables or line wires.** John Edwards Hill, Commercial-street, Halifax.

5487. **Improvements in electric heating and cooking apparatus.** Friedrich Wilhelm Schindler, 15, Took's-court, Cursitor-street, Chancery-lane, London.

5488. **Improvements in electric bell pushes.** John S. Ross, 95, Bath-street, Glasgow.

5489. **Improvements in or relating to electric tramways.** Frank George Sealy, 111, Hatton-garden, London.

5496. **Improvements in electric meters.** Emile Batault, 21, Ely-place, Holborn-circus, London. (Date applied for under Patents, etc., Act, 1883, Sec. 103, Aug. 17, 1900, being date of application in France.)

5510. **Improvements in commutator brushes and brush-holders for electric meters or dynamo-electric machines.** Robert Lundell, 45, Southampton-buildings, Chancery-lane, London. (Complete specification.)

5523. **Improvements in wireless telegraphy.** John Robert Milnes, 22, Southampton-buildings, Chancery-lane, London.

MARCH 16.

5542. **Improvements in and relating to trolley-wire guards or "protectors" of overhead-driven electric tramways.** James Townsley Pearson, St. James's Hall, Burnley.

5547. **Improvements in electric railways and tramways on the sectional conductor system.** John Milnes, 15, Water street, Liverpool.

5560. **Improvements in electrical switches.** Charles Mark Dorman and Reginald Arthur Smith, Ordsal Electrical Works, Salford, Manchester. (Complete specification.)

5562. **Improvements in and relating to devices for cutting out broken or short-circuited sections of trolley wires used in connection with electric traction systems.** John Wylie Donaldson, 70, Market-street, Manchester.

5576. **Improvements in electric arc lamps and electrodes therefor.** Charles Andrew Lee, 56, Paulton's-square, Chelsea, London.

5589. **Improvements in electric telegraphy.** Alexander Muirhead, 323 High Holborn, London.

5592. **An improved method of manufacturing filaments for incandescing electric lamps.** William Lawrence Voelker, Clun House, Surrey-street, London.

5596. **Improvements in the electrolysis of chlorides of metals of the alkalies and alkaline earths for the purpose of obtaining chlorine, and apparatus therefor.** George Jones Atkins, 115, Cannon-street, London. (Complete specification.)

5598. **Improvements relating to portable electric lamps.** Moritz Kaeser, 45, Southampton-buildings, Chancery-lane, London.

COMPLETE SPECIFICATIONS ACCEPTED.

To be published on April 6.

1900.

4576. **Overhead travelling electric cranes.** Vaughan and Foster.

4685. **Electricity meters.** Wright and Reason Manufacturing Company, Limited.

NOTES.

Manchester Telegraphs.—We are pleased to note that the Postmaster-General has appointed Mr. W. E. Halton to be chief superintendent of telegraphs at Manchester.

A New Electrical Paper.—To those more interested in the electrical profession from a financial point of view, *Electrical Investments* will be found of considerable value. The first issue of this new publication has just made its bow to the public under a title which leaves no doubt as to its object. In short, *Electrical Investments* is practically devoted to the financial side of electrical undertakings, and to the investor the large share list of companies which is included cannot but be a very desirable feature. The new journal is brought out under the auspices of the "Manual of Electrical Undertakings," and will be published twice a month.

Rockhampton Gas Company.—We have received a copy of the report and accounts for the half-year ended Dec. 31, 1900, of the Rockhampton Gas and Coke Company, Limited, of Queensland, who also supply electricity for lighting purposes. The operations of the company in this direction show a slight improvement upon the corresponding period of last year. The balance carried to net revenue account stands at £217. 2s. 11d., while the profit and loss account shows a net profit for the period under review of £1,587. 13s. 7d. This enabled the directors to recommend a dividend at the rate of 7 per cent. per annum upon the ordinary shares and 9 per cent. per annum upon the preference shares.

Theatre Dimmers.—At the end of last month Mr. C. Wirt read a paper on theatre dimmers before the Chicago Electrical Association. We are surprised to find that he advocated as the best form of fireproof rheostat one using galvanised steel wire coils supported on porcelain insulators. The wire coils in this rheostat were brazed to the copper connectors. We also gather that the galvanised steel wire coils were surrounded by ground glass sand. In connection with this dimmer a large number of contacts are required in the regulator in order to get a gradual effect, as the author states that even with 100 contacts it is possible to see slight fluctuations in the grading of the light. It is for this reason that in England the highest authorities on theatre lighting advocate the use of liquid resistance for regulating the lighting effects. With this type of resistance an absolute gradual alteration in the intensity of the light is obtained, which is utterly impossible with the wire resistance such as is referred to above.

Standardising Switchboard Instruments.—A suggestion is thrown out in a short article by Mr. T. W. Freet, jun., in the *Electrical World*, on the provision of switchboard connections by which any of the ammeters or wattmeters on the switchboard can be easily calibrated. With the introduction of the moving-coil type of instrument now so largely used, it is becoming almost the universal practice to measure the current in any circuit by the fall in voltage across a low-resistance strip inserted in that circuit. The author suggests that provision should be made for the insertion of the low-resistance shunt for a standard instrument in the various circuits and the switchboard. It is possible to do this by arranging the shunt to come in the switch contacts, but a more easy way of obtaining uniformity would be to have an additional pair of contacts which could be bridged by the shunt. If this were done, there would no longer be any need to remove the instruments on the switchboard for calibration, as they could actually be tested from time to time against a standard instrument. It seems to us that the correct place for the connections to be made would be near the connections of the shunt for the ordinary instrument, so that the temperature conditions would be the same.

American Electrolysis Law.—Having regard to the decision of the House of Lords Committee on the question of electrolysis in the case of the Sheffield Corporation Bill, it is interesting to note the state of the law relating to this subject in America. In the State of Indiana, for instance, a short time ago a Bill was introduced in the Legislature which aimed at the prevention of electrolysis. Some of the more important terms of this Bill are given in the *Electrical Review* of New York. In the first place, every street railway company which uses the overhead trolley system or any other system employing an uninsulated or earthed return for the current must instal the double trolley system or its equivalent according to the approval of the Board of Public Works or on approval of the councils in cities where they do not have such boards. If within two months of the date upon which the Bill goes into effect any company has failed to submit plans, or fails to carry out the plans six months after their approval, it shall be liable to a fine of £5 per day. Upon failing to pay this penalty, the company shall forfeit its charter. The earthing of any wires conveying an electrical current for electrical lighting, power, and heat are also proposed in this Bill.

Aberdeen Electrical Subway.—The members of the Aberdeen Association of Civil Engineers recently paid a visit of inspection to the electrical subway, Crown-street, in that city. This subway is constructed to carry all feeder cables with their pilot leads for supplying energy to the tramways and for the distribution mains in the west, north, and central districts of the city. We understand that arrangements are being made for carrying along the side of the subway 56 feeder cables, capable of supplying upwards of 10,000 h.p. These cables will be of the low insulation class, and are to be supported on porcelain insulators resting on iron pins screwed into cast-iron wall plates built into the brick lining of the subway every 6ft. At present two rows of cables on each side of the subway are being allowed for, but provision is made for four additional rows when found necessary. The subway is to be electrically lighted by lamps placed in the roof every 20ft., and midway between these lamps a socket will be placed for connecting a portable hand lamp. Efficient ventilation will be provided by means of an electrically-driven fan at the Union-street termination of the subway. The total length of the present section of subway is about 700 lineal yards, and the cost £8,500.

Electric Tramways in Siam.—The Belgian Minister at Siam has communicated to the *Bulletin Commercial* an article in which he states that the Bangkok Tramways Company and the Siam Electricity Company, Limited, intend to amalgamate. It is interesting to note that such amalgamation cannot take place unless the companies place themselves under the jurisdiction of the Siamese Government, as no territorial concessions are made in Siam to any companies unless they have expressly agreed to place themselves under the jurisdiction of the country. Moreover, the Government are now preparing a law, which will shortly come into force, relating to limited liability companies proposed to be formed by strangers in that country. The article states that if this amalgamation take place, a new tramway line will have to be built which will cross the new quarter of the town and the streets near the Royal city, and will run into the suburb of Sam-Sen, where the King is just now building a summer residence. It appears that the old line will have to be completely

Digitized by Google

remodelled, as the existing rails have been down since 1897, when animal traction was introduced. It is estimated that the new rails alone will cost about £9,000 to £10,000. This is another instance showing the useful work which is being done by the Belgium consular and ambassadorial officials abroad.

Employment in Spain.—The latest report issued by the Foreign Office states that the increase in the use of electric lighting and tramways has created many openings in the electrical businesses in Spain for young English engineers. They should not, however, think of settling in Madrid, which offers few openings for foreigners. It would be preferable to search for employment in the electrical undertakings in the country towns, where they could learn the language quickly, and at the same time study the customs and requirements of the country.

Glasgow Exhibition.—An interesting feature of the Glasgow Exhibition, to be opened in May by the Duke of Fife, as representing King Edward, will be a complete reproduction of a telephone exchange in full working order. The National Telephone Company have the matter in hand, and they intend to introduce to the public notice on this occasion many novelties, which in due course are to be adopted in the company's exchanges throughout the United Kingdom. One of the improvements in use which will be shown is the call lamp, which dispenses with what is now looked upon as the old-fashioned drop indicator.

Progress in Canada.—Some recent statistics of the Dominion Government show the marked development that has taken place in electrical matters in Canada during the past decade, especially for lighting purposes. There were 80 establishments selling electric light in the Dominion in 1891, whereas in 1897 there were 187, which increased in 1900 to 297. Again, the electric lamps supplied by the establishments selling electricity for light numbered 443,897 in 1897, and 807,772 in 1900. Ontario, perhaps, has made the most rapid strides in the employment of electricity for lighting purposes, having more than doubled the number of lamps used in three years, the figures being 201,955 in 1897, against 418,573 in 1900. Almost as good progress has been made in Quebec province, where in the same time the number of electric lamps was increased from 185,892 to 235,322. In 1900 British Columbia had 13 electric companies, with an equipment of 52,653 lamps. There were but two establishments supplying electric light in 1897.

Electric Light and Tramways in Trinidad.—We understand that the Legislative Council of Trinidad have just granted a concession to a Canadian syndicate to light the city of Port-of-Spain by electricity, and to run electric cars on a more extended scale than the present mule lines. Negotiations between the representative of the syndicate and the Government of the colony had been proceeding for some time previous to the concession being granted, one condition of which is that one-fifth of the shares in the new enterprise will be placed at the disposal of local investors. The estimated cost of the scheme is put at about £200,000, and the syndicate has arranged to take over the existing electric works and tramcar system. Last year the syndicate also proposed to take over the Belmont Tramway Company's system, but the offer was not agreed to. The company, however, has just lately again been approached by the syndicate, and we understand that negotiations are proceeding which, it is anticipated, will probably end in the syndicate's offer being accepted.

Standardisation Bureau.—A Bill approving of the establishment of a national standardisation bureau has been passed by the United States Government. The functions of the bureau will consist, among other duties, in the custody of the standards; the comparison of the standards used in scientific investigations, engineering, manufacturing, commerce, and educational institutions, with the standards adopted or recognised by the Government; the construction, when necessary, of standards, their multiples and sub-divisions; the testing and calibration of standard measuring apparatus; the solution of problems which arise in connection with standards; the determination of physical constants and the properties of materials when such data are of great importance to scientific or manufacturing interests, and are not to be obtained of sufficient accuracy elsewhere. Our contemporary, the *Electrical World* of New York, expresses a hope that one of the first objects to be provided for will be the testing and supply of secondary incandescent lamp standards upon application of lamp manufacturers and central stations.

A New Insulation.—According to an American contemporary, a patent was recently granted on a method of insulating fine wire of the kind used in electrical measuring instruments and the like with a structureless coating of cellulose. The wire is first passed through a solution of cellulose, made by dissolving cotton-wool in an ammoniacal solution of cupric oxide; the latter reagent is prepared by first precipitating with caustic soda a solution of sulphate of copper to which salammoniac has been added, preserving the precipitate under water, and when the reagent is new, adding the hydrated cupric oxide to ammonia so long as it dissolves. The solution produces a deep-blue mucilaginous liquid. After the wire has been passed through the solution it is allowed to dry, and is then passed through diluted hydrochloric acid in the proportion of one part of acid by weight to five parts of water, and is afterwards freely washed in pure water and dried. The dilute acid dissolves out the cupric ammonia, and leaves the cellulose upon the wire in the form of a horny, brownish grey, structureless coating. For larger wires, or thicker films of cellulose, the coating may be impregnated with linseed oil, or some other similar substance, to increase its toughness and flexibility.

Central London Railway Management.—In a letter to the *Financial Times* Mr. George Goring complains of the present management of this company's business, and states his intention of calling a private meeting "for the purpose of discussing the unsatisfactory position of the company in relation to the shareholders, with the object of proposing some alteration in the organisation and management." It has been suggested that a first-class carriage should be placed at each end of the trains with a slot turnstile, charging an extra penny for admission. It is also proposed that at the two extreme stations threepence should be charged. These slight variations, Mr. Goring points out, would not cause an alteration in the general administration, but would raise the revenue to a sum adequate to pay a fair remuneration to the shareholders. "The present system," he continues, "is discouraging to the progress of similar ventures, as the public see no advantage in investing where they receive such small interest for their money, while industrials, under the management of practical and sound men of business, pay a liberal interest. There is a proposal to raise a large loan for the purpose of improvements, and it will take about £18,000 to pay the yearly interest on this further issue of shares, thereby depleting the already miserable pittance of interest by one-half, and many shareholders are of opinion that some decided steps should be taken to increase the revenue before this great expenditure is carried out."

The Osmium Lamp.—A paper was read at the annual meeting of the Deutsche Gasglühlicht Gesellschaft on the

Digitized by Google

new osmium lamp invented by Dr. Auer von Welsbach. The author (Mr. Schols) emphasised the fact that the efficiency of an artificial source of light is greater the higher the temperature of the light-emitting surfaces. This has led to the substitution of the platinum filament in an electric incandescent lamp by one of carbon, but the high temperature to which it is subjected causes this material to disintegrate, whereas osmium, in virtue of its very high melting point—the highest of all known metals—resists such action for a very long time. However, the employment of osmium in the form of a filament is of recent origin, which may be attributed to the difficulty hitherto experienced in working the metal mechanically. The principal advantage claimed for it as a lamp filament consists in that it enables a high candle-power to be obtained with a small consumption of current. Lamps requiring 1·5 watts per candle-power possess a life of from 700 to 1,200 hours and upwards. A lamp which had been burning 1,500 hours was found to be in splendid condition, and had lost only 12 per cent. of its original candle-power. The consumption of the lamp at the beginning was 1·45 watts per candle, and after burning 1,500 hours 1·7 watts. On account of its greater conductivity the osmium filament requires less voltage than the carbon filament, and lamps have been constructed requiring only from 20 to 50 volts. On most existing systems it would, therefore, be necessary to burn a number of the lamps in series, or to transform the voltage, which would, of course, tend to counterbalance any saving effected in the lamp itself. Hence, even apart from the rarity of the metal, its commercial application to any considerable extent in the form of a lamp filament is a question of considerable doubt.

Electrical Machinery on Gold Mines.—We have already referred in these columns to the proposal of the Mysore Gold Mining Company to drive the machinery on their mines by means of electricity. We are pleased to see that the scheme is progressing favourably, and within the next 18 months we may expect to hear that a considerable portion of the mine machinery at least is being propelled by electrical power. For effecting this object it is intended to obtain the necessary power from the Cauvery Falls, some 90 miles from the Colar goldfield, where there is available an immense resource of hitherto unapplied energy. As stated by the chairman at a recent meeting of the company, an agreement has been entered into with the Mysore Government by which the Mysore State undertakes to provide and instal, in addition to the plant necessary for generating, transmitting, and transforming the electrical power, all conductors, motors, electrically-driven air-compressors, and other apparatus and buildings necessary for distributing and utilising such power. The agreement is for 10 years from the date on which the power is first used on the field, and it is anticipated that satisfactory and economical results will ensue from the establishment of this method of operating machinery on the property. At the ordinary meeting of the Nundydroog Company the chairman also referred to the scheme of the Mysore Government for the supply of electrical power from the Cauvery Falls. He announced the decision of his Board to be that in the first instance this electrical power shall only be applied to what he called non-vital portions of the company's machinery. It was not their intention to discard steam power, which, although expensive, could always be relied upon. From the *résumé* given by the chairman of the agreement regarding the supply of power between the company and the Mysore Government, it appears that for the first year the Government will charge £29 per horse-power per annum; for the second, third, and fourth years it will be reduced to £18 per horse-power per annum; and for the fifth year such sum not exceeding £24 per horse-power per annum as the Government may determine. During the remainder of the 10 years only £10 per horse-power per annum will be charged.

High-Speed Electrical Monorail.—Sir Frederick Bramwell communicates some noteworthy remarks to the *Journal* of the Society of Arts on the subject of the proposed "monorail" between Liverpool and Manchester. Regretting that he was unable to take part in the discussion of Mr. F. B. Behr's paper before the society on the 13th inst., he refers more particularly to the question of brake power. Together with the late Mr. Cowper he was called upon by the Midland Railway Company to examine into two systems of vacuum brakes exactly 20 years ago. He devised a simple apparatus which enabled the speed of the train at any moment to be accurately known, and also after the brakes were applied showed the rate at which that speed diminished, and the time occupied in the stoppage. His recollection quite confirmed the statement that with an ordinary portion of the whole weight of the train being supplied with brake power, the speed of the train could be reduced at the rate of three miles per second—that is to say, a 30-mile-per-hour train could be brought to rest in 10 seconds, and without shock. But with respect to the brakes needed for the higher rate of 100 or 120 miles proposed to be obtained on the "monorail" system—a system in which he entirely believed, and one which he hoped a more intelligent committee than the one which dealt with the matter last year would pass into law in session 1901—it might be worth while to ask whether another system of braking, not dependent upon the insistent weight applied, might not well be considered. He referred to the "clip" brake used by the late Sir James Brunlees on the inclines of the São Paulo Railway. These brakes, as their name implied, gripped the sides of the rails after the manner of a pair of tongs. A single handle worked two such brakes, one on each rail. Sir Frederick Bramwell concludes by expressing the opinion that such brakes, when properly brought before the notice of a Parliamentary Committee, ought to dispel all fear as to the ability to stop high-speed trains.

Progress in Telephones.—While the local authority were debating the question of establishing a municipal telephone in Hull, the National Telephone Company had been building in Mytongate, in that city, an exchange which may justly be styled one of the most scientific and modern telephonic systems in Europe. The switchboard with which the branch has been equipped is said to have no equal, except its duplicate, recently installed at Bristol. At present the switchboard is equipped for 1,800 subscribers, but if necessary this number may be increased to 6,300. The board controls 2,434 separate instruments scattered about the district, and is linked with no fewer than 2,047 telephone lines. The main advantages which are secured by this up-to-date switchboard are automatic calling, automatic clearing, and common battery speaking. The last-mentioned improvement is an advantage of considerable value, for it renders unnecessary any battery on the subscriber's instrument. The automatic calling and clearing device, however, is that which most calls for special mention. By lifting the receiver from the book, the subscriber supplies the signal by causing a small electric lamp to glow opposite the operator in the switch-room, and it is by the flashing of these lamps that the operator knows when the subscribers have commenced and ended their conversation. The replacing of the receiver on the hook lights the "clearing lamp," and not until both lamps are lit does the operator switch the subscribers off. At each operator's table there

Digitized by Google

is an auxiliary lamp, so that if the calling lamp is faulty the auxiliary one can be lighted. Other departments of this new exchange are equally interesting, the test-room particularly, which contains the lightning arresters for protecting the delicate apparatus of the switchboard, and an ingenious arrangement for guarding the apparatus against the tramway trolley wires. Another interesting spot is the intermediate room, where upon a large iron frame the wires are arranged so that the work shall be fairly distributed among the operators at the switchboard. The power-room contains two dynamos, a combined gas-engine and dynamo, and a motor and dynamo. It is practically a double plant, the power from the dynamos being used by day and the power from the accumulators by night. At present the company have 6,009 miles of cables and 1,348 miles of overhead wires in Hull, and also seven branch exchanges working from Hull.

Arc Lighting.—The twenty-first article on elements of illumination by Dr. Louis Bell, in the *Electrical World*, gives an interesting *résumé* of a report on arc lamps by a committee of the National Electric Lighting Association. The investigations of the committee of this association we have referred to before, but Dr. Bell incorporates in his *résumé* some information of his own, which makes it more interesting. Dealing with the question of alternating arcs, he advises that a frequency of from 50 to 60 cycles per second gives the best result. At higher frequencies than 60 the arc is apt to become noisy, and at frequencies below 40 the light is unsteady. Dr. Bell adds that the light of the alternating arc is really of a pulsatory character, and that if a pencil is moved rapidly to and fro in the light of such an arc a number of images is shown—one for each pulsation, and this effect would be very distressing if one had to view moving objects like quick-running machinery by such light. A tale is told of a certain theatre in which alternating arcs were installed for some gorgeous spectacular effects, and of the extraordinary centipedal results when the ballet came on. On the question of the relative efficiency of the various kinds of arc lamps, the direct-current open arc stands first, requiring only about one watt per spherical candle-power. With a globe the watts per spherical candle rise to about 1·3. This figure for an alternating arc without a globe becomes 1·7. All the enclosed arc lamps give much poorer results than these. Commencing with the direct-current enclosed lamp without an outer globe, the figure becomes about 2·4 watts per candle, while as much as 3·3 watts per spherical candle-power are taken by a smaller lamp with an opal outer globe. The alternating-current enclosed lamps with a clear outer globe takes about three watts per spherical candle, and with an opal outer globe 3·6. Dr. Bell points out that when the horizontal candle-power is considered, all alternating-current enclosed arcs do better than is indicated by the above figures. He also adds that, when comparing arc lamps with incandescents, it must be remembered that when the incandescents are rated on the mean spherical candle-power, they will not do much better than from 4 to 4·5 watts per candle. Brief allusion is also made to experiments on the Continent with carbons impregnated with metallic salts. These have been got to give exceedingly good results as high as 0·5 watt per spherical candle-power. But the use of these impregnated carbons has not yet become commercial for some unexplained reason.

Cable-Laying.—The laying of underground cables is a subject of increasing importance, and Mr. Arthur Devey's paper, entitled "Notes on Some Systems of Laying Underground Cables," which was read before a meeting of the Glasgow Section of the Institution of Electrical Engineers recently, may be said to have come at a most opportune time. The author at the outset classed the usual systems of laying cables under three headings—first, laying cable direct in the ground, armoured or unarmoured; second, pipe or conduit systems; third, solid systems. Where the initial cost was a consideration, the first of these was much in favour. It was usual to cover the cables with timber to indicate their presence, and so prevent mischief from this cause. The best covering was probably an inverted three-sided wood trough. Laying direct in the ground had the advantage of being a very flexible system, and the work could be carried out whatever the weather might be. Its disadvantage, however, was that the outer layer of jute sooner or later rotted off, exposing the iron or steel armour, which in turn got eaten away; of course, the quickness or slowness of these actions depended on the nature of the soils in which the cable was laid. Turning to pipe or conduit systems, their advantages lay in the fact that cables could be drawn out in case of need and new ones drawn in without disturbing the surface of the streets; also, that spare ways could be laid for future extensions. Their disadvantages were, however, numerous. In the first place, they were not flexible, and unless the pipes or conduits were laid practically straight and level, it was exceedingly difficult to get the cables in, and still more difficult to get them out again when necessary. Another serious disadvantage lay in the fact that if a fault occurred on the cable, it was necessary to draw out the whole of the faulty length and to draw in a new length, which meant keeping a large stock of cable on hand to be able to meet any demand. Again, it was practically impossible to keep a pipe or conduit system dry, while a still greater one was the risk of explosions from gas leaking into the pipes or boxes. Whatever pipe or conduit system was adopted, it was absolutely essential that it must have a perfectly smooth interior, be free from all lumps or projections; the joints should be watertight, and so arranged that the jointing material could not get into the interior of the pipes or conduits. Its various units should be as long as possible, so as to minimise the number of joints, and these units should be capable of being easily cut into short lengths, so as to get round bends or obstacles. The system should always be laid with a fall from one manhole to the next, so that all water might drain away easily. With regard to the "solid" system, this seemed to be the chief favourite for the moment, although it was curious to note that the Americans considered it absolutely antiquated and out of date, they pinning their faith to the conduit systems. Its advantages were its flexibility, a great desideratum in large towns where pipes of all sorts were so numerous, combined with at least quite as good mechanical protection as iron pipes, whilst there was no danger to be feared from gas. The best system, in the author's opinion, would probably be armoured cable laid solid in wood troughs, with a minimum thickness of bitumen of 1in. all round, the troughs and covers to be of 1in. thickness also. Such a system would be expensive, but it should be a guarantee against damage of all kinds, whether mechanical or electrical, and therefore would prove cheapest in the long run.

Patent Law Reform.—After nearly 12 months' investigation and some 16 meetings, the committee appointed by the Board of Trade to enquire into the working of the Patent Acts in certain specified respects have issued their report, which contains some recommendations of considerable importance both to the general public and to inventors. The questions which were submitted to the committee, who had for their chairman Sir Edward Fry, and Lord Alverstone as one of their members,

Digitized by Google

were: (1) Whether any, and if so what, additional power should be given to the Patent Office to control, impose conditions on, or otherwise limit the issue of letters patent in respect of inventions which are obviously old, or which the information recorded shows to have been previously protected. (2) Whether any, and if so what, amendments are necessary to Section 22, dealing with compulsory licenses, of the Patents, etc., Act, 1883. (3) Whether the period of seven months' priority allowed by the Act of 1883 to applicants for letters patent under the International Convention may properly be extended, and if so, on what conditions. On the first question, the report points out, upwards of 42 per cent. of the specifications accepted in the first week of June from 1877 to 1899 were anticipated, either in whole or in part. The committee are of opinion that the grant of invalid patents is a serious evil, and that, in addition to the existing enquiries, an examination ought to be made in the Patent Office into the question whether any invention claimed in a deposited specification has been claimed or described in any, and what, specifications of letters patent granted in the United Kingdom dated less than 50 years previous to the date of the application. This enquiry should not, however, be extended to provisional specifications which have been published but not followed by a complete specification, and the committee think that, consequent upon the limitations of this enquiry, an enactment should be passed to the effect that the publication of an invention in specifications of letters patent granted in the United Kingdom dated 50 years or more previous to the date of the application, or in a provisional specification of any date of the kind before mentioned, should not of itself be deemed an anticipation of the invention. As to the second question, in regard to Section 22 of the Act of 1883, the committee recommend its repeal and the substitution for it of an enactment embodying, amongst others, the following proposals: That the right of applying be confined, as at present, to a person interested; that the jurisdiction be transferred to the High Court; that the jurisdiction shall apply to all letters patent, whether granted before or after the passing of the proposed enactment; and that the Court have power to make an order conferring a license on the applicant upon such terms as to the duration of the license, the amount of royalties, security for payment and otherwise as the Court, having regard to the nature of the invention and the circumstances of the case, shall deem just. Replying to the third question, the committee think the seven months' priority allowed may reasonably be extended to a year, subject to the conditions that foreigners who apply shall file a complete specification, that upon acceptance, or at the end of the 12 months, the specification shall be published by the Patent Office, and that the extension of time be met by a corresponding concession in favour of British inventors abroad. In a note to the report, the chairman regrets the omission of the enquiry whether an invention claimed is obviously old. He thinks that the enquiry, if made in conjunction with that into anticipation by previous specifications, would add very little to the trouble of the examiner, and he fears that the omission of this enquiry may let through some of the patents which it is expedient to check.

The Electrolysis Question.—The only opposition to the Sheffield Corporation's Bill before the House of Lords Committee, presided over by Lord Newton, was offered by the Sheffield United Gas Company to the proposal for electric tramway extensions. The question raised was as to making provision in excess of the present protection given to gas companies against the possible effect of the electrolytic action of electricity escaping from tramway mains. This is the proviso which the gas company desired to have inserted in the Bill: "Provided that, notwithstanding anything contained in the said Acts or this Act, if it be proved that any injury, or damage to any mains, pipes, or apparatus of the Sheffield United Gaslight Company shall have resulted from fusion or electrolytic action caused by any currents generated or used for the purpose of electric traction or any of the tramways for the time being belonging to the Corporation, nothing in the said Acts or this Act shall relieve the Corporation from any liability to make compensation for such injury or damage which would have existed but for the passing of the said Acts and this Act." The promoters of the Bill objected to this special clause being inserted, contending that the general regulations of the Board of Trade were sufficient to protect the petitioners, and that so long as the Corporation carried out the Board's regulations, they were entitled to the same protection as other local authorities who worked tramways by electric power. If these regulations were not sufficient, it was for the Board of Trade to amend them. The electrical engineer of the Sheffield Corporation tramways, Mr. A. L. Fell, gave evidence on behalf of the promoters to the effect that every proper precaution against electrolytic action had been taken in the construction of the tramways. For instance, the rails were laid in a solid bed of concrete and were plastered up with Portland cement and sand on each side, so that they were practically insulated from the general body of the earth. Again, every joint was bonded, and the tracks themselves were cross-bonded. The records showed that the amount of current passing back to the power station otherwise than by the rails was very small. In Mr. Fell's opinion the insertion of such a proviso as was proposed by the gas company would cause endless litigation. Mr. Horace F. Parshall also gave evidence. He had had American experience, and in the United States there were no regulations like those of the Board of Trade in this country. A tramway company was allowed to adopt any system of traction they wished, and if the company did damage they had to fight it out in the law courts. He had examined the Dublin Tramway Company's system particularly, and he found no deterioration in the rails through electrolysis, and there was no talk of electrolysis in any of the numerous installations with which he was connected. In his opinion the Board of Trade regulations afforded all the protection that was necessary to the owners of gas and water pipes. Mr. Robert Hammond agreed that, particularly in Sheffield, even though the pipes were situate in ashy and damp ground, the Board of Trade regulations furnished sufficient protection. If electric tramways were properly constructed, there was no risk whatever of electrolytic action. Among the witnesses called on behalf of the petitioners were Prof. J. Perry and Prof. W. E. Ayrton, both of whom agreed that there was serious danger of electrolytic action to pipes laid near electric tramway lines. The former stated that under Board of Trade rules 5 per cent. of leakage might take place, but a single ampere of current continuing for one week, to leave metal and enter soil of a certain kind, would remove a cubic inch of iron or two cubic inches of lead. Prof. Ayrton referred to the London County Council plans of electric traction, stating that the return conductor has to be as wholly insulated as the going conductor, which would afford an absolute safeguard to the pipes in the roads through which the tramways would be laid. He was inclined to think that the Board of Trade rules were drawn up under a misconception, for whatever was the difference of potentials, electrolysis would take place. The Committee finally decided to allow the Bill to proceed, subject to the addition of the clause proposed by the gas company.

THE DIESEL OIL-ENGINE.

On Monday last, we, in common with a large number of other engineers, had the privilege of inspecting at the works of Messrs. Scott and Hodgson the first Diesel engine which has been made in England. This firm, who have their works at Guide Bridge, near Manchester, have taken up the manufacture of the Diesel engine in this country, and their first production is remarkable for several improvements over types of the engine made under the inventors' direction abroad. As, however, this first engine had only been completed some 10 days when we saw it, there has been no time to conduct full tests of efficiency. The indicator cards, however, show that it is fulfilling in every way the conditions which should result in excellent economy.

Although the general principle of the oil-engine invented by Mr. Rudolph Diesel, of Munich, has been often published before, we propose to give a brief *résumé* of the same in describing the new engine which the owners of the English patents have constructed. From the first it has been recognised by all experts in engine design that the principles of the Diesel engine are sound, and the slow progress made by the engine commercially has been due to mechanical defects in the construction of the engine. Briefly, the cycle of events laid down by the inventor as requisite for a perfect heat-engine are as follows: The rapid compression of the working charge of air in the main cylinder to a point at which the temperature of the charge exceeds that at which the combustible used will be spontaneously ignited. This combustible, which in the present case is crude petroleum oil, is then injected in a fine spray into the heated compressed charge of air, and it burns without shock. In consequence of the above conditions, the combustion is absolutely complete. Another point is that the expansion takes place over a very large range, as the volume of the compressed charge of air is only some 5 per cent. of the total volume of the cylinder at the end of the working stroke. The temperature range of engine is much greater in consequence than that of any other known engine, and the Carnot efficiency of the Diesel engine thus is higher than that of any of its competitors. The exhaust temperature is extremely low for an oil-engine, as it is not too warm to hold one's hand on.

Coming, now, to the actual engines for realising the above conditions, the inventor has had his engines constructed on the Otto cycle, giving only one working stroke for every two revolutions. The engine we saw on Monday, and which we illustrate below, however, was so designed that a charge of oil is burned at every forward stroke of the piston. In this engine the working cylinder is 7⅞in. diameter, and the stroke is 10½in. Beyond the cylinder in which the work is done is a second cylinder, which acts as an air-pump to flush the burnt charge out into the exhaust. At the side will also be seen another small air-pump, which provides the supply of air at 600lb. pressure for injecting the air into the main cylinder. The cycle is then as follows: At the beginning of the backward stroke of the main piston the cylinder is full of air, which is compressed into the very small clearance at the back of the cylinder. The pressure rises to about 420lb., with a corresponding large rise of temperature, owing to the fact that the cylinder walls are unable to take up much heat in the short time during which the compression takes place. Air from a reservoir tube, at 600lb. pressure, is then used to inject a fine spray of oil into this heated charge of air. Complete combustion takes place, and the charge expands, as shown in the indicator diagram (Fig. 2). As the piston completes its forward stroke, the exhaust valve, which is situated at the back of the cylinder, opens, and from the diagram it is gathered that this takes place while there is still some 30lb. pressure in the cylinder. Fig. 3 is an enlarged diagram taken of the exhausting period. At the extreme end of the forward stroke the piston uncovers ports in connection with another air reservoir in the engine bed-plate, which contains air at about 4lb. above atmospheric pressure. This causes a flush of clean air to sweep out the cylinder into the exhaust before the exhaust port is closed and a second compression begins. The first duty of this pump is to keep the flushing air reservoir charged with air, but it also acts a pressure pump to supply air to the smaller air-pump. At the end of each forward stroke the pressure in the pump rises to about 40lb., and at this instant the small pump takes in a charge of this compressed air. The small pump has a diameter of only 3⅛in., and its diagram is shown in Fig. 4 The compressed air goes under ordinary conditions into one of the three vertical reservoir tubes seen in Fig. 1. The other two tubes are also charged by the same pump, and are kept charged ready for starting up

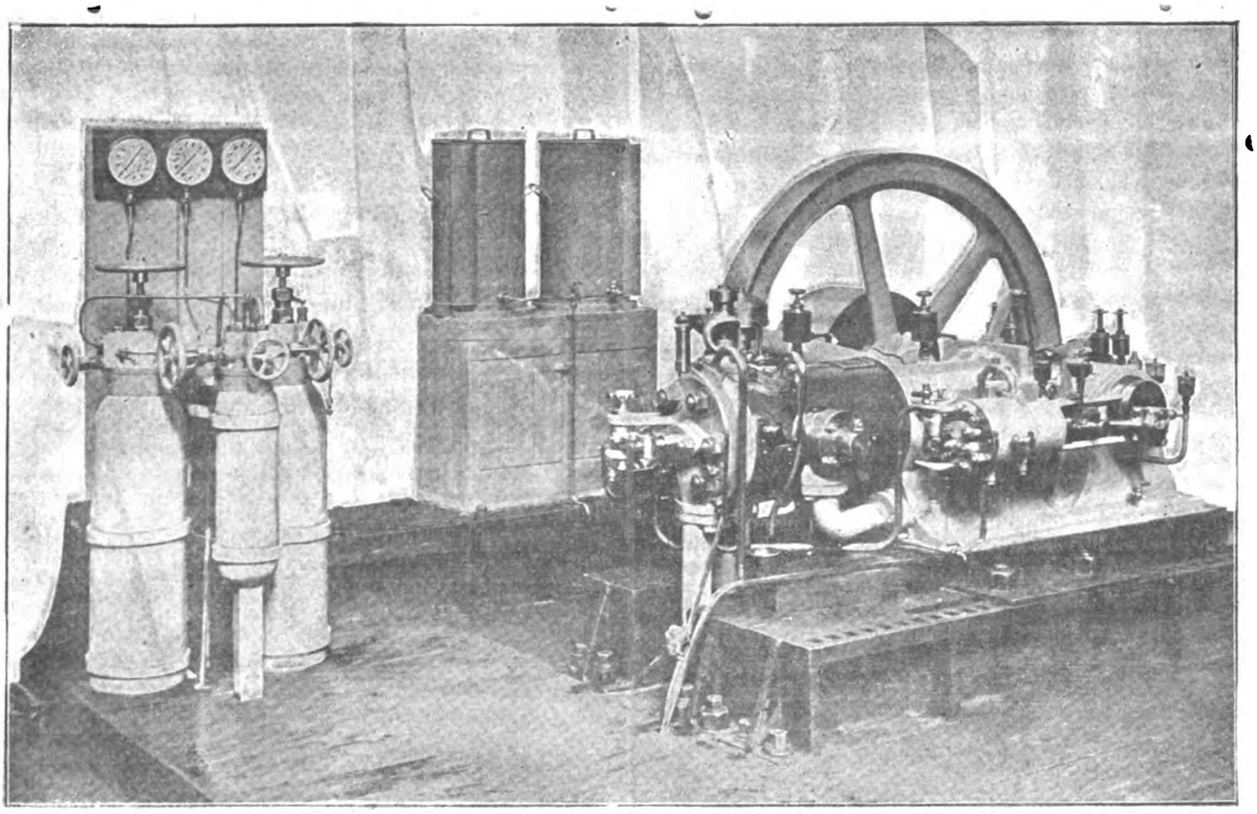

FIG. 1.—View of the Diesel Engine at the Works of Messrs. Scott and Hodgson.

Digitized by Google

the engine from rest. The governing of the engine is effected by varying the quantity of oil admitted. This is done by varying the time during which the valve in the oil supply pipe is opened.

The general arrangement of the engine at Guide Bridge is shown in Fig. 1. The small tube in the front of the two larger tubes is alone connected to the air-pump under ordinary conditions. Before the engine is stopped, however, the valves are open to the larger cylinders, so that the

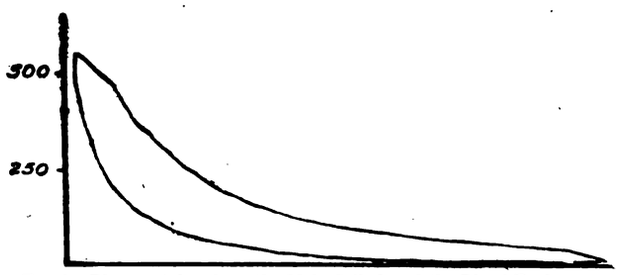

FIG. 2.—Diagram taken from the Main Cylinder of the Diesel Engine. The vertical scale shows the pressure in pounds.

pressure in them is raised rather more than 600lb. In starting the engine, it is moved round by hand until it is just past the dead centre, with the piston at the back end of the cylinder. A lever on the governor is then moved so that oil is admitted as required. Immediately the pressure is turned on from the air reservoirs the engine starts working like a compressed-air engine. For the first few strokes the compression on the back stroke is relieved. As the engine gets up considerable speed after

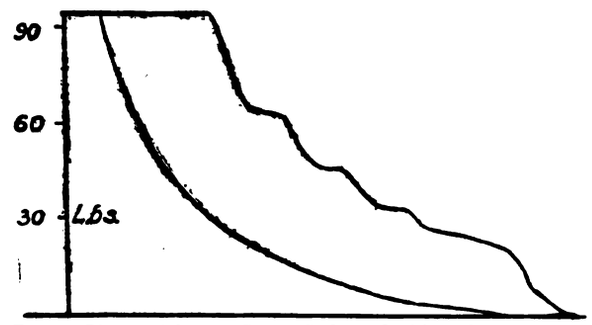

FIG. 3.—Diagram taken on Larger Scale, and with weaker spring of that period of the stroke at which the exhaust to atmosphere is taking place

a few revolutions, the compression of the air is allowed to take place on the back stroke, oil is then injected in the usual way, and the engine is ready to take up its load. The actual time taken in starting is only a fraction of that required to start an ordinary oil-engine, in which the heating up of the ignition tube and the vaporiser requires a considerable time. It will be seen, however, that the ease of starting entirely depends in the air pressure being maintained in the tubes which act as

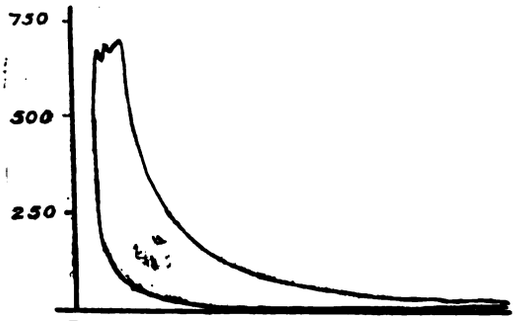

FIG. 4.—Diagram from the Air Pump Cylinder.

reservoirs. This is largely a question of the valves employed. The engineers at Guide Bridge informed us that they had surmounted the mechanical difficulties, and that the storage cylinders would hold up sufficient pressure to start the engine for six weeks.

Another point of interest in the engine is that it does not require a refined oil. The two tanks seen in Fig. 1 contain respectively a raw Tegernsee oil and a refined oil. While relative experiments as to the work obtained by these two oils had not been completed when we saw the engine, it had been proved that the low-grade oil gave no trouble whatever. The apparatus used for breaking up the oil into very small particles when introducing it into the heated charge of compressed air consists of holes in metal plates, through which the oil is forced by the compressed air from the reservoir. The holes in the one plate are not opposite those in the next, and the zigzag course results in a very fine pulverisation of the oil. These holes can be made as much as $\frac{1}{75}$in. in diameter, and, as might be expected from this, no clogging whatever takes place. Again, the facility for using a crude petroleum, is, from a monetary point of view, a greater advantage of the engine than even its increased efficiency, as compared with other types. It is also found that the quantity of the crude oil required is practically the same as that taken when the oil has been refined. As regards the combustion, we were able to tell from the exhaust that this was carried out completely, as there was no smell whatever of petroleum and no staining of a handkerchief held directly in the discharge—in fact, when this engine was first run the exhaust delivered directly into the workshop without causing any inconvenience whatever to the workmen. There was a slight white vapour in the exhaust, which was said to be due to the lubricating oil not being quite of the right composition. The engine ran wonderfully smoothly, and without that shock which is usually associated with gas and oil engines.

After the inspection of the engine the company were taken on to Manchester by the special train which had been used on the way from London, and in the course of the evening a dinner was given by the Diesel Engine Company, Limited, at the Albion Hotel. The menu of the dinner itself was a revelation of what Manchester caterers can do, and the arrangements of the speeches were a pleasing exception to usual rules. Mr. HENRY HODGSON, a partner of the firm of Messrs. Scott and Hodgson, was in the chair, and proposed the usual loyal toast, which was the only toast of the evening. After this had been honoured, Mr. Hodgson proceeded to give a brief *résumé* of the steps which the firm had taken in developing and improving the Diesel engine. The first engine working on the Diesel principle, and giving a working stroke for every revolution of the engine, had been made by them, and inspected by the company that day. It was also the first horizontal engine, but they were making the next ones of a vertical type for certain mechanical reasons. The heat efficiency obtained already exceeded 37 per cent., and it was quite possible that with an increase in dimensions they would reach as much as 40 per cent. It would be seen from the illustrated diagrams that oil was steadily burnt during the first 10 or 12 per cent. of the stroke, and that without explosion. In consequence of this the engine ran more like a steam-engine than a gas-engine. As commercial men, they were largely interested in the consideration of how far this oil-engine would be able to replace other prime movers. In consequence of its consuming only about half the oil required by the ordinary types of oil-engines, and also because it could work with a low-grade oil, it would easily replace its rivals in that direction. It had been estimated in Germany that with oil at 4½d. per gallon it was more economical than a steam-engine using coal at 16s. 6d. per ton. While coal was much cheaper in this country, the same applied to oil, and with crude petroleum at 1½d. per gallon the Diesel engine would be able to compete commercially with steam-engines for driving works. There were many other fields, such as marine work and automobiles, in which the engine should have a large field of service.

Prof. W. C. UNWIN, at the request of the chairman, then gave a brief *résumé* of the various opportunities he had had of inspecting engines of the Diesel type on the Continent. When the book written by Mr. Diesel was issued several years ago, he at once recognised that the author was working on the right lines, and he had been pleased to see at Augsburg from time to time the success which had been obtained. In the ordinary oil-engine they had to contend with what he might call the temper of the engine—for instance, the engine often refused to start. An overload would stop the engine exceedingly quickly, and often the

Digitized by Google

engines refused to work without apparent cause. The clogging of the various parts was another point of difficulty. When making an inspection, at the request of Mr. Oppenheimer, at Ausburg he was struck with the ease with which the Diesel engine was started, and with its capabilities of dealing with overload. The most remarkable feature from an economical point of view was that the efficiency was so good at light load. The consumption of oil per indicated horse-power showed a most remarkable state of things. From some experiments carried out by Prof. Schröter it was seen that with the engine he experimented with the consumption of oil per indicated horse-power hour at normal full load was 0·352lb. At three-quarter load this figure was reduced to 0·348lb. and at half load to 0·33lb. It must be remembered that in the majority of cases engines were not worked at their full load, and hence the economy with light loads was a most important factor in estimating the performance of the engine. The Diesel engine was certainly the most efficient engine at the present day, and he saw no reason why it should not be manufactured for large outputs.

An informal discussion followed, in which the question of the complication of the engine was referred to. It certainly has more working parts than an ordinary oil-engine, but the construction may be simplified in the future. It was pointed out by Mr. Hodgson that the novelty of the engine was rather apt to give an idea of complication, but that the engine had been worked by unskilled labour for a considerable number of years on the Continent.

The proceedings terminated with a vote of thanks to the directors of the Diesel Engine Company for their hospitality. We understand that this first engine is to be exhibited at Glasgow, and that several more engines are now nearing completion in the shop. As regards the financial status of the company, we learn that its nominal capital is £500,000. Of this £40,000 has been issued in preference shares, of which £30,000 has been paid up. Of the remaining shares, £320,000 worth of ordinary stock has been issued, we presume, as purchase money, which seems to us to be a heavy amount in comparison with the £40,000 provided for working capital.

WESTINGHOUSE "O.D." TRANSFORMERS.

The illustrations accompanying this article show some of the peculiarities of construction of a new Westinghouse transformer recently placed on the market. It is classified among the other well known and widely-adopted types of the same make under the name "O.D. transformer." The design of the transformer is based upon the results of over 15 years' experience in the manufacture of transformers, and it is claimed that all other transformers are excelled by it as far as all-round electrical efficiency and general mechanical design are concerned. The general principles of construction of the well-proved Westinghouse transformer have been retained in the "O.D." type, so that the introduction of the new type cannot be said to be of the nature of the many strange types which have appeared from time to time during the past few years, and which have achieved no success in actual practice. The transformer under notice can, therefore, hardly be termed a novelty; it is really a perfected form of a type which has during many years held the best of records.

The new transformer has been designed to secure the best all-round results. No one characteristic has been over-developed at the expense of any other: at the same time the most important features of transformer performance were ever kept in mind, and the outcome has been a transformer which embodies such points as highest efficiency under both all-day and full loads; the best of regulation with either arc or incandescent lamps or motors or other inductive loads; highest insulation resistance both against normal pressures and disruptive discharges; simplicity of construction; and permanence and reliability of the materials used in construction. The "O.D." transformer is of the oil-immersed type. The oil is not used, strictly speaking, as an indispensable part of the insulation of the transformer. Experience has shown that oil is not only most valuable on account of its insulating properties, but that it is one of the best cooling mediums, that it preserves and increases the life of the coil insulating materials, and that it adds to the power of the transformer for resisting lightning discharges. As a matter of fact, many of these transformers are in use without oil, especially in the case of smaller sizes, and they are designed to be reliable whether used as oil or dry transformers. However, it may be said that the makers prefer the use of oil wherever possible. In view of the fact that these transformers are designed for dry work, it should be mentioned that every transformer before being sent from the works is tested in the dry state. All sizes of transformer are submitted to the following tests, in every case

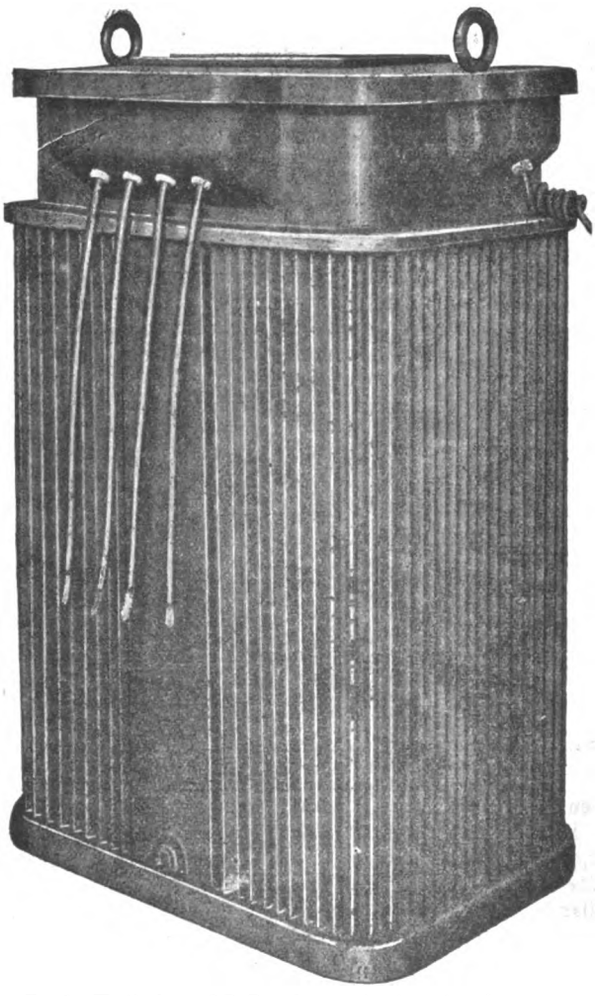

FIG. 1.—Westinghouse O.D. Transformer, showing external appearance of larger sizes.

the transformers being without oil: (*a*) a continuous run of several hours at overload under normal pressures; (*b*) a continuous run at three times the normal voltage at no load; (*c*) an insulation test of 8,000 volts between primary and secondary; (*d*) an insulation test of 6,000 volts between primary and iron core; (*e*) an insulation test of 4,000 volts between secondary and iron core. The iron losses and the transforming ratios of each transformer are also accurately measured.

The practice of winding each transformer for two primary and two secondary voltages was first introduced on the original Westinghouse transformers, and has proved to be so useful that other makers have very generally adopted it. The "O.D." transformer windings are arranged for two primary voltages and three secondary voltages. At the present time, when the voltages of lighting circuits are being raised and changed so frequently, and when alternate-current motors are coming to the fore, the advantages to be secured by this arrangement of several pressures will be at once perceived. The pressures adopted for the standard sizes are: In all sizes, primary pressures of 1,050 and 2,100 volts; in sizes up to 3 kw. capacity, secondary pressures of 52·5, 105, and 210 volts. Larger sized trans-

Digitized by Google

formers may have these secondary pressures, or three pressures twice as much respectively. Sizes ranging from ½ kw. capacity up to 50 kw. capacity are stocked. The smallest size is about 7 5in. square by 13in. high (outside

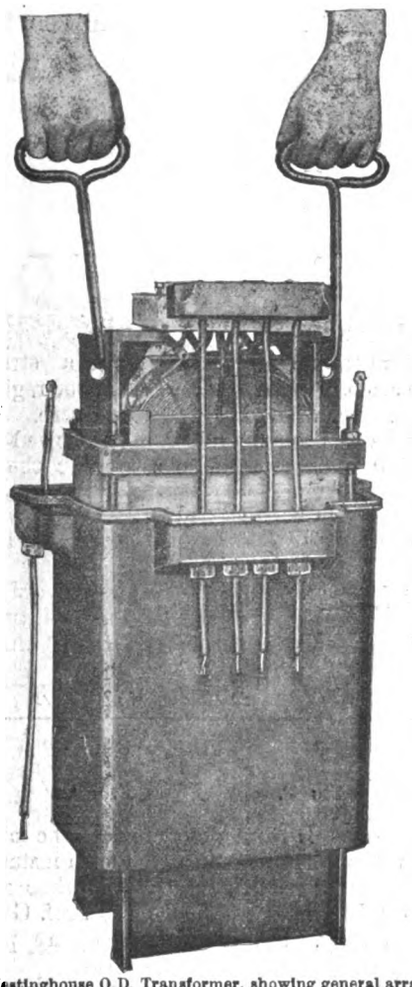

FIG. 2.—Westinghouse O.D. Transformer, showing general arrangement of parts (small sizes).

dimensions), and has a gross weight of 76lb. The 50-kw. size is about 22in. by 27in. by 44in. high, with a gross weight of 1,800lb.

The transformer coils are wound separately, are all similar in form, and are placed on the core side by side; there is thus no straining of the coils, and the insulation resistance between them is of the highest value. The primary coils are wound in many layers, with few turns per layer; the difference of potential between adjacent turns is thereby reduced to a small value. The secondary coils are wound, of a square section conductor, in a manner which avoids the usual crossing of the wires at the end of each layer. By using square wire the section of conductor available in a given sized coil is 30 per cent. greater than it would be were round wire used. The secondary resistance is correspondingly reduced and the transformer efficiency increased. By the arrangement of flat coils, parallel and spread apart with the ends exposed, as shown, the cooling surface is very great, and forms one of the distinguishing features of Westinghouse transformers.

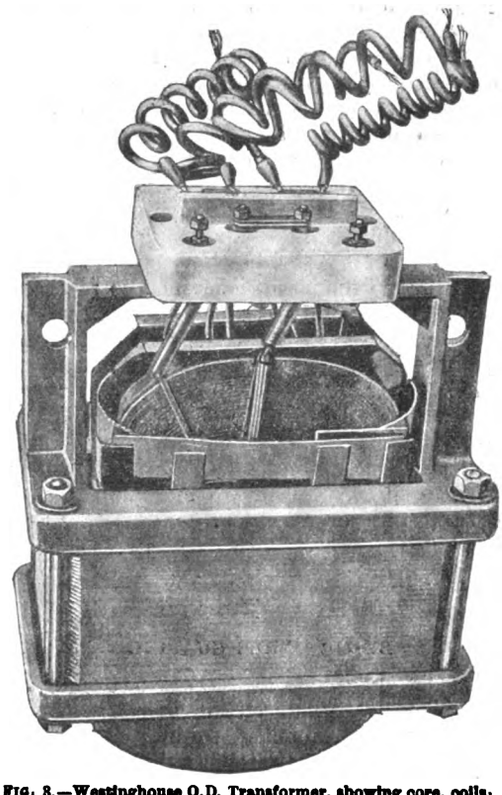

FIG. 3.—Westinghouse O.D. Transformer, showing core, coils, and terminal block.

With the large cooling surface thus obtained, it is not necessary to make any parts larger or to sacrifice efficient electrical design in any way for the sake of securing cool running, as has been done in many other types of transformers.

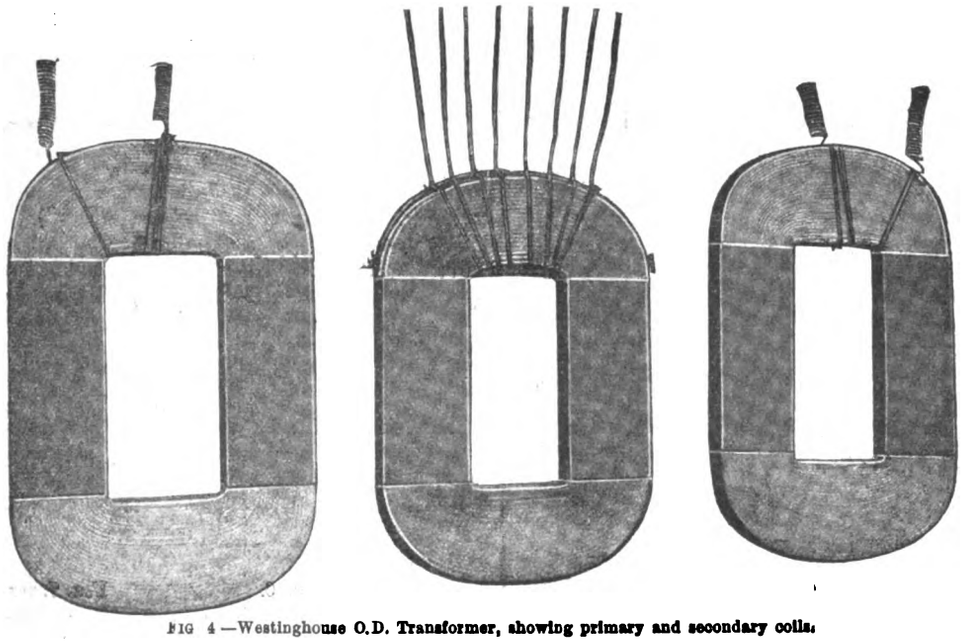

FIG 4.—Westinghouse O.D. Transformer, showing primary and secondary coils.

The porcelain block just under the cast-iron lid of the transformer carries terminals to the four primary-coil leads and for the eight secondary-coil leads. The changes in the primary windings from series to parallel,

Digitized by Google

or *vice versâ*, are quickly made by screw and link connection; the secondary-coil combinations are, however, made by soldered connections, a soldered connection being most reliable for heavy current work. Just below the terminal block the leads from the coils are bared to prevent the capillarity of the insulation siphoning the oil from the case. The outer oil-containing cases of "O.D." transformers up to the 10 kw. size are of cast iron; larger-sized transformers are enclosed in a corrugated sheet-iron case fitted with a cast-iron top and bottom. The cooling surface of the corrugated iron is large, and conduces to further cool running of the transformer.

Although made in certain standard sizes and of certain standard ratios, as previously stated, the "O.D." transformers are made also in special forms for much higher pressure work and in very large capacity units. It is interesting to note that before placing these transformers on the market a most rigid series of tests were applied to them. A complete line of them was built, and each one carefully tested for iron and conductor losses and for insulation resistance. The transformers were then operated for a year at double the normal working pressure. At the end of this time a repetition of the previous tests on each transformer proved the permanency of the materials used in their construction. Practically no deterioration had taken place in the iron of the cores, and each transformer was subjected to six and eight times the normal working pressure for several short periods of time, the transformer coils withstanding pressures up to 20,000 volts. It will thus be seen that the result of the whole test was extremely gratifying, the factor of safety of these transformers being thus proved to be considerably in excess of that usually considered necessary or expected.

INDUCTION EXPERIMENTS.

BY MR. EMILE GUARINI.

The following experiments were made to show that it is possible to obtain in an induced circuit a current producing the same effect as a continuous current. The author made a series of experiments, using the connections which are illustrated in the various figures. In the first experiment he connected the external coatings of two condensers to a small Wimshurst machine, the diameter of the plates of which was 10in. The other coatings of the two condensers were connected to the terminals of the high-resistance winding of an induction coil, the resistance of which was 11,000 ohms. The primary circuit of the induction coil, which had a resistance of ½ ohm, was connected to a

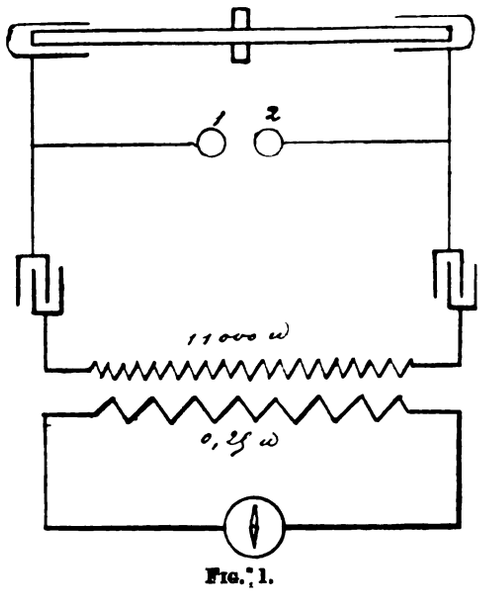

FIG. 1.

galvanometer, and the interrupter of the coil was disconnected. When a strong spark was made to pass between the balls (1 and 2), the needle of the galvanometer was deflected through a certain angle α. It then returned to rest. If the sparks passed in rapid succession, the galvanometer was reflected through a constant angle β, and did not return to zero except when the sparks ceased. He then changed over the poles, and the deflection of the needle was reversed. He replaced the galvanometer

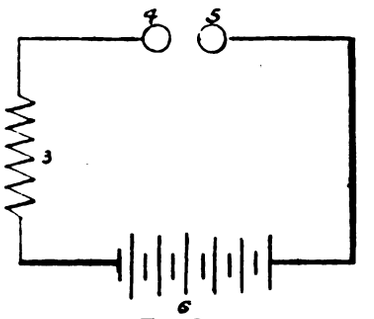

FIG. 2.

by a milliampere-meter. Then when a strong spark passed between the balls the ampere-meter registered two milliamperes, after which it returned to zero. With continuous sparks the ampere-meter only showed one milliampere, and it only returned to zero when the succession

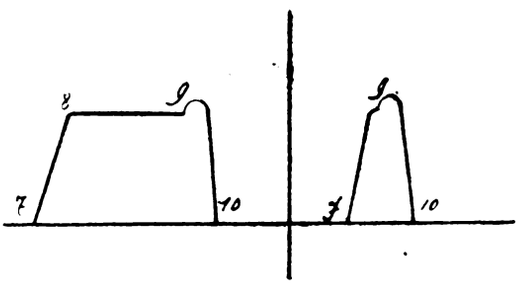

FIG. 3. FIG. 4.

of sparks ceased. Having then replaced the milliampere-meter by a voltmeter, this indicated for an instant 0·5 volt when a single spark passed, and 0·3 volt when a series of sparks was passing between the balls. Prof. Govi, of the Naples University, has remarked upon phenomena

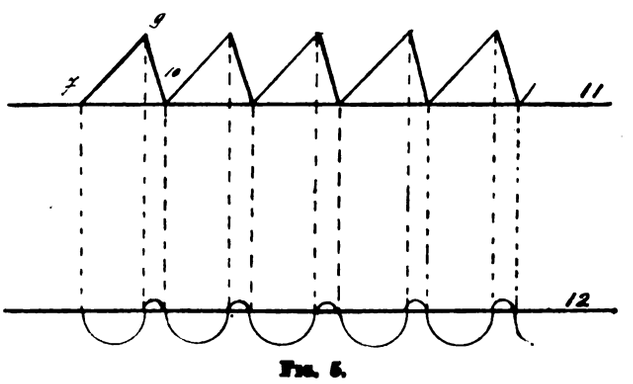

FIG. 5.

somewhat similar to this experiment in one of his publications ("Trattato Elmentare di Titica"). Between the extremities of the secondary wire of a Ruhmkorff coil the Italian professor has made sparks to pass by means of a Holtz machine, and has obtained elec-

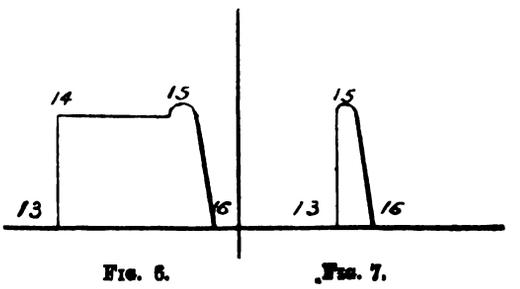

FIG. 6. FIG. 7.

trolysis in a voltameter. He also obtained a deflection of the needle of a galvanometer inserted in the primary circuit when the interrupter of the coil was disconnected—that is say, he obtained the effects of a continuous current. Mr. Vichet, professor at the Higher

Digitized by Google

Normal School of Paris, also showed experimentally, in 1873, that the high-tension current produced by a Holtz or a Wimshurst machine was able to be transformed into a current producing analogous effects to those of a battery. The way in which his experiments were carried out is not known. As regards the theory of the subject, if we take coil 3 in Fig. 2, formed of several layers of insulated metal wire, and of which the extremities terminate in two small spheres (4 and 5) not far apart, and then in the air-space between 4 and 5 connect any source whatever of energy which would give a continuous current (this source of energy is indicated by Fig. 6 in the diagram), then at the instant when the generator

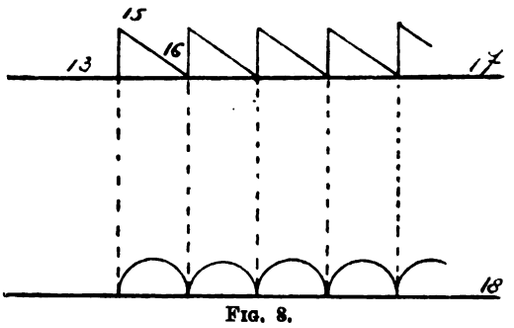

FIG. 8.

of electricity is connected to the circuit, and when it is disconnected, a small spark is produced between the terminals 4 and 5, in spite of the fact that the ordinary conditions of the circuit are such that there is no potential difference sufficient to cause a spark to cross the air-gap in question. This spark seems to be a single one in consequence of the rapidity of the phenomena, but in reality it is composed of an exceedingly rapid succession of small sparks. Each of these sparks closes the circuit, which remains open during the time between the passing of two

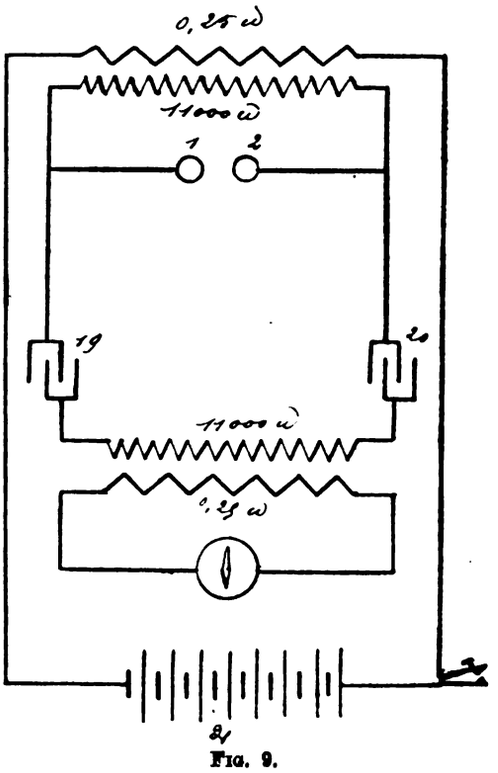

FIG. 9.

of these small sparks. In fact, the sparks play the part of an exceedingly rapid interrupter. Looking into this question more closely, one finds that before the source of electrical energy is connected in the circuit no current is able to pass in it, but as each connection with the source of electricity is made the first small spark appears, and the circuit is closed. A current traverses this circuit in the meanwhile, and there is an extra current on closing. When the first spark extinguishes itself the circuit is broken, and there is produced an extra current due to the break. The same phenomena are repeated for each successive spark.

One knows that the extra current on closing lasts much longer, and that the E.M.F. is more feeble than the current which is produced on rupture, which lasts an exceedingly short time and has a very high E.M.F. These extra currents behave differently according as R is smaller or greater than $\sqrt{\frac{4L}{C}}$; R, L, and C being respectively the coefficients of resistance, self-induction, and of the capacity of circuit. If R is less than $\sqrt{\frac{4L}{C}}$, the curves 7, 8, 9, and 10 in Fig. 3 are able to represent the current which traverses the bobbin during the appearance of the first spark. The portions of the curve between 7 and 8 corre

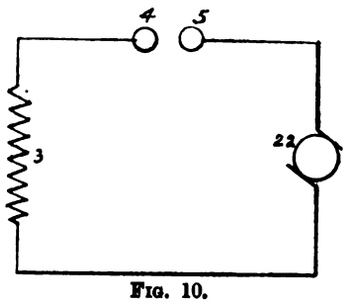

FIG. 10.

spond to the variable period during which the circuit is closed. The portion 8 to 9 represents the more permanent condition, and the portion between 9 and 10 the variable period during which the break takes place. If one considers the extreme rapidity of the phenomena, one is able to calculate that the steady state is of exceedingly short duration, and that the curves 7, 9, and 10 (Fig. 4) really represent the current corresponding to the interruption of the spark. For a succession of small sparks we should thus get something like as shown in the diagram (Fig. 5). Supposing, now, that we wind a second wire on the bobbin of Fig. 2, this wire would be traversed by an induced alternating current of the wave form, which is represented in 12, Fig. 5. If R is greater than $\sqrt{\frac{4L}{C}}$, the extra current on making the circuit, which is a growing current, represents the inertia

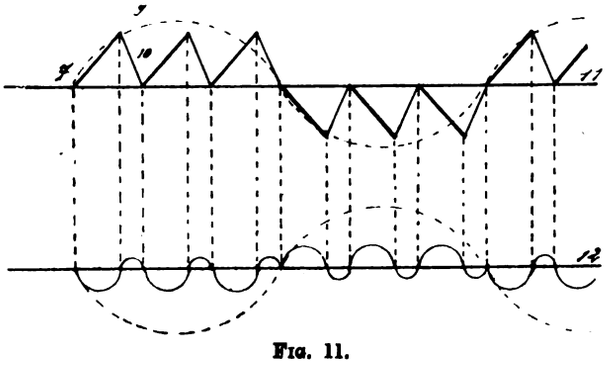

FIG. 11.

to be overcome, and is transformed completely into heat, following the Joule effect. In this case the constant *régime* is instantly established. The diagrams shown in Figs. 3, 4, and 5 now become those of Figs. 6, 7, and 8, in which one sees that in the induced circuit a succession of very rapid currents in the one direction takes place. It is not what one could call an even current, but it is a current which is able to produce the same effect as a continuous current, much in the same way that in a good cinematograph the exceedingly rapid succession of figures on the retina gives the effect of a continuous movement. This same succession of exceedingly rapid impulses of current in the one direction produces the effect of a continuous current. The result is easily explained if one considers the diagram in Fig. 8. One there sees that the variable period when the circuit is closed and the permanent period disappear in the inducing circuit. The period of induction corresponding is necessarily suppressed, and there is only the period which corresponds to the breaking of the circuit which appears in curve 17. There only thus

Digitized by Google

exists one period of the induction in curve 18. Expressed as a law, the previous experiments may be condensed as follows: if one renders intermittent the inducing current in the circuit, and if one suppresses the extra current due to the closing of the circuit by transforming it into heat according to the Joule effect, by the insertion of a very great resistance, one obtains in the induced circuit a current producing the voltaic effect.

Second Experiment.—By the aid of a key the author closed the circuit of the electric source of energy indicated by 21 in the diagram (Fig. 9). He introduced this key in the primary circuit of a Ruhmkorff coil, the secondary of which worked an oscillator, shown by 1 and 2. The rest of the arrangement is much the same as shown in Fig. 1. In working the first coil, the needle of the galvanometer

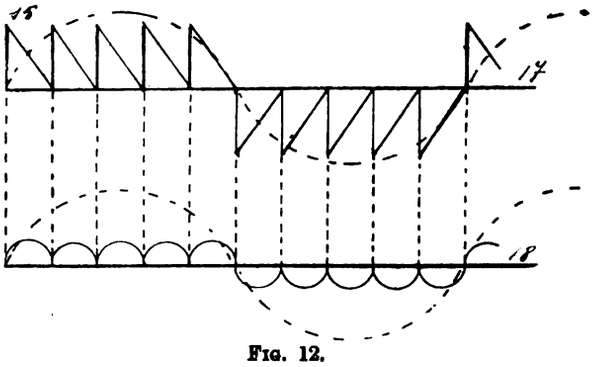

FIG. 12.

inserted in the thick-wire circuit of the second coil was not permanently deflected, but a frequent and rapid oscillation indicated the passage of an alternating current. The author's explanation of this is that in Fig. 10 coil 3 is formed, as in Fig. 2, of several layers of insulated metallic wire, with its extremities also terminating in a spark-gap (4 and 5). In this circuit, however, the alternator, 22, was introduced. This current is able to be considered as formed from successive alternating currents positive and negative, from each of which we are able to adduce the following: If for the first phase, during which the current is in the positive direction, for example, we obtain the diagram of Fig. 4 or

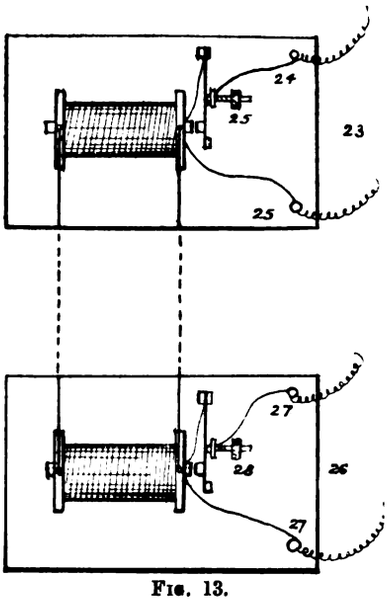

FIG. 13.

Fig. 7, according as R is less than or greater than $\sqrt{\frac{4L}{C}}$, then for the small sparks which succeed each other during these phases the diagrams will be respectively those in Fig. 5 or Fig. 8. For the next phase, during which the current is in the negative direction, we should get the same diagrams, but reversed. In short, for these two successive phases of complete periods of alternating current we should have the curve of Fig. 11 if R is less than $\sqrt{\frac{4L}{C}}$, or Fig. 12 if R is more than $\sqrt{\frac{4L}{C}}$. The outline of the curves figured represent what would happen with ordinary alternating currents. The author's conclusion is that if by any arrangement whatever one renders intermittent the alternating current flowing in an inducing circuit, and if one suppresses the extra current on making the circuit by transforming it into heat, following the Joule effect by the insertion of a great resistance, one obtains in the induced circuit a series of impulses which change in direction with the changes in the principal current.

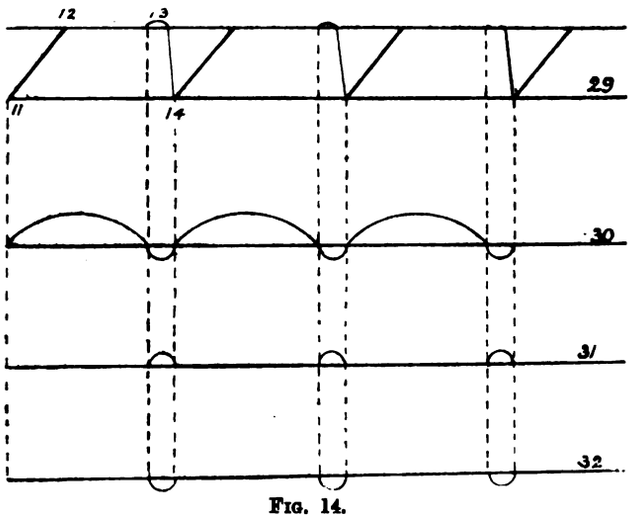

FIG. 14.

Third Experiment.—The author repeated the experiments of M. Bichat, described in the *Annales de Physique et de Chemie*, vol. vi, 1875. The primary circuit (Fig. 13) of the coil as receiver at the terminal marked 24, is the current of a battery rendered intermittent by the vibration of the interrupter, 25. The induced current of high voltage is produced in the fine-wire circuit of this coil. This high-tension current is taken to the thin-wire circuit of a second induction coil independent of the first. From the low-tension winding of the second coil one gets a current of small voltage and of a certain strength. In this experiment the vibrator, 28, of the second coil should be screwed up hard. The author's theory of this occurrence is that explained higher up. Fig. 14 represents what happens in the four conductors of these coils. The diagrams 29, 30, 31, and 32 of this figure represent

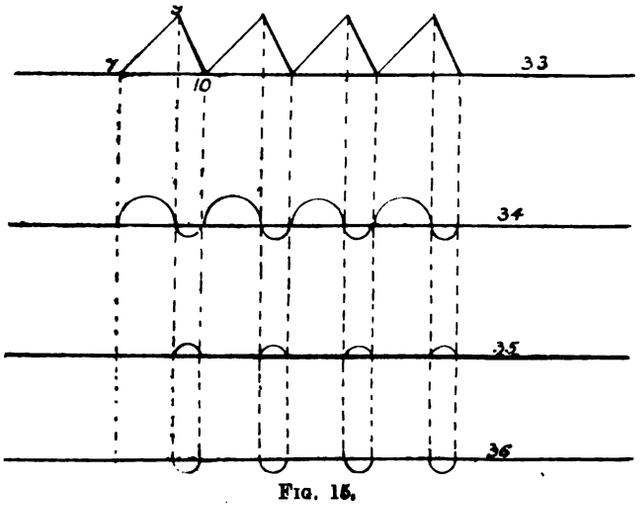

FIG. 15.

respectively the primary and secondary waves of the coil 23 and the primary and secondary waves of the coil 26. If we suppose that the interruptions produced in the coil 23, not by an interrupter, but by the spark which would pass between two small metallic spheres, then the curve (Fig. 3) which is used in the diagrams (Fig. 14) would be replaced by the curve in Fig. 4, and Fig. 14 would then be replaced by Fig. 15. In this last case the diagram represents the redressed alternating current, and the variable current is as in a Gramme machine. The author concludes from this that if one makes the current intermittent in the primary circuit of a Ruhmkorff coil by any arrangement whatever, and if one connects secondary to

Digitized by Google

secondary of another induction coil in the primary thick-wire winding in this last coil, one obtains a current capable of producing the same effects as a continuous current if the conditions in the secondary of this last coil are such that R is greater than $\sqrt{\frac{4L}{C}}$. It results from this experience of M. Bichat that the Ruhmkorff coil is reversible, and that the current of a battery is able to be transformed into a high-tension current, and this high-tension current is able to be retransformed into a current of low voltage, and of a certain value, producing all the effects analogous to those produced by the battery serving to excite the first Ruhmkorff coil.

Fourth Experiment.—The author attached the terminals of a small dynamo-electric machine for continuous currents (shunt-wound with a Siemens armature) to the thick-wire primary of an induction coil, and introduced a galvanometer into the secondary circuit of the same. In

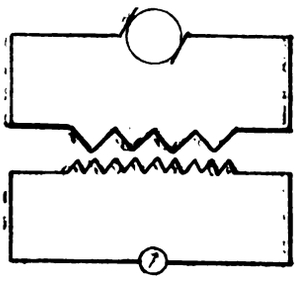

FIG. 16.

starting up the machine the galvanometer vibrated rapidly, due to the passage of an alternating current in the secondary of the coil. The author's theory is that the primary of the induction coil is traversed by impulses in the same direction (Fig. 17). The current is great, but the E.M.F. relatively low. It sets up a valuable magnetic field such as is shown in 37 and 38 (Fig. 17). In virtue of the fundamental law of magnetic induction, $E = -\frac{dN}{dt}$. When the current in the thick-wire winding increases, the E.M.F. which is induced in the secondary is negative. When the magnetic field of the thick-wire winding—that is to say, when dN becomes negative—the E.M.F. induced in the secondary is positive, and the current changes sign. The author concludes that if one sends in the primary of the induction coil impulses of current of the same sense as exist usually

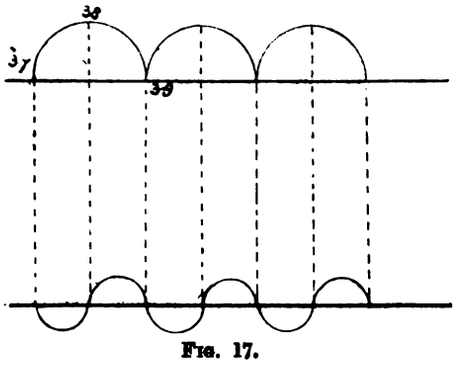

FIG. 17.

in continuous currents, and if the current is large, but of small voltage (the electric field being very small), it produces round itself a variable magnetic field, which generates in the secondary circuit an alternating current.

Fifth Experiment.—The terminals of the small dynamo experimented with above are attached to the thin-wire winding of the induction coils, and the galvanometer is placed in the thick-wire winding (Fig. 18). The current which circulates in the circuit of the fine wire is very small, but the voltage is relatively high. The needle of the galvanometer inserted in the secondary is deflected to the left or the right according to the sense of the current traversing the fine-wire circuit, and this vibration always shows a current in the opposite direction to that which passes through the inducing circuit. The author's theory is that the current traversing the fine-wire circuit, while extremely small, but of relatively high voltage, induces round it an intense electric field, but the magnetic field is negligible. The variable electric field only results in variations in the E.M.F., which from a zero value mounts up to the maximum value (a), afterwards falling back again to zero, as shown in Fig. 19. In the induced circuit E.M.F. is produced in the contrary direction, which increases and decreases in the same way as the inducing current. In other words, X B = X' B', X A = X' A', etc. The author's conclusion is that if one sends through the primary of the induction coil impulses of current of the same sense, and if the current is very small but of relatively high intensity, the magnetic field is negligible, and it generates round itself an electric field which is variable and produces in the second circuit a current capable of producing the same effects as a continuous current. This current is in the opposite direction to the primary current.

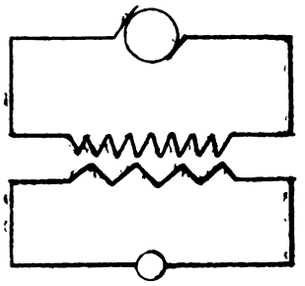

FIG. 18.

General Theory.—The author states that a variable current in the same direction passing through the primary of an induction coil sets up round itself a magnetic field and an electric field. The magnetic field is a function of the current strength, and the electric field is a function of the voltage. The magnetic field increasing or decreasing induces in the secondary an alternating current. The electric field induces in the secondary a current capable of producing the same effects as a continuous current. The current traversing the secondary is the result of these two fields. Finally, first, in the case of a current of very great strength and small voltage in the secondary, one has an alternating current; second, in the case of a current of small amount, but of great voltage, one has in the secondary a current capable of producing the same effects as a con-

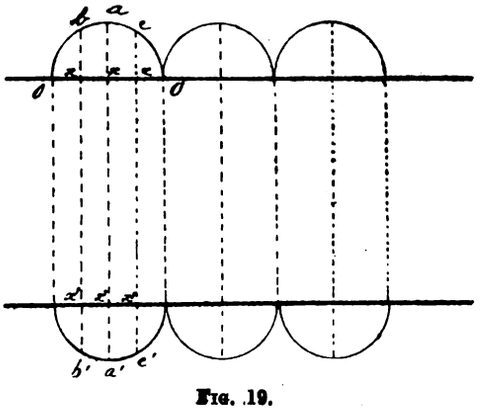

FIG. 19.

tinuous current. In conclusion, the author states that the currents, which we call continuous, but which in his opinion should better be called variable currents in one direction, are able in predetermined circumstances to have the same advantages of transformation as alternating currents. For instance, they can be transformed from high voltage to low voltage in static transformers instead of in rotating transformers.

We are indebted to Mr. E Guarini for the above particulars of his interesting researches, but should have been pleased to have some idea from him as to the efficiency of the suggested means of transforming continuous currents by static transformers. The effect seems to us to be largely due to the wasting of a considerable portion of the energy transformed into heat, which would make the process only of scientific interest.

DIRECT-CURRENT GENERATORS.*

BY SIDNEY H. SHORT.

Some months ago I received through Dr. Hopkinson your kind invitation to read a paper before this society. The letter expressed a desire that the paper be of a character to induce discussion by the members present. I have therefore selected the subject "Direct-Current Generators" with the view to considering the feasibility of more nearly standardising this class of electrical machinery. I will not consume much time with the paper itself, but will take part in the discussion to follow. You will pardon me if I call to mind some well-known facts with reference to the construction and operation of dynamo-electric machines, which I find it necessary to do in order that I may indicate the changes which are taking place in the design of these machines, and to foreshadow the probable modifications which will produce better results in the future. We are all familiar with the original types, the first of which were made just 50 years ago. The pioneer designers produced dynamos which differed widely in the arrangement of their several parts as well as in the construction of the armatures and field magnets. Clark, who was the first to put into execution Faraday's great discovery of induction, used permanent magnets for the field, and an armature core provided with projections, each projection being wound with a coil of insulated wire, the ends of which were connected to commutator bars in the usual way. Gramme, on the other hand, used a ring of soft iron wire for an armature core, the coils of insulated wire being wound spirally around the section of the ring with branches at intervals leading to the commutator. This form is known as the Gramme ring, and for many years was a favourite with generator designers, but is fast going out of use. Early in the history of dynamo construction, Siemens devised the well-known drum winding, the coils of insulated wire being wound lengthwise and over the ends of a cylindrical armature core, with their terminals joined to the commutator strips. This winding in an improved form is now coming into general use, and promises to be the final one. All of the earlier machines were bipolar, with their armatures revolving at a high rate of speed between the two poles of a single U-shaped magnet. They were mostly belt-driven, especially in America, and to some extent in this country, but here the direct-driven high-speed generator made its first appearance in commercial form owing to the splendid engines available.

When the commercial value of the dynamo became apparent as a source of power for electric lighting, for operating motors, and for the many uses to which large electric currents are put, there sprang up a demand for machines of larger and larger capacity. The two-pole machines were increased in capacity until a limit of distortion was reached, where it was found impractical to further augment their dimensions. The next step, therefore, was the adoption of the multipolar type. In these machines there are two or more magnetic circuits formed in the same core by arranging two or more pairs of field magnets around the periphery of the armature. You are familiar with the advantages of this type of machine. A four-pole machine containing the same quantity of active material as two bipolar dynamos will have their combined output at half their speed. The ease with which these machines can be ventilated, owing to the large internal diameter of the armature, makes them run much cooler than the bipolar type. The arrangement of a number of sets of brushes around the periphery of the commutator permits the use of very short bars rendering the mechanical construction most perfect. As direct-driven slow-speed generators having many poles are usually specified for our modern power stations, you will be interested in the details of their construction. The magnet frame is a ring of large diameter usually with a rectangular section, having two feet or brackets cast integral with it, to support it in a vertical plane upon a masonry foundation. The width of the face and the cross-section of this frame do not differ very greatly in machines of different speeds and capacities, except for the very small ones, but the diameter depends on the capacity and number of poles. Some makers prefer to cast this frame in iron, others in steel; each have their advantages and disadvantages. On the whole, I prefer the cast-iron frame, because, while it is nearly twice as heavy as the steel one, it is more rigid and costs less. However, when very large machines are required to be shipped to great distances, it is necessary to use the steel castings, because of the smaller weight. The frame is always divided into two half rings, with finished joints, where they are bolted together. This division is usually on the horizontal plane, but one or two makers divide the ring vertically. On the inner periphery of the magnet frame at intervals are fastened an even number of pole-pieces, projecting radially towards the centre. These pole-pieces are always made of good soft steel, sometimes rectangular in section and sometimes round. The area of the cross-section is about equal to that of a cast-iron yoke, but considerably greater than that of a steel yoke. The radial length of these poles, which does not vary greatly with the capacity of the machine, is from 12in. to 15in. When the frame is made of cast iron, these pole-pieces are composed of steel plates riveted together to make a nearly square section, and cast into the ring in the proper positions. If the frame is made of cast steel this method of attaching the poles cannot be advantageously used, but they must be bolted to finished surfaces, prepared for them, on the inner surface of the magnet ring, which is a much more expensive process. I must not neglect to explain, however, that when the pole-pieces are bolted to the steel frame they may be cast in steel, with a round section, and provided with a suitable pole-shoe to fit the armature face, while with the laminated pole the shoe must be fitted to its inner end. On the whole, however, the laminated pole cast in the frame is cheapest, and lends itself to ease of manufacture. The pole-pieces are provided with spools, upon which are wound the magnet coils. These coils are connected in series, and the exciting current traversing them produces alternate positive and negative poles at their free ends.

This completes the essential parts of the stationary portion or field magnet of a multipolar generator. We will next turn our attention to the construction of the armature, with its commutator, which we will find more intricate. The engine shaft carries, besides its flywheel, a massive cast-iron armature hub, keyed to it securely. This hub is provided at its periphery with a flange bolted to the flywheel, thus relieving the shaft and keys from the torsional strain due to the interchange of energy between them. The armature hub is provided with a number of radiating arms, the ends of which are dovetailed parallel with the shaft for a length equal to the width of the pole-pieces. Into these dovetailed grooves are fitted the key pieces formed on the inner edges of the armature laminations. The laminations which form the magnetic portion of the armature ring are made from thin sheet steel of the softest quality. They are in the form of segments of a circle with notches in the outer edges. These segments are built on to the ends of the spokes of the armature hub, lapping joints, until a complete rim or core is formed equal to the width of the pole-faces. Occasional radial ducts are left so that the air may circulate freely through the core to carry away the heat produced by hysteresis and eddy currents. This mass of thin sheet segments are clamped firmly between two end rings of cast iron, held together by bolts passing between them just inside the lamination. The notches in the edges of the sheets register perfectly, so that slots are formed across the face of the armature to receive the armature windings. An extension of the armature hub carries the commutator support, which is much like an ordinary spoked pulley. At each end of its face clamping rings are provided to secure the commutator bars. These strips are hard-drawn copper of the best quality, and should have a width at the face of the commutator of at least $\frac{1}{4}$in. The mica which separates them should never exceed $\frac{1}{32}$in., and must be of a very soft quality, so that it will wear more easily than the copper. The bars are bevelled or notched at the ends to receive the mica insulating and clamping rings, which secure them to the face of the hub. The commutator is always smaller

* Paper read before the Manchester Section of the Institution of Electrical Engineers, Jan. 29, 1901.

Digitized by Google

in diameter than the armature core. In fact, it must not have a peripheral speed of more than 2,500ft. or 2,600ft. per minute. With higher-surface speeds it is difficult to prevent sparking. To each bar at the end nearest to the armature core is riveted and soldered a copper strip, projecting radially to the same diameter as the armature core, where it connects with the ends of the armature coils. The armature coils are simple in construction. Ribbon copper, usually ½in. by $\frac{1}{10}$in., is cut into pieces long enough to make a complete coil. This strip is bent on edge in the middle, making the two halves parallel with each other and about ½in. apart; it is then bent flatwise around a former into a rectangular coil, with V-shaped ends, joining the two parallel sides, the angle of the V at one end being formed by the terminals of the coil, which are afterwards soldered to the commutator leads. The coils are carefully taped with combination insulation made from paper, mica, and linen webbing. They are saturated with insulating compound and baked before being placed in the armature slots. The coils span a segment of the periphery of the armature core equal to or slightly less than the pitch of one pole, one of the parallel sides being fitted into the bottom of a slot, while the other side occupies the top of another slot; two and sometimes more of these coils are placed side by side in the same slot, but it is not best to multiply the number. These coils overlap each other, making a closed circuit spiral winding around the face of the armature with each turn connected to a commutator bar. After the winding is completed, the coils are held in place by banding wires at intervals across the face of the core. The windings are connected to balancing rings placed conveniently between the armature core and commutator, each ring connecting at points of equal potential, ensuring uniform pressure between all the units making up the multipolar machine. It only remains to provide a support for the brushes which collect the current from the face of the commutator. Four brackets are bolted to the end of the frame, and in these the brush rocker rotates through a limited angle. This rocker carries a brush-holder and set of carbon brushes for each pole-piece. They are carefully insulated from the rocker and from each other, but all the positive brush-holders are connected to one massive ring, and all the negative holders to another. These cross-connecting rings form the terminals of the generator from which the leads pass to the working circuit.

The mechanical construction of direct-current generators has, as you can see, been very well developed, and there remain apparently very few improvements to be made in it. We will, therefore, have to look in other directions for changes which will improve their operation and diminish the cost of their manufacture. Until recently multipolar generators were constructed with a limited number of poles, and to accommodate them to the various speeds and increasing capacities required their proportions were distorted, as in the bipolar machines, with the unfortunate consequences always attendant on poor design. Recent machines are being built with an increasing number of poles, and generators of 1,000 kw. with 14 poles, 1,600 kw. with 16, and 3,000 kw. with 24, are in successful operation with speed ranging from 75 revolutions per minute for the larger size to 90 revolutions for the smaller. It is apparent that modern design is tending to a greater number of magnets in the direct-current generator, and it is interesting to see that, on the other hand, the modern alternating-current machine is being made with fewer and fewer poles. The frequency in modern direct-current generators is about 15 cyles per second, while in alternators for power transmission the frequency is as low as 25 cycles per second. Even in the mechanical construction and general appearance these two classes of machines are approaching each other with this difference, that for the direct-current the armature must revolve to carry on the process of commutation, while in the alternator the field magnets are made to revolve. How far are these changes in design to be carried, and what are the causes acting to bring them about? Experience has taught us that there are certain mechanical, electrical, and magnetic values, which, when strictly adhered to in the design of direct-current generators, produce the best working results. We will apply the best average working values to a unit dynamo with one pair of poles, and for greater capacities add two or more of these units together in the form of multipolar machines to determine the best relation between speeds and capacities. The capacities of these machines thus made from unit dynamos will be fixed, depending on the capacity of the unit and the number of these units used in its design. The speed of these machines will also be established, as we have in the unit dynamo adopted certain values depending upon speed. I have taken for the unit dynamo a surface speed of 3,300ft. per minute for the armature; for the commutator a peripheral speed of 2,500ft. per minute. The teeth on the face of the armature have a pitch of 1in. The commutator bars (550-volt generator) are ·377in. wide, and the pressure between them is 10 volts. Every inch of the periphery of the armature face carries at full load 500 amperes; 10·3 million magnetic lines pass through the magnetic circuit in this unit dynamo. The density in the poles at full load is fixed at 95,000 lines per square inch, in the air it is 80,000, while in the teeth it reaches 120,000 lines. In the armature core the flux is reduced to 65,000 lines per square inch. A fair average frequency for direct-current generators is 1,600 alternations, or 800 cycles per minute; therefore, this unit must run when made into a bipolar machine 800 revolutions per minute and deliver 137½ kw. The performance of this machine will in every way be good, for the various values taken are those most satisfactory. Without making any changes in the dimensions of the parts or in the electrical and magnetic values, we will put two of these units together in the form of a multipolar generator. There will now be four poles, but they will have the same section and the same magnet spools. The armature will be doubled in circumference, also the slots and armature coils, commutator bars, brushes, brush-holders, and various other parts, all being interchangeable with those of the unit machine. This four-pole machine will deliver 275 kw., and the speed will be 400 revolutions per minute. Applying these unit dynamos in the construction of an eight-pole machine, we find that it runs 200 revolutions per minute and has an output of 550 kw. A 10-pole machine will run 160 revolutions per minute and deliver 687 kw.

The accompanying table gives the speeds, capacities, and general dimensions of machines up to 30 poles, and in all of them we have not varied from our original data established for the unit dynamo.

A study of this table reveals the fact that when we have established certain running values to be used in the construction of multipolar generators, we must let the speed of the machine depend upon the output. In making up this table of speeds, the unit dynamo adopted works out

Digitized by Google

well for capacities up to 1,000 kw. or 1,200 kw. For the larger machines, however, it is possible to load the armature with 600 or even 700 amperes per inch of periphery, thus lowering the number of poles, decreasing the diameter of the armature, and increasing the speed. A considerable variation in speed for a given output may be secured by varying the section of the magnetic circuit of the unit dynamo and the number used; the range through which this change in speed can be made is, however, limited. The advantages of a standard system of design as outlined here will be appreciated by manufacturers as well as by users of electrical apparatus, because of the interchangeability of parts and the certainty of uniformly perfect operation of every machine regardless of capacity. In all sizes of machines the same size pole-pieces would be used. The magnet spools would all be interchangeable. The armature coils would all be alike. The brushes, brush-holders, and all the connecting parts would be made after the same patterns. The slots in all the armature laminations would have the same width and depth. These conditions, if existing, would greatly cheapen the cost of manufacturing dynamos, therefore the prices charged the purchaser. The steam-engine stands in the way of accomplishing these results. The speeds and capacities of engines have been established by their makers without reference to the best conditions for the successful operations of the generators they are to drive. For the smaller dynamos, as you will see by the table given above, speeds of from 300 to 800 revolutions per minute are permissible and entirely proper, but when the larger capacities are reached the speed must be lowered in order to obtain good performance, especially for traction generators. I hope, therefore, that the builders of engines and the manufacturers of direct-current generators will co-operate in establishing a satisfactory scale of speeds and capacities for steam dynamo sets.

DISCUSSION.

Mr. M. Marie congratulated the author on his paper, and expressed his approval of the proposed reduction of speed of large direct-current generators. There was no doubt that 250 revolutions were much too high for a 1,600-h.p. dynamo. This speed was asked for by consulting engineers, and engines had been designed to give the output; he held, however, that the economy in first cost in consequence of a high speed was not a true economy as an inferior machine was the result. It was a false idea that the factor of safety of the commutator was the thing which limited the speed. The real point was that the peripheral speed of the commutator must not exceed a certain limit, as otherwise sparking would ensue. It was, in fact, impossible to satisfactorily commutate the current at excessive speed. Unfortunately, while the leading manufacturers had proved that this was so, there still remained firms who, without experience in large machines, were ready to undertake the manufacture of these machines to run at high speed. In consequence of this, the consulting engineers continued to ask for high speed machines, and with the large range of engine speeds, makers were compelled to have in stock a very considerable number of patterns. He thought that Prof. Short's suggestion as to the standardisation of the various parts of direct-current dynamos was a good one. He would have been glad if the author could have given them more particulars of the rings for cross-connecting the armature circuit at equal potential points.

Major P. Cardew said that he must admit that his previous ideas had been that increased speed affected the engines more than the dynamos. He then referred to the progress made in dynamo design since the early days, when the types of machines were so constantly being changed. He thought that large machines would be the rule in the future, and that those responsible for the laying down of new plants should not hamper the undertaking by commencing with too small units, which so frequently had to be abandoned after the first two or three years of working.

Mr. E. S. Giles said that from the method adopted by consulting engineers when specifying the output of dynamos, these had to be made considerably larger than would be expected at first sight. For instance, a 1,000-kw. plant would be specified to give its full output at any voltage from 450 volts for lighting up to 550 volts for electric traction. Overloads were also variously specified as from 25 per cent. for three hours up to as much as 100 per cent. for any period. As a rule the specifications contained no statement as to the voltage at which the overload was to be applied, and he thought that consulting engineers should make their specifications much more definite in this respect. He agreed that the commutator was the greatest source of trouble in the design of large machines. As regards the author's proposal for using standard poles and field winding for a number of different machines, he thought that there might be trouble over the bore for the armature.

Prof. Short here explained that the pole-pieces were always made quite flat, and were afterwards bored out in position to suit the radius required by the armature.

Mr. Giles also added that the standard would be varied with a variation in the voltage, which would alter both the copper bars and also the slots in the iron core.

Mr. Cooper thought that consulting engineers might leave the overload clauses out of their specification, and fix, say, a maximum allowable temperature rise of 60deg. F. The engineer, when he had the machine delivered, could then try for his own satisfaction what overload it would stand. As regards the sparking of the commutator, he thought it was best to so design the brush-holders that only the light blocks of carbon were moved in consequence of slight inequalities on the commutator surface. If the carbon blocks were fixed to the brush-holders, the increased inertia made matters worse.

Dr. E Hopkinson, the chairman, said that he should also like to hear from the author more particulars of the cross-connecting copper rings which had been shown in the diagrams, and of the effects they produced in the smooth running of the plant. There was also a question of the slot, which apparently was left in the centre of the poles, and he should like to hear from the author as to how far this slot was useful in practice.

Prof. S. Short, in reply, said that the diagram had misled Dr. Hopkinson. There was now no slot left in the centre of the poles, as such slots had been found to be of little service in practice. What looked like a slot in the illustration projected on the screen was the clearance between the two halves of the pole pieces, which were clamped on to the laminated poles by means of bolts passing through both halves. As regards the cross-connecting rings, he first noticed what was called in America the "bucking" of direct-current generators in 1893. A 1,500-kw. machine was erected in the Chicago Exposition in that year, and on the first run round it broke away from the foundations. An explanation of the phenomena was not obtained until the machine had been secured again and started up slowly. It was then seen from the pulsation of the sparking at the brushes that, owing to the extremely low reluctance of the magnetic circuit, there was a regular surging of the magnetic field, which resulted in the magnetisation and demagnetisation of certain poles. This was only found in machines of low reluctance, and was enhanced by the low resistance of the armature circuit as cross-connected. The same thing occurred in rotary converters, but it was then termed hunting. It could be prevented or minimised by cross connecting the armature winding at equal potential points. An alternative was to place heavy copper bars between the pole-pieces. As regards the winding of the proposed standard machines, it would be easy to adopt the same slots for a 220-volt winding as for a 440 volt. It would mean that a single bar could be put in each slot instead of two side by side. Another alternative would be to use the same bars with two independent parallel-wound circuits. The speeds he had given were the ideal speeds, but they, of course, could be varied on either side of the values listed. He thanked them for the kind vote of thanks which they gave the paper.

The Chairman then stated that the next meeting announced on the programme would not be held but that on May 7 they would hold the last meeting of the present session, at which the officers and council for the next year would have to be elected. It was proposed to have a council of 12, and he appealed to those present to send in nominations and to see that only those men who were prepared to work actively in the interests of the Manchester branch of the Institution of Electrical Engineers were elected. Dr. Hopkinson added that an informal discussion on some topic of interest would be held after the formal business on May 7, and the meeting they adjourned.

ELECTRIC LIGHTING ENQUIRY.

Question of Increased Pressure.

The Board of Trade enquiry into this matter, presided over by Sir Courtenay Boyle, was concluded at the Westminster Town Hall last Friday.

Mr. E. MOON first addressed the Court on behalf of the Chelsea Electric Lighting Company. The real matter of controversy was as to the relative efficiency of the 100-volt and the 200-volt lamps. The evidence showed that the 200-volt lamp was the lamp which was generally adopted now, and the 100-volt lamp was only used by exceptional consumers. So far from the position being as it was in 1896, when there was no lamp in the market which could be used for 200-volt current, at the present time this pressure was used wherever new installations were put up, and in the vast majority of cases it had taken the place of the 100-volt supply. Then, with regard to the contention that the consumers were entitled to some monetary concession for the change because they were changing to a more expensive system of supply, the evidence proved nothing of the kind. He submitted that to lay it down as a direction to the arbitrator, as was contended for by the County Council, that the undertakers must give some kind of compensation for the alleged inferiority of the 200-volt lamp, would not be fair. He was perfectly willing to accept the risk of an open arbitration, but he objected to having any such conditions on the arbitrator's discretion. He appealed to the Board of Trade to say whether it would not be unfair if a consumer had wired his house insufficiently that he should be paid the whole cost of the new wiring which would be necessary with the 200-volt supply. With regard to the Metropolitan Company, he did not intend to call any evidence. The only change proposed to

Digitized by Google

be made in their case was from 50 to 100 volts, and nobody could say anything against the efficiency of the 100-volt lamp.

Mr. R. CUNNINGHAM GLEN, for the borough of Paddington, argued that the evidence proved that there was greater economy with the 100-volt lamps than the 200-volt, and that being so it must be to the detriment of the consumer to force him to use in all cases 200-volt lamps, especially as there was so much controversy as to whether the lamps were really trustworthy or not. It might be indirectly for the benefit of the consumer whose installation required changing, but the proof was in the evidence that on the whole the consumer was not benefited; and, moreover, they had it admitted by Prof. Kennedy that there was no difference in the light that was obtained from the change to the higher pressure. In the event of the Board of Trade deciding to withdraw the necessity for the consumer's consent, he submitted that the consumer should not be required to pay any of the costs of arbitration with the supplier, especially where that arbitration was forced upon him by the action of the insurance company.

Mr. DANCKWERTS, K.C., who appeared for the Corporation of London, referring to the evidence, said Mr. Drake, Prof. Ayrton, and Major Cardew had all told them distinctly that the 200-volt lamp was not yet procurable of a good character, that with the same consumption of energy you did not get as much light as from the 100-volt lamp, and that, as a matter of fact, the consumption of energy by the latter was less than that of the 200-volt lamp. Again, short of perfectly fresh installation, in many cases it would be impossible to be certain you had got safety, and yet Mr. Balfour Browne had argued that the consumer was to bear that cost. His contention was that the companies alone benefited by the increase in pressure, and that benefit consisted of a mere saving of capital. On the question of insurance, the companies should certainly undertake to satisfy every insurance company that had insured the premises where the change occurred. Moreover, the person who was compulsorily changed over to the higher pressure ought to have indemnity for the lesser efficiency of the lamps, and the only possible way of doing that was by giving him a reduction in price in the shape of a discount, say 10 per cent. He was instructed by the Corporation to press upon the Board of Trade that in every case, if the company insist upon going to arbitration, they ought to pay all the costs.

Mr. J. ROSKILL, on behalf of the City of London Electric Lighting Company, argued with regard to the suggestion that the arbitration clauses of the Lands Clauses Act should be made applicable to the present case, that it was an unheard-of thing to apply an Act of Parliament which only dealt with a vested right in the absence of a vested right. Any disadvantage that the consumer might conceivably suffer from inefficient lamps would be amply provided for by the fact that the arbitrator would take into consideration that, incidentally to the cost of the change, the question arose as to whether the 200-volt lamp was really efficient or not. He reminded the Court that the local authorities here represented did not directly represent the consumers in any way. Not a single argument by any one of their witnesses had met the contention that this change was right and inevitable. He submitted that the clause which the president had drafted met every objection which could reasonably be urged against the change.

Mr. H. J. SMITH, town clerk for the borough of Lambeth, said he quite agreed with what had been said by other counsel representing local authorities—viz., that if the change were authorised, it should be made on the fullest compensation to the consumers, and that the consumers should be placed in certainly as good a position when the change had been made as they were when they were subject to the original voltage.

The PRESIDENT having expressed his obligation to counsel for the way in which the enquiry had been conducted, the proceedings closed.

YORKSHIRE POWER BILLS.

At the meeting of the Leeds Chamber of Commerce on Tuesday, Mr. Robert Hudson (director of the Yorkshire Electric Power Company) met the Chamber by arrangement to further discuss the Bill before Parliament promoted by the company, and explained that the Bill had already passed its second reading, and would come before a committee of the House of Commons about the middle of April. Many of the local authorities throughout the area affected by the Bill had been afraid of one clause (Clause 40), which gave power of appeal to the Board of Trade against the local authorities if they were unreasonable in withholding their consent to the company coming into a district. A resolution expressing approval of the Bill generally was adopted.

There was also a meeting of representatives of rural and urban district councils in the West Riding at the Hotel Metropole, Leeds, for the purpose of investigating the South Yorkshire Electric Power Bill. Amongst the councils represented were Hunslet Rural, Horbury, Ardsley (East and West), Saddleworth, Selby, Ardsley, Doncaster Rural, Farsley, Burley-in-Wharfedale, Otley, Gomersal, Rawmarsh, Bolton-on-Dearne, Queensbury, Liversedge, Gildersome, Hebden Bridge, Sandal Magna, Tadcaster Rural, Wath-on-Dearne, Royston, Thornhill, Wakefield Rural, Calverley, Ravensthorpe, Birkenshaw, South Crosland, Cleckheaton, Worsborough, Oxenhope, Springhead, Silsden, and Mytholmroyd. Mr. S. V. Clirehugh, of Manchester, the engineer to the scheme, said both the companies who were seeking powers proposed to sell it to local authorities and other consumers at about 1½d. per unit. The cost of distribution to the local authority would not exceed 1d., so that in the near future they might distribute electricity in the smallest village and make a profit for themselves out of it at a price not exceeding 3d. per unit. If so, they would certainly confer an enormous benefit on the community. The two competing schemes had very much in common, but they differed chiefly with regard to price. The Yorkshire Company would, he admitted, be in a position to supply the larger consumer cheaper than his own company, but if the smaller local authorities took their terms they would, he claimed, be penalised for 20 years, because their demands would never grow sufficiently during that time (so far as they could humanly see) to get their prices into line with those charged under the South Yorkshire scheme. Mr. Hopkins, in moving a vote of thanks at the close, said it would probably be the best thing that could happen to the local authorities if both schemes were sanctioned by Parliament, but of that there is little probability.

A special committee of the Halifax Chamber of Commerce appointed for the consideration of the Yorkshire Electric Power Bill and the South Yorkshire Electric Power Bill have reported as follows: "Your committee, having considered the above Bills, recommend the council of the Chamber to support neither of them, believing that the maximum charges in each Bill are too excessive, and they do not desire to commit the council to either scheme, but if the council decide to support one of the schemes, your committee recommend the South Yorkshire Bill as tending to benefit the smaller industrial concerns."

At the last meeting of the Mirfield District Council, the Clerk reported attending a further meeting called by the promoters of the South Yorkshire Electric Power Bill at Huddersfield. Various points were discussed, and the company agreed to amend their Bill in certain particulars to meet with the views expressed by those who support they desired to obtain.

FORTHCOMING EVENTS.

FRIDAY, MARCH 29.

Electro Harmonic Society.—Smoking concert at St. James's Restaurant, W.

North-East Coast Institution of Engineers and Shipbuilders.—At 7 15 p.m., general meeting at South Shields. Mr. F. W. Jennings will reply to the discussion on his paper on "The Ventilation and Heating of Ships"; the discussion on Mr G. M. Brown's paper on "Some Attempts to Increase the Efficiency of Marine Boilers" and on Mr. Walter Scott's paper on "The Commercial Organisation of Shipyards," will be resumed; paper on "Water-Tube Boilers," by Mr. Edwin Griffith, Wh.Sch.

SATURDAY, MARCH 30.

North-East Coast Institution of Engineers and Shipbuilders.—Graduates' Section, at 7 30 p.m., general meeting at Newcastle-upon-Tyne. Mr. A. Q Carnegie will open a discussion on "Condensers—and the Re-cooling of Water for Electric Power Stations."

Royal Institution.—At 3 p.m., Lord Rayleigh on "Sound and Vibrations."

MONDAY, APRIL 1.

Society of Engineers.—At 7.30 p.m., ordinary meeting. "The Production of Metallic Bars and Tubes under Pressure," by Mr. Percy F. Nursey, past-president.

Royal Institution.—General monthly meeting.

TUESDAY, APRIL 2.

Institution of Civil Engineers.—At 8 p.m., ordinary meeting. Paper on "The Burrator Works for the Water Supply of Plymouth," by Mr. Edward Sandeman.

WEDNESDAY, APRIL 3.

Institution of Junior Engineers.—At 8 p.m., "Works Management," by Mr. A. H. Barker, Wh.Sch. (lecture V.).

THURSDAY, APRIL 4.

Civil and Mechanical Engineers' Society.—At 8 p.m., ordinary meeting. Paper on "The Proportions of Cylinders for Multiple-Expansion Engines," by Mr. A. Hanssen.

SATURDAY, APRIL 6.

Glasgow and West of Scotland Scientific Society.—General meeting.

Westminster.—The Westminster City Council yesterday unanimously elected Mr. James Wm. Bradley to the appointment of city engineer and surveyor. Since 1895 Mr. Bradley has occupied the same position under the Corporation of Wolverhampton.

MUNICIPALITIES AS EMPLOYERS.

A few days of east wind ought sometimes to be esteemed "a boon and a blessing to men," in that it provides an adequate excuse for grumbling. It may not be believed, because the necessities of life lead to the probability of grumbling rather than praising, but we are altogether in favour of praise. Yet how can you praise actions that, upon the face of them, savour of injustice, or neglect to chronicle them in favour of some detail that affords a chance of praise? Municipal employers in the "loomp" are fairly good, but there are many exceptions to the rule—exceptions that cause men to live a life of slavery and deceit. The one great fault of municipalities is that they pay too little and expect too much. They seem to have no sense of proportion, paying a man who has little or no responsibility as much as the man who has responsibility, and upon whose efforts and knowledge success or failure depends. Municipalities, again, do not always realise the fact that upon the ability and experience of a man in one of the great spending departments depends the whole question of economical or expensive work. We do not wish to restrict our remarks altogether to electric light or tramway engineers, in that specific examples might be taken as tending to personalities. It is easy to see, however, that very much depends upon the design of a sewage scheme, for example, if it is to be constructed and maintained economically. A poor design means greater initial expenditure and greater cost for maintenance. Quite recently a well-known engineer designed a water-supply scheme, and reported in favour of a tender not the lowest. The report was based upon a careful examination of the working expenses, as well as the initial cost, and the former were much less with the apparatus supplied by a contractor whose tender was not the lowest than by the contractor whose tender was lowest. The council concerned, impressed with the outcry of not accepting the lowest tender, and not strong enough to act for themselves, to save responsibility called in another eminent engineer, whose report fully bore out that of their own engineer, so we suppose the contract will be given in accordance with the original report. This brings us back to the point we desire to mention. A municipality should, in the first place, be sure that it employs a competent consulting engineer, and when he is employed let him have a free hand, and give him full and complete confidence. It is necessary for someone to enter an emphatic protest against a plausible action which is gaining ground, the criticism by rival consultants of the plans of the consultant employed. The whole question is difficult, in that an incompetent scheme ought to be nipped in the bud, but when a rival merely disagrees with a scheme that a competent engineer has designed, he ought not to be heard. Great harm has been done and is being done by these irrepressible critics. The individual members of councils are not experts, and the position of a consulting engineer is not an envious one if his employers are brought into that frame of mind which makes them doubtful of his every action and suggestion. The only other point we have room to mention is the

Digitized by Google

disastrous policy of procrastination. An official doing good work and giving every satisfaction is largely underpaid. Naturally, he knows his work, and seeing a position of greater remuneration open, goes for it and possibly gets it. The result may be a total reorganisation of the department, and the increase of expenses double or treble what would have kept the experienced official. The reorganisation, too, is frequently disastrous, duties being put into the hands of the wrong man, and generally an enormous addition of clerical work, red-tape, and inefficiency. Those who run may read.

ELECTRIC RAILWAYS.

BY MAJOR P. CARDEW.

The concluding lecture of this series of Cantor lectures was delivered by Major Cardew at the Society of Arts on Monday last. The first portion of the lecture was devoted to the consideration of the advantages and disadvantages of the direct-current system and of the polyphase system. The balance of advantages was held to be in favour of the polyphase system. It was pointed out that in the equipment of the transformer stations on the different systems the three-phase system had the advantage that no moving machinery was required, whereas with a direct-current system, not only static transformers, but usually rotary transformers, were employed, the static transformers having, of course, no moving parts, but the rotary converters have. The latter are generally used to obtain a direct current for the motors actuating the cars. Such apparatus can be made very efficient, but it requires skilled attention. Accumulators, too, might be used with the direct-current system, and by their means the fluctuating demand required by the motors could be supplied, although the machinery at the generating station would get a more uniform load. References were made to Mr. Grindle's recent paper read before the Manchester branch of the Institution of Electrical Engineers. A direct-current system is essentially a two-wire system, thus having an advantage over the polyphase, which is a three-wire system. Then, again, with a direct current and the use of a battery the plant both at the generating station and at the sub-station would be of less capacity. Further, with a direct current there is no idle current, while the polyphase probably has to be allowed a generation of 15 per cent. more than is wanted. In the machinery required for a constant-current plant the clearance in the machines may be less. On the whole, as we have said, the summing up was in favour of a polyphase system, and especially as it requires a simpler plant equipment, particularly in the sub-stations, thus reducing initial cost and also working expenses, in that no attendance would be required, for instance, in the sub-stations. A voltage up to 3,000 could also be used, and as a line would be overhead, and there would be no trouble about bonding, the sub-stations might be further apart. The speed of the train would be governed by the periodicity, and the return energy would be greater in the polyphase than with the direct-current system, so that altogether it was more suited to full-sized railways.

The latter part of the lecture was devoted to the consideration of a practical example. The lecturer took for his example a circular railway adapted for large suburban traffic, connected with the main line, some 50 miles long, ending at a large town where there was also some local traffic. It was assumed the train should run on the suburban lines for 15 minutes and on the main line for half an hour, the express trains to stop twice on the main line between what may be termed the two termini, there being on the main line a number of smaller stations to be served otherwise than by the express trains. The weight of the trains was also assumed, and it was shown how many trains would be required for such a service, the power and energy that would be required, and the differences that would arise when a 60-mile-per-hour rate was adopted on the main line, with the alternative of a 40-mile-per-hour rate or a 30-mile-per-hour rate on the suburban lines. The conclusion was that, while a 30 mile-per-hour rate might be a little more economical, it would be less popular, and that the greater popularity of faster trains would make the faster service preferable.

We can only refer thus generally to this exceedingly interesting lecture, because for its full value it would be necessary to give the complete figures. These will be published in due course. The lecturer concluded with a rough estimate as to the cost at the present prices of materials for a scheme such as that disclosed by the author. He estimated the generating stations to cost £325,000, sub-station £62,000, mains £160,000, line equipment £228,000—total £775,000. The rolling-stock, if new, would come to about £424,000.

Prof. AYRTON moved a vote of thanks to the lecturer for his course of lectures upon one of the most interesting subjects and one of the most important at the present time that could come before the society. The vote was carried by acclamation.

PRACTICAL NOTES ON ELECTRIC MAINS.

BY A MAINS ENGINEER.

(Continued from page 373.)

5.—House Services and Installations.

The work of making house services always belongs to the mains engineer's department, but it is usually only on the smaller supply systems that he has also the installation work. On the larger systems there is an installation inspector, who takes over all the work beyond the meters. It would seem to be a better arrangement that the mains engineer should have the direction of the installation work on all systems, whatever their size, as when an installation is connected to the mains it becomes a part of the mains; therefore if the mains engineer has the direction of testing installations, he is in a better position to say exactly how his mains stand for insulation and for load. This is particularly the case with regard to three and five wire networks, where good balancing plays an important part in the general good working.

Many chief engineers do not trouble themselves much about the installations which they connect to their mains beyond the one test for insulation to earth. They say that it is nothing to them what sort of work a consumer pays for so long as the insulation is good. This, however, is quite a wrong notion for any engineer to hold, as he must or ought to realise that he would get more consumers were he to exert himself on the behalf of people likely to come on. Such people know very little about electrical installations, and would often be made very happy if they knew that a competent official was watching the work and material put in by their contractors; such engineers would certainly watch the work and material where free wiring was in practice. If the work is watched by the supply officials it might tend to raise prices a little, but as every contractor in one town would be similarly treated, one would not suffer more than another.

If the installation is not watched in its entirety, there are at least four points which must have the attention of the supply officials: (1) The installation must be made to conform to the rules laid down by the fire insurance office in which the intending consumer is insured. The consumer should be distinctly told this before he has any work started—the responsibility for seeing that it does so conform may then be left to him. (2) After the installation is complete and before fuses are finally inserted, the P.D. should be tested at the farthest lamp with all the lamps switched on. (3) The insulation resistance of the whole installation to earth should be tested with no lamps in, but with all switches on. It is of no use to insert lamps for an insulation test, because the insulation resistance of lamps between filaments and collars varies very much indeed, so that although an excellent test might be obtained with the first batch of lamps, yet, after only one lamp had been changed, providing it was a bracket or other fixed lamp, a test giving no insulation resistance to earth might be obtained. (4) The type and capacity of the main switch should be absolutely decided by the engineer. We all of us know the thing called a five-

Digitized by Google

ampere main switch, so often used by wiremen on installations of about six lights, where there are no restrictions—things which fall to pieces after six months' use; which hardly ever make contact, even enough to carry five amperes, without overheating; and which are always liable to cause a short on account of their wretched little binding screws being so close to each other (in many cases not more than $\frac{1}{16}$in. divides their heads). It may be remarked here that it is not always the man who is a *bo'd fide* electrical wireman who puts in the best work. Very often better work will be obtained from an ironmonger or plumber, simply because the latter people do not know how to do bad work, and would be afraid to do it if they did. They therefore take special care until they, too, become learned in scamping.

There is very little else which need give the engineer much trouble on any installation, for the very good reason that there are now so many people engaged in perfecting electrical accessories. One point which perhaps needs special attention is the method employed to fix the lampholders on outside lamp fittings. These lampholders should always be insulated by means of porcelain or ebonite rings or bushes from the bracket or fitting. If the wiring is at all watched, the use of those small bits of casing called "crossing-over blocks" should be insisted on. These blocks are let into walls and ceilings flush wherever a joint is made on the wires, thus preventing the tapping from touching plaster, etc Sometimes the crossing over is done on the front of the main casing, but is extremely unsightly. These blocks are used only for instal lations carried out in casing. Wiring in casing on the surface is to be preferred to any other system of single-conductor work, and can be made to fit in so well with the decorations as to be anything but an eyesore Probably the very best system of wiring yet invented is Mr. Sam Mavor's concentric system so far as safety goes, but this system, with an earthed outer, could hardly be allowed on installations connected to public supply mains, and thus is of more use to owners of small private plants. If the engineer at any time draws up specifications for the wiring of his consumers' premises, he should certainly specify wiring from distribution boards, thus saving many joints. On some very large and excellent installations the use of distribution boards is carried so far that every single lamp has a circuit to itself, fed from a double-pole board. This, of course, materially increases the initial cost of an installation, but results in a first-class job.

The insulation test to earth is generally specified to be so much per 8-c.p. lamp, whether there are many lamps grouped or whether they are single lights; this is not right, and is hardly fair to the contractor, as it will easily be seen that it is much more difficult to get so good a test in the latter case as in the former. The insulation test for motors again requires a separate table. The insulation between the windings of a motor and its frame or shaft very often comes out very low, and it is usual on some supply networks to insulate the frame or bed-plate of the motor from earth to get the required test. This should not be allowed, especially now that the use of 400 volt motors is allowed. With these motors the frame should in all cases be directly connected to earth. Starting resistances for motors should always be insisted on, to obviate as much as possible the flickering of the lights caused by suddenly switching on a motor, which is more perceptible on alternating than on continuous current networks For connection to three or five wire networks the installation should be evenly balanced, and as many pairs of wires brought to the main cut-outs as there are circuits. According to the number of circuits—two, three, or four—so will be the number of meters required and the number of conductors from the supply mains.

Turning to the question of the service, which belongs to the supply company, we have to consider the service joint-box, the service cable, the main fuses, and the meters; also, for high-pressure services, the transformer. The service joint box should always be of a disconnecting type, not by means of fuses, but by means of links coming fairly near the top of the box. Such disconnecting boxes are very useful when it is desired to test a length of main at night-time, as it would not otherwise be possible to separate the conductors in the main owing to transformer windings and meter shunts, and without this separation not much testing can be done. Service cable should always be concentric in form, the outer conductor being the neutral and sometimes earthed wire. If single-conductor is used, more especially if it is also armoured, there is great risk of burning holes in gas and other metallic pipes inside the building. Such burning of metallic pipes inside buildings could occur if the insulation of one of the service conductor cables, other than an earthed conductor, broke down charging its own armour, which would be insulated somewhat if laid solid, the charged armour then sparking to any pipe which it touched. If this sparking should occur between the armour and a gaspipe on the main side of the gasmeter, disastrous results would probably ensue. The use of concentric cable would go far to eliminate such occurrences. At any time, however, it is best, but not always easy, to keep away from gas and water services.

The armoured service cable should, as soon as possible after entering the building, be taken into an iron fuse-box, the armour of the cable being taken right into the box, thus preventing as far as possible the tapping of the service on the main side of the meter. Probably the best description of armouring for service cables is in the form of plaited steel wire. This form ensures easy bends. The cable should also be lead-covered if it is not laid solid, but should not be lead-covered if used for continuous-current work. The main fuses should be enclosed in an iron box capable of being sealed. The binding terminals should be provided with sweating thimbles, and the binding screws for the fuses should be amply large and strong, all screws and nuts being made of brass or gunmetal. The box itself should be divided into compartments by means of insulating bridges to prevent sparking across the poles; or separate boxes should be provided, one for each pole. The fuse box or boxes are best mounted on a hardwood board, so as to obtain some additional insulation from earth. The board should be painted with asbestos paint, and on this same board the meters can be fixed.

Of meters there are many, but not so many that do not give considerable trouble. Those that are excellent in an electrical way fail mechanically, and *vice versâ*. Also meters that have permanent magnets go wrong, because the magnets lose their magnetism, thus giving a large plus error. The meters that give the best results, and which are mostly in use, are the Aron meter, the Chamberlain-Hookham meter, the Westinghouse meter, the British Thomson-Houston meter, and Messrs. Johnson and Phillips's new meter. The first and the last named are clockwork meters, and, in the writer's opinion, give the best results electrically, although they do not conform to simplicity of design mechanically. The Chamberlain and Hookham continuous-current meter is decidedly good, and, as there is very little friction, starts easily with a very small current—a thing greatly to be desired.

For alternating currents, the Westinghouse and British Thomson-Houston meters give excellent results, and if the writer had many meters to instal at the present time he would use these two, and of these two giving the preference to the Westinghouse, on which reliance can always be placed. Simplicity of design and absence of many working parts are points to be sought after, and inventors would do well to turn their attention into this channel. The maximum demand meter is another most useful meter, and must not be left out of consideration, but seems to be rather an excessive cost in a service. The demand meter should certainly be included in the same case with the watt-hour meter. Messrs Johnson and Phillips have gone some way towards this end by providing an ammeter scale in their new meter, but it is not recording. All meter cases should be provided with a small glass window opposite the meter discs or other moving parts, so that the working of the meter can be easily seen without having to remove the case.

All meters before being fixed on the circuit should be tested at the supply works, as, although each meter has its test sheet sent with it, yet in many cases they arrive with large errors, in some cases 35 per cent. out, either minus or plus. Most meters can be set to record within 2·5 per cent. from light load to half load, and from half load to full load, the error at light load being minus, and at full load plus. Meters should be tested with a good standard wattmeter in circuit, and the test can be made on meters with revolving discs by counting the disc revolutions during a certain time, using also the constant of the meter which is supplied by the makers. Other meters have to be tested by front dial

Digitized by Google

readings, and should be allowed to run for some considerable time to eliminate error as far as possible. When installing meters, they should be secured to a seasoned hardwood board; as many meters are sent out with bad insulation between their windings and case. The hardwood board will thus give additional security. Three and five wire meters do not give good results unless all circuits are in use at the same time.

For a high-tension service from an alternating supply, the service cable must be concentric, must be well protected, and must not show inside the building. Where the service cable enters the building, a small firebrick chamber should be built to contain the transformer, and the service cable should enter this chamber direct. Transformers can be obtained in iron cases, with the cases specially designed for leading in a concentric cable, division being effected inside. This is a good arrangement if the service joint-box on the mains is of switch type, but if not, the cable must enter some sort of switch-box before passing into the transformer, otherwise the transformer could not be handled. It is an easy matter to design a suitable switch-box for this purpose. At the time of laying the service cable an earth wire stranded $^7/_{16}$ must be laid also, one end of it being attached to the water-main in the road and the other end to the transformer case. A Cardew earthing device must also be fixed inside the brick chamber and connected to one lead of the secondary winding of the transformer and to earth. The secondary leads then pass out of the brick chamber to the main fuses and the meters in the ordinary way. The brick transformer chamber should be provided with an iron door, which must be padlocked and the key removed.

(To be continued.)

THE SIEMENS ENGINEERING SOCIETY.

The annual conversazione of the above society was held on Wednesday last at the Charlton Assembly Rooms, which were tastefully decorated for the occasion. According to the rules of the society, only members of the staff of the well-known firm of Messrs. Siemens Bros. and Co. are allowed to take part in the meetings of the society, at which papers are read and discussed on engineering subjects. This rule is always suspended for the conversazione, and the council of the society invite a number of old friends who, by holding positions in other firms, are no longer eligible for membership. In consequence of this, the conversaziones are most pleasant reunions, and the one held last Wednesday was, if anything, more successful than its predecessors. The good programme of music was interspersed with an exhibition of the cinematograph by Mr. J. Peschek, and two exhibitions of conjuring by Mr. C. Volcard. Amongst the scientific exhibits was a thermo-magnetic motor, which illustrated clearly how the magnetic properties of iron disappear at high temperatures. It consisted of a thin ring of iron passing in front of two poles of a small electromagnet. The part of the ring between the two poles was, of course, magnetised. A blowpipe flame was applied to the ring opposite one of the poles, with the result that the ring moved, the direction of motion being from the pole at which the heat was not applied towards the flame. This motion was, of course, slow, as it took an appreciable interval of time to heat up the thin ring to a temperature at which it became non-magnetic. A number of interesting alternate-current experiments were arranged, but an interruption in the supply current to the assembly rooms prevented these from being on view for a considerable portion of the evening. The other attractions in the way of scientific experiments included Röntgen rays, the harmonograph, a number of pendulum experiments, including one which showed the reaction of one pendulum on another near it having the same periodic time. A number of gyrostatic experiments were performed, while one member of the staff showed himself exceedingly proficient in blowing bubbles. Amongst the art exhibits were a number of Japanese swords and sword guards, and some relics from the Boer war were also on view. The Siemens Engineering Society are certainly to be congratulated on the most enjoyable evening's entertainment provided, which was fully appreciated by all present.

Personal.—Mr. C. H. Wordingham, who has acted as borough electrical engineer since the commencement of the electrical supply in Manchester, is now taking up work as consulting engineer, and will open offices at 19, Brazennose-street, Manchester, on April 1, where we trust he will meet with every success.

QUESTIONS AND ANSWERS.

If thou hast knowledge, let others light their candle at it.

Under this heading we insert questions and answers of a practical character relating to central-station work, tramway work, or construction work; and for each suitable question offer *one shilling*, and for the best solution of any question we offer *ten shillings*. We also give *five shillings* for every other answer we print. The answers to any question should be sent within 10 days after the question has appeared. We would call the attention of those sending in answers to the fact that the neatness of any sketches (which must be in *ink*) sent in is considered when marking the relative values of these answers. All formulæ should be carefully written to prevent mistakes as to symbols, and all loose sketches should be signed by the author. The matter must be written on one side only of the paper. Questions may be sent at any time.

Questions.

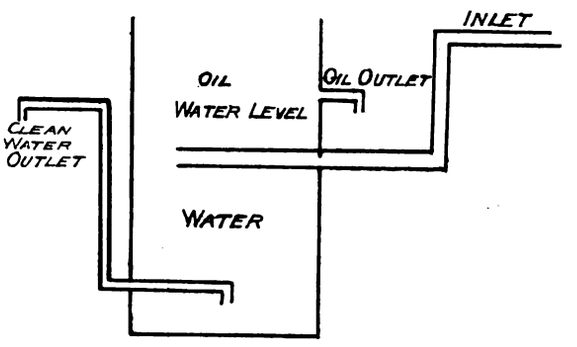
363. In wiring an installation we had 11 lights in a row, the first light on one switch and the remaining 10 on one switch. We wired the 10 lights, each light a loop off the previous one, and the first light we looped one pole and brought a switch wire from the other. On switching on the first light it lights perfectly, but on switching on the 10 lights it goes out, and on putting the 10 off it relights. The current is continuous and the pressure 100 volts. Please explain this.—A. H.

364. A four-pole, steel-clad, ventilated motor is capable of giving 20 b.h.p. continuously, without the temperature rise exceeding 80deg. F. at 800 revolutions per minute at 400 volts. What power will it be capable of giving continuously for six hours if entirely enclosed and airtight for working among explosive gases?—T. R.

Answers.

Question No. 357.—Can any reader recommend a thoroughly reliable feed-water filter which will take out all oil from surface condensed water? The condensed water as it leaves the air-pump has a very milky appearance, the oil being very intimately mixed with it. The oil is a mineral oil drawn up the low-pressure piston rods by the vacuum.

Best Answer to No. 357 (*awarded* 10*s.*).—To free water entirely from all kinds of oil is not a very simple problem, because water can dissolve a small percentage of some oils, but with a purely mineral oil there is very little difficulty. However, mineral oil can so easily dissolve vegetable oil, etc., that it is not easy to say for certain that a sample of mineral oil is pure. My own experience in the matter of purifying boiler feed waters is that the best way to get rid of the oil is by taking advantage of the action of gravity. This I do by means of the simple apparatus illustrated in section below. The tank must be large enough to allow



the mixture of oil and water to remain quiet and free from any agitation, so that the water may collect at the bottom and the oil float on the surface of the water. The inlet pipe must be fairly large, so that the incoming stream may have very little or no force. The side of the tank acts as a baffle plate, and separation begins at once, the oil naturally floating to the surface. The outlet as shown collects the cleanest water, and, being bent up outside the tank, maintains the proper level inside by hydrostatic action. The layer of oil on the top of the water may be drawn off by means of the oil outlet.

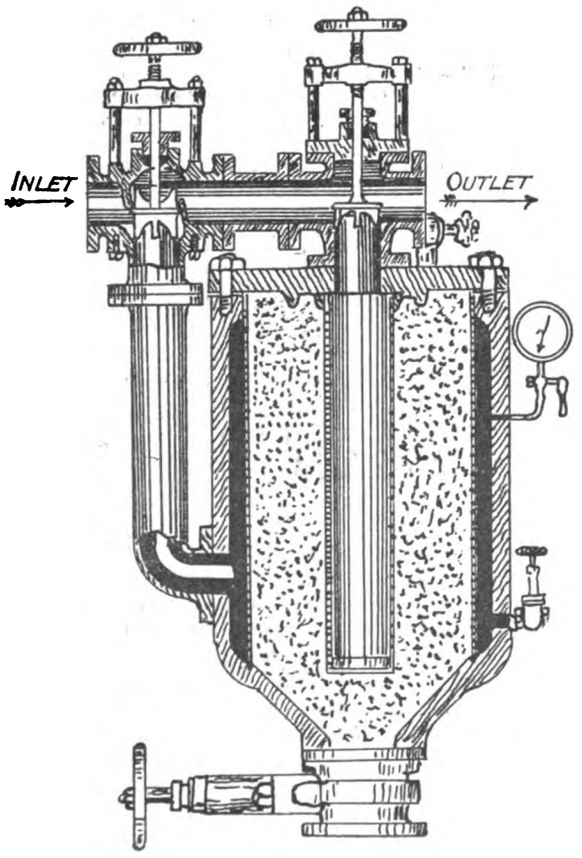
The oil outlet should be provided with a tap. In some cases the above apparatus is all that is necessary, and the water will come out clean and bright, while the oil may

Digitized by Google

be collected as convenient and used again, but in other cases the water is not bright. If perfect clearness is required, the water must be filtered through flannelette, the inside surface (or upper surface) of which has been carefully and thoroughly smeared with wet light carbonate of magnesia. Filtration through this is very rapid and effective, and the materials of the filter are cheap, but, of course, they must be kept clean and occasionally renewed.

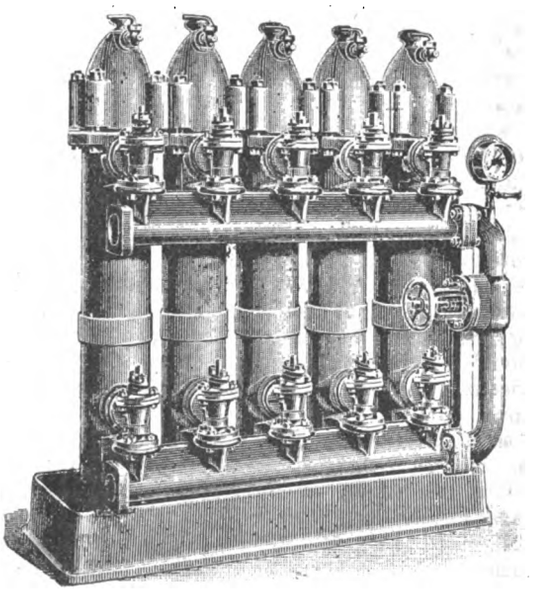
If any vegetable or fish oil should be present, it will probably be decomposed by the heat of the steam into glycerine and a fatty acid. The glycerine is perfectly soluble in water, but the fatty acid is not. It would, therefore, be easily separated from the water by the above treatment. As filtering is always more or less tedious and troublesome, I would just mention before leaving the subject that often a dirty water may be clarified by adding to it some insoluble powder—such as sand or carbonate of lime—stirring all intimately together, and then allowing time for settling, when it will be found that in falling the heavy particles have taken the lighter ones with them to the bottom, and so have left the supernatant liquid quite bright.—F. G. A.

Answer to No. 357 (*awarded* 5*s.*).—The latest type of Reeves feed-water heater is one of the best in the market, and is in use in many stations throughout the kingdom, and in several cases repeat orders have been the best testimonials the makers could receive of its successful working. The filtering material is coarse sawdust. A section of the filter is seen below. There is a perforated pipe placed inside a cast-iron cylinder having a part of the space



between the tube and cylinder filled with compound sawdust. It will be seen that there is on top an arrangement of valves which serve as a by-pass, and permit the water, if desired, to be passed direct from pump to boiler without passing through the filter. The water passes from the inlet valve to an annular space inside the cylinder formed of a thin Muntz metal perforated partition lined internally with wire gauze. The gathering tube is fixed centrally, and consists of a perforated open-ended steel cylinder covered externally with wire gauze. The entire space between the inside of the internal perforated cylinder and the gathering tube is completely and tightly packed with coarsely granulated softwood sawdust, through which the feed water slowly percolates. The caked sawdust entirely absorbs all oil, the purified water alone passing to the boiler. No pressure, other than that resultant from boiler pressure, will be indicated by the pressure gauge attached to the filter until the filtering medium becomes fully charged with oil and other impurities, when, the pressure commencing slowly to rise, the sawdust requires changing. When it is required to change the sawdust, the slide valve at the bottom of the filter is opened, the inlet and outlet valves closed, and the two small valves on the top of the filter, which are connected to pipes leading to the water space in the water, are opened. The pressure of the hot water gradually forces the dirty sawdust out of the filter and thoroughly cleans it. These valves and the bottom sluice valves are then closed, and the filling-hole covers on the top of the filter taken off. Into these holes fresh sawdust, mixed with water until it is the consistency of thin porridge, is poured until the filter is full. These covers are then readjusted, and the filter is then ready for use.—A. B.

Answer to No. 355 (*awarded* 5*s.*).—The Pulsometer Engineering Company manufacture a "grease filter" which gives excellent results in connection with surface condensers. It consists of a number of iron cylinders arranged in parallel with each other, through which the water is forced on its way from the pump to the boiler. On reference to the sketch it will be seen that the feed water can be by-passed, if desired, by the arrangement at the side. The water flows along the pipe at the top of the filter through the vertical cylinders and out at the lower horizontal pipe. Each of the vertical cylinders is filled with a bag containing some suitable filtering material, which, when the filter



has been in use some time, can be easily withdrawn and removed by diverting the water from the filter, unscrewing the tops of the vertical cylinder, and taking out the bags of spent material and renewing them with others. In this type of filter it is possible to get a very large filtering surface, and at the same time a slow rate of flow of water through the filter itself.—F. B. A.

Question No. 358.—In power transmission work is there any advantage in generating two-phase currents and transforming them up to three-phase for transmission? Also again transforming down and to two-phase current for distribution? Give a diagram of the transformer connections.

Best Answer to No. 358 (*awarded* 10*s.*).—The problem can best be considered along the following lines: (*a*) what the advantage would be of transforming two-phase currents to a high tension, transmitting them over a distance at this tension, and transforming them down again for distribution; (*b*) whether any further advantage would be gained by so arranging the transformers that a three-phase current was produced for transmission, this being reconverted to two-phase at the further end of the line.

With regard to the first point, there are the opposing considerations of the first cost of transformation—both in prime cost of apparatus and loss of power in conversion—

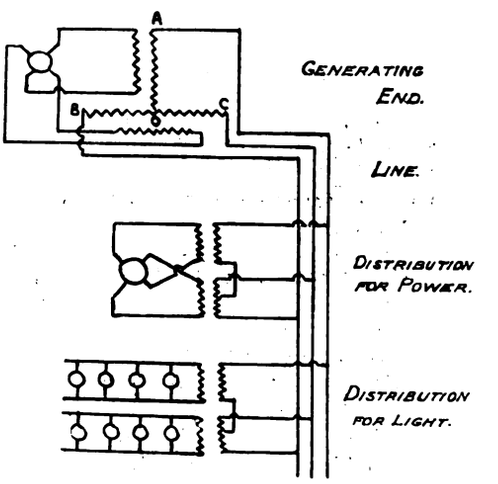
TABLE A.

System.	Two-phase four-wire.		Two-phase three-wire.		Three phase three-wire.	
Conditions.	Effective pressure, 5,000 volts. Line loss 10 %	Voltage drop 10 %	Effective pressure, 5,000 volts. Line loss 10 %	Voltage drop 10 %	Effective pressure, 5 000 volts. Line loss 10 %	Voltage drop 10 %
Effective volts at motor	5,000	5,000	(a) 3 550 (b) 5,000	(a) 3 550 (b) 5,000	5,000	5,000
Effective volts at power station	5,500	5,500	(a) 3 962 (b) 5,590	(a) 4 050 (b) 5 500	5,288	5,500
Line loss in watts	5,000	7,100	(a) 5,000 (b) 5,000	(a) 6,050 (b) 4 270	5,000	8,700
Drop to volts	500	500	(a) 412 (b) 590	(a) 500 (b) 500	288	500
Ratio of weights of copper	1·0	1·0	(a) 1·478 (b) 0 737	(a) 1·204 (b) 0·853	0·755	0·435

opposed to cost of copper conductors and loss of power due to C^2R effects. The actual initial costs of the two alternatives are determined by the conditions of each scheme considered. Chief among these are the length of line of transmission and the method of carrying the conductors. If underground cable is used, the comparative cost of conductors will be made of three factors: (1) a practically equal amount in both cases for trench work; (2) the cost of the manufactured copper; (3) the cost of insulation round the copper, which may vary widely in the two cases. If the conductors are carried overhead, it must be remembered that in addition to the difference in price of the copper wire in each case due to the difference in section, the weight of the heavier conductors will necessitate stouter posts, insulators, and stay wires, and possibly more of them due to shorter spans being necessary. The actual comparative cross-sections of the wires, with and without transformation, depend eventually on the price of power at the generating end. For example, if free water power is available, then a great amount of waste can be allowed in transmission with financial advantage, whereas if coal and water have to be paid for, the losses in transmission must be as small as possible; and in such cases a 90 per cent. efficiency of transmission is not an unusual stipulation to make. Yet another consideration may affect the comparative values of transforming or otherwise. It may be desirable to keep a high and constant voltage at the distributing end of the system. In this case it is necessary, first, that the voltage drop along the line at full load should not be great, say 5 per cent.; and, secondly, that adequate engineering precautions be taken to avoid breakdown along the line due to high voltage, and to secure safety to machinery and life if a breakdown does happen. All these considerations point to the probability that in long-distance transmission of power it is a distinct advantage, so long as the limits of safety are not exceeded, to transform up to the line and reconvert down again for distribution. The correctness of this belief was first demonstrated in 1891 by the success of the Frankfort-Lauffen three-phase transmission scheme, and since then a large number of installations for long-distance work have been completed, both on the Continent and in America. Their financial success proves the first point we are considering.

With reference to the question of phase transformation, it is necessary first to discuss the relative values of two-phase and three-phase machinery for power purposes. As regards generators and motors, two and three phase machines have about the same efficiency, weight, starting torque, and apparent watt consumption for the same output. Possibly the two-phase type is simpler in winding details. If the transmission scheme is strictly for power purposes at the distributing end, then the three-phase system is as good as the two-phase as regards pressure regulation between the phases, as the load will certainly be equally distributed. But if it is required to distribute for lighting also, the two-phase system is better, because if the two circuits are kept separate, they are as easily dealt with as single-phase circuits. As far as the line is concerned, however, the three-phase system is better. This can be seen from the following comparative figures, which have been abstracted from a valuable table compiled by Mr. A. T. Snell. A concrete example has been taken—the transmission of 50,000 watts (at receiving station) under the conditions of constant effective pressure at the receiving station with either a constant line loss of 5,000 watts (10 per cent.) or constant drop of 500 volts. Three systems are here compared: (1) two-phase, with four transmitting wires; (2) two-phase, with three wires—*i.e.*, the currents of both phases flowing through a common lead on one-half of their circuits; (3) three-phase, with three equal wires. The comparative weights of copper are given in Table A.

In the two-phase three-wire system the comparison will be altered if we consider the effective pressure to be 5,000 volts (*a*) with respect to the working pressure in each circuit, or (*b*) with respect to the component pressure in the common lead, which, of course, will be subjected to wider fluctuations of pressure than the two other leads during each period. Both these cases are shown.



It appears, then, that so far as distribution for power and lighting purposes is concerned, the two-phase system is superior; while for transmission alone, a three-phase line is better. Hence if we can combine the two systems as suggested in the question, we secure the advantages of both and eliminate the drawbacks. This has been done in the Niagara-Buffalo transmission scheme, in which power is generated at 5,000 volts (two-phase currents), transformed up to 11,000 volts and carried in the form of three-phase currents overhead for 15 miles, and then transformed down and back again to two-phase currents for distribution for power and lighting; with only a 5 per cent. voltage drop on the line and a power factor throughout the day of 95 per cent. (the load is very constant). The arrangement of transformers is due to Mr. Scott, chief electrician of the Westinghouse Company, and is as shown: The device for transforming two-phase into three-phase consists of two transformers, one connected to the middle point of the other. The former has 87 turns, as compared with 100 turns of the latter. Hence the arms, A O, B O, C O, would have E.M.F.'s in the ratio $50\sqrt{3}$, 50, and 50, if the impressed voltages were in the same phase. But since A O receives its impressed E.M.F. a quarter period earlier or later than B O and C O, the practical effect is that equal voltages are induced in the three arms, differing equally in phase between themselves; hence a three-phase current is produced. The reverse action takes place in the trans-

Digitized by Google

formers at the other end of the line, reconverting into two-phase currents.—J. A. S.

CATALOGUES.

We have received from the General Electric Company (1900), Limited, a tenth edition of their "S" catalogue, which includes

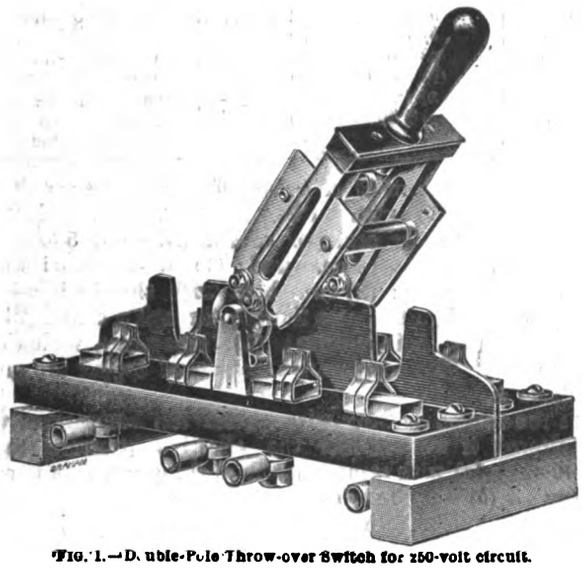


FIG. 1.—Double-Pole Throw-over Switch for 250-volt circuit.

switchboard accessories and incandescent lamps. There are in this new edition a large number of novelties which we are obliged to pass over without even a casual reference. We note, however, that special features are made of new types of switch gear for carrying heavy currents on high-voltage circuits. In Fig. 1 we illustrate one of these, which would be used for throwing over the load from one supply company to another. In this "Peel" switch the contact bar is not rigidly connected

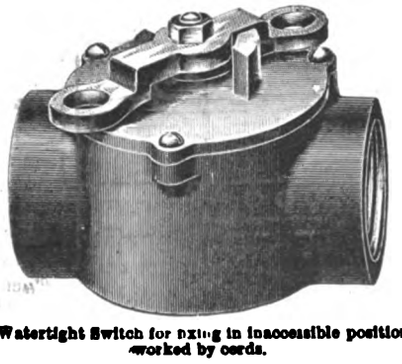

FIG. 2.—Watertight Switch for fixing in inaccessible positions, to be worked by cords.

to the handle, and is quite insulated from it. The spring between the handle and the contact bar serves to give a quick break when interrupting the circuit. The various parts of the switch are well proportioned, the conductivity being such that it is equivalent to a density of about 800 amperes per square inch in pure copper. These switches are mounted in both single and double pole, and can be combined with fuses for the main switchboards of installations taking their supply from the public mains. They are standardised for all currents from 30 up to 1,000 amperes. Amongst other new switches we find a rectangular battery-regulating switch listed in four sizes, from 8 to 20 ways, and a high-tension 10,000-volt switch, having only the lever accessible, whilst the contacts, which work in an insulated tubular air chamber, can be placed at any distance away. A new watertight switch for incandescent lamp-posts is shown in Fig. 2 for five and ten amperes, mounted in a cast-iron case, tapped to take the barrel, and provided with a lever arm for manipulation from the pavement; also four new arc lamp-post switches for various functions. Turning to smaller things, we notice a new pressel, readily manipulated with one hand; a dust-proof floor socket, with automatic arrangement for closing the holes on removal of the plug; a china adaptor, fitted with fuse terminals; "loop-in" ceiling roses; a new "side-contact" ceiling rose, with double-potential fuse terminals; high-tension distributing boards, with "lined chamber" fuses; and an excellent series of watertight house service and tramcar cut-outs for 110 volts and 500 volts.

We notice amongst the accessories for arc-lighting work the "isolating" switch (shown in Fig. 3), which both isolates the lamp from the circuit and at the same time introduces a resistance, so that the conditions of the circuit are not varied to cause interruption in the working of the rest of the lamps. This switch is mounted in a cast-iron case, and can also be fixed high up on the poles, so that it is not easily tampered with by the man in the street. Amongst the new types of cut-outs we find the one shown in Fig. 4. In this case the fuse consists of an ordinary fuse wire, which is wound in a spiral groove on a china core. In the middle of this core is a chamber, which is so arranged that the cooling of the fuse is least in this space. In consequence, when an excess current passes, the rupture always takes place in the middle. The large amount of cooling surface then prevents the arc from being maintained. The china core and fuse wire are contained in a glass tube for the smaller sizes,

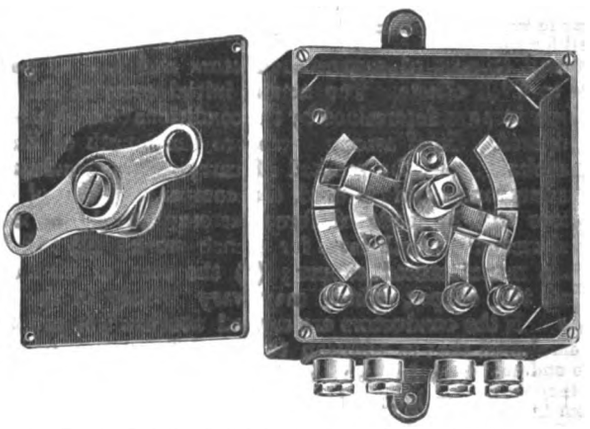

FIG. 3.—Isolating Switch for Arc Lamps for Street Lighting.

and in a heavier tube of china for fuses for larger currents. The illustration (Fig. 4) shows one of these new cut-outs in a cast-iron case such as would be required when bringing a 500-volt supply from the street mains into a motor. The last portion of the catalogue is devoted to the lampholders manufactured by the firm, and to the "Robertson" lamp. At the present time this lamp is so well known that any detailed reference to it would be superfluous. The fact that the Robertson Lamp Company have recently added a large wing to

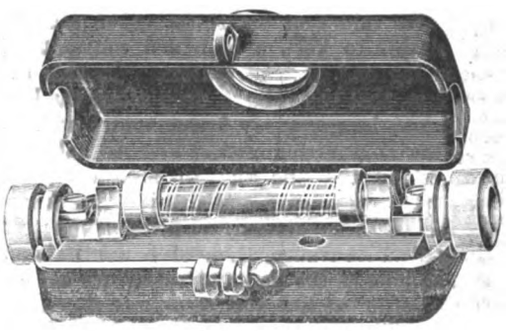

FIG. 4.—500-volt Cut-Out in Cast-Iron Case.

their lamp factory is sufficient evidence of the good qualities of the lamps supplied.

COMPANIES' MEETINGS AND REPORTS.

HOVE ELECTRIC LIGHTING.

The annual general meeting of the shareholders was held on Monday at the Cannon-street Hotel, Colonel A. J. Filgate presiding.

In moving the adoption of the report, the **Chairman** expressed a hope that the shareholders would be satisfied with the result of the past year's working to Dec 31 last. Another Babcock and Wilcox boiler had been ordered for erection this summer, and with this addition the directors hoped to be able successfully to meet the demand for electric current during the ensuing winter. It had for a long time been clear to them that the resources of the present station would at no distant date prove insufficient to meet the rapidly growing business of the Company, and timely steps had been taken by the Board to select a site for a new station. After considerable enquiry they found a suitable piece of land immediately adjoining the railway. The plans for the new station were now matured, and the directors hoped to lay them forthwith before the Corporation of Hove. When the latter's approval was received it was at once intended to place the work in hand. A considerable tract of land had been acquired, and the station was so designed that it could be enlarged to such extent as might be necessary to meet the requirements of the undertaking for

Digitized by Google

a number of years. The scheme would involve considerable outlay, but not more than the progressive nature of the business demanded. When the new station was in working order they would be able to meet any demand likely to arise, and would then have to consider what reduction they could make in their charges As he stated last year, the directors agreed to supply customers on the 220 volt pressure at 7d. per unit for the first hour instead of 8d , and this had led to a good number of customers changing over from the 110 volts. The Corporation of Hove had steadily opposed the alteration, and apparently had done a good deal to prevent the Company's customers from changing to the higher voltage; indeed, recently they had refused to allow any such change, although more than four years ago they authorised the Company to take on future consumers at the 220 volts. Why the Corporation had adopted this course he could not say, and if it were continued it would probably tend to prevent the Company from reducing their charges sooner than would otherwise be the case. The directors would, no doubt, have to issue fresh capital this year in some form. The continued increase in the business spoke well for the Company's prospects.

Colonel H. Wood having seconded the motion, the report and accounts were adopted.

IMPERIAL TRAMWAYS.

The annual meeting of the shareholders was held on Saturday at Bristol.

Mr. George White presided, and, in moving the adoption of the report, said he believed that a sale of the Darlington tramways would shortly be made upon terms which would be mutually agreeable to the Corporation of Darlington and to the shareholders of the Imperial Tramways Company. With regard to the Reading tramways, the Board of Trade had appointed Sir Frederick Bramwell to determine the price to be paid by the Corporation for the undertaking, but in the meantime the Corporation had enquired if they were willing to suggest some reasonable price for agreement in order to obviate the necessity for an arbitration. He need hardly say that the directors were giving that subject consideration. Turning to the Middlesbrough, Stockton, and Thornaby electric tramways undertaking, the receipts were exceedingly satisfactory, and anyone comparing the number of passengers with the amount of money earned would readily perceive that they were giving the public of these three towns a wonderfully cheap service. They were constructing the extension of the Middlesbrough line to Clarence Ferry, and would open it in May. It was not a lengthy piece of line, but it would serve the Tees ferry connecting Middlesbrough and Port Clarence, where there were no less than 5 000 people passing to and fro daily, and he had no doubt the extension would prove a useful feature of the general system, and that they would obtain a fair return upon the outlay of their additional capital. He would now like to refer to the London United Tramway Company's undertaking, in which the Imperial Company had taken a further interest during the past twelvemonth. On the whole, without going into the details of the exact position at this moment, they might take it from him that they had good grounds for believing that they would be able to give to Londoners the benefit of an important electric traction scheme in their western suburbs during the next few weeks. In summing up the position of the Imperial Company, he thought he might fairly say that during the past 12 months they had more than held their own upon a normal state of things, whilst now that their anticipations from London were so nearly approaching realisation, they might fairly look forward this year to another distinct advance

Mr. H. C. Godfrey seconded the motion, which was carried unanimously.

BOURNEMOUTH AND POOLE ELECTRICITY SUPPLY.

At the ordinary meeting of the proprietors held on Tuesday **Mr. Aymer H. Sandersen**, who presided, said he was glad to be able to state that the Board of Trade had refused to grant the order applied for by the Bournemouth Corporation in respect of private lighting, but they had granted an order enabling the Corporation to supply the public lighting. As, however, the Company had not supplied any public current, they had not been prejudicially affected. The secretary (Mr. H. B. Renwick) had prepared a valuable table showing the progress of the Company since 1891. This showed that they had a most progressive business, and the directors felt convinced that there was a bright future for the undertaking. The contract which they had entered into for the supply of current to the Poole and District Electric Traction Company would provide their own Company with what was so necessary for an electric lighting undertaking—a day load. During the year the Richmond Company had opened up an entirely new district, and carried their mains into Kew. In regard to the provisional order held by their own Company for the lighting of Poole and Branksome, the directors had hitherto delayed carrying it out for reasons which he need not mention, but they now proposed to consider this matter seriously, as they felt sure that there was in the neighbourhood in question a large and remunerative field for business.

The motion for the adoption of the report and accounts was seconded by **Mr J. A. Hooker.**

The **Chairman**, in answer to a question, said the directors quite agreed in the opinion which had been expressed, that the Company could supply current to the public lamps more cheaply than the Corporation of Bournemouth, who, however, like other corporations, had preferred to supply themselves.

The motion was carried unanimously.

BRITISH COLUMBIA ELECTRIC RAILWAY.

An extraordinary general meeting of the proprietors was held on Monday at the Cannon-street Hotel to consider a resolution for altering the articles of association by inserting a clause to the effect that upon any offer of shares to the public for subscription the Company or the directors on behalf of the Company may pay a commission at a rate not exceeding 10 per cent. to any person in consideration of his subscribing or agreeing to subscribe, whether absolutely or conditionally or procuring or agreeing to procure, subscriptions, whether absolute or conditional, for shares in the Company.

Mr. A. C. Mitchell Innes, who presided, observed that the enterprise was a prosperous and progressive one, and in view of the great strides which the business had made and their large number of customers, they would not, he thought, be surprised that the directors were asking for more money. The result of last year's working showed a substantial advance in the gross earnings, but the net earnings were a few hundred pounds less, there having been a material increase in the working expenses in consequence of exceptional circumstances. The net earnings would otherwise have been considerably more. Two extraordinary storms entailed a loss on the Company of about £1,500, and they had also suffered from the non-delivery of machinery. Throughout the summer they had been collecting customers for the electric light, and steps were taken to increase the machinery and plant in order that when the winter came the Company might be able to supply the increased demand. As the machinery was delayed the Company were put to considerable expense, and they had not been able to satisfy their customers as they had desired to do. He was glad to say that they had now ample machinery for their purposes, and before the winter the Company would be able materially to increase the supply. There had been a considerable increase in the railway business, and it would be necessary to have additional rolling-stock. It was calculated that the new money would yield more than the 5 per cent. preference interest upon it.

The resolution was carried.

BRUSH ELECTRICAL ENGINEERING.

Directors: J. B. Braithwaite, jun., M.I E.E. (chairman); C. E. Hodgkin; E. A Hopkins; J. Slater Lewis; J. S. Raworth; Reginald Ryley; R. Percy Sellon. Consulting engineer: J. S. Raworth.

Report of the directors (with abstract of accounts) for the year ended Dec. 31, 1900:

The profit and loss account shows an available gross profit of £61,732 8s. 9d. After deducting maintenance, general charges, interest on debenture stock, and interim dividend on preference shares for the half-year ended June 30 last, there remains a balance of net profit of £24 070 0s. 8d. The directors recommend that this sum be applied as follows: dividend at the rate of 6 per cent. per annum on preference shares for the half-year ended Dec. 31, 1900, £5 948. 3s. 6d.; dividend at the rate of 5 per cent. per annum on ordinary shares for the full year ended Dec. 31 1900, £9 521. 8s. 9d.; bonus payable to employés under profit sharing scheme, £2,098. 1s. 7d.; depreciation reserve fund, £5,000; balance carried forward, £1,502. 6s. 10d. Capital expenditure to the extent of £68 087. 2s. 11d. has been incurred during the year. The extensive additions to the Company's works and plant at Loughborough, which have been in progress during the past three or four years, are now virtually complete, and the directors anticipate that the Company will reap the benefit of the large expenditure that has been made on capital account in the increased facilities for economical manufacture which the works now afford. Complete electric cars, comprising trucks, motor equipments, controllers, and car bodies are now being manufactured at the Company's works, and the directors continue to look for a large and increasing business in connection with electric traction. In order to provide for the expenditure on capital account the directors have decided to offer for subscription 12 500 preference shares of £2 each and 20 000 ordinary shares of £2 each, particulars of which will be announced shortly. The Company's profits have been prejudicially affected during the past year by the high price of coal and materials generally. In pursuance of the agreement dated Jan. 3, 1901, between the Company and the British Electric Traction Company, Limited, adopted by the shareholders in general meeting on Jan. 14, 1901, Mr. A. Ayres, Mr. A. H. Sanderson, Colonel F. G. Stewart, and Mr. E. Woods resigned their seats on the Board, and Mr. C. Shirreff B. Hilton and Lord Vaux of Harrowden, nominees of the British Electric Traction Company, were elected as directors. Mr. R. Percy Sellon also resigned his position as general manager of the Company, and was elected to a seat on the Board. The offer of the British Electric Traction Company, Limited, to issue ordinary shares in exchange for ordinary shares of the Brush Electrical Engineering Company, Limited, on the terms set out in the agreement of Jan. 3, 1901 (above referred to), has resulted in their acquiring 15 584 ordinary shares of the Company. In consequence of an informality, the appointment of Lord Vaux of Harrowden and Mr. C. Shirreff B. Hilton as directors of the Company has become void. Mr. E. A Hopkins and Mr. Reginald Ryley have been elected to fill the casual vacancies thus occurring on the Board, and Lord Vaux of Harrowden and Mr. C. Shirreff B Hilton will be proposed to the shareholders for re-election at the general meeting. The retiring directors are Mr. J. B. Braithwaite, jun., and Mr. C. E. Hodgkin, who, being eligible, offer themselves for re-election. The auditors, Messrs. Cooper Bros. and Co., also retire and offer themselves for re-election.

WOOLWICH DISTRICT ELECTRIC LIGHT.

The annual meeting of this Company was held at Broad Sanctuary-chambers, Westminster, on Monday.

Mr. J. A. Findlay, chairman, in moving the adoption of the report, pointed out that compared with the previous year, while the sale of current had nearly doubled, jumping from £3,372 to £6,109 the expenditure had only gone up by a little over £700, and that if the price of coal had remained the same last year as it was the previous year these expenses would have been £500 less. In the past the Company had passed through a number of lean years; now they had entered on something more in the way of fat years, and there was every prospect of the improvement continuing.

Mr. Gripper seconded the motion.

Mr. Whale pointed out that Woolwich was in a much better position to take the electric light now than it had been in the past owing to the extensive rebuilding of the main streets.

The motion was then put and agreed to.

The **Chairman** afterwards moved a special resolution: "That the capital of the Company be increased to £50,000 by the issue of 25,000 shares of £1 each." When the shares were issued, he remarked, there would be sufficient to pay off the amounts due to the contractors, and leave sufficient in hand for this year's capital expenditure. He might inform the shareholders that they had been approached by the Council of the borough of Woolwich with reference to the sale of their undertaking, and that if they were made an offer by the Council which they considered reasonable and a suitable one, they would call the shareholders together to consider it. Having got a very sound concern, they were not by any means inclined to part with it, except at its full mercantile value.

The resolution was adopted.

SOUTH LONDON ELECTRIC SUPPLY.

At the ordinary meeting of the shareholders on Wednesday, held at the offices, Bengeworth-road, Loughborough Junction, S.W., **Mr. George Ellis**, who presided, said that the profit shown by the accounts would have been much larger but for the abnormal price of coal during the period under review. The actual number of lamps added to the circuit had been 17 697 of 8 c.p., and to-day the total number stood at 45,863, besides which they held applications for a further 3,552. Had this increase been spread over the whole of the past year, the effect of it upon the revenue would have been much greater, and as the demand for additional lamps still kept up, the prospects for the future appeared likely to satisfy them all. In March, 1900, the price for current used for lighting purposes was reduced from 6d. per unit to 5½d., and that for power and heating from 4d. to 2d. per unit, the meter rentals being also slightly revised. The Board had also introduced a scheme for installing six lights on consumers' premises absolutely free of all cost to them, and at the present time there were 205 customers wired under this scheme, and in addition to the six lights installed these customers had added many lights at their own expense. The Company's customers were fairly evenly distributed over the whole area in which the Company had powers, and this, notwithstanding that a large portion consisted of small shops and residences which were necessarily but small consumers of current, led the Board to hope that the normal increase would be as steady and widespread as the work had been up to now. The Company had in the last three years been passing through the unproductive period which had characterised the progress of every electric lighting undertaking, but the directors hoped that on the current year's working a dividend would be shown.

Mr. Jacob Atherton seconded the motion for the adoption of the report and accounts, which was carried.

COUNTY OF LONDON AND BRUSH PROVINCIAL ELECTRIC LIGHTING.

Directors: The Right Hon. Lord Rathmore (chairman); J. B. Braithwaite, jun. (deputy-chairman); Frederick W. Reynolds; Aymor H. Sanderson; Francis E. Savory; Joseph Shaw; R. Percy Sellon, M.I.E.E. Chief engineer: Charles P. Sparks, M.I.C.E. Secretary: H. B. Renwick.

Report of the directors (with abstract of accounts) for the year ended Dec. 31, 1900.

The capital expenditure during the year on account of the Company's London districts amounted to £174,481. 3s. 4d., making the total expenditure in respect of those districts up to Dec. 31 last £892,677. 2s. 3d. This expenditure was met in part by the issue in July, 1900, of a further £100,000 4½ per cent. debenture stock, at a premium of £8 per cent. The premium received on the above-mentioned issue has been placed to reserve for depreciation, repairs, and renewals. The balance from last account after payment of the final dividend on the preference shares for the half-year ended Dec. 31, 1899, less income tax, and of the dividend of 4 per cent. on the ordinary shares for the year ended Dec. 31, 1899, less income tax, amounted to £12,594. 2s. 8d., and the balance from revenue account, after payment of directors' fees, rent, taxes, general establishment and other charges, wages and proportion of salaries, to £27,367. 19s. 7d., making a total available revenue for the year 1900 of £39,962. 2s. 3d., from which must be deducted the following items: interest on debenture stock, including interest on instalments paid in advance, £9,606. 14s. 10d.; interim dividend on 20 000 6 per cent. preference shares for half-year ended June 30, 1900, less income tax, £5,750; interim dividend on 40 000 ordinary shares at 4 per cent. per annum for half-year ended June 30, 1900 less income tax, £7,666. 13s. 4d., leaving for further distribution £16 938. 14s. 1d. The directors recommend (*a*) that payment of the interim dividend on the 20,000 6 per cent. preference shares for the half-year ended June 30, 1900, less income tax, be confirmed; (*b*) that pay-

Digitized by Google

ment of the interim dividend on the 40,000 ordinary shares at the rate of 4 per cent. per annum for the half-year ended June 30, 1900, less income tax, be confirmed; (c) that a further dividend on the 20,000 6 per cent. preference shares for the half-year ended Dec. 31, 1900, less income tax, be declared; and (d) that a further dividend on the 40,000 ordinary shares for the half-year ended Dec. 31, 1900, at the rate of 4 per cent. per annum, less income tax, be declared, and that the same be paid to all proprietors registered at March 19, 1901. This will absorb £13,300, and leave a balance of £3,638. 14s. 1d. to be carried forward. Notwithstanding the high price paid for fuel during the greater part of the year, the profits derived from the City-road station have risen from £8,707. 7s. 9d. in 1899 to £17,239. 0s. 3d. in 1900, being an increase of 98 per cent., while at the Wandsworth station the profits have risen from £11,136. 10s. in 1899 to £15,624. 8s. 5d. in 1900, an increase of 40 per cent. The equivalent number of 8-c.p. lamps applied for during the year was 102 003, as against 58,523 for 1899; and the units sold were 2,990,138, against 1,766,515 for the previous year. The directors are glad to report that, as a result of this satisfactory progress, they are this year enabled to recommend a dividend out of the earnings of the Company's London stations without assistance from the further realisation of any of the Company's investments. These results reflect great credit upon the chief engineer, the secretary, and the Company's staff. The retiring directors are Mr. F. E. Savory and Mr. Joseph Shaw, who are eligible for re-election. The auditor, Mr. R. H. Marsh, also retires, and is eligible for re-election.

London Stations.

St. Luke and Clerkenwell, Eastern Holborn, Western Holborn and St. Giles.—The balance to credit of revenue for the 12 months ended Dec. 31, 1900, amounted to £17,239. In these districts, the total applications to Dec. 31 last, including power, represented the equivalent of 143,195 8-c.p. lamps, of which 119,076 were then connected to the mains. The applications for the year represented an increase of 62,272, and the connections an increase of 57,888. At the same date 165 users of motors, aggregating 1,171 h.p., were supplied from the Company's mains, showing an increase of 796 h.p. for the year, and further applications have since been received, raising the total to 214 applications, representing 1,941 h.p. The special plant erected for the generation of continuous current for power purposes will shortly be insufficient, and further machinery has been ordered to meet the rapidly increasing demand. Additional plant for the lighting supply has also been ordered for delivery in time for next winter. The Board of Trade granted a competing order, which was confirmed in the last session of Parliament, to the local authorities in the Company's East-end districts, and your directors have accordingly lodged the Company's claim for compensation as provided for under the order referred to.

Wandsworth District (including the parishes of Putney, Wandsworth, Clapham, Streatham, and Tooting) *Camberwell, and St. George-the-Martyr, Southwark.*—The balance to credit of revenue for the 12 months ended Dec. 31 last amounted to £15,624. In these districts the total applications to Dec. 31 last represented the equivalent of 96,607 8-c.p. lamps, of which 90,472 were then connected to the mains. The applications for the year represented an increase of 39,731, and the connections an increase of 35,825. In order to meet the increasing demand in these districts, additional plant has been erected at the Company's station on the Wandle.

Investments in Provincial Electricity Supply Companies.

Bournemouth and Poole Electricity Supply Company, Limited.—This Company continues to make satisfactory progress. The directors have recommended the payment of a dividend on the ordinary shares of the Company at the rate of 6 per cent. for the year ended Dec. 31, 1900, less income tax, as against 5 per cent. for the previous year.

Dover Electricity Supply Company, Limited.—This Company has made satisfactory progress during the past year. The balance from revenue account for the year ended Dec. 31 last has allowed the payment of a dividend on the share capital of the Company at the rate of 3½ per cent. per annum, as against 3 per cent. for 1899.

Scottish House-to-House Electricity Company, Limited.—Satisfactory terms have been arranged for a transfer to this Company of the electric lighting order for the adjoining borough of Airdrie, and an agreement has been entered into with the Airdrie Corporation for both public and private lighting. The Company has also acquired the interests of the Airdrie and Coatbridge Tramways Company in the Airdrie and Coatbridge Tramways Act, 1900, and is promoting a provisional order in the present session of Parliament, under agreement with the Coatbridge Corporation, for the construction of tramways in Coatbridge.

CITY OF LONDON ELECTRIC LIGHTING.

The ordinary meeting of this Company was held last Friday at Cannon-street Hotel.

In moving the adoption of the report, **Sir David L. Salomons** said he trusted the statement he had to make respecting the affairs of the Company would be regarded as reassuring, notwithstanding the small amount of profit made in the past year. The main point which called for remark in the report was the table of figures given under the heading "average price per unit obtained." It would be observed that the average price had steadily gone down, till last year it reached 4·09d. per unit. This figure, combined with two other circumstances, had rendered the payment of a dividend on the ordinary share capital impossible on this occasion. Looking a little ahead at their prospects for the year now passing, he stated that with the new tariff a considerable increase in the receipts should ensue. Coal had already begun to fall in price. He pointed out that 1d. per unit was equal to £50 000 on an output of 12,000,000 units—an output they almost reached last year, or, say, about 7 per cent. on the issued ordinary share capital. Referring to the recent litigation in the Court of Appeal as to the validity of certain contracts, the chairman stated that from the nature of this latter judgment it appeared desirable to appeal no further, for by this decision the Corporation were bound to the contracts in the eastern part of the City, which was equal to about half the whole of the City, and therefore the City could not under any circumstances enter into competition with them, either by buying up the Charing Cross Company or by obtaining an order for themselves for a given period. He specially asked the shareholders to bear in mind that for private lighting their position remained the same, since their provisional orders were untouched by the contracts being upset. The general business of the Company was not touched in any way whatever. His own individual view was that the shareholders had to encounter their worst enemy in the fact that the public placed complete confidence in the honesty and integrity of the City, and it was only natural that the shares of this Company should be registered as a first-class holding. He considered that they had been treated most unfairly in the matter of rating, and they had appealed against the enormous increase that had been made. The additional machinery which had been placed in the works was for the production of continuous current, which simplified the working to a great extent, and was very efficient besides.

Colonel Martindale seconded the adoption of the report.

In an answer to questions, the **Chairman** said that although they were advised at present not to appeal against the judgment of the Court of Appeal, if the Corporation did not come to reasonable terms it might become necessary to do so. He admitted that the lowering of the rate had proved to be a mistake, but the rate had again been changed to a figure which he believed would pay the Company.

The report was then adopted.

The **Chairman** announced his retirement from the Board on grounds of health. He stated that now the corner appeared to him to have been turned in the position of the Company, he felt perfectly free to take that course.

Much regret was expressed at the chairman's announcement, and a vote of thanks to him was unanimously passed.

The retiring directors were re-elected.

DIRECT SPANISH TELEGRAPH.

On Tuesday the Marquis of Tweeddale presided at the meeting of the shareholders held at the offices, Winchester House.

The **Chairman** said there had been two rather serious interruptions during the year; but it was satisfactory to learn that the Bilbao cable was found in excellent order, except just where the faults occurred, and he had reason to believe that, owing to the change in position of this line and the thoroughness of the repairs it would give no more trouble for some time to come. Since the beginning of the year the Barcelona-Marseilles cable had been interrupted, and, owing to the bad weather prevailing in the Mediterranean, it had been impossible as yet to repair it, but in all probability it would be at work again in a few days. The cost of this and other repairs would make a considerable inroad on their reserve, which would probably be depleted to an extent of not less than £10,000; but so long as they continued to maintain the fund efficiently and keep it at a substantial sum, there was no reason to fear.

Mr. J. Denison Pender seconded the resolution, which was carried.

NATIONAL ELECTRIC WIRING.

Directors: R Stewart Bain, Esq., C.A. (chairman); B. Bernheim, Esq.; W. R. Davies. Esq.; G. Ellis, Esq., J.P.; J. T. Jervis, Esq., M.I.C.E., F.R.G.S.; J. W. Swan, Esq., F.R.S. Manager and secretary: W. B. Cownie.

Report of the directors for the year ended Dec. 31, 1900:

The gross profit for the period under review is £9 636. 0s. 2d., from which has to be deducted expenses of administration, allowances on contracts, etc., amounting to £5 642. 4s. 8d., leaving a balance of £3 993 15s. 6d. To this has to be added the balance carried forward at Dec. 31, 1899—viz., £281. 1s. 5d.—making a total of £4,274. 16s. 11d. The directors recommend that this amount be dealt with as follows: to pay a dividend at the rate of 4 per cent. on the paid up capital for the year, £2 499. 11s 8d.; provision for further allowances, depreciation, etc., £1 390 19s 6d.; to carry forward, £384 5s 9d. The directors have pleasure in stating that the increase in the business during the year has been very satisfactory. The orders taken from Jan. 1 of the current year to date of this report show that the increase has been more than maintained. Several large contracts have been secured by the Company, involving the complete equipment of plant necessary for power and lighting. During the year 2,240 installations with an aggregate of 57,519 lamps of 8 c.p., have been completed, of which 777 installations, with an aggregate of 19 973 lamps of 8 c.p., were free wiring, and 1,463 installations, with an aggregate of 37,546 lamps of 8 c.p., were contract, while the orders in hand at the close of the year were 590 installations, with an aggregate of 33,084 8-c.p. lamps.

Digitized by Google

Free wiring contracts have been entered into with the Corporation of Swansea, the borough of Poplar, and the Scottish House-to-House Electricity Company, Coatbridge. Mr. R. Stewart Bain and Mr. B. Bernheim in accordance with the articles of association, retire at this meeting but are eligible, and offer themselves for re-election. Messrs Monkhouse, Sconeham, and Co., the auditors, also retire at this meeting, but offer themselves for re-election.

WILLANS AND ROBINSON.

Directors: Mark Robinson, Esq. M.I.C.E (chairman); Sir Gilbert A. Clayton East, Bart. (deputy-chairman); Captain H. Riall Sankey; Lieut.-General Sir Richard H. Sankey; Thomas O. Lazenby, Esq.

Report of the directors (with abstract of accounts) for the half-year ended Dec. 31 1900:

After writing off as depreciation from plant patents, etc., the sum of £5 855. 15s. 8d. and paying interest upon debenture stock the balance to the credit of profit and loss account at the end of the half-year (including £6 757 2s 11d. brought forward) is £39,360. 19s. 10d. Out of this the directors propose that dividends be paid at the rate of 6 per cent. per annum upon the preference shares and 10 per cent. per annum upon the ordinary shares and that a bonus of 2 per cent. be paid upon the ordinary shares for the year 1900 the whole amounting to £20 761 16s 11d. The amount payable to the original directors, in accordance with the articles of association being £5 685 16s 5d., the balance available is £12 912 6s. 6d. From this the directors propose to carry £2,000 to the debenture redemption fund and £3 500 to the reserve fund, leaving a balance of £7 412 6s 6d. to be carried forward. The auditors having questioned the propriety of investing the debenture redemption fund (the creation of which is a voluntary act on the part of the Company) in the names of the trustees, and thus placing it beyond the control of the Company, the directors have taken counsel's opinions, and are advised that future investments should be in the Company's name. The necessary alterations have been made in the accounts. The opinion of counsel, and of the auditors, has also been taken, as promised at the last meeting, upon the questions then raised as to the appropriation of share premiums. Copies of the opinions and of other papers relating thereto have been circulated among the shareholders. It will be seen that counsel and the auditors consider that the proposed applications of the premiums (which they say are profit and not capital) to meeting various exceptional expenses, are in accordance with the articles of association. The proposal to carry a portion of the premiums to the reserve fund is in accordance with general practice and under ordinary articles of association such profit may lawfully be divided among the shareholders. But in view of the special wording in one of this Company's articles, counsel think that the distribution of premiums as dividend is open to question. This opinion is consistent with carrying premiums to the reserve fund as proposed, it being only necessary to take care that any amount so carried shall not be distributed. It will be seen that a further question arises as to the remuneration of the original directors, and (as regards a certain limited period) the remuneration of the staff. Under the circumstances, the balance of the share premiums account amounting to £27 440. 2s. 4d., is again carried forward. The growth of the business in the past two years has largely diverted to more pressing uses the additional capital intended for new buildings and plant. Between December, 1898, and December, 1900, while the value of buildings and plant increased by about £78,000, the floating capital of the business, including the sums locked up in stock of all kinds, in work in progress, and in balances owing by debtors, increased by no less than £115,000. In the opinion of the directors, this growth is only the natural consequence of the increased volume of the Company's trade, and is justified by the increased profits of the same period. But it results that if the extensions of premises and plant, which are more than ever necessary, and to which the Company is, in fact, committed, are to be properly carried out, and especially if the new boiler works near Chester are to start upon the scale plainly desirable, the capital of the Company must be increased. With this object a resolution will be submitted authorising the creation of new shares (in equal proportions of preference and ordinary shares) to raise the share capital from £500 000 to £750,000—to be issued not necessarily at once, but as may be required. The first portion of the extension works at Rugby is nearly completed Work has been commenced in the new part of the foundry, and the fixing of tools in the new machine shops will begin shortly. The boiler works at Queensferry make good progress. The Admiralty has ordered Niclausse boilers to be fitted in the new armoured cruiser "Suffolk," of 22 000 h.p., and in a sloop of 1,400 h.p. The directors consider that the interim report of the Admiralty Boiler Committee, recently published, is likely to have favourable results upon the future of the Niclausse boiler. Captain H. Riall Sankey, R.E. (retired), and Mr. Thomas Orger Lazenby retire from the Board, in accordance with the provisions of the articles of association, but are eligible, and offer themselves for re-election. The auditors, Messrs. Cooper Bros. and Co., also retire, but are eligible for re-election.

CONTRACTS FOR ELECTRICAL SUPPLIES.

CONTRACTS OPEN.

Burnley.—Tenders are invited for accumulators, boilers, and economisers by April 9.

Piatra Neamtz (Roumania).—The Municipality invite tenders for the electric lighting of the town for 30 years. Tenders by April 25.

Sunderland.—The Corporation invite tenders for the supply of 104 arc lamp pillars, lamps, and accessories. Tenders by April 3. Details in our advertisement columns.

Halifax.—The Tramways Committee invite tenders for trolley wire. Particulars can be obtained from Mr. H. F. Street, borough electrical engineer. Tenders by April 4.

Ploesti (Roumania).—The Municipality invite tenders for the laying down and working of electric tramways for 30 years. The provisional deposit is £2,000. Tenders by April 3.

Kirkcaldy.—The Corporation invite tenders for engines and dynamos, storage battery, and overhead travelling crane. Tenders by April 15. Details in our advertisement columns.

Salford.—The Corporation invite tenders for wiring for motors, dynamo leads, engine-room and switchboard connections, etc. Tenders by April 9. Details in our advertisement columns.

Hornsey.—The Urban District Council invite tenders for the supply and erection of various plant for electricity works. Full details in our advertisement columns. Tenders by April 11.

Halifax.—The Electricity Committee invite tenders for the supply of steel steam-piping. Particulars can be had from Mr. H. F. Street, borough electrical engineer. Tenders by April 11.

Motherwell.—The Electric Light Committee invite tenders for steam dynamo and switches, and steam, feed, and exhaust pipes, etc. Tenders by April 29. Details in our advertisement columns.

Colwyn Bay.—The Urban District Council invite tenders for a water-tube boiler, feed pump, injector, steam, exhaust, and feed pipes, etc. Tenders by April 13. Details in our advertisement columns.

Paris.—The Post and Telegraph Department invite tenders for 270,000 kg. bronze or copper wire and 30,000 copper connections, in eight lots. Particulars may be obtained at Rue de Grenelle, 103, Paris.

Zagazig (Egypt).—The Local Commission invite tenders for the electric lighting of the town. Specifications, etc., may be obtained from the Public Works Department, Cairo, where tenders may be addressed until April 15.

Dublin.—The Lighting Committee invite tenders for condensing plant, pipework, feed pumps, superheaters, mechanical coaling apparatus, overhead crane, and workshop equipment. Tenders by April 22. Details in our advertisement columns.

Edinburgh.—The Corporation invite tenders for arc lamp carbons, cast-iron pipes, pavement and road box frames, and covers, etc., for their electricity supply stations for the year from May 15. Tenders by April 20. Details in our advertisement columns.

Bradford.—The Corporation invite tenders for the supply, delivery, and erection of a combined motor balancer and boosters, with switch gear for same, at their electricity works, Bolton-road, Bradford. Tenders by April 3. Details in our advertisement columns.

Gross-wardein (Austria).—Tenders for electric lighting are required. The town has a population of 51,000, and 1,220 lamps, averaging 2 000 hours per year, will be guaranteed. Particulars may be obtained from the Municipal Authorities. Tenders by March 30.

Portsmouth.—The Corporation invite tenders for the supply and erection of additional Lancashire boilers, feed pumps, mechanical stokers, economiser, steam, feed, and other pipes, chequer plating, and sundry ironwork. Tenders by April 16. Details in our advertisement columns.

Eastbourne.—The Corporation invite tenders for the building of nine large and six small underground transformer chambers, to be constructed of brick or cast-iron. Specification, etc., can be obtained and drawings inspected at the office of the Borough Electrical Engineer. Tenders by April 3.

Metropolitan Asylums Board.—The Board invite tenders for the supply and erection of a complete electrical generating plant and a complete boiler plant for heating at the asylum now in course of construction at Tooting Bec., S.W. Tenders by April 24. Details in our advertisement columns.

Rochdale.—The Corporation invite tenders for the supply of steel tramrails (girder section), fishplates, bolts, nuts, and washers, anchor joint and sole plates, points and crossings, drain rails, etc. Specifications, etc., can be obtained at the office of Mr. S. S. Platt, M.I.C.E., borough surveyor, Town Hall. Tenders by April 1.

Farnworth (Lancs.).—The Urban District Council invite tenders for taking up and removing existing pavement, excavation, concreting, and paving (labour) in connection with the laying of about four miles of tramway, single track. Particulars may be obtained from the engineer, Mr. W. J. Lomax, A.M.I.C.E., 11, Fold-street, Bolton. Tenders by April 8.

Leeds.—The Lighting Committee invite tenders for steam, feed-water, exhaust, overflow, blow-off and other pipes, valves, hot-wells, feed-water pumps, economiser, etc., in connection with engines of 4,000 i.h.p. Specifications, etc., may be obtained from Mr. H. Dickinson, manager of the department, Whitehall-road, Leeds. Tenders by April 15.

Bradford.—The Corporation invite tenders for the supply, delivery, and erection of one 100-kw. motor-generator, with switch gear for same, at their electricity works, Valley-road, Bradford. Specifications, etc., may be had on application to Mr. R. A. Chattock, M.I.E.E., city electrical engineer, Town Hall, Bradford. Tenders by April 3.

Middlesbrough.—The Electric Lighting Committee invite tenders for boiler-house plant—one 30ft. by 8ft. 6in. Lancashire boiler and accessories; engine-house plant—one 300-kw. high-speed steam dynamo and accessories, together with steam, exhaust, and feed pipes, etc.; condensing apparatus—ejector condenser, with circulating pumps. Tenders by April 30. Details in our advertisement columns.

Palencia (Spain).—Tenders are invited for the installation and working of a telephone system for not more than 20 years; 10 per cent. of the annual receipts will have to be paid to the Government. Tenders may be addressed to the General Post and Telegraph Department by April 21. Such particulars as have been received may be examined on personal application at the Commercial Department of the Foreign Office any day between 11 a.m. and 5 p.m.

RESULTS OF TENDERS.

Dublin.—The tender of J. and W. Stewart, Belfast, for building and chimney shaft at the Pigeon House Fort has been accepted.

Croydon.—The County Council have accepted the tender of Mr. E. Danks for the supply and erection at the electricity works of two dry-back boilers at £1,630.

Battersea.—The Works Committee have accepted the tender of Mr. E. B. Mitchell for the supply and fixing of four copper tape lightning conductors at the central electric lighting station at £64.

Aberdeen.—The Gas and Electric Lighting Committee have accepted the tender of Messrs. Gall and Walker, builders, at £2,897, for the erection of a plain circular chimney stack in connection with the electricity station at Dee Village.

Bradford.—The Corporation have accepted the following tenders for the works required to be done in erection of a generating station at the electricity works, Valley-road, Bradford: T. Obank and Sons, Thackley, masons etc.; Wilkinson and Dawson, joiners, etc.; L. Roberts and Co., Limited, Cutler Heights, smiths and ironfounders; Hill and Nelson, slaters; R. Townend, plumber and glazier; Bradley, Krischke, and Co., plasterers; T. H. Hewitt, painter.

Eastbourne.—The Town Council have accepted the tender of Messrs. Walter F. Glover and Co., at £7,663, for underground mains for private and public lighting, etc., and of the British Electric Transformer Company for £2,600. 10s. for transformer sub-stations and equipments. The following tenders have been received for arc lamps and posts, the carbons to burn for 45 hours—viz., Messrs. Gilbert and Co., £1,830; Messrs. Oliver and Co., £1,784. 8s.; and Messrs. Crompton and Co., £1,770.

Cardiff.—The Corporation have received the following tenders in connection with the erection of a chimney shaft, etc. (160ft. high from floor line), for the electric (tramway) power station at Roath, Cardiff:

W. Symonds and Co., Cardiff (accepted)	£1,626	12	1
Clark and Co., Cardiff	1,565	1	5
Alphons Custodis Chimney Company, Sheffield	1,600	0	0
Chubb and Co. Cardiff	1,732	0	0
Knox and Wells, Cardiff	1,770	0	0
Walters and Johns, Morriston	2,072	18	7
R H. B. Neal, Plymouth	2,540	0	0

Poplar.—The Borough Council have received the following tenders for the supply of an electric crane to lift a maximum load of five tons, with a return block, the electricity supply being continuous current at 460 volts:

Carrick and Sons, Dalry Ironworks, Edinburgh (accepted)	£780
Marshall, Fleming, and Jack, Dellburn Ironworks, Motherwell	780
Crompton and Co., Mansion House-buildings, E.C.	821
Chatteris Engineering Company, Chatteris, Cambs	821
J. Booth Bros., 75A, Queen Victoria-street, E.C.	845
Wimshurst, Hollick, and Co., Rochford	895
T. Smith, Rodley, Leeds	902
Jessop and Appleby, 22, Walbrook, E.C.	915
Higginbottom and Mannock, 25, Victoria-street S.W.	1,000
J. Whitley and Co., Bramley, Leeds	1,022
Carrick and Ritchie, Waverley Engineering Works, Edinburgh	1,027
Mather and Platt, Manchester	1,035
Stothert and Pitt	1,355

BUSINESS NOTES.

TRACTION.

Newcastle.—The work of laying the new tramways has been begun on Jesmond-road.

Sheffield.—The public service of electric tramways to Broomhill was inaugurated on Monday.

British Guiana.—An electric tramway of over 10 miles in length has just been opened for traffic in Georgetown.

Penge.—It is proposed to construct an electric tramway in direct communication with Croydon and the Crystal Palace.

Digitized by Google

Poole.—The official inspection of the tramways from Poole to the County Gates was carried out by Major Pringle last week.

King's Norton Tramways Bill.—The House of Lords Committee presided over by Lord Stanmore have passed the preamble of this Bill.

Brighton.—The engineer's plans and specification for the erection of a car-shed and offices at an estimated cost of £9,360 have been approved.

Leeds.—Electric cars have been run for the first time between Beeston Hill and Woodhouse-street. The new line comprises a length of nearly 3½ miles.

Hampstead.—The Works Committee will recommend the Council to spend £1,500 in the purchase of motor-vans for street cleaning and watering purposes.

Hammersmith.—The Law and Parliamentary Committee have approved the amended agreement between the Borough Council and the London United Tramways Company.

Kinver.—The electric tramway was inspected on Friday by Colonel Yorke on behalf of the Board of Trade. The line will be opened immediately the official certificate is received.

Wednesfield.—The Urban District Council have decided to send a deputation to the Wolverhampton Corporation to urge the extension of the Corporation tramways to Wednesfield.

Private Bills.—The London County Council (Tramways and Street Widenings) and the Notting Hill Electric Lighting Bills were read a second time in the House of Commons on Tuesday.

Scarborough.—A company is being promoted to introduce a motorcar service into the town. In the winter months the cars will be converted into omnibuses, and used for a regular public service.

Aberdeen.—The Tramways Committee have been requested to report as to the propriety of having the tramway stations indicated on the street lamps along the various routes, so that the stations may be known at night.

Tramway Receipts.—The following are the latest traffic receipts: Buenos Ayres and Belgrano Electric (to Feb. 24), £604 increase; Perth Electric (to March 22), £302 increase; Brisbane Electric (to Feb. 6), £49 increase.

West London Tramways.—The difficulties between the Kew Observatory authorities and the London United Tramways Company are evidently at an end, as we are informed that the line will shortly be open to the public.

Stoke-on-Trent.—The Light Railway Commissioners have granted the application of the Potteries Electric Traction Company for light railway extensions in the borough, and have fixed the limit of time for purchase at 31 years.

Kingston-on-Thames.—The Tramways Committee have had an interview with the representatives of the London United Tramways Company, and plans of certain street widenings in connection with the scheme are being considered.

Hendon.—The Urban District Council have given their consent to the Charing Cross, Euston, and Hampstead Railway and the Finchley and Hendon Tramway schemes, subject to the incorporation of certain approved clauses in the Bills.

Willesden.—Of the 21 newly-elected members of the District Council, nine are supporters of the tramway scheme and 12 opponents. For the most part the residential districts have voted against the scheme, and the artisans in favour of it.

Nottingham.—The work of constructing the Bulwell section of the electric tramways is progressing favourably, but at least another four months must elapse before electric cars can run between the Great Market-place and the Bulwell terminus.

Merthyr Tydfil.—If the Board of Trade certificate be received this week, it is possible that electric cars will commence to run for passenger traffic to-morrow. The traffic superintendent is arranging a time-table, including provision for workmen's cars.

London's Underground Railways.—The following peers have been appointed to serve on the Joint Committee to examine into the subject of underground railway communication in the Metropolis: the Earl of Lauderdale, the Earl of Rosse, Viscount Knutsford, Lord Windsor, and Lord Herries.

Rochdale.—The Tramways Committee have decided to give out orders for six cars, each of different construction. The public will thereby have an opportunity of showing which type or types of car they prefer. It has also been decided to take steps to procure 1,400 tons of steel rails, sufficient to lay about eight miles of track.

Folkestone.—Major Pringle has held an enquiry as to the application of the Corporation for a provisional order giving power to construct tramways within the borough. The Light Railway Commissioners will open an enquiry on April 1 into the provisional order of the Folkestone, Sandgate, and Cheriton Company for the same purposes.

Bath.—At the Town Council meeting last week, the Electric Traction Committee reported that there were many variations in the agreement between the Corporation and the promoters of the electric tramway scheme, and that they proposed to give way on the question of the right to purchase at the end of 14 years on the payment of an annual wayleave.

Lytham.—The local authorities have approved, subject to minor alterations, a scheme for a light electric railway from Lytham to Preston. A syndicate is negotiating for the purchase of the Blackpool, Lytham, and St. Annes tramway, and it is proposed to have an electric line right through from Preston, *viâ* Lytham, St. Annes, and Blackpool, to Fleetwood.

District Railway.—According to the *Daily Mail* the Bill for the electrification of the Metropolitan District Railway, asking for powers to provide the necessary plant, is not likely to be proceeded with. A change in the plans of the company makes such a course necessary, though this does not imply the abandonment of the project. On the contrary, it is likely to be expedited thereby.

Cardiff.—At Monday's meeting of the joint Lighting and Tramways Committees it was decided to locate the chief offices and storeroom for these departments above the fish market. The sub-committee appointed to enquire into the tramcars have been asked to complete their work and report at the earliest possible minute. The borough engineer has submitted proposals for the alteration of the existing lines.

Richmond.—The result of the postcard poll on the question of the London United Tramways Company's scheme up to the present is 3,130 in favour, 101 against. Fresh negotiations between the Town Council and the company have now been opened. It is reported that the outcome of a private meeting of the Tramways Committee was of such a nature that appeared likely to give satisfaction to both sides.

London County Council.—On Tuesday the Council unanimously passed a motion instructing the Highways Committee, *inter alia*, to report what extensions were required to perfect the London tube or underground railway system at the earliest possible date. It was also decided to instruct the Parliamentary Committee to take steps to have the views of the Council placed before the Joint Committee of Parliament dealing with these matters.

Shildon.—The United Kingdom Tramways Electrical Syndicate are considering the question of laying down tramways in the Shildon Council's district. It will be remembered that they recently obtained parliamentary powers on similar lines to those which they suggest for Shildon for the north-east portion of the county of Durham. It is proposed to run a quick service of cars, including workmen's cars, night and morning, and to use the overhead electric system.

Burnley.—The Tramways Committee have decided to reduce the tram fares both outside and in for certain stages. It has also been decided to run a 15 minutes service daily, except on Sunday, when a half-hour service will be run until one o'clock noon, followed by a 15 minutes' service in the afternoon. The Tramways Committee have decided to recommend the Town Council to appoint Mr. H Mozley, of Burnley, as manager of the Corporation tramways. The salary is £350 a year, rising to £400.

Tramcar Collision.—An electric tramcar accident of a serious character occurred at Ewood, Blackburn, shortly after 7 o'clock on Wednesday night. It appears that a car from Blackburn overran the points at Ewood, with the result that another car proceeding in the opposite direction, from Darwen, came into violent collision with it. The front of the Darwen car was smashed by the impact, the driver and a conductor off duty, who was riding with him, sustaining severe injuries. Several of the passengers of the Darwen car also were more or less injured.

Walker.—At the monthly meeting of the District Council the Tramway Committee reported upon the Tyneside Tramways Bill, stating that the committees of the Lords and Commons had dispensed with the Standing Order respecting the non-consent of the local authorities, and allowed the Bill to proceed, provided that the Tramway No. 3 be struck out. This had been done, and the Bill would be read a second time and go before the committee in due course. The Council's petition against the Bill had been presented, as also petitions by the Newcastle Corporation and the Northumberland County Council.

Huddersfield.—At the monthly meeting of the Town Council, the Tramways Committee reported that the accounts for the 11 months ended Feb. 28 showed a deficiency of £10,885 17s. 3d., of which £2,560. 4s. 2d. arose upon the steam-power working and £8,325. 13s. 1d. upon the electrically-worked section, but this latter sum includes £7,776. 2s. 1d. for interest and sinking fund. The receipts for February for the steam traction sections were £1,904 1s. 11d., and from the electrically-equipped lines were £620. 17s. 7d. The Council decided that the inside fares shall be the same as the present outside fares on all routes from the 1st prox. for three months.

Blackpool.—The *Blackpool Times*, after announcing that the Blackpool and Lytham tramways have been purchased by a syndicate, states that the line will be doubled without delay, equipped with electrical plant, and provided with the most luxurious cars. The paragraph further states that the line will be continued from Lytham to Freckleton, and then as a light railway to Preston. It has been decided to make an advance of 2s. a week all round on the wages of the tramway employés of the Corporation. Thus drivers will commence at 26s. a week, and length of service and good conduct will eventually entitle them to 30s. Guards are to commence at 24s., rising to 28s. An additional inspector is to be appointed, and preparations are being made in various directions for the inauguration of the new service round Marton.

Halifax.—The traffic report of the Corporation tramways for the past fortnight for the first time this year shows a balance of receipts over expenses, the former amounting to £1 538. 11s. 9d. and the latter to £1 527. 14s. 6d. At the meeting of the committee last week the question under discussion was as to the delivery of 2 000 tons of rails, purchased with a view to tramway extensions *viâ* the proposed lift at Salterhebble to Rishworth and Elland. On the motion that the rails be stored some members wanted to know why, if the rails were not to be used, the contracts for their purchase had been sanctioned. The reply given

Digitized by Google

was that the time had arrived for the exercise of caution in regard to tramway developments. Within the next month the Northowram line, it is expected will have been completed to Stocks Arms, the Queensbury line into Queensbury village, and the Hebden Bridge line to the Congregational church at Luddenden Foot.

New Issue.—The Tynemouth and District Electric Traction Company Limited, announce that their share capital will be £80,000, divided into 8,000 5 per cent. cumulative preference shares of £5 each, and 8,000 ordinary shares of £5 each. The whole of the ordinary shares have been issued and paid up. The company was formed to buy up the North Shields and District tramways, and to replace the steam traction by electric traction. The old lines have been considerably extended. They now run from the New Quay, North Shields, through Tynemouth, along the Marine Parade, past Cullercoats, to Whitley Bay. The electric trams are now running upon this route. It is estimated, when the lines are in full working order, the total annual revenue will be £10 440, and the working expenses £5 590, leaving a surplus of £4,850 The dividend on the present issue of preference shares will absorb £1,500 leaving £3 350 for depreciation and dividend on the ordinary shares. The estimated population to be served is 60 800.

Isle of Thanet.—Some successful running trials have already been made in the neighbourhood of St. Peter's with the cars to be used on the new light railway, and it is officially stated that next week cars will go over the whole line. It is expected that the tramways will be ready for traffic at Easter. The power-house at St. Peter's contains two 320-h.p. Allis horizontal engines direct coupled to two 200-kw. generators, and two Bellis and Morcom vertical three cylinder compound engines, 520 h.p., direct coupled to two three-phase generators. There are two batteries of boilers by Babcock and Wilcox, and the surface condensers and cooling tower, which is capable of cooling 35 000lb. of steam per hour, are by the Wheeler Condenser Company. The storage battery of 530 cells is by the Tudor Accumulator Company and the switchboard, generators, and sub-station, electrical equipments, and car motors have been supplied by the British Thomson-Houston Company. A suite of offices for the company's officials is attached to the main building, and detached offices for traction purposes are situate near the entrance to the works. A large car shed with repair shop has been built to hold 40 cars. A siding has been laid direct to the power-house which will give ready access for receipt of coal, etc. For the efficient working of the system, and with a view to future development, sub-stations have been erected at Margate and Ramsgate, to which the current will be sent at high tension, and there transformed for traction and lighting purposes. A track has been laid on the quay at Ramsgate Harbour for the conveyance of coal, etc., over the tramway. The cars, which were built by the St. Louis Car Company, are of the upper deck style, having an enclosed vestibule. Twenty are of the bogie type, and carry 72 passengers. Mr. Arthur A. Tyler is the general manager of the system.

LIGHTING AND GENERAL.

Bristol.—The continuous-current main is to be extended to Milk street.

Imperial Tramways Co.—The directors have declared a dividend of 8½ per cent.

Bournemouth and Poole Electricity Supply Co.—The directors have declared a dividend of 6 per cent.

Bath.—Mr. Francis Teague has been appointed electrical engineer for a further period of three months.

Removal.—Mr. A. R Bennett, Glasgow, has removed from 55 West Regent-street to 65, Renfield street.

City of Birmingham Tramways Co.—A dividend of 5 per cent and a bonus of 5 per cent. have been declared.

Share Market.—There was very little business in electric shares during the week, and prices are practically unchanged.

Globe Telegraph and Trust Co.—The directors have declared an interim dividend of 2s. 6d. per share on the ordinary shares.

Grimsby.—A cable is to be laid down Pasture-street. The cost will be £77, and it is expected that it will pay over 20 per cent.

Llandudno.—The District Council have decided to apply for sanction to a loan of £1,027 for a new feeder from the works to South-parade.

Battersea.—Application is to be made to the London County Council for a further loan of £10,600 in connection with the electric lighting of the borough.

Stoke-on-Trent.—Messrs. Peers and Trentham, electrical engineers, Manchester, have been engaged to make a report upon the proposed electric light installation.

Newport (Mon.).—Colonel Luard has held an enquiry into the application of the Corporation for sanction to borrow a further sum of £23 000 for electric lighting.

Wellingborough.—The draft agreement between the National Telephone Company and the Urban District Council has been referred to the Highway and Lighting Committee.

London Gazette.—An adjudication order has been made out *re* A. J. Greenberg (carrying on business as the Midland Electrical Company), 20, Arthur-road, Erdington, Birmingham.

Stockton.—The Sanitary, Park, and Electricity Committees and the Bridge Board estimate their requirements for the coming year at £14,336, or £290 above their expenditure of this year.

Hart Accumulator Co.—This Company have opened an office, owing to the increase of their business in the Midlands and the North, at Temple-chambers, 33, Brazennose-street, Manchester.

Stock Exchange.—Application has been made to the Stock Exchange Committee to grant a quotation to the British Electric Traction Company's further issue of ordinary shares of £10 each.

Direct United States Cable Co.—The directors have resolved upon an interim dividend of 3s. per share, free of income tax, being at the rate of 3 per cent. per annum for the quarter ending March 31.

Haslingden.—We understand that the tender of Messrs. Meldrum and Co. for a destructor has been adopted. The borough surveyor is preparing plans and estimates of a destructor and electric lighting station.

Gillingham.—We understand that at the next meeting of the Council it will be proposed that an expert be employed to advise the Council with regard to the proposed purchase of the electric light undertaking in the district.

Buxton.—It is proposed to establish a line of telegraphs between Sheffield and Buxton in order that communication may be improved. The National Telephone Company have decided to commence the laying of underground wires forthwith.

Eastern Telegraph Co.—The directors announce a dividend of 3½ per cent. per annum on the preference stock for the quarter ending 31st inst., and an interim dividend of 1½ per cent. on the ordinary stock for the quarter ended Dec. 31 last.

Cannock.—An arrangement has been made between the Telephone Company and the Postmaster-General by which he delegates his rights to the Telephone Company. These rights have been confirmed by the Urban District Council.

Penge.—The consideration of the question of the supply of electric light for the district has been referred to a committee of the whole Urban District Council, with directions to obtain further expert opinion on the whole question and to report thereon.

Bilston.—At the next meeting of the District Council the terms offered by the Midland Electric Corporation, Limited, for the public lighting of the town will be considered. It is proposed that the Council enter into a contract from Dec 25 next.

Sleaford.—With reference to a note in our last issue, we are informed that the Board of Trade granted the provisional order to the Sleaford District Council last year. Plans have been prepared and tenders have been accepted, and the works are now being actively carried out under the supervision of Messrs. E. Bremner-Smith and Bremner, electrical engineers to the Council.

Dublin.—The Corporation on Monday adopted the report of the Lighting Committee, recommending the acceptance of a number of tenders in connection with the municipal scheme of electric lighting By this action the Corporation has committed itself to a vast undertaking, involving the expenditure of £250 000 The Corporation's action is still bitterly opposed in the local Press.

Personal.—We are informed that Mr. S Thos. Pemberton, at present representative engineer and electrical expert of the Blackman Ventilating Company, is transferring his services on the 1st prox. to Messrs. John Gibbs and Sons ventilating, electrical, and consulting engineers Duke-street, Liverpool. We wish Mr. Pemberton every success in his new sphere of usefulness.

Winding-up.—The petition of C. E. Foster and others for the compulsorily winding-up of the London Electrical Cab Company, Limited, was before Mr. Justice Wright on Wednesday. His Lordship, in dismissing the petition with costs, said he had decided that there were no misfeasance assets to come in, and the official receiver had satisfied him that there were no tangible assets There had been charges of fraud insisted on, and therefore he should allow the costs.

Arbroath.—The Corporation have, as we announced some time ago, resolved that the electric lighting scheme shall be carried out by themselves. However, an agitation amongst shopkeepers and others against this decision resulted in a meeting which was held on Wednesday, and at which the following resolution was carried: "That this meeting is of opinion that before committing the ratepayers finally an opportunity ought to be given by means of a *plébiscite* of saying whether they consider it in the public interest for the Corporation to carry out the provisional order or to hand it over to a company on the best conditions obtainable."

Bradford Workhouse.—Mr. F. H. Bentham, chairman of the Board of Guardians, on Wednesday formally started the steam turbo-dynamo which is to run the electric plant that has been installed at the union workhouse. The installation has been effected from plans and specifications prepared by Mr. A. Bernstein, of Bradford, who has acted as consulting engineer to the Board. The plant consists of a Parsons steam turbo-dynamo of a capacity of 75 kw., equal to 112 h.p., which is capable of maintaining 1,250 incandescent lamps of 16 c.p. at one time. If required, an extra 10 per cent. can be put on that for a period of two hours, while space is reserved in the engine-house for an additional engine should it be required. There is also a smaller dynamo driven by the old laundry engine, and suitable boosting arrangements are made to charge a storage battery of 128 cells, capable of maintaining 300 lamps of 16 c.p for a period of four hours. The new engine was supplied by Messrs C. A. Parsons and Co., of Newcastle-on-Tyne; the dynamo booster, and switchboard by Rosling Appleby, and Fynn, Limited, of Bradford; the cables by Mr. G. A. Steinthal, Bradford; and the battery by the Electrical Power Storage Company, Limited, London. The engine-house has been built from plans prepared by Mr. F. Holland, Bradford.

Digitized by Google

Sedbergh.—The District Council have rescinded their resolution passed at the meeting held on Feb. 20: "That the question of electric lighting be left to the new Council," and confirmed the resolution passed at the last meeting that expert advice be obtained on the electric light question.

Norfolk.—Various applications for leave to erect telegraph poles on the sides of main roads have been granted by the County Council; also an application from the National Telephone Company for leave to erect poles on main road from Coltishall to junction of road to Stratton Strawless Hall.

Kensington.—The Council have refused sanction to the laying of an armoured cable under the footway on the north side of Brompton-road by the Kensington and Knightsbridge Electric Lighting Company. The objection was that the whole street would have to be disturbed when the cable was worn out.

Shannon Electric Power Bill.—The conference of representatives of the County Councils of Limerick and Clare which was to have met in the offices of the Limerick County Council, George-street, on Monday, has been adjourned to next Saturday, owing to the failure of a sufficient number of members attending.

Weybridge.—An application of the National Telephone Company for the Council's consent to their laying underground cables from their exchange in High-street to Thames-street and Walton-lane, and near Weybridge Lock, following Church-street and Bridle-road, is before the Highways Committee of the Urban District Council.

Maidstone.—An alteration has been made in the plan of the electric light station by substituting a slate roof for the galvanised iron one provided for in the original scheme. The additional cost is estimated at £90, and ought to be well worth the money considering the accentuation of both heat and cold caused by galvanised roofs.

Statistics.—The National Telephone Company keep a record of the number of telephone messages sent and received by their subscribers, and up to the last report the total for the year amounted to 682,857 864—in other words, if the entire population of the British Isles made use of the telephone it would mean 20 messages per head per annum.

Ham.—At the meeting of the District Council on the 21st inst the Clerk formally reported that at the Board of Trade enquiry the scheme of the Richmond Electric Lighting Company to supply electricity to Ham and Hampton Wick had fallen through. Mr. J. Clifton Robinson wrote that the London United Tramways Company were prepared to supply electric light to Ham at a price not exceeding 4d per Board of Trade unit.

Acton.—At the last meeting of the Urban District Council a hope was expressed that the question of the electric light for the district would be taken up promptly and dealt with by the new Council. Messrs. Neville and Co. wrote stating that they would be glad to know if there was any prospect of a public supply of electric lighting for the district in the near future, as it would influence them as regards fitting up their factory.

Croydon.—At the last meeting of the County Council the Borough Electrical Engineer reported that he had obtained prices for the erection of a generating panel with necessary equipment at the works, and expressed the opinion that this can be efficiently executed, and at less cost, by means of the staff at the station, and suggested accordingly. The Council decided that the work should be carried out by the staff in the manner suggested.

Dunstable.—The Town Council are getting alarmed at the increased number of telegraph wires running through the town. Twelve months ago they made an application for all the wires to be put underground, and received an assurance from the Telegraph Department that no additional wires should be put up, but it appears that now a considerable increase is being made. They have decided to write again, protesting against that increase. Only 12 miles away, at St. Albans, all the wires are underground, and that Council refuse to have an overhead wire in the city.

Gutta Percha Corporation.—Mr. H. Brougham, official receiver, on Monday mentioned the affairs of this Corporation to Mr. Registrar Hood in the Bankruptcy Court. The Registrar, at the previous hearing, said that having regard to Mr. Shenton's evidence he would give Prof. Ramsay an opportunity of submitting himself for examination if he so desired. Mr. Brougham now said he was informed that Prof. Ramsay did not see that any material advantage was likely to be gained by the shareholders, or that his own interests would be served by his giving evidence in the matter.

Heating of Show Windows.—An apparatus is just being placed upon the market by the Allgemeine Elektricitäts-Gesellschaft, Berlin, for the heating of goods exposed in show windows, for the prevention of the settling of steam or ice on the window panes. It consists of an iron frame, in which a number of wires are fixed in such a manner as to prevent short-circuit. The heating resistance is so calculated as to exclude superheating even by maximum load. The contrivance has the advantage that it is not necessary to disturb the goods when lighting or extinguishing it, as this may of course be done by means of a switch fixed anywhere in the shop. It is also less dangerous than the open gas-burners used for this purpose at the bottoms of some windows.

Newbury.—The Town Council recently submitted to the Board of Trade their objections to the Urban Electric Supply Company's application for an electric lighting provisional order. The Board of Trade replied that, regard being had to the failure of the Corporation to give effect to their order, the Board were of opinion that it was desirable that the provisional order now applied for should be granted, and that they proposed to dispense with the consent of the Corporation. The Board further intimated that should the Corporation desire to make any further representations in the matter they would be prepared to arrange for an interview. A deputation has been appointed to wait upon the Board of Trade, and press upon the Board the claims of the Council to their consideration and support.

Sheffield.—At last week's meeting of the council of the Chamber of Commerce it was resolved that the Chamber, having considered the Bill of the Electric Power (Yorkshire) Company, and having regard to the fact that the rights of the Sheffield Corporation have been provided for and saved under the new fortieth clause of the Bill, do hereby declare that in their opinion the company's Bill is conceived in the best interests of the commerce and industry of the locality, and that it must be of great advantage to traders generally that central power stations should be established for the generation and distribution of electric power for motive and general manufacturing purposes at the lowest possible cost, and the Chamber is prepared to support this principle by evidence before the Parliamentary Committee if this be deemed necessary.

Leeds.—At the last meeting of the Gas and Water Committee the Clerk stated that he had communicated with Mr. Medhurst with regard to the price which they inserted in their electric lighting order. Section 1, and the charge for any amount up to 20 units was 13s. 4d. and for each unit over 20 8d. The Board of Trade had passed a general rule, not applying to this order in particular, but to all orders, that the first 20 units had to be 11s. 8d., and all over 7d. per unit. If they objected to that they could oppose it. Mr. Medhurst, however, had based his report on 6d., and therefore he did not object to this. Messrs. Graham then wrote to him, saying that they did not think that the proposed reduction in the maximum price to 11s. 8d. need be objected to, and therefore they could inform the Board of Trade that the Council approved of the rule.

Brighton.—Application is to be made for sanction to borrow a further sum of £850 for electric lighting works. The Lighting Committee have decided to take up and relay about 150 yards of electricity mains in Grand parade so as to allow of the necessary concrete for the wood paving of the tramway route to be laid. The cost of the work is £200. They have also accepted the quotations of Messrs. Babcock and Wilcox for the supply and fixing (exclusive of brickwork) of two additional water tube boilers, to be used in connection with the tramway electric lighting plant, for the sum of £2 150; also for the necessary steam, feed and other piping in connection therewith, for the sum of £643. The amended draft, conferring upon the Council the power to carry on telephonic business within the Brighton telephone area, fixes May 1 as the date for the commencement of the term. Mr. H. H. Law has held an enquiry into the application of the Town Council for sanction to the borrowing of £19 600 for purposes of electric lighting.

Bromley.—The Bromley Urban District Council have informed the Rural District Council that they had had under consideration the question of obtaining cheaper terms for telephone communication with the district, and with that view they had considered the question of applying for a license from the Postmaster-General. As, however, the district was within the metropolitan area and as it was understood that the Post Office authorities proposed to provide a system themselves, they would be glad if the resolution passed by them were brought before the Rural District Council, to ascertain whether they would be prepared to make a joint application to the Post Office authorities, with a view of such installation being laid as soon as possible. The resolution passed was to the effect that all parishes within the Bromley Union that are situated in the metropolitan district be asked to unite with the Council in approaching the General Post Office with a view of an installation being commenced by them in the district at the earliest possible moment. It was decided to accede to the request of the Bromley authority.

Tunbridge Wells.—We learn that Mr. H. Boot is pushing forward with the extensions, and hopes to have the new engines running next week. Mr. Boot will then be in a position to meet all demands. On Wednesday last a deputation from Brighton, including the Mayor, were conducted over the works, and they expressed themselves highly delighted with what they had seen. On the same day, says the *Kent and Sussex Courier*, the wind blew one of the arc lights out of position, and this somewhat interfered with a circuit of about 20 other lamps. It was at once detected, and the incandescent lamps were switched on. The arc lamps were then put out a few minutes before the usual time. The incident was immediately telephoned to a Press agency in London, and on the following day a paragraph appeared in the halfpenny London papers of a most sensational character, stating that there had been a failure of the electric supply, and that the town was placed in darkness. The paper is justly indignant, because such slipshod reports are most damaging to the town and its officials. Mr. E. A. Sandford Fawcett has held an enquiry into the application of the Corporation to borrow £10,000 for the establishment of a municipal telephone system in the borough and surrounding districts.

Eastbourne.—Mr. E. A. Sandford Fawcett has held an enquiry into applications for sanction to an additional loan of £50 362 on account of extensions of the electric light undertaking. The Town Clerk gave particulars of the application stating that loans of £36,635 for the purchase of the electric light undertaking and £2,000 for subsequent extensions had been previously sanctioned and raised. It was understood at the time that these extensions would be necessary, and it was on the recommendation of Mr.

Digitized by Google

Hawtayne that the Council resolved, for the sake of the economical working of the undertaking, to replace some of the antiquated machinery by newer appliances and to remove the generating station to a site at Roselands, already the property of the Corporation. The borough accountant had prepared a report as to the first year's working, which allowing for interest and other charges, showed a balance of £834 11s. 2d. As to the Decoy and Low Level-road, etc., the Council asked to be allowed to borrow £3,000 for the purchase of the land, about 32 acres, and the remainder of the sum applied for was to enable them to fulfil their covenants as to making-up roads on property belonging to the Duke of Devonshire and Mr. C. Davies Gilbert, who were liable, however, to the repayment of a considerable amount of this as the building estate was developed. This statement was supported by the testimony of the various officials in attendance. At the termination of the enquiry the inspector visited the electric light works and the Decoy.

Hackney.—At the last meeting of the Council the Electric Lighting Committee reported on the question of the use of the river frontage of the electricity and refuse destructor works at Millfields for wharfage, etc., by the construction of a dock. The cost of carrying out this work is estimated at £1 250. The Lee Conservancy Board will accept a rental of £25 per annum for the occupation of the land, the Board at the same time undertaking to offer no objection to the construction of the dock as proposed. Subject to the satisfactory completion of the negotiations, the proposed works of the construction of the dock, for which tenders have been invited, are to be carried out. The committee further reported that as the time is not far distant when the works will be in a position to supply electricity, it is necessary that all proper steps should be taken to ensure a good demand. The price to be charged for lighting—viz., 4d. per unit—is a very moderate one, and there should be no obstacle in the way of the supply becoming popular and electricity being placed within the reach of the small consumer. It is obvious, however, that many of the small consumers could not be expected to bear the initial cost of wiring and fitting their premises at an approximate cost of from 20s. to 30s. per lamp, and this initial cost has hitherto severely operated against the expansion of electricity supply amongst this class of consumer. The free wiring system in vogue in various places has disposed satisfactorily of these difficulties, as by this method consumers may get their premises fitted up free of cost, the only monetary consideration being that a small rental per lamp has to be paid to the company undertaking the wiring, etc. There is no doubt that a system of free wiring in Hackney would have a material effect in promoting the development of the electric lighting undertaking, but the Borough Council under the Electric Lighting Acts and the provisional order has no power to borrow money for the purpose. The engineer has estimated that the wiring for the number of lights estimated for in his original report would involve the following capital outlay: first year, £7,000; second year, £5,000; third year, £8 000; fourth year, £10,000. It is proposed that the Borough Council enter into an agreement for the free wiring of consumers' premises at a rate not exceeding 2s. per lamp (for any lamp up to 50 c p.) installed per annum, and the Electric Lighting Committee will consider schemes on this basis, submitting the name of the firm they recommend to the Council for effecting this purpose.

London County Council.—At Tuesday's meeting of the Council it was agreed to lend the Hackney Borough Council £30,000 for electric light installation, and the Hammersmith Borough Council £13,530 for a similar purpose. There were 112 applications for the appointment of resident foreman of the generating station in connection with the electric light installation for the Victoria-embankment and Westminster Bridge. Mr. Robert Simpson is to be appointed in the engineer's department to act as foreman, and to reside at and to take charge of the machinery and staff of the generating station. Permission was granted to the National Telephone Company to run a telephone cable into the Victoria-embankment subway through the base of the pedestal in course of erection for the Boadicea statuary group. Sanction was also given to notices under Electric Lighting Acts and Orders as follows: Brompton and Kensington Electricity Supply Company, under the House-to-House Order, 1899, to lay high-tension mains along a portion of Clareville-grove; County of London and Brush Provincial Electric Lighting Company, under the Camberwell Order, 1896, to lay low-tension mains along Odell-street and Dartnell-road, and across Longcroft-road, under the Wandsworth Order, 1892, to lay low-tension mains along both sides of Hopton-road, Streatham, and under the St. Saviour's Order, 1896, to lay mains of low and extra high tension along Newcomen-street to Great Maze-pond; London Electric Supply Corporation, to lay high and low tension distributing mains along a portion of and across Borough High-street, and to construct underground converter boxes; Notting Hill Electric Lighting Company, to lay mains along a portion of and across Dawson-place; County of London and Brush Provincial Electric Lighting Company, under the Wandsworth Order, 1892, of intention to lay high and low tension mains along Heathfield-road, Alma-terrace, Trinity-road and Nicosia-road, and low-tension mains along Routh-road, Lyford-road, and Magdalen road, and to construct a transformer box in Nicosia-road, and under the Battersea Order, 1900 to lay high and low tension mains along Trinity-road and Hendham-road, and low-tension mains along Burntwood lane, and to construct a transformer box in Hendham-road; the Kensington and Knightsbridge Electric Lighting Company, under the company's order and the Kensington and Knightsbridge Electric Lighting Act, 1893, to lay mains (*a*) along and across Brompton-road, and (*b*) along a portion of Victoria-road; the London Electric Supply Corporation of intention to lay high-tension distributing mains along Charing-cross, Whitehall, Downing-street, Parliament-street, and Charles-street; Metropolitan Electric Supply Company, under the West London Order, 1889 of intention to lay low-tension mains along York gate, Marylebone road and Brunswick-place, and under the Mid-London Order, 1889, to lay high-tension mains along Tower-street and Upper St. Martin's lane.

Aberdeen.—In connection with the resolution of the Aberdeen Town Council to sanction experimentally the erection of lamps in the centre of the tramway track in Union-street, the Watching and Lighting Committee of the Council had a meeting last week for the purpose of considering the matter. In order to have a practical test of the safety of the proposed experiment, says the *Aberdeen Journal*, a model of a lamp in wood was manufactured, the diameter at the base being 16in., and tapering gradually upwards to the lamp, which was erected at a height of about 16½ft. from the ground, and several feet higher than the top of the tramway cars. The model was erected opposite the Municipal Buildings and was lightly fixed at the base, but was also further supported by a couple of ropes attached to the top of the lamp and held by two men. While the committee were sitting in the town house, Councillor Wilkie, convener of the Tramways Committee; Mr. D. Moonie, the manager; and Mr. Lewis Anderson, lighting inspector, watched the traffic in the street. The cars passed quite clear of the lamp-post, but if a passenger were to project his head over the car it would come in contact with the lamp-post. Councillor Ross tried this experiment, and the lamp-post touched the crown of his hat. A projecting umbrella would also probably touch the standard. About 20 minutes to four o'clock a Bayview car, in which were a pair of light greys, approached the lamp-post. One of the pair was evidently frightened either at the post or the ropes being held by the two men and shied, springing partly upon the other horse farthest from the pole, and it lost its footing and fell. The first horse struggled a little, and came within an inch or two of kicking the standard. Mr. Moonie came to the rescue, and both horses were detached from the car to allow the harness to be adjusted, which was done, and the fallen horse having been raised, the car proceeded. The incident, however, created a considerable amount of interest, and it was considered to be somewhat an unfavourable omen for the success of the central pillar arrangement. When cars cross a given point there is a distance between them of 48in. When a lamp of the diameter of the base of the model is erected there is only 16in. clear on each side of the base of the lamp. The remit from the Council in regard to the erection of Kitson lamps in Union-street was remitted with full powers to the Lighting Sub-Committee. The committee then considered the effect of the dummy lamp erected in front of the town house, and the committee had a couple of cars drawn up in order to see what space would be available between the car and the pillar. The opinion of the committee was that when the lamps were erected first a guard should be put upon all the cars at the top to obviate the possibility of any danger to passengers. This proposal the convener and the committee agreed to see carried out, and negotiations will at once be proceeded with. It is expected that 12 standard lamps will be erected in Union-street between Union-terrace and Holborn-street. They will be of 1,000 c.p. each.

NEW COMPANIES.

The following new companies have been registered since our last issue:

C. G. Reed and Sons, Limited.—Capital, £22,500. Object: to adopt an agreement with C. G. Reed for the acquisition of the business carried on by him at 26, North street, 58 King-street, and in North-road, Brighton, to develop the same, and to carry on business as ironmongers, engineers, millwrights, electricians, etc.

East Coast Automobile Company, Limited.—Capital, £2 000. Object: to carry on the business of motorcar and automobile owners, manufacturers, hirers, and letters on hire of automobiles, carriages, and vehicles of all kinds, etc.

Pritchetts and Gold, Limited.—Capital, £40,000. Object: to adopt an agreement for the acquisition of the business now and hitherto carried out under the style or firm of Pritchetts and Gold, to develop and extend the same, and generally to carry on business as manufacturers of and dealers in storage batteries and accessories; as electrical engineers, makers of electrical appliances and machinery, etc.

Hedges, McKrell, and Co., Limited.—Capital, £1,000. Object: to acquire the business of electricians, etc., as carried on by Hedges, McKrell, and Co. at 31 and 34, Barbican, E.C., to develop the same, and generally to carry on business as electrical engineers, makers of electric tramcars, motorcars, etc.

Public Undertakings Syndicate, Limited.—Capital, £10,000. Object: to carry on business as constructors and controllers of public works and conveniences of all kinds, to include rail and tram roads, docks, piers, canals, wharves, drainage, water, gas, electric light, telephones, telegraphs, electric energy, and supply works, etc.

New Electric Lamp Regenerating Company, Limited.—Capital, £80,000. Object: to adopt an agreement made by this Company with C. W. Milne, and to carry on in all or any of their respective branches the businesses of lamp manufacturers, electric and mechanical engineers, etc.

PROVISIONAL PATENTS, 1901.

MARCH 18.

5688. Self-fastening rail bond for electrical connection of rail. John William Shepherdson, 89, Albion-street, Leeds.

5662. Improvements in electric heaters. Alexander Ritchie Leask and Percy Morgan Bellis, 11, Southampton-buildings, Chancery lane, London.

5700. Improvements in or relating to electric clocks. Johann Pöschl and Johann M. Gautsch, 111, Hatton-garden, London. (Complete specification.)

MARCH 19.

5712. Improvements in electrical switches. Henry Lomax, Ralph Lomax, and John Tomlinson, 57 Barton-arcade, Manchester.

5714. Improvements in hand-fed arc lamps. George Smith and Herbert Hampton Hall, 57, Barton-arcade, Manchester.

5719. Self-lubrication (without oil) of the swivelling spindles or forks connected with "trolley heads" used on the overhead trolley system of electric tramway cars. Thomas Beaumont Birkby and Frederick Ernest Birkby, Woodfield Mills, Liversedge, Yorks.

5723. Improvements in apparatus for changing illuminated advertisements and for other purposes, the switch connected therewith being also applicable for electric lighting generally. Peter Mushet and Charles Plow Eggar, 154, St. Vincent-street, Glasgow.

5754. Improvements in mounting incandescence electric lamps. Ernest de Pass, 78, Fleet-street, London. (La Société Anonyme pour la Transmission de la Force par l'Electricité, France.)

5764. Improvements in obtaining zinc by electrolysis and apparatus for that purpose. Ludwig Mond, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London.

5766. Improvements in the working and controlling of electrically-driven cars. Siemens Bros. and Co., Limited, Alexander Siemens, and A. Mervyn Duke, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London.

5786. Improvements relating to telephonic apparatus comprising conversation counters or meters. Henrich Eichwede, 18, Buckingham-street, Strand, London. (Complete specification.)

5808. An improved single or duplex electric clockwork switch for turning on and off electric light every half minute, or for longer or shorter period, for illumination or advertising purposes. Thomas Joseph Phippe, 199, St. Alban's-road, Watford.

MARCH 20.

5868. Improvements in ships' telegraphs for gunnery purposes. Sydney Evershed and Evershed and Vignoles, Limited, 1, Queen Victoria-street, London.

5868. Improvements in electrical heating apparatus. Richard Wade Boyd, 11, Southampton-buildings, Chancery-lane, London. (Complete specification.)

MARCH 21.

5921. Improvements in life guards for electric tramcars or the like. Dionysius Newton, Lombard-chambers, Bixteth-street, Liverpool.

5952. An improved watertight cover for electric cut-outs, switches, joint-boxes, and the like. Hugo Hirst and Thomas Henry Bacon, 71, Queen Victoria-street, London.

5954. Improvement in armatures for dynamo-electric machines and the like, and in the manufacture of the same. Joseph Matthews and William Davies, 77, Colmore-row, Birmingham.

5964. Improvements in or relating to electric railway signals. Alfred Julius Boult, 111, Hatton-garden, London. (Jonathan David Price and William Henry Council, United States.) Complete specification.)

5975. Improvements in carriers for glow lamps. Carl Colsman and Alfred Colsman, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Complete specification.)

5985. Improvements in and relating to current collectors for electric railways on the overhead system. August Reinecke and Adolf Jost, 322, High Holborn, London. (Complete specification.)

5987. Improvements in carrying telephone and telegraph wires across streets and protecting the trolley wires or overhead wires of electrical tramways therefrom in case of breakage. Alfred William Bennis, 6, Bakn-street, Manchester.

6004. Improvements in means or apparatus for driving dynamos on railway and other vehicles from the axles thereof, and for connecting such dynamos and batteries to lighting, heating, or other circuits on such vehicles. Frederick John Beaumont and William Mudd Still, 46, Lincoln's-inn-fields, London.

6006. Improved armature core for electric generators. Gerhard Koppelmann, 322, High Holborn, London. (Complete specification.)

MARCH 22.

6016. An automatic electric cut off. Edward Phipps Appleyard, 28, Bradford-avenue, Manchester.

6018. An improved insulated glove. Francis Pegler and James Joseph Warry, 15, Water-street, Liverpool.

6041. Improved contrivance for concealing slack wires on lifts, arc lamps, wall plugs, ceiling pendants, and the like. William Brown, 229, Munster-road, Fulham, London.

6042. Improvements in printing telegraphs. Leo Camm, 27, Powell-street, Goswell-road, London.

6043. Trolley conductor insulated fitting for electric tramways and railways. Frank Gustav Kleinsteuber, 52, Chancery-lane, London.

6076. Improvements in apparatus for the generation and electrolytic application of electric currents. Francis Edward Elmore, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Partly by John Oliver Surtees Elmore, India.)

6085. Improved terminal for electric wires. Eardley Delauney Billing and Alfred Dunhill, 1 and 4, Mitre-court-chambers, Fleet-street, London.

MARCH 23.

6095. Improvements in transformers and the like. William Ernest Burnand, 119, St. Mary's-road, Sheffield.

6096. Improvements in and relating to electric arc lamps. Llewellyn Burbank Codd, 211, Woodborough-road, Nottingham.

6097. Improvements in storing up waste power by balance weight for enabling electric and other tramcars or vehicles to travel up and down very steep inclines with perfect safety. Thomas Greenwood, 249, Burlington-terrace, Queen's-road, Halifax.

6104. Improvements in or connected with the trolley wheels used in overhead electrical traction. Robert Lighton Ross and Robert Bridge, 5, John Dalton-street, Manchester.

6107. Improvements in electrical measuring instruments. Arthur Cecil Heap and William Oliver Smith, Century Works, Lewisham, London.

6118. An electric fog and danger railway signal. Harry James Everatt and Arthur Tewson, 30, Holborn, London.

6125. Improvements in incandescent electric lampholders. George Herbert Parr, 111, Hatton-garden, London.

6137. Improvements in or relating to starting and controlling electromotors. Wilfrid Swanwick Boult, 111, Hatton-garden, London.

6161. Method of and apparatus for controlling single-phase alternate-current motors. Siemens Bros. and Co., Limited, and Francis Lydall, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London.

6164. Improvements in and relating to accumulator plates. Eduard Francke, 27, Chancery-lane, London.

COMPLETE SPECIFICATIONS ACCEPTED.

To be published on April 13.

1900.

4934. Current-feeding devices for electric meter tramcars or the like. Johannes Wilhelm Ehlers and Lambert Wheitz.

5650. Asynchronous rotary converters and other dynamo-electric machines. Thompson. (Helios Electricitäts Actien-Gesellschaft.)

5567. Electric contacts or couplings. Andreas.

5598. Electricity meters. Wright and Reason Manufacturing Company, Limited.

5649. Telegraphic apparatus. Sidney George Brown and Joseph Arthur Lovel Dearlove.

6237. Electrical gas-igniting apparatus. Schwarzenbach.

6936. Switches for electrical circuits. Moy and Ernest F. Moy, Limited.

6947. Dynamo-electric machines. Lamme. (Date applied for under International Convention, Feb. 26, 1900.)

7237. Electric railways with underground conductors. Henne and Schönfelder.

7795. Electric light fittings. Calderbank.

8289. Insulated electric cables or conductors and the manufacture thereof. Heyl-Dia.

8290. Insulated electric cables or conductors and the manufacture thereof. Heyl-Dia.

9059. Electromagnetic brakes for railway and tramway vehicles. Newell.

9060. Electromagnetic brake shoes for railway and tramway vehicles. Newell.

9212. Trolley or like current collectors for electric railways and tramways. Killip.

9279, Supports for electric conductors. Lorain and Dennery.

9563. Electrolysing process for zinc and other salts with soluble anodes. Abel. (Soc. des Piles Electriques.)

Digitized by Google

9697. Process of depolarizing by liquid circulation in galvanic batteries. Abel. (Soc. des Piles Electriques.)

10219. Electric energy meters. Wise. (Lux'sche Industriewerke Actiengesellschaft.)

10511. Manufacture of negative or spongy lead plates or elements for secondary batteries or electrical accumulators. Electrical Power Storage Company, Limited. (Butler and May.)

15006. Method of suspending the moving parts of an electric integrating meter or other instruments. Fell. (Stanley.)

17726. Dynamo-electric generators. Batchelor. (Batchelor.)

18089. Electric railways and tramways on the closed-conduit system. Marzi.

22572. Electrostatic machines. Schall. (Messrs. Reiniger, Gebbert, and Schall.)

22842. Regulating device for electric current generators. De Hoor, Reinitz, and Stark.

1901.

466. Electric switches. Lake. (Globe Manufacturing Company.)

1010. Dynamo-electric machines. British Thomson-Houston Company, Limited. (Thomson.)

1167. Electric meters. Mathiesen.

2346. Trolley repeholders for electric cars. Clayton.

2370. Battery electrodes. Liddle. (Globe Electric Company.)

2493. Method for obtaining electric currents from the earth. Jahr.

2570. Telautographs and methods of telautographic transmission. Newton. (Gray National Telautograph Company.)

Supplement to "The Electrical Engineer,"

MARCH 29, 1901.

INSTITUTION OF ELECTRICAL ENGINEERS.

Some Notes on Polyphase Sub-Station Machinery

BY A. C. EBORALL, MEMBER.

Polyphase systems of generation and transmission, combined with direct-current distribution from sub-stations, are very much in evidence at the present time in connection with many large lighting and traction schemes, and there is little doubt but that the use of such combined systems will greatly extend in the future for those cases where power has to be supplied in very large amounts over large areas. The author thought, therefore, that a paper embodying some notes on the subject might be of interest to many members of the Institution; and, complying with a request of the President, the scope of the paper has been confined as far as possible to practical questions of everyday working that have come within his own experience. Consequently many of the points discussed must be quite familiar to those members who have worked in the same direction, who must kindly bear in mind in this connection that the author does not profess to put forward anything new, but merely to bring up for discussion some working notes on the subject.

In the following pages, then, the general ideas underlying the equipment and operation of polyphase sub-stations are first dealt with, and this is followed by some features of working, and a comparison of the different types of machinery that can be employed for the work under consideration, together with some details and examples taken from actual practice. It is always to be understood that the author has in mind the case in which very large amounts of power (transmitted at high pressures) have to be handled—the modern case, in fact. Moreover, on account of their greater commercial importance, three-phase systems are more particularly considered.

I.—Sub-Station Equipments for Lighting or Traction.

Considering the general case, applicable to large towns, the polyphase current will be sent over the transmission lines from the distant power station, usually arriving at the various sub-stations in the supply area at a pressure between 5,000 to 10,000 volts between lines, according to the length of the feeders and amount of power to be transmitted; the work to be done comprises the conversion of the whole of the current in question into direct current at 2 × 220 volts for lighting, or 500 to 550 volts for traction, together with the provision of means for regulating the current and feeding it into the low-pressure networks comprised in the area. It can be done by three different types of sub-station, each type embodying a distinct class of equipment, as set out more particularly below; the size of the units in the sub-stations will vary in general between 300 kw. and 1,000 kw. individual output.

(*a*) *Asynchronous Motor-Generator Equipment.*—This type of sub-station equipment consists in the employment of a number of polyphase induction motors driving an equivalent number of direct-current generators; the motor-generator units will be of such a size that the high-pressure current can be led directly into the motors, and consequently the equipment and operation of the sub-station will be of the simplest possible character. No starting gear has to be provided beyond a simple rotor resistance for each motor, there is no synchronising to be done, and the regulation on the direct-current side is made on the fields of the generators, either by hand or by compound windings in the usual way. The author does not know of a single case in which polyphase motors of large size (either synchronous or asynchronous) are operated with transformed current. The construction of such motors lends itself so well to high insulation of the stator that motors as small as 150 h.p. can be perfectly satisfactorily (and cheaply) built for pressures of 5,000-6,000 volts. With the large units required for sub-station work, it does not pay from either the technical or commercial point of view to employ step-down transformers—at any rate up to 10,000 volts. If the motors are less than about 500 h.p. individual output, and the pressure greater than this figure, it may pay to employ transformers, because the amount of slot insulation required will probably be found to be excessive, necessitating the employment of motors of large dimensions compared with their output. The trouble with high-pressure working without transformers in the sub-stations is, as a rule, in the switch gear for the motors; but great improvements have been made in this during recent years, and at the present time there is very little to fear in this respect.
